Dedication

In loving memory of my parents—

To my mother, Frances Mary, and my father, Arnold Lawrence, who taught me to always love, care, and be the best that I could be. My memories of their love, support, and words of encouragement will remain in my heart forever!

Linda Anne Silvestri

To my parents, Mary Elizabeth and Lawrence Peter, who have instilled in me the values of working hard and being selfless, and who have been my support system as I pursue my professional goals and life aspirations. My success thus far would not have been possible without them. From the bottom of my heart, thank you, Mom & Dad!

Angela E. Silvestri
Letter from the Authors

To All Future Registered Nurses,

Congratulations to you!

You should be very proud and pleased with yourself on your most recent well-deserved accomplishment of completing your nursing program to become a registered nurse. We know that you have worked very hard to become successful and that you have proven to yourself that indeed you can achieve your goals.

In our opinion, you are about to enter the most wonderful and rewarding profession that exists. Your willingness, desire, and ability to assist those who need nursing care will bring great satisfaction to your life. In the profession of nursing, your learning will be a lifelong process. This aspect of the profession makes it stimulating and dynamic. Your learning process will continue to expand and grow as the profession continues to evolve. Your next very important endeavor will be the learning process involved to achieve success in your examination to become a registered nurse.

We are excited and pleased to be able to provide you with the Saunders Pyramid to Success products, which will help you prepare for your next important professional goal, becoming a registered nurse. We want to thank all of our former and current nursing students whom we have assisted in their studies for the NCLEX-RN® examination for their willingness to offer ideas regarding their needs in preparing for licensure. Student ideas have certainly added a special uniqueness to all of the products available in the Saunders Pyramid to Success.

Saunders Pyramid to Success products provide you with everything that you need to ready yourself for the NCLEX-RN examination. These products include material that is required for the NCLEX-RN examination for all nursing students regardless of educational background, specific strengths, areas in need of improvement, or clinical experience during the nursing program.

So let’s get started and begin our journey through the Saunders Pyramid to Success, and welcome to the wonderful profession of nursing!

Sincerely,
Dr. Linda Anne Silvestri and Dr. Angela E. Silvestri
As a child, I always dreamed of becoming either a nurse or a teacher. Initially I chose to become a nurse because I really wanted to help others, especially those who were ill. Then I realized that both of my dreams could come true; I could be both a nurse and a teacher. So I pursued my dreams.

I received my diploma in nursing at Cooley Dickinson Hospital School of Nursing in Northampton, Massachusetts. Afterward, I worked at Baystate Medical Center in Springfield, Massachusetts, where I cared for clients in acute medical-surgical units, the intensive care unit, the emergency department, pediatric units, and other acute care units. Later I received an associate degree from Holyoke Community College in Holyoke, Massachusetts; my BSN from American International College in
Springfield, Massachusetts; and my MSN from Anna Maria College in Paxton, Massachusetts, with a dual major in Nursing Management and Patient Education. I received my PhD in Nursing from the University of Nevada, Las Vegas, and conducted research on self-efficacy and the predictors of NCLEX® success. I am also a member of the Honor Society of Nursing, Sigma Theta Tau International, Phi Kappa Phi, the American Nurses Association, the National League for Nursing, the Western Institute of Nursing, the Eastern Nursing Research Society, and the Golden Key International Honour Society. In addition, I received the 2012 Alumna of the Year/Nurse of the Year Award from the University of Nevada, Las Vegas, School of Nursing. I was selected for Fellowship in the American Academy of Nursing and will be inducted in October, 2019.

As a native of Springfield, Massachusetts, I began my teaching career as an instructor of medical-surgical nursing and leadership-management nursing in 1981 at Baystate Medical Center School of Nursing. In 1989, I relocated to Rhode Island and began teaching advanced medical-surgical nursing and mental health nursing to RN and LPN students at the Community College of Rhode Island. While teaching there, a group of students approached me for assistance in preparing for the NCLEX examination. I have always had a very special interest in test success for nursing students because of my own personal experiences with testing. Taking tests was never easy for me, and as a student I needed to find methods and strategies that would bring success. My own difficult experiences, desire, and dedication to assist nursing students to overcome the obstacles associated with testing inspired me to develop and write the many products that would foster success with testing. My experiences as a student, nursing educator, and item writer for the NCLEX examinations aided me as I developed a comprehensive review course to prepare nursing graduates for the NCLEX examination.

Later, in 1994, I began teaching medical-surgical nursing at Salve Regina University in Newport, Rhode Island, and I remain there as an adjunct faculty member preparing senior nursing students for the NCLEX-RN examination. Also, I am currently a part-time instructor at the University of Nevada, Las Vegas.

I established Professional Nursing Seminars, Inc. in 1991 and Nursing Reviews, Inc. in 2000. These companies are located in Henderson, Nevada. Both companies are dedicated to helping nursing graduates achieve their goals of becoming registered nurses, licensed practical/vocational nurses, or both.

Today, I am the successful author of numerous review products. Also, I serve as an Elsevier consultant for HESI Live Reviews, the review courses for the NCLEX examinations conducted throughout the country. I am so pleased that you have decided to join me on your journey to success in testing for nursing examinations and for the NCLEX-RN examination!
Being a nurse is one of the most enriching aspects of my life. It is a career that is multifaceted and complex, and allows me to be challenged scientifically, technically, and spiritually. As a nurse educator, I feel honored to impart my knowledge and experience to others who are hoping to serve in this selfless, caring profession. As a nurse scientist, I aim to make an impact on health care delivery methods, quality of care provided, and overall health care outcomes.

I earned my baccalaureate of science in nursing at Salve Regina University in Newport, Rhode Island. Upon graduation, I worked in long-term care, subacute care, rehabilitation, and acute care settings. I continue to work as a bedside nurse to maintain my technical skills set and to remain apprised of the changes reflected in health care today. I had the opportunity to serve as a preceptor for new graduate RNs while working in these areas. With the desire to become an educator, I pursued my Master of Science in nursing with a focus in education from the University of Nevada, Las Vegas, and began my teaching career. I continued my studies in the Doctor of Philosophy program at the University of Nevada, Las Vegas, focusing on beginning my research program as a nurse scientist. I completed my postgraduate certificate in advanced practice recently and am looking forward to serving in the role of the advanced practice nurse.

Throughout the years, I have worked extensively in the development of NCLEX
review products, as well as with students in live review courses for the NCLEX. I am very excited at the prospect of helping graduates take the final step in becoming a licensed nurse. Thank you for your dedication to the profession of nursing, and I hope you find this resource useful as you move forward in your journey in becoming a licensed nurse. If you don’t already know, nursing is an amazing profession!

“To laugh often and much, to appreciate beauty, to find the best in others, to leave the world a bit better, to know that even one life has breathed easier because you have lived, this is to have succeeded.”

Ralph Waldo Emerson

“Success is never an accident. To be successful is to have been perseverant, to have sacrificed, and to have loved what you are cultivating to become successful.”

Welcome to Saunders Pyramid to Success!

An Essential Resource for Test Success

Saunders Comprehensive Review for the NCLEX-RN® Examination is one in a series of products designed to assist you in achieving your goal of becoming a registered nurse. This text will provide you with a comprehensive review of all nursing content areas specifically related to the new 2019 test plan for the NCLEX-RN examination, which is implemented by the National Council of State Boards of Nursing. This resource will help you achieve success on your nursing examinations during nursing school and on the NCLEX-RN examination.

Organization

This book contains 20 units and 70 chapters. The chapters are designed to identify specific components of nursing content. They contain practice questions, both multiple-choice and alternate item formats, that reflect the chapter content and the 2019 test plan for the NCLEX-RN examination. The final unit, Chapter 70, contains a 75-question Comprehensive Test. All questions in the book and on the Evolve site are presented in NCLEX-style format.

The new test plan identifies a framework based on Client Needs. These Client Needs categories include Safe and Effective Care Environment, Health Promotion and Maintenance, Psychosocial Integrity, and Physiological Integrity. Integrated Processes are also identified as a component of the test plan. These include Caring, Communication and Documentation, Culture and Spirituality, Nursing Process, and Teaching and Learning. All chapters address the components of the test plan framework.
Special Features of the Book

Pyramid Terms

*Pyramid Terms* are important to the discussion of the content in the chapters in each unit. Therefore, they are in bold green type throughout the content section of each chapter. Definitions can be reviewed in the Audio Glossary on the Evolve site.

Pyramid to Success

The *Pyramid to Success*, a featured part of each unit introduction, provides you with an overview, guidance, and direction regarding the focus of review in the particular content area, as well as the content area’s relative importance to the 2019 test plan for the NCLEX-RN examination. The *Pyramid to Success* reviews the Client Needs and provides learning objectives as they pertain to the content in that unit. These learning objectives identify the specific components to keep in mind as you review each chapter.

Priority Concepts

Each chapter identifies two *Priority Concepts* reflective of its content. These *Priority Concepts* will assist you to focus on the important aspects of the content and associated nursing interventions.

Pyramid Points

*Pyramid Points* (▲▼) are placed next to specific content throughout the chapters.

The *Pyramid Points* highlight content that is important for preparing for the NCLEX-RN examination and identify content that is likely to appear on the NCLEX-RN examination.

Pyramid Alerts

*Pyramid Alerts* are the red text found throughout the chapters that alert you to important information about nursing concepts. These alerts identify content that typically appears on the NCLEX-RN examination.

Special Features Found on Evolve

Pretest and Study Calendar

The accompanying Evolve site contains a 75-question pretest that provides you with feedback on your strengths and weaknesses. The results of your pretest will generate an individualized study calendar to guide you in your preparation for the NCLEX-RN examination.

Heart, Lung, and Bowel Sound Questions
The accompanying Evolve site contains Audio Questions representative of content addressed in the 2019 test plan for the NCLEX-RN examination. Each question presents an audio clip as a component of the question.

**Video Questions**

The accompanying Evolve site contains Video Questions representative of content addressed in the 2019 test plan for the NCLEX-RN examination. Each question presents a video clip as a component of the question.

**Case Study (Testlet) Questions**

The accompanying Evolve site contains case study questions. These question types include a client scenario and several accompanying practice questions that relate to the content of the scenario.

**Audio Review Summaries**

The companion Evolve site includes three Audio Review Summaries that cover challenging subject areas addressed in the 2019 test plan for the NCLEX-RN examination, including Pharmacology, Acid-Base Balance, and Fluids and Electrolytes.

**Practice Questions**

While preparing for the NCLEX-RN examination, it is crucial for students to practice taking test questions. This book contains 945 NCLEX-style multiple-choice and alternate item format questions. The accompanying software includes all questions from the book plus additional Evolve questions for a total of more than 5200 questions.

**Multiple-Choice and Alternate Item Format Questions**

Starting with Unit II, each chapter is followed by a practice test. Each practice test contains several questions reflective of the content in the chapter and those presented on the NCLEX-RN examination. These questions provide you with practice in prioritizing, decision-making, critical thinking, and clinical judgment skills. Chapter 1 of this book provides a description of each question type. Sample questions of the Next Generation NCLEX (NGN) are also provided in this chapter.

The answer section for each practice question throughout the chapters and on the Evolve site provides the correct answer, the rationale for the correct and incorrect options, and a specific test-taking strategy that will assist you in answering the question correctly. The specific test-taking strategy is highlighted in bold blue type. This highlighting will provide you with guidance and direction for further remediation in the Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam.

The categories identified in each practice question include Level of Cognitive Ability, Client Needs, Integrated Process, the specific nursing Content Area, the Health Problem, and Priority Concepts. Every question on the accompanying Evolve
site is organized by these question codes, so you can customize your study session to be as specific or as generic as you need. Additionally, a link to view normal laboratory reference intervals are provided with each practice question.

**Pharmacology and Medication Calculations Review**

Students consistently state that pharmacology is an area with which they need assistance. The 2019 NCLEX-RN test plan continues to incorporate pharmacology in the examination, but only the generic drug names will be included. Therefore, pharmacology chapters have been included for your review and practice. This book includes 13 pharmacology chapters, a medication and intravenous prescriptions calculation chapter, and a pediatric medication administration and calculation chapter. Each of these chapters is followed by a practice test that uses the same question format described earlier. This book contains numerous pharmacology questions. Additionally, more than 950 pharmacology questions can be found on the accompanying Evolve site.

**Next Generation NCLEX (NGN) Questions**

The NCSBN is currently piloting research questions for a project known as the “Next Generation NCLEX.” An NCLEX candidate may encounter these questions once they complete their examination, and they will have the option to answer these questions as part of NCSBN’s research on these new item types. The NCSBN is aiming to launch the NGN questions on the examination sometime during the years 2022-2023, and these item types are designed to test the candidate’s ability to make safe and competent clinical judgments. This resource includes 25 NGN item types, and although it is not live on the NCLEX now, practicing these items will assist the current candidate in preparing for the NCLEX examination. The NGN questions are located on the Evolve site.

**How to Use This Book**

*Saunders Comprehensive Review for the NCLEX-RN® Examination* is especially designed to help you with your successful journey to the peak of the Saunders Pyramid to Success: becoming a registered nurse! As you begin your journey through this book, you will be introduced to all of the important points regarding the 2019 NCLEX-RN examination, the process of testing, and unique and special tips regarding how to prepare yourself for this very important examination.

You should begin your process through the Saunders Pyramid to Success by reading all of Unit I in this book and becoming familiar with the central points regarding the NCLEX-RN examination. Be sure to read Chapter 3, written by a nursing graduate who recently passed the examination, and note what she has to say about the testing experience. Chapter 4 will provide you with the critical testing strategies that will guide you in selecting the correct option or assist you in selecting an answer to a question if you must guess. Keep these strategies in mind as you
proceed through this book. Continue by studying the specific content areas addressed in Units II through XIX. Review the definitions of the *Pyramid Terms* located in each chapter, and the *Pyramid to Success* notes, and the Client Needs and Learning Objectives located in each unit introduction. Read through the chapters and focus on the *Pyramid Points* and *Pyramid Alerts* that identify the areas most likely to be tested on the NCLEX-RN examination. Pay particular attention to the *Priority Nursing Actions* boxes because they provide information about the steps you will take in clinical situations requiring clinical judgment and prioritization.

As you read each chapter, identify your areas of strength and those in need of further review. Highlight these areas and test your abilities by taking all practice tests provided at the end of the chapters. Be sure to review all rationales and test-taking strategies.

After reviewing all chapters in the book, turn to Unit XX, Chapter 70, the Comprehensive Test. Take this examination and then review each question, answer, and rationale. Identify any areas requiring further review; then take the time to review those areas in both the book and the companion Evolve site. In preparation for the NCLEX-RN examination, be sure to take the pretest and generate your study calendar. Follow the calendar for your review because the calendar represents your pretest results and the best study path to follow based on your strong and weak content areas. Also, be sure to access the *Case Studies* and the *Audio Review Summaries* as part of your preparation for the NCLEX-RN examination.

**Climbing the Pyramid to Success**

The purpose of this book is to provide a comprehensive review of the nursing content you will be tested on during the NCLEX-RN examination. However, *Saunders Comprehensive Review for the NCLEX-RN® Examination* is intended to do more than simply prepare you for the rigors of the NCLEX-RN examination; this book is also meant to serve as a valuable study tool that you can refer to throughout your nursing program, with specific customizable Evolve site selections to help identify and reinforce key content areas and prepare you for your nursing exams.

After using this book for comprehensive content review, your next step in the *Pyramid to Success* is to get additional practice with the Q&A review product. *Saunders Q&A Review for the NCLEX-RN® Examination* offers more than 6000 unique practice questions in the book and on the companion Evolve site. The questions are focused on the Client Needs and Integrated Processes of the NCLEX-RN test plan, making it easy to access your study area of choice. For on-the-go Q&A review, you can pick up *Saunders Q&A Review Cards for the NCLEX-RN® Examination*.

Your final step on the *Pyramid to Success* is to master the online review. *Saunders Online Review for the NCLEX-RN® Examination* provides an interactive and individualized platform to get you ready for your NCLEX exam. This online course provides 10 high-level content modules, supplemented with instructional videos, animations, audio, illustrations, case studies, and several subject matter exams. End-of-module practice tests are provided along with several *Crossing the Finish Line* practice tests. In addition, you can assess your progress with a Pretest, Test Yourself quizzes, and a Comprehensive Exam in a computerized environment that prepares you for the actual NCLEX-RN examination.

At the base of the *Pyramid to Success* are our test-taking strategies, which provide
a foundation for understanding and unpacking the complexities of NCLEX-RN examination questions, including alternate item formats. *Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam* takes a detailed look at all of the test-taking strategies you will need to know in order to pass any nursing examination, including the NCLEX-RN. Special tips are integrated for nursing students, and there are more than 1200 practice questions included so you can apply the testing strategies. NGN questions are included on the Evolve site.

Good luck with your journey through the Saunders Pyramid to Success. We wish you continued success throughout your new career as a registered nurse!
Acknowledgments

A Few Words From Linda

There are many individuals who in their own ways have contributed to my success in making my professional dreams become a reality. My sincere appreciation and warmest thanks are extended to all of them.

First, I want to acknowledge my parents, who opened my door of opportunity in education. I thank my mother, Frances Mary, for all of her love, support, and assistance as I continuously worked to achieve my professional goals. I thank my father, Arnold Lawrence, who always provided insightful words of encouragement. My memories of their love and support will always remain in my heart. I am certain that they are very proud of my professional accomplishments.

I also thank my best friend and love of my life, my husband, Larry; my sister, Dianne Elodia, and her husband, Lawrence; my brother, Lawrence Peter, and my sister-in-law, Mary Elizabeth; my cousin Paula; and my nieces and nephews, Angela, Gina, Karen, Katie, Brianna, and Nicholas, who were continuously supportive, giving, and helpful during my research and preparation of this publication. They were always there and by my side whenever I needed them.

I want to thank my nursing students at the Community College of Rhode Island who approached me in 1991 and persuaded me to assist them in preparing to take the NCLEX-RN examination. Their enthusiasm and inspiration led to the commencement of my professional endeavors in conducting review courses for the NCLEX-RN examination for nursing students. I also thank the numerous nursing students who have attended my review courses for their willingness to share their needs and ideas. Their input has certainly added a special uniqueness to this publication.

I also wish to acknowledge all of the nursing faculty who taught in my review courses for the NCLEX-RN examination. Their commitment, dedication, and expertise have certainly assisted nursing students in achieving success with the NCLEX-RN examination. I also want to extend a very special thank you to my niece, Angela, for joining me in preparing and authoring these NCLEX resources. Angela is wonderful to work with. Her tremendous theoretical and clinical knowledge and expertise and her consistent ideas and input certainly added to the excellent quality of this product. She is very dedicated to promoting and ensuring student success. Thank you, Angela!

A special thank you goes to Loren Wilson, former Senior Vice President, for her years of expert guidance and continuous support for all of the products in the Pyramid to Success.

I would also like to acknowledge Patricia Mieg, former educational sales representative, who encouraged me to submit my ideas and initial work for the first edition of this book to the W.B. Saunders Company.
I also need to thank Salve Regina University for the opportunity to educate nursing students in the baccalaureate nursing program and for its support during my research and writing of this publication. I would like to especially acknowledge my colleague Dr. Eileen Gray for all of her encouragement and support and dedication to my professional endeavors.

I wish to acknowledge the Community College of Rhode Island, which provided me with the opportunity to educate nursing students in the Associate Degree of Nursing Program. A special thank you goes to Patricia Miller, MSN, RN, and Michelina McClellan, MS, RN, from Baystate Medical Center, School of Nursing, in Springfield, Massachusetts, who were my first mentors in nursing education.

And finally, a very sincere and special acknowledgment to my husband, Laurent (Larry) W. Valliere, for his contribution to this publication, for teaching in my review courses for the NCLEX-RN examination, and for his commitment and dedication in assisting my nursing students to prepare for the examination from a nonacademic point of view. I thank him for all of his continuous support; he was so loyal and loving to me each and every moment as I worked to achieve my professional goals. Larry, you are my “rock of support!” Thank you so much!

A Few Words From Angela

There are many people who contributed to my success in my work on this product. I am very grateful for their continued support in all of my endeavors.

First and foremost, I would like to thank my husband, Brent, for his light-hearted and positive attitude. He always knows how to make me laugh, especially when I’m stressed. All of this would not be possible without him!

I would also like to thank my parents, Mary and Larry, for their continued support throughout the years. Their words of encouragement and wisdom have been tremendously important to my success. I also don’t know what I would do without their support in caring for my kids!

I would like to thank my sister Katie, who is a wonderful nurse. Her ambitions as a nursing student were so inspiring and reminded me about why I’m so passionate about being an educator. Thank you to my brother, Nick, who always is positive and encouraging about my work. His wit and sarcasm are always a great way to lift your mood at the end of the day. I would also like to thank my friends Jessica, Alena, and Lisa for their continued support, encouragement, and camaraderie throughout my professional endeavors.

Finally, I want to extend a special thank you to Linda for her collaboration, guidance, and expertise. Without her, I would not be where I am today. Thank you, Linda!

A Few Words From Both Linda and Angela

First and foremost, we want to thank our associate editor, Katie Silvestri, for all of her dedicated and hard work in editing and preparing manuscript for this edition. Her expertise and close attention to details have certainly added to the quality of this resource. In addition, we sincerely thank Katie for writing a chapter for this book about her experiences with preparing for and taking the NCLEX-RN examination.
Katie, thank you so much!

We also want to acknowledge and thank Laurent W. Valliere for writing a chapter addressing those important nonacademic test preparation issues.

A very special thank you and acknowledgment goes to all of the reviewers, contributors, and item writers who updated and provided many of the practice questions and all of the previous contributors who provided contributions to this book.

Additionally, we want to thank Paula Richards for her expertise and input in creating our new chapter, titled Care of Special Populations. Thank you, Paula!

We wish to offer a very special acknowledgment and thank you to Jane Tyerman for reviewing many sections of this book, including the Mental Health section, to ensure that it included Canadian nursing practice and standards. Thank you, Jane!

We would also like to thank other reviewers and contributors who spent so much of their own time reviewing and/or contributing to the new chapters of the book and the specialty sections of this book. Their expertise has certainly added to the quality of this book. Thank you, Jessica Grimm and David Peterson, for your expertise in reviewing the new Complex Care chapter. Thank you, Lisa Nicholas, for your expertise in reviewing and updating developmental stages. Thank you, Eileen Gray, for your updates in Pediatrics; and thank you, Carmen George, for your updates in Maternity. Finally, thank you, Debra Hagler, for your expertise in updating the cardiovascular section of this edition. In addition, a special thank you to both, Veronica Vital and Kimberly Head, for reviewing our new Special Populations chapter.

We thank Dianne E. Fiorentino for her continuous support and dedication to our work and in her reference support and other secretarial responsibilities for the eight editions of this book. We thank Jimmy Guibault for providing medication research support, and Nick Silvestri for his communication and proofreading skills as he reviewed the manuscript. And we thank Mary and Larry Silvestri for their assistance with all of the tasks and projects we needed completed. A special thank you to all of you!

We thank all of our student and graduate reviewers who read all of the practice questions in this book and provided input on their quality. And we sincerely extend a very special thank you to Kristen Hickey, a nursing graduate, who edited and coded all of our practice questions on the Evolve site.

We sincerely acknowledge and thank some very important and special people from Elsevier. We thank Jamie Blum, Senior Content Strategist, and Laurie Gower, Director of Development, for their continuous support, enthusiasm, and expert professional guidance throughout the preparation of this edition. And a very special thank you goes to Laura Goodrich, Senior Content Development Specialist, for her tremendous amount of support and assistance, for prioritizing for us to keep us on track, for her ideas for the product, and for her professional and expert skills in organizing and maintaining an enormous amount of manuscript for production. We could not have completed this project without Laura—thank you, Laura!

We want to acknowledge all of the staff at Elsevier for their tremendous help throughout the preparation and production of this publication. A special thanks to all of them. We thank Julie Eddy, Publishing Services Manager and Amy Buxton, Designer. You have all played such significant roles in finalizing this publication. We need to especially acknowledge Cindy Thoms, Senior Project Manager, who took
over when Laura was on maternity leave. Cindy, you were so supportive and so awesome to work with. Your attention to the many details to ensure and maintain the quality of this book was so greatly appreciated. We thank you so much!

Lastly, a very special thank you to all our nursing students: past, present, and future. All of you light up our life! Your love and dedication to the profession of nursing and your commitment to provide health care will bring never-ending rewards!
UNIT I
NCLEX-RN® Exam Preparation
CHAPTER 1

The NCLEX-RN® Examination

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

The Pyramid to Success

Saunders Comprehensive Review for the NCLEX-RN® Examination

About This Resource and the NCLEX-RN® Examination

Welcome to the Pyramid to Success and Saunders Comprehensive Review for the NCLEX-RN® Examination. This resource is specially designed to help you begin your successful journey to the peak of the pyramid, becoming a registered nurse. As you begin your journey, you will be introduced to all of the important points regarding the NCLEX-RN examination and the process of testing, and to unique and special tips regarding how to prepare yourself for this important examination. You will read what a nursing graduate who recently passed the NCLEX-RN examination has to say about the test. Important test-taking strategies are detailed. These details will guide you in selecting the correct option or assist you in making an educated guess if you are not entirely sure about the correct answer. Each unit in this book begins with the Pyramid to Success. The Pyramid to Success addresses specific points related to the NCLEX-RN examination. Client Needs as identified in the test plan framework for the examination are listed, as are learning objectives for the unit. Pyramid Terms are key words that are defined in the glossary at the end of the book and set in color throughout each chapter to direct your attention to significant points for the examination.

This resource provides you with nursing content review, including the content identified in the current NCLEX test plan, and practice questions. Throughout each chapter, you will find Pyramid Point bullets that identify areas most likely to be tested on the NCLEX-RN examination. Read each chapter, and identify your strengths and areas that are in need of further review.

The book contains 945 NCLEX-style questions. The Evolve site accompanying this book contains all of the questions from the book plus additional Evolve questions for a total of more than 5200 practice questions. The types of practice questions include multiple choice; fill-in-the-blank; multiple-response; ordered-response (also known as drag and drop); questions that contain a figure, chart/exhibit, or graphic option item; audio or video item formats; and case studies (testlets). In addition, the new Next Generation NCLEX® (NGN) question types are also provided on the accompanying Evolve site. Examples of question types can be located throughout this chapter.

Test your strengths and abilities by taking all practice tests provided in this book and on the accompanying Evolve site. Be sure to read all rationales and test-taking
strategies. The rationale provides you with significant information regarding the correct and incorrect options. The test-taking strategy provides you with the logical path to selecting the correct option. Reference source and page number are provided so that you can easily find information you need to review in another Elsevier text. You may also review in the content review sections of this book. Each question in the book and on the accompanying Evolve site is coded on the basis of the Level of Cognitive Ability, the Client Needs category, the Integrated Process, Content Area being tested, and a Health Problem, if applicable. The Health Problem code allows you to filter and select questions based on a disease process. For example, if heart failure is the area of interest, you can select “Adult Health, Cardiovascular, Heart Failure” on the Evolve site. In addition, two Priority Concepts that relate to the content of the question are identified. This code is helpful for students specifically whose curriculum is concept-based. Additionally, information about all of the special features of this resource and the question types is located in the preface of this book.

Other Resources in the Saunders Pyramid to Success

There are several other resources in the Saunders Pyramid to Success program. These include the following: The Saunders Q&A Review for the NCLEX-RN® Examination, The HESI/Saunders Online Review for the NCLEX-RN® Examination, Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam, Saunders Q&A Review Cards for the NCLEX-RN® Exam, and Saunders RNtertainment for the NCLEX-RN® Exam.

All of these resources in the Saunders Pyramid to Success are described in the preface of this book and can be obtained online by visiting http://elsevierhealth.com or by calling 800-545-2522.

Let’s begin our journey through the Pyramid to Success.

Examination Process

An important step in the Pyramid to Success is to become as familiar as possible with the examination process. Candidates facing the challenge of this examination can experience significant anxiety. Knowing what the examination is all about and knowing what you will encounter during the process of testing will assist in alleviating fear and anxiety. The information contained in this chapter was obtained from the NCSBN Web site (www.ncsbn.org) and from the NCSBN 2019 test plan for the NCLEX-RN and includes some procedures related to registering for the exam, testing procedures, and the answers to the questions most commonly asked by nursing students and graduates preparing to take the NCLEX. You can obtain additional information regarding the test and its development by accessing the NCSBN Web site and clicking on the NCLEX Exam tab or by writing to the National Council of State Boards of Nursing, 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. You are encouraged to access the NCSBN Web site, because this site provides you with the most up-to-date and valuable information about the NCLEX and other resources available to an NCLEX candidate. You are also encouraged to access the most up-to-date Candidate Bulletin. This document provides you with everything you need to know about registration procedures and scheduling a test date.
**Computer Adaptive Testing**

The acronym CAT stands for computer adaptive test, which means that the examination is created as the test-taker answers each question. All the test questions are categorized on the basis of the test plan structure and the level of difficulty of the question. As you answer a question, the computer determines your competency based on the answer you selected. If you selected a correct answer, the computer scans the question bank and selects a more difficult question. If you selected an incorrect answer, the computer scans the question bank and selects an easier question. This process continues until all test plan requirements are met and a reliable pass-or-fail decision is made.

When taking a CAT, once an answer is recorded, all subsequent questions administered depend, to an extent, on the answer selected for that question. Skipping and returning to earlier questions are not compatible with the logical methodology of a CAT. The inability to skip questions or go back to change previous answers will not be a disadvantage to you; you will not fall into that “trap” of changing a correct answer to an incorrect one with the CAT system.

If you are faced with a question that contains unfamiliar content, you may need to guess at the answer. There is no penalty for guessing, but you need to make an educated guess. With most of the questions, the answer will be right there in front of you. If you need to guess, use your nursing knowledge and clinical experiences to their fullest extent and all of the test-taking strategies you have practiced in this review program.

You do not need any computer experience to take this examination. A keyboard tutorial is provided and administered to all test-takers at the start of the examination. The tutorial will instruct you on the use of the on-screen optional calculator, the use of the mouse, and how to record an answer. The tutorial provides instructions on how to respond to all question types on this examination. This tutorial is also provided on the NCSBN Web site, and you are encouraged to view the tutorial when you are preparing for the NCLEX examination. In addition, at the testing site, a test administrator is present to assist in explaining the use of the computer to ensure your full understanding of how to proceed.

**Development of the Test Plan**

The test plan for the NCLEX-RN examination is developed by the NCSBN. The examination is a national examination; the NCSBN considers the legal scope of nursing practice as governed by state laws and regulations, including the Nurse Practice Act, and uses these laws to define the areas on the examination that will assess the competence of the test-taker for licensure.

The NCSBN also conducts an important study every 3 years, known as a practice analysis study, that is conducted to link the examination to nursing practice. The results of this study determine the framework for the test plan for the examination. The participants in this study include newly licensed registered nurses from all types of generalist nursing education programs. From a list of nursing care activities (activity statements) provided, the participants are asked about the applicability, frequency, and importance of performing these activities in relation to client safety. A panel of content experts at the NCSBN analyzes the results of the study and makes
decisions regarding the test plan framework. The results of this recently conducted study provided the structure for the test plan implemented in April 2019.

**Test Plan**

The content of the NCLEX-RN examination reflects the activities identified in the practice analysis study conducted by the NCSBN. The questions are written to address Level of Cognitive Ability, Client Needs, and Integrated Processes as identified in the test plan developed by the NCSBN.

**Level of Cognitive Ability**

Levels of cognitive ability include knowledge, understanding, applying, analyzing, synthesizing, evaluating, and creating. The practice of nursing requires complex thought processing and critical thinking in decision making. Therefore, you will not encounter any knowledge or understanding questions on the NCLEX. Questions on this examination are written at the applying level or at higher levels of cognitive ability. **Table 1-1** provides descriptions and examples of each level of cognitive ability. **Box 1-1** presents an example of a question that requires you to apply data.

<table>
<thead>
<tr>
<th><strong>Table 1-1</strong></th>
</tr>
</thead>
</table>

**Levels of Cognitive Ability: Descriptions and Examples**

<table>
<thead>
<tr>
<th>Level</th>
<th>Description and Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>Recalling information from memorizing. Example: A normal blood glucose level is 70 to 99 mg/dL (3.9 to 5.5 mmol/L).</td>
</tr>
<tr>
<td>Understanding</td>
<td>Recognizing the meaning of information. Example: A blood glucose level of 60 mg/dL (3.34 mmol/L) is lower than the normal reference range.</td>
</tr>
<tr>
<td>Applying</td>
<td>Carrying out an appropriate action based on information. Example: Administering 10 to 15 g of carbohydrate such as a 1/2 glass of fruit juice to treat mild hypoglycemia.</td>
</tr>
<tr>
<td>Analyzing</td>
<td>Examining a broad concept and breaking it down into smaller parts. Example: The broad concept is mild hypoglycemia and the smaller concepts are the signs and symptoms of mild hypoglycemia, such as hunger, irritability, weakness, headache, or blood glucose level lower than 70 mg/dL (3.9 mmol/L). So, for example, the question may present information that you need to interpret as mild hypoglycemia. Then, the question asks you to select the option(s) that identify the appropriate nursing action(s) to correct hypoglycemia.</td>
</tr>
<tr>
<td>Synthesizing</td>
<td>Examining smaller parts or information and determining the broad concept. Example: The smaller concepts are manifestations such as polyuria, polydipsia, polyphagia, vomiting, abdominal pain, weakness, confusion, and Kussmaul respirations. The broad concept is diabetic ketoacidosis (DKA). So, for example, the question may provide specific information about the manifestations of DKA. You need to interpret these manifestations as DKA. Then, the question asks you to select the option(s) that identify the appropriate nursing action(s), based on your interpretation that the client is experiencing DKA.</td>
</tr>
<tr>
<td>Evaluating</td>
<td>Making judgments, conclusions, or validations based on evidence. Example: Determining that treatment for mild hypoglycemia was effective if the blood glucose level returned to a normal level between 70 to 99 mg/dL (3.9 to 5.5 mmol/L) after a specified time period.</td>
</tr>
<tr>
<td>Creating</td>
<td>Generating or producing a new outcome or plan by putting parts of information together. Example: Designing a safe and individualized plan of care with the interprofessional health care team for a client with diabetes mellitus that meets the client’s physiological, psychosocial, and health maintenance needs.</td>
</tr>
</tbody>
</table>

Box 1-1

Level of Cognitive Ability: Applying

The nurse notes blanching, coolness, and edema at the peripheral intravenous (IV) site. On the basis of these findings, the nurse should implement which action?

1. Remove the IV.
2. Apply a warm compress.
3. Check for a blood return.
4. Measure the area of infiltration.

**Answer: 1**

This question requires that you focus on the **data in the question** and determine that the client is experiencing an infiltration. Next, you need to consider the harmful effects of infiltration and determine the action to implement. Because infiltration can be damaging to the surrounding tissue, the appropriate action is to remove the IV to prevent any further damage. Once the IV is removed, further action should be taken depending on the medication infusing at the time of infiltration based on agency protocol, but may include aspiration of the fluid from the site, injection of an antidote, application of warm or cool compresses for specified time intervals, and elevation of the extremity.

**Client Needs**

The NCSBN identifies a test plan framework based on Client Needs, which includes 4 major categories. Some of these categories are divided further into subcategories. The Client Needs categories are Safe and Effective Care Environment, Health Promotion and Maintenance, Psychosocial Integrity, and Physiological Integrity (*Table 1-2*).

**Table 1-2**

Client Needs Categories and Percentage of Questions on the NCLEX-RN Examination
Safe and Effective Care Environment

The Safe and Effective Care Environment category includes 2 subcategories: Management of Care, and Safety and Infection Control. According to the NCSBN, Management of Care addresses prioritizing care and providing and directing nursing care that will ensure a safe care delivery setting to protect clients and health care personnel. The NCSBN indicates that Safety and Infection Control addresses content that will protect clients and health care personnel from health and environmental hazards within health care facilities and in community settings. Box 1-2 presents examples of questions that address these 2 subcategories.

Box 1-2

Safe and Effective Care Environment

Management of Care
The nurse has received the client assignment for the day. Which client should the nurse assess first?

1. The client who needs to receive subcutaneous insulin before breakfast
2. The client who has a nasogastric tube attached to intermittent suction
3. The client who is 2 days postoperative and is complaining of incisional pain
4. The client who has a blood glucose level of 50 mg/dL (2.8 mmol/L) and complaints of blurred vision

Answer: 4
This question addresses the subcategory Management of Care in the Client Needs category Safe and Effective Care Environment. Note the strategic word, first, so you need to establish priorities by comparing the needs of each client and deciding which need is urgent. The client described in the correct option has a low blood glucose level and symptoms reflective of hypoglycemia. This client should be
assessed first so that treatment can be implemented. Although the clients in options 1, 2, and 3 have needs that require assessment, their assessments can wait until the client in the correct option is stabilized.

**Safety and Infection Control**

The nurse prepares to care for a client on contact precautions who has a hospital-acquired infection caused by methicillin-resistant *Staphylococcus aureus* (MRSA). The client has an abdominal wound that requires irrigation and has a tracheostomy attached to a mechanical ventilator, which requires frequent suctioning. The nurse should assemble which necessary protective items before entering the client’s room?

1. Gloves and gown
2. Gloves and face shield
3. Gloves, gown, and face shield
4. Gloves, gown, and shoe protectors

**Answer:** 3

This question addresses the subcategory Safety and Infection Control in the Client Needs category Safe and Effective Care Environment. It addresses content related to protecting oneself from contracting an infection and requires that you consider the methods of possible transmission of infection, based on the client’s condition. Note the **data in the question**. Because of the potential for splashes of infective material occurring during the wound irrigation or suctioning of the tracheostomy, option 3 is correct.

**Health Promotion and Maintenance**

The Health Promotion and Maintenance category addresses the principles related to growth and development. According to the NCSBN, this Client Needs category also addresses content required to assist the individual to prevent health problems; to recognize alterations in health; and to develop health practices that promote and support optimal wellness. See **Box 1-3** for an example of a question in this Client Needs category.

**Box 1-3**

**Health Promotion and Maintenance**

The nurse is choosing age-appropriate toys for a toddler. Which toy is the **best** choice for this age?

1. Puzzle
2. Toy soldiers
3. Large stacking blocks
4. A card game with large pictures

**Answer:** 3
This question addresses the Client Needs category Health Promotion and Maintenance and specifically relates to the principles of growth and development of a toddler. Note the strategic word, best. Toddlers like to master activities independently, such as stacking blocks. Because toddlers do not have the developmental ability to determine what could be harmful, toys that are safe need to be provided. A puzzle and toy soldiers provide objects that can be placed in the mouth and may be harmful for a toddler. A card game with large pictures may require cooperative play, which is more appropriate for a school-age child.

**Psychosocial Integrity**

The Psychosocial Integrity category addresses content required to promote and support the ability of the client to cope, adapt, and problem-solve during stressful events. The NCSBN also indicates that this Client Needs category addresses the emotional, mental, and social well-being of the client experiencing stressful events and care for the client with an acute or chronic mental illness. See Box 1-4 for an example of a question in this Client Needs category.

**Box 1-4**

**Psychosocial Integrity**

A client with end-stage chronic obstructive pulmonary disease has selected guided imagery to help cope with psychological stress. Which client statement indicates an understanding of this stress-reduction measure?

1. “This will help only if I play music at the same time.”
2. “This will work for me only if I am alone in a quiet area.”
3. “I need to do this only when I lie down in case I fall asleep.”
4. “The best thing about this is that I can use it anywhere, anytime.”

**Answer:** 4

This question addresses the Client Needs category Psychosocial Integrity and the content addresses coping mechanisms. Focus on the subject, a characteristic of guided imagery. Guided imagery involves the client creating an image in the mind, concentrating on the image, and gradually becoming less aware of the offending stimulus. It can be done anytime and anywhere; some clients may use other relaxation techniques or play music with it.

**Physiological Integrity**

The Physiological Integrity category includes 4 subcategories: Basic Care and Comfort, Pharmacological and Parenteral Therapies, Reduction of Risk Potential, and Physiological Adaptation. The NCSBN describes these subcategories as follows. Basic Care and Comfort addresses content for providing comfort and assistance to the client in the performance of activities of daily living. Pharmacological and Parenteral Therapies addresses content for administering medications and parenteral therapies, such as intravenous therapies and parenteral nutrition, and
administering blood and blood products. Reduction of Risk Potential addresses content for preventing complications or health problems related to the client’s condition or any prescribed treatments or procedures. Physiological Adaptation addresses content for managing and providing care to clients with acute, chronic, or life-threatening conditions. See Box 1-5 for examples of questions in this Client Needs category.

### Box 1-5

**Physiological Integrity**

**Basic Care and Comfort**

A client with Parkinson’s disease develops akinesia while ambulating, increasing the risk for falls. Which suggestion should the nurse provide to the client to alleviate this problem?

1. Use a wheelchair to move around.
2. Stand erect and use a cane to ambulate.
3. Keep the feet close together while ambulating and use a walker.
4. Consciously think about walking over imaginary lines on the floor.

**Answer:** 4

This question addresses the subcategory Basic Care and Comfort in the Client Needs category Physiological Integrity and addresses client mobility and promoting assistance in an activity of daily living to maintain safety. Focus on the subject, akinesia. Clients with Parkinson’s disease can develop bradykinesia (slow movement) or akinesia (freezing or no movement). Having these clients imagine lines on the floor to walk over can keep them moving forward while remaining safe.

**Pharmacological and Parenteral Therapies**

The nurse monitors a client receiving digoxin for which early manifestation of digoxin toxicity?

1. Anorexia
2. Facial pain
3. Photophobia
4. Yellow color perception

**Answer:** 1

This question addresses the subcategory Pharmacological and Parenteral Therapies in the Client Needs category Physiological Integrity. Note the strategic word, early. Digoxin is a cardiac glycoside that is used to manage and treat heart failure and to control ventricular rates in clients with atrial fibrillation. The most common early manifestations of toxicity include gastrointestinal disturbances such as anorexia, nausea, and vomiting. Neurological abnormalities can also occur early and include fatigue, headache, depression, weakness, drowsiness, confusion, and nightmares.
Facial pain, personality changes, and ocular disturbances (photophobia, diplopia, light flashes, halos around bright objects, yellow or green color perception) are also signs of toxicity, but are not early signs.

**Reduction of Risk Potential**
A magnetic resonance imaging (MRI) study is prescribed for a client with a suspected brain tumor. The nurse should implement which action to prepare the client for this test?

1. Shave the groin for insertion of a femoral catheter.
2. Remove all metal-containing objects from the client.
3. Keep the client NPO (nothing by mouth) for 6 hours before the test.
4. Instruct the client in inhalation techniques for the administration of the radioisotope.

**Answer:** 2
This question addresses the subcategory Reduction of Risk Potential in the Client Needs category Physiological Integrity, and the nurse’s responsibilities in preparing the client for the diagnostic test. Focus on the **subject**, preparing a client for an MRI. In an MRI study, radiofrequency pulses in a magnetic field are converted into pictures. All metal objects, such as rings, bracelets, hairpins, and watches, should be removed. In addition, a history should be taken to ascertain whether the client has any internal metallic devices, such as orthopedic hardware, pacemakers, or shrapnel. A femoral catheter is not used for this diagnostic test. An intravenous (IV) catheter may be inserted if a contrast agent is prescribed. Additionally, shaving is not a common practice because of the risk for microabrasions and infection. If needed, hair may be clipped away from a surgical or insertion site. NPO status is not necessary for an MRI study of the head. Inhalation of the radioisotope may be prescribed with other types of scans but is not a part of the procedures for an MRI.

**Physiological Adaptation**
A client with renal insufficiency has a magnesium level of 3.5 mEq/L (1.44 mmol/L). On the basis of this laboratory result, the nurse interprets which sign as significant?

1. Hyperpnea
2. Drowsiness
3. Hypertension
4. Physical hyperactivity

**Answer:** 2
This question addresses the subcategory Physiological Adaptation in the Client Needs category Physiological Integrity. It addresses an alteration in body systems. Focus on the **data in the question**. The normal magnesium level is 1.8 to 2.6 mEq/L (0.74 to 1.07 mmol/L). A magnesium level of 3.5 mEq/L (1.44 mmol/L) indicates hypermagnesemia. Neurological manifestations begin to occur when magnesium levels are elevated and are noted as symptoms of neurological depression, such as drowsiness, sedation, lethargy, respiratory depression, muscle weakness, and areflexia. Bradycardia and hypotension also occur.
Integrated Processes

The NCSBN identifies five processes in the test plan that are fundamental to the practice of nursing. These processes are incorporated throughout the major categories of Client Needs. The Integrated Process subcategories are Caring, Communication and Documentation, Nursing Process (Assessment, Analysis, Planning, Implementation, and Evaluation), Culture and Spirituality, and Teaching and Learning. See Box 1-6 for an example of a question that incorporates the Integrated Process of Caring.

Box 1-6

Integrated Processes

A client is scheduled for angioplasty. The client says to the nurse, “I’m so afraid that it will hurt and will make me worse off than I am.” Which response by the nurse is therapeutic?

1. “Can you tell me what you understand about the procedure?”
2. “Your fears are a sign that you really should have this procedure.”
3. “Those are very normal fears, but please be assured that everything will be okay.”
4. “Try not to worry. This is a well-known and easy procedure for the cardiologist.”

Answer: 1

This question addresses the subcategory Caring in the category of Integrated Processes. The correct option utilizes a therapeutic communication technique that explores the client’s feelings, determines the level of client understanding about the procedure, and displays caring. Option 2 demeans the client and does not encourage further sharing by the client. Option 3 does not address the client’s fears, provides false reassurance, and puts the client’s feelings on hold. Option 4 diminishes the client’s feelings by directing attention away from the client and toward the health care provider’s importance.

Types of Questions on the Examination

The types of questions that may be administered on the examination include multiple-choice; fill-in-the-blank; multiple-response; ordered-response (also known as drag and drop); image (hot spot) questions; figure, chart/exhibit, or graphic option items; and audio or video item formats. You may also be administered some Next Generation NCLEX® (NGN) questions, which may be a part of the NCSBN research study. A pilot study on NGN questions is being conducted by the NCSBN, and results demonstrate that there is an asymmetrical relationship between knowledge and clinical judgment; thus, recall of learned material is not translating to safety and efficacy in practice. This is the impetus behind these new item types. Research on these new item types is still being conducted. The candidate will be informed if the
questions are research items and will be given the option to answer them or to decline. Regardless, you need to focus and use critical thinking and clinical judgment skills to answer these correctly. These NGN question types can include CLOZE items, enhanced multiple response, enhanced hot spots, extended drag and drop, dynamic exhibits, and constructed response. Additionally, case studies may accompany some question types, and media may be integrated in these questions. These new item types are intended to evaluate a candidate’s ability to utilize the dynamic skill of clinical judgment, rather than knowledge or recall alone.

Some questions may require you to use the mouse and cursor on the computer. For example, you may be presented with a picture that displays the arterial vessels of an adult client. In this picture, you may be asked to “point and click” (using the mouse) on the area (hot spot) where the dorsalis pedis pulse could be felt. With the NGN questions, you receive matrix-type items and may be asked to highlight answers. You may also be asked to enter short answer information and to provide a short rationale for your answer selections, such as with the CLOZE or constructed response item types.

In all types of questions, the answer is scored as either right or wrong. Credit is not given for a partially correct answer. In addition, all question types may include pictures, graphics, tables, charts, sound, or rich media scenarios using video or virtual simulation. The NCSBN provides specific directions for you to follow with all question types to guide you in your process of testing. Be sure to read these directions as they appear on the computer screen. Examples of some of these types of questions are noted in this chapter. All question types are provided in this book and on the accompanying Evolve site.

Multiple-Choice Questions

Many of the questions that you will be asked to answer will be in the multiple-choice format. These questions provide you with data about a client situation and four answers, or options.

Fill-in-the-Blank Questions

Fill-in-the-blank questions may ask you to perform a medication calculation, determine an intravenous flow rate, or calculate an intake or output record on a client. You will need to type only a number (your answer) in the answer box. If the question requires rounding the answer, this needs to be performed at the end of the calculation. The rules for rounding an answer are described in the tutorial provided by the NCSBN and are also provided in the specific question on the computer screen. In addition, you must type in a decimal point if necessary. See Box 1-7 for an example.

Box 1-7
Fill-in-the-Blank Question
A prescription reads: acetaminophen liquid, 650 mg orally every 4 hours PRN for pain. The medication label reads: 500 mg/15 mL. The nurse prepares how many
milliliters to administer one dose? **Fill in the blank. Record your answer using one decimal place.**

**Answer:** 19.5 mL

**Formula:**

\[
\text{Desired} \times \frac{\text{volume}}{\text{Available}} = mL
\]

\[
\frac{650\ mg}{500\ mg} \times 15\ mL = 19.5\ mL
\]

In this question, you need to focus on the **subject**, mL per dose, and use the formula for calculating a medication dose. When the dose is determined, you will need to type your numeric answer in the answer box. Always follow the specific directions noted on the computer screen. Also, remember that there will be an on-screen calculator on the computer for your use.

**Multiple-Response Questions**

For a multiple-response question, you will be asked to select or check all of the options, such as nursing interventions, that relate to the information in the question. In these question types, there may be 1 correct answer, there may be more than 1 correct answer, or all answers could be correct. No partial credit is given for correct selections. You need to do exactly as the question asks, which will be to select all of the options that apply. See **Box 1-8** for an example.

**Box 1-8**

**Multiple-Response Question**

The emergency department nurse is caring for a child suspected of acute epiglottitis. Which interventions apply in the care of the child? **Select all that apply.**

- [ ] 1. Obtain a throat culture.
- [x] 2. Auscultate lung sounds.
- [x] 3. Prepare the child for a chest x-ray.
4. Maintain the child in a supine position.
5. Obtain a pediatric-size tracheostomy tray.
6. Place the child on an oxygen saturation monitor.

In a multiple-response question, you will be asked to select or check all of the options, such as interventions, that relate to the information in the question. Focus on the subject, interventions for the child with suspected acute epiglottitis. To answer this question, recall that acute epiglottitis is a serious obstructive inflammatory process that requires immediate intervention and that airway patency is a priority. Auscultating lung sounds allows the nurse to obtain information about airway patency without causing further airway compromise by examining the throat. Examination of the throat with a tongue depressor or attempting to obtain a throat culture is contraindicated because the examination can precipitate further obstruction. A lateral neck and chest x-ray is obtained to determine the degree of obstruction, if present. To reduce respiratory distress, the child should sit upright. The child is placed on an oxygen saturation monitor to monitor oxygenation status. Tracheostomy and intubation may be necessary if respiratory distress is severe. Remember to follow the specific directions given on the computer screen.

**Ordered-Response Questions**

In this type of question, you will be asked to use the computer mouse to drag and drop your nursing actions in order of priority. Information will be presented in a question and, based on the data, you need to determine what you will do first, second, third, and so forth. The unordered options will be located in boxes on the left side of the screen, and you need to move all options in order of priority to ordered-response boxes to the right side of the screen. Specific directions for moving the options are provided with the question. See Figure 1-1 for an example. These type of practice questions are located on the accompanying Evolve site.
Figure or Hot Spot Questions

A question with a picture or graphic will ask you to answer the question based on the picture or graphic. The question could contain a chart, a table, or a figure or illustration. You also may be asked to use the computer mouse to point and click on a specific area in the visual. A chart, table, figure, or illustration may appear in any type of question, including a multiple-choice question. See Box 1-9 for an example.

Box 1-9

Figure Question

A client who experienced a myocardial infarction is being monitored via cardiac telemetry. The nurse notes the sudden onset of this cardiac rhythm on the monitor (refer to figure) and immediately takes which action?

1. Takes the client’s blood pressure
2. Initiates cardiopulmonary resuscitation (CPR)
3. Places a nitroglycerin tablet under the client’s tongue
4. Continues to monitor the client and then contacts the cardiologist

**Answer: 2**

This question requires you to identify the cardiac rhythm, and then determine the priority nursing action. Note the **strategic word**, **immediately**. This cardiac rhythm identifies a coarse ventricular fibrillation (VF). The goals of treatment are to terminate VF promptly and to convert it to an organized rhythm. The primary health care provider, cardiologist, or an Advanced Cardiac Life Support (ACLS)–qualified nurse must immediately defibrillate the client. If a defibrillator is not readily available, CPR is initiated until the defibrillator arrives. Options 1, 3, and 4 are incorrect actions and delay lifesaving treatment.

**Chart/Exhibit Questions**

In this type of question, you will be presented with a problem and a chart or exhibit. You will be provided with tabs or buttons that you need to click to obtain the information needed to answer the question. A prompt or message will appear that will indicate the need to click on a tab or button. See **Box 1-10** for an example.

**Box 1-10**

**Chart/Exhibit Question**

The nurse reviews the history and physical examination documented in the medical record of a client requesting a prescription for oral contraceptives. The nurse determines that oral contraceptives are contraindicated because of which documented items? **Refer to chart. Select all that apply.**

<table>
<thead>
<tr>
<th>History and Physical</th>
<th>Medications</th>
<th>Client’s Chart</th>
<th>Diagnostic Results</th>
</tr>
</thead>
</table>
| Item 1: Has admitting diagnosis of renal calculi | Item 6: Multivitamin orally daily | Item 10: Renal ultrasound shows no hydronephrosis, low probability of renal artery stenosis  
Item 11: Insert a space Complete blood cell (CBC) shows white blood cells (WBC) 13,000 mm$^3$ (13 × 10$^3$/L), hemoglobin (Hgb) 16 g/dL (60 mmol/L), hematocrit (Hct) 47% (0.47); platelets 490,000 mm$^3$ (490 × 10$^3$/L) |  |
| Item 2: Past medical history: deep vein thrombosis with associated thrombophlebitis | Listopril 40 mg orally daily |  |
| Item 3: Hypertension | Atorvastatin 10 mg orally daily |  |
| Item 4: Hyperlipidemia | Metformin 500 mg orally twice daily |  |
| Item 5: Prediabetes |  |  |

**Answer: Items 2, 3, 4, 11**

This chart/exhibit question provides you with data from the client’s medical record. Focus on the **subject**, the item(s) that are a contraindication to the use of oral contraceptives. Oral contraceptives are contraindicated in women with a history of any of the following: thrombophlebitis and thromboembolic disorders, cardiovascular or cerebrovascular diseases (including stroke), any estrogen-dependent cancer or breast cancer, benign or malignant liver tumors, impaired liver function, hypertension, and diabetes mellitus with vascular involvement. Adverse
effects of oral contraceptives include increased risk of superficial and deep venous thrombosis, pulmonary embolism, thrombotic stroke (or other types of strokes), myocardial infarction, and accelerations of preexisting breast tumors. Item 2 is a thromboembolic disorder with associated thrombophlebitis. Items 3 and 4 are cardiovascular diseases. The medications the client is taking are not specific contraindications to oral contraceptives. The normal WBC is 5000-10,000 mm$^3$ (5-10 × 10$^9$/L). The normal Hgb for a male is 14-18 g/dL (140-180 mmol/L) and 12-16 g/dL (120-160 mmol/L) for a female. The normal Hct for a male is 42-52% (0.42-0.52) and 37-47% (0.37-0.47) for a female. The normal platelet count is 150,000-400,000 mm$^3$ (150-400 × 10$^9$/L). Item 11 has components that are contraindicated; of note is that this client has polycythemia, which is a thromboembolic disorder and therefore is contraindicated for the use of oral contraceptives.

Graphic Item Option Questions

In this type of question, the option selections will be pictures rather than text. You will need to use the computer mouse to click on the option that represents your answer choice. See Box 1-11 for an example.

Box 1-11

**Graphic Item Option Question**

The nurse should place the client in which position to administer an enema? *(Refer to the figures in 1 to 4.)*

1. [Image]
2. [Image]
3. [Image]
4. Answer: 2
This question requires you to select the picture that represents your answer choice. Focus on the subject, the position for administering an enema. To administer an enema, the nurse assists the client into the left side-lying (Sims’) position with the right knee flexed. This position allows the enema solution to flow downward by gravity along the natural curve of the sigmoid colon and rectum, improving the retention of solution. Option 1 is a prone position. Option 3 is a dorsal recumbent position. Option 4 is a supine position.

Audio Questions
Audio questions will require listening to a sound to answer the question. These questions will prompt you to use the headset provided and to click on the sound icon. You will be able to click on the volume button to adjust the volume to your comfort level, and you will be able to listen to the sound as many times as necessary. Content examples include, but are not limited to, various lung sounds, heart sounds, or bowel sounds. Examples of this question type are located on the accompanying Evolve site (Fig. 1-2).
Video Questions

Video questions will require viewing of an animation or video clip to answer the question. These questions will prompt you to click on the video icon. There may be sound associated with the animation and video, in which case you will be prompted to use the headset. Content examples include, but are not limited to, assessment techniques, nursing procedures, or communication skills. Examples of this question type are located on the accompanying Evolve site (Fig. 1-3).
Next Generation NCLEX (NGN) Item Types

These NGN question item types that may be used on the NCLEX exam can include, but are not limited to, CLOZE, enhanced multiple selection, enhanced hot spots, extended drag and drop, dynamic exhibits and constructed response, highlighting items, and matrix items. Additionally, case studies may accompany some question types. You are encouraged to access www.ncsbn.org for the most current information on these test items, their description, and how they will be presented.

An enhanced multiple-response question is similar to a multiple-choice question in that it usually allows more than one option to be chosen. The difference is that an enhanced multiple-response question presents a long list of options. The NCLEX examination committee has not yet provided specific information as to how these question types will be presented. An example of one way they may be presented can be located in Box 1-12.

**Box 1-12**

NGN Items: Case Study With Enhanced Multiple Response, CLOZE Item, Dynamic Exhibit, and Constructed Response

Victoria Machane, 76 years old, is brought to the emergency department by her son, Michael. Michael tells the nurse that Victoria has not been able to tolerate any physical activity and that when she tries to do something she tires very easily. Victoria began to experience shortness of breath and a cough that started this morning, and Michael states that his mother’s skin looked pale and gray. On assessment, the nurse notes that Victoria exhibits shortness of breath on exertion;
she is coughing and expectorating frothy white mucus. Her pulse rate is 102 beats/min, and her blood pressure is 164/98 mm Hg. The nurse auscultates Victoria’s lung sounds and notes the presence of bilateral crackles in the lower lobes. Victoria is hospitalized. Her current home medications include betaxolol hydrochloride for glaucoma and glimepiride for type 2 diabetes mellitus. She also takes over-the-counter hydroxyaluminum sodium carbonate to help prevent acid indigestion. Heart failure is diagnosed. In addition to the medication that Victoria takes at home, the following medications are prescribed: captopril, furosemide, metoprolol, and digoxin.

**Enhanced Multiple Response**

The nurse reviews Victoria’s admission data and prepares to collaborate with the interprofessional health care team about Victoria’s plan of care. What should the nurse discuss with the team? Select all that apply.

1. Victoria’s age as a risk for falls.
2. The need for respiratory treatments.
3. Victoria’s inability to tolerate activity.
4. That the antacid could affect the absorption of digoxin.
5. That metoprolol may mask symptoms of hypoglycemia.
6. That the antacid must be used with caution in clients with glaucoma.
7. That potential systemic side effects of betaxolol hydrochloride include heart failure.
8. That betaxolol hydrochloride may contribute to hypertension when taken with the newly prescribed medications.

**Answer:** 1, 2, 3, 4, 5, 7

Victoria is 76 years of age. In addition to her age, her poor respiratory status and inability to tolerate activity place her at risk for falls. These factors require implementing a plan of care that will meet her needs. Antacids increase the digoxin level by increasing digoxin absorption or bioavailability. Antacids also decrease the absorption of captopril. However, antacids are not a concern in clients with glaucoma. Ophthalmic beta blockers can have additive therapeutic or adverse effects when given with systemically administered beta blockers or other cardiovascular medications. Toxic reactions to beta blockers are rare but primarily involve the cardiovascular system. Symptoms include bradycardia, cardiac failure, hypotension, and bronchospasm. Treatment involves discontinuation of the medication and supportive care (e.g., administration of adrenergic and anticholinergic medications). In addition, the nonselective beta blockers can interfere with the normal responses to hypoglycemia, such as tremor, tachycardia, and nervousness, in essence masking the signs and symptoms of hypoglycemia. Hypotension is more likely than hypertension in clients taking beta-blocker medications.

On the following morning (day 2 of hospitalization), the nurse checks Victoria’s vital signs and notes a blood pressure (BP) of 98/64 mm Hg and a heart rate of 62 beats per minute. On review of the laboratory data, the nurse notes the following:

Hemoglobin 14 g/dL (140 g/L)
Hematocrit 41% (0.41)
White blood cell count 7,000 mm$^3$ ($7 \times 10^9$/L)
Sodium 145 mEq/L (145 mmol/L)
Potassium 3.6 mEq/L (3.6 mmol/L)
Blood urea nitrogen 20 mg/dL (7.1 mmol/L)
Creatinine 1.1 mg/dL (97 mcmol/L)
Blood glucose 99 mg/dL (5.5 mmol/L)

**CLOZE Item**
Which medication would be of **most** concern and require clarification prior to administration? **Complete the following sentences by choosing from the dropdown lists.**

The nurse should not administer the (Select one)

- Captopril
- Digoxin
- Captopril
- Glimepiride
- Furosemide

Because (Select one)

- The BP is low
- The pulse is low
- The blood glucose is low
- The potassium level is low
Captopril is an angiotensin-converting enzyme (ACE) inhibitor. The main side/adverse effects of this medication are cough, hypotension, hyperkalemia, and tachycardia. Other side effects associated with ACE inhibitors include headache, dizziness, fatigue, insomnia, and weight loss. Victoria’s BP is low at 98/64 mm Hg. Digoxin is a cardiac glycoside and would require clarification about administration if the pulse were below 60 beats per minute or if she were showing signs of toxicity. Victoria’s pulse rate is 62 beats per minute. Glimepiride is used to manage blood glucose levels and would require clarification about administration if the blood glucose was low. Victoria’s blood glucose is normal 70 to 99 mg/dL (3.9 to 5.5 mmol/L). Furosemide is a diuretic. Although the nurse would monitor for a drop in BP in the client receiving furosemide, the primary concern is hypokalemia. Victoria’s potassium level is normal (normal level is 3.5-5.0 mEq/L [3.5-5.0 mmol/L]).

**Dynamic Exhibit and Constructed Response**

**Day 3 of Victoria’s Hospitalization**

It is reported that Victoria had a comfortable night. Shortness of breath has subsided, and vital signs are stable. Her color is pale, but she is showing no signs of respiratory compromise. She still has bilateral crackles in the lower lobes with no expectoration of mucus. The nurse prepares to administer morning medications to Victoria.

What assessment is unnecessary before administering the digoxin? **Enter the assessment in the box below.**

Check pedal pulses

**Enter the rationale for included assessments in the box below.**

- Digoxin is withheld if the pulse is not within the 60 to 100 bpm range because of the risk for decreased cardiac output if administered.
- Digoxin levels are routinely checked to monitor for subtherapeutic, therapeutic, supratherapeutic, and toxic levels.
- Monitoring for early and late signs of digoxin toxicity are integral to the safety of a client on digoxin.

Digoxin is a cardiac glycoside. It will decrease the heart rate and could affect the heart rhythm. Therefore, the nurse would check the client’s apical pulse immediately before administering the medication. If the pulse is slower than 60 or greater than 100 bpm, the digoxin is withheld and the primary health care provider or cardiologist is notified. It is not necessary to check the pedal pulses before administering the digoxin. The nurse would also check the morning digoxin level to
ensure that the level is in a therapeutic range. Gastrointestinal disturbances are early signs of digoxin toxicity, so the nurse would assess the client for any discomfort. Visual disturbances are also signs of digoxin toxicity, so the nurse would assess the client for these disturbances.

**CLOZE Item**

The CLOZE item type is similar to a short-answer type question. In this type of question, you will need to select a response from a drop-down menu. See Box 1-12 for an example.

**Dynamic Exhibit and Constructed Response**

A constructed response is a type of open-ended question that requires a short-answer response. The answer is constructed using information that can be found in a dynamic exhibit, such as a case study. See Box 1-12 for an example.

**Enhanced Hot Spots**

An enhanced hot spot question may presented in various ways. This question type could include an exhibit, a case study, assessment data or other information, or a figure in which you may need to use the mouse and cursor and point and click to locations as asked in the question. An enhanced hot spot may also ask you to highlight specific information. See Box 1-13 for an example.

**Box 1-13**

**NGN Item: Enhanced Hot Spot**

Which areas should the nurse place the stethoscope to check the right bronchovesicular breath sounds, the left bronchovesicular breath sounds, the right vesicular breath sounds, the left vesicular breath sounds, and the bronchial breath sounds?
Use the mouse to select each area, place the cursor on the area, and click. Five areas need to be selected to answer this question.

Three types of breath sounds are considered normal in certain parts of the thorax. These include vesicular, bronchovesicular, and bronchial. These breath sounds should be clear to auscultation. Bronchial breath sounds are located over the trachea. Bronchovesicular breath sounds are located over the main bronchi. Vesicular breath sounds are located over the lesser bronchi, bronchioles, and lobes.

**Extended Drag and Drop**

There are various ways in which extended drag and drop question types will be presented. An extended drag and drop question will provide you with several pieces of specific information and will ask you to order that information into the correct order of action or placement. See Box 1-14 for an example.

**Box 1-14**

**NGN Item: Extended Drag and Drop**

The nurse is preparing assignments for the day for the eight clients below and needs to assign clients to a registered nurse (RN), a licensed practical nurse (LPN), and an assistive personnel (AP). Drag each client to the most appropriate health care provider.
A client requiring a platelet transfusion.

A client requiring a colostomy irrigation.

A client receiving continuous tube feedings.

A client with respiratory failure on a mechanical ventilator.

A client who requires frequent ambulation and has a steady gait.

A client who requires a bed bath and range of motion exercises.

A client who requires hourly pulse and blood pressure measurements.

A client requiring abdominal wound irrigations and dressing changes every 3 hours.

The nurse must determine the most appropriate assignment based on the education and skills of the health care provider and the needs of the client. In general, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to the AP. In general, a LPN or vocational nurse (VN) can perform not only the tasks that a AP can perform but also certain invasive tasks, such as dressing changes, wound irrigations, tube feedings, colostomy irrigations, suctioning, urinary catheterization, and medication administration (oral, subcutaneous, intramuscular, and selected piggyback medications), according to the education and job description of the LPN or VN. The LPN or VN can also review with the client teaching plans that were initiated by the registered nurse. A registered nurse can perform the tasks that an LPN or VN can perform and is responsible for assessment and planning care, initiating teaching, and administering medications intravenously.

Highlighting Items

These items present data pertinent to a client case, and asks the student to highlight the information that requires follow-up. See Box 1-15 for an example.

Box 1-15

NGN Item: Highlighting Item

The nurse is assessing a male client admitted 1 day ago for newly diagnosed type 2 diabetes mellitus. Clinical findings are noted below.
With newly diagnosed type 2 diabetes mellitus, the client is at risk for diabetic ketoacidosis or hyperglycemic hyperosmolar non-ketotic syndrome, both of which can lead to hypovolemia and shock. The blood pressure has remained stable for this client but is declining. At this time, it does not require further follow-up. The pulse rate has increased significantly since admission, and is a sign of hypovolemia, which is a finding that should be addressed. The respiratory rate is slightly elevated and should be addressed early on because this is a sensitive indicator of fluid status. The capillary glucose and serum glucose levels at each of the timepoints has been elevated, and an intervention is required to address this abnormality. The serum potassium level was within the normal range initially but has decreased since admission and is now at a critical level. This could be due to the client’s treatment, which likely involves insulin. This requires follow-up because of the risks associated with hypokalemia. The urine output has steadily decreased and could be an indicator of hypovolemia, and therefore requires follow-up. The temperature is normal and does not require follow-up.

**Matrix Items**

These items present data regarding a client, and may ask the student to select actions that are essential, nonessential, and contraindicated. See Box 1-16 for an example.

The nurse notes that there has been an increase in the number of central-line–associated blood stream infections (CLABSIs) that developed in the clients being cared for on the nursing unit. How should the nurse proceed to implement a quality improvement program? For each action below, click to specify whether the action would be:

- **Indicated**: An action that the nurse should take to resolve the problem
- **Nonessential**: An action that the nurse could take without harming the client, but the action would not be likely to address the problem
- **Contraindicated**: An action that could harm the client and should not be taken

</tbody>
</table>

Quality improvement, also known as performance improvement, focuses on processes or systems that significantly contribute to client safety and effective client care outcomes; criteria are used to monitor outcomes of care and to determine the need for change to improve the quality of care. If the nurse notes a particular problem, such as an increase in the CLABSIs, the nurse should collect data about the problem. This should include information such as the primary and secondary diagnoses of the clients developing the infection, the type and location of IV catheters being used, the site of the catheter, IV site dressings being used, frequency of assessment and methods of care to the IV site, and length of time that the IV catheter was inserted. Once these data are collected and analyzed, the nurse should examine evidence-based practice protocols to identify the best practices for care to IV sites to prevent infection. These practices can then be implemented and followed by evaluation of results based on the evidence-based practice protocols used. Collecting identifying client information is contraindicated because of client confidentiality and is unnecessary in this quality improvement effort. Noting the mental status of the client can be done but is not likely to address the problem. Noting the types of medications being infused can also be done but will not address the problem of IV site infection. Although it is helpful to know the expected duration of the IV site, this information does not change infection control practices in managing the IV site and is therefore considered a nonessential action.

**Case Studies (Testlets) and NGN Items**

Case Studies and NGN Item Types are included in this resource and can be located in the Evolve site accompanying this book. These are specially designed to simulate the NCLEX experience of testing for these Next Generation NCLEX (NGN) Item Types. Refer to the Evolve site for practice with these question types.
The NCSBN Practice Test Questions for the NCLEX

The NCSBN provides a practice test for candidates that is composed of previously used NCLEX questions that are no longer a part of the NCLEX. This exam simulates the look of the real exam and provides the candidate with practice for the NCLEX. This practice test can be purchased through the NCSBN at www.ncsbn.org

Registering to Take the Examination

It is important to obtain an NCLEX Examination Candidate Bulletin from the NCSBN Web site at www.ncsbn.org, because this bulletin provides all of the information you need to register for and schedule your examination. It also provides you with Web site and telephone information for NCLEX examination contacts. The initial step in the registration process is to submit an application to the state board of nursing in the state in which you intend to obtain licensure. You need to obtain information from the board of nursing regarding the specific registration process, because the process may vary from state to state. Then, use the NCLEX Examination Candidate Bulletin as your guide to complete the registration process.

Following the registration instructions and completing the registration forms precisely and accurately are important. Registration forms not properly completed or not accompanied by the proper fees in the required method of payment will be returned to you and will delay testing. You must pay a fee for taking the examination; you also may have to pay additional fees to the board of nursing in the state in which you are applying.

Authorization to Test Form and Scheduling an Appointment

Once you are eligible to test, you will receive an Authorization to Test (ATT) form. You cannot make an appointment until you receive an ATT form. Note the validity dates on the ATT form, and schedule a testing date and time before the expiration date on the ATT form. The NCLEX Examination Candidate Bulletin provides you with the directions for scheduling an appointment; you do not have to take the examination in the same state in which you are seeking licensure.

The ATT form contains important information, including your test authorization number, candidate identification number, and validity date. You need to take your ATT form to the testing center on the day of your examination. You will not be admitted to the examination if you do not have it.

Changing Your Appointment

If for any reason you need to change your appointment to test, you can make the change on the candidate Web site or by calling candidate services. Refer to the NCLEX Examination Candidate Bulletin for this contact information and other important procedures for canceling and changing an appointment. If you fail to arrive for the examination or fail to cancel your appointment to test without providing appropriate notice, you will forfeit your examination fee and your ATT
form will be invalidated. This information will be reported to the board of nursing in the state in which you have applied for licensure, and you will be required to register and pay the testing fees again.

Day of the Examination

It is important that you arrive at the testing center at least 30 minutes before the test is scheduled. If you arrive late for the scheduled testing appointment, you may be required to forfeit your examination appointment. If it is necessary to forfeit your appointment, you will need to reregister for the examination and pay an additional fee. The board of nursing will be notified that you did not take the test. A few days before your scheduled date of testing, take the time to drive to the testing center to determine its exact location, the length of time required to arrive at that destination, and any potential obstacles that might delay you, such as road construction, traffic, or parking sites.

In addition to the ATT form, you must have proper identification (ID) such as a U.S. driver’s license, passport, U.S. state ID, or U.S. military ID to be admitted to take the examination. All acceptable identification must be valid and not expired and contain a photograph and signature (in English). In addition, the first and last names on the ID must match the ATT form. According to the NCSBN guidelines, any name discrepancies require legal documentation, such as a marriage license, divorce decree, or court action legal name change. Refer to the NCLEX Examination Candidate Bulletin for acceptable forms of identification.

Testing Accommodations

If you require testing accommodations, you should contact the board of nursing before submitting a registration form. The board of nursing will provide the procedures for the request. The board of nursing must authorize testing accommodations. Following board of nursing approval, the NCSBN reviews the requested accommodations and must approve the request. If the request is approved, the candidate will be notified and provided the procedure for registering for and scheduling the examination.

Testing Center

The testing center is designed to ensure complete security of the testing process. Strict candidate identification requirements have been established. You will be asked to read the rules related to testing. A digital fingerprint and palm vein print will be taken. A digital signature and photograph will also be taken at the testing center. These identity confirmations will accompany the NCLEX exam results. In addition, if you leave the testing room for any reason, you may be required to perform these identity confirmation procedures again to be readmitted to the room.

Personal belongings are not allowed in the testing room; all electronic devices must be placed in a sealable bag provided by the test administrator and kept in a locker. Any evidence of tampering with the bag could result in the need to report the incident and test cancellation. A locker and locker key will be provided for you;
however, storage space is limited, so you must plan accordingly. In addition, the testing center will not assume responsibility for your personal belongings. The testing waiting areas are generally small; friends or family members who accompany you are not permitted to wait in the testing center while you are taking the examination.

Once you have completed the admission process, the test administrator will escort you to the assigned computer. You will be seated at an individual workspace area that includes computer equipment, appropriate lighting, an erasable note board, and a marker. No items, including unauthorized scratch paper, are allowed into the testing room. Eating, drinking, or the use of tobacco is not allowed in the testing room. You will be observed at all times by the test administrator while taking the examination. In addition, video and audio recordings of all test sessions are made. The testing center has no control over the sounds made by typing on the computer by others. If these sounds are distracting, raise your hand to summon the test administrator. Earplugs are available on request.

You must follow the directions given by the testing center staff and must remain seated during the test except when authorized to leave. If you think that you have a problem with the computer, need a clean note board, need to take a break, or need the test administrator for any reason, you must raise your hand. You are also encouraged to access the NCSBN candidate Web site to obtain additional information about the physical environment of the testing center and to view a virtual tour of the testing center.

### Testing Time

The maximum testing time is 6 hours; this period includes the tutorial, the sample items, all breaks, and the examination. All breaks are optional. The first optional break will be offered after 2 hours of testing. The second optional break is offered after 3.5 hours of testing. Remember that all breaks count against testing time. If you take a break, you must leave the testing room, and when you return you may be required to perform identity confirmation procedures to be readmitted.

### Length of the Examination

The minimum number of questions that you will need to answer is 75. Of these 75 questions, 60 will be operational (scored) questions and 15 will be pretest (unscored) questions. The maximum number of questions in the test is 265.

The pretest questions are questions that may be presented as scored questions on future examinations. These pretest questions are not identified as such. In other words, you do not know which questions are the pretest (unscored) questions; however, these pretest (unscored) questions will be administered among the first 75 questions in the test.

### Pass-or-Fail Decisions

All examination questions are categorized by test plan area and level of difficulty. This is an important point to keep in mind when you consider how the computer
makes a pass-or-fail decision, because a pass-or-fail decision is not based on a percentage of correctly answered questions.

The NCSBN indicates that a pass-or-fail decision is governed by three different scenarios. The first scenario is the 95% Confidence Interval Rule, in which the computer stops administering test questions when it is 95% certain that the test-taker’s ability is clearly above the passing standard or clearly below the passing standard. The second scenario is known as the Maximum-Length Exam, in which the final ability estimate of the test-taker is considered. If the final ability estimate is above the passing standard, the test-taker passes; if it is below the passing standard, the test-taker fails.

The third scenario is the Run-Out-Of-Time (R.O.O.T) Rule. If the examination ends because the test-taker ran out of time, the computer may not have enough information with 95% certainty to make a clear pass-or-fail decision. If this is the case, the computer will review the test-taker’s performance during testing. If the test-taker has not answered the minimum number of required questions, the test-taker fails. If the test-taker’s ability estimate was consistently above the passing standard on the last 60 questions, the test-taker passes. If the test-taker’s ability estimate falls below the passing standard, even once, the test-taker fails. Additional information about pass-or-fail decisions can be found in the NCLEX Examination Candidate Bulletin located at www.ncsbn.org.

**Completing the Examination**

When the examination has ended, you will complete a brief computer-delivered questionnaire about your testing experience. After you complete this questionnaire, you need to raise your hand to summon the test administrator. The test administrator will collect and inventory all note boards and then permit you to leave.

**Processing Results**

Every computerized examination is scored twice, once by the computer at the testing center and again after the examination is transmitted to the test scoring center. No results are released at the testing center; testing center staff do not have access to examination results. The board of nursing receives your result, and your result will be mailed to you approximately 6 weeks after you take the examination. In some states, an unofficial result can be obtained via the Quick Results Service 2 business days after taking the examination. There is a fee for this service, and information about obtaining your NCLEX result by this method can be obtained on the NCSBN Web site under candidate services.

**Candidate Performance Report**

A candidate performance report is provided to a test-taker who failed the examination. This report provides the test-taker with information about her or his strengths and weaknesses in relation to the test plan framework and provides a guide for studying and retaking the examination. If a retake is necessary, the
candidate must wait 45 days between examination administration, depending on state procedures. Test-takers should refer to the state board of nursing in the state in which licensure is sought for procedures regarding when the examination can be taken again.

**Interstate Endorsement and Nurse Licensure Compact**

Because the NCLEX-RN examination is a national examination, you can apply to take the examination in any state. When licensure is received, you can apply for interstate endorsement, which is obtaining another license in another state to practice nursing in that state. The procedures and requirements for interstate endorsement may vary from state to state, and these procedures can be obtained from the state board of nursing in the state in which endorsement is sought. It may be possible to practice nursing in another state under the mutual recognition model of nursing licensure if the state has enacted a Nurse Licensure Compact. To obtain information about the Nurse Licensure Compact and the states that are part of this interstate compact, access the NCSBN Web site at [www.ncsbn.org](http://www.ncsbn.org).

**The Foreign-Educated Nurse**

An important first step in the process of obtaining information about becoming a registered nurse in the United States is to access the NCSBN Web site at [www.ncsbn.org](http://www.ncsbn.org) and obtain information provided for international nurses in the NCLEX Web site link. The NCSBN provides information about some of the documents you need to obtain as an international nurse seeking licensure in the United States and about credentialing agencies. Refer to Box 1-17 for a listing of some of these documents. The NCSBN also provides information regarding the requirements for education and English proficiency, and immigration requirements such as visas and VisaScreen. You are encouraged to access the NCSBN Web site to obtain the most current information about seeking licensure as a registered nurse in the United States.

**Box 1-17**

**Foreign-Educated Nurse: Some Documents Needed to Obtain Licensure**

1. Proof of citizenship or lawful alien status
2. Work visa
3. VisaScreen certificate
4. Commission on Graduates of Foreign Nursing Schools (CGFNS) certificate
5. Criminal background check documents
6. Official transcripts of educational credentials sent directly to credentialing agency or board of nursing from home country school of nursing
7. Validation of a comparable nursing education as that provided in U.S. nursing programs; this may include theoretical instruction and clinical practice in a variety of nursing areas including, but not limited to, medical nursing, surgical nursing, pediatric nursing, maternity and newborn nursing, community and public health nursing, and mental health nursing
8. Validation of safe professional nursing practice in home country
9. Copy of nursing license or diploma or both
10. Proof of proficiency in the English language
11. Photograph(s)
12. Social Security number
13. Application and fees

An important factor to consider as you pursue this process is that some requirements may vary from state to state. You need to contact the board of nursing in the state in which you are planning to obtain licensure to determine the specific requirements and documents that you need to submit.

Boards of nursing can decide either to use a credentialing agency to evaluate your documents or to review your documents at the specific state board, known as in-house evaluation. When you contact the board of nursing in the state in which you intend to work as a nurse, inform them that you were educated outside of the United States and ask that they send you an application to apply for licensure by examination. Be sure to specify that you are applying for registered nurse (RN) licensure. You should also ask about the specific documents needed to become eligible to take the NCLEX exam. You can obtain contact information for each state board of nursing through the NCSBN Web site at www.ncsbn.org. In addition, you can write to the NCSBN regarding the NCLEX exam. The address is 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. The telephone number for the NCSBN is 1-866-293-9600; international telephone is 011 1 312 525 3600; the fax number is 1-312-279-1032.
Preparing to take the NCLEX-RN® examination can produce a great deal of anxiety. You may be thinking that this exam is the most important test you will ever have to take and that it reflects the culmination of everything you have worked so hard for. This is an important examination because receiving your nursing license means that you can begin your career as a registered nurse. Your success on this exam involves freeing yourself of all thoughts that allow this examination to appear overwhelming and intimidating. Such thoughts can take complete control over your destiny. A strong positive attitude, a structured plan for preparation, and maintaining control in your pathway to success ensure reaching the peak of the Pyramid to Success (Fig. 2-1).
Pathways to Success (Box 2-1)

Foundation
The foundation of pathways to success begins with a strong positive attitude, the belief that you will achieve success, and developing self-control. It also includes developing a list of your personal short-term and long-term goals and a plan for preparation. Without these components, your pathway to success leads to nowhere and has no endpoint. You will expend energy and valuable time in your journey, lack control over where you are heading, and experience exhaustion without any accomplishment.

Box 2-1

Pathways to Success

Foundation
- Maintaining a strong positive attitude
- Thinking about short-term and long-term realistic goals
- Developing a plan for preparation
- Maintaining control

List
- Writing short-term and long-term realistic goals in a journal

Plan for Preparation
- Developing a study plan and schedule
- Deciding on the place to study
- Balancing personal and work obligations with the study schedule
- Sharing the study schedule and personal needs with others
- Implementing the study plan

Positive Pampering
- Planning time for exercise and fun activities
- Establishing healthy eating habits
- Including activities in the schedule that provide positive mental stimulation

Final Preparation
- Reviewing and identifying goals achieved
- Remaining focused to complete the plan of study
Writing down the date and time of the examination and posting it next to your name with the letters “RN” following, and the word “YES!”
Planning a test drive to the testing center
Engaging in relaxing activities on the day before the examination

Day of the Examination

Grooming yourself for success
Eating a nutritious breakfast
Maintaining a confident and positive attitude
Maintaining control—breathe and focus
Meeting the challenges of the day
Reaching the peak of the Pyramid to Success

Where do you start? To begin, find a location that offers solitude. Sit or lie in a comfortable position, close your eyes, relax, inhale deeply, hold your breath to a count of 4, exhale slowly, and, again, relax. Repeat this breathing exercise several times until you feel relaxed, free from anxiety, and in control of your destiny. Allow your mind to become void of all mind chatter; now you are in control and your mind’s eye can see for miles. Next, reflect on all that you have accomplished and the path that brought you to where you are today. Keep a journal of your reflections as you plan the order of your journey through the Pyramid to Success.

List

It is time to create the “List.” The List is your set of short-term and long-term goals. Begin by developing the goals that you wish to accomplish today, tomorrow, over the next month, and in the future. Allow yourself the opportunity to list all that is flowing from your mind. Write your goals in your personal journal. When the List is complete, put it away for 2 or 3 days. After that time, retrieve and review the List and begin the process of planning to prepare for the NCLEX-RN exam.

Plan for Preparation

Now that you have the List in order, look at the goals that relate to studying for the licensing exam. The first task is to decide what study pattern works best for you. Think about what has worked most successfully for you in the past. Questions that must be addressed to develop your plan for study are listed in Box 2-2.

Box 2-2

Developing a Plan for Study

Do I work better alone or in a study group?
If I work best in a group, how many study partners should I have?
Who are these study partners?
How long should my study sessions last?
Does the time of day that I study make a difference? Do I retain more if I study in the morning?
How does my work schedule affect my study pattern?
How do I balance my family obligations with my need to study?
Do I have a comfortable study area at home or should I find another environment that is conducive to my study needs?

The plan must include a schedule. Use a calendar to plan and document the daily times and nursing content areas for your study sessions. Establish a realistic schedule that includes your daily, weekly, and future goals, and stick to your plan of study. This consistency will provide advantages to you and the people supporting you. You will develop a rhythm that can enhance your retention and positive momentum. The people who are supporting you will share this rhythm and be able to schedule their activities and lives better when you are consistent with your study schedule.

The length of the study session depends on your ability to focus and concentrate. You need to think about quality rather than quantity when you are deciding on a realistic amount of time for each session. Plan to schedule at least 2 hours of quality study time daily. If you can spend more than 2 hours, by all means do so.

You may ask, “What do you mean by quality study time?” Quality study time means spending uninterrupted quiet time at your study session. This may mean that you have to isolate yourself for these study sessions. Think again about what has worked for you during nursing school when you studied for examinations; select a study place that has worked for you in the past. If you have a special study room at home that you have always used, plan your study sessions in that special room. If you have always studied at a library, plan your study sessions at the library. Sometimes it is difficult to balance your study time with your family obligations and possibly a work schedule, but, if you can, plan your study time when you know that you will be at home alone. Try to eliminate anything that may be distracting during your study time. Silence your cellphone appropriately so that you will not be disturbed. If you have small children, plan your study time during their nap time or during their school hours.

Your plan must include how you will manage your study needs with your other obligations. Your family and friends are key players in your life and are going to become part of your Pyramid to Success. After you have established your study needs, communicate your needs and the importance of your study plan to your family and friends.

A difficult part of the plan may be how to deal with family members and friends who choose not to participate in your plan for success. For example, what do you do if a friend asks you to go to a movie and it is your scheduled study time? Your friend may say, “Take some time off. You have plenty of time to study. Study later when we get back!” You are faced with a decision. You must weigh all factors carefully. You must keep your goals in mind and remember that your need for positive momentum is critical. Your decision may not be an easy one, but it must be one that will ensure that your goal of becoming a registered nurse is achieved.
Positive Pampering

*Positive pampering* means that you must continue to care for yourself holistically. Positive momentum can be maintained only if you are properly balanced. Proper exercise, diet, and positive mental stimulation are crucial to achieving your goal of becoming a registered nurse. Just as you have developed a schedule for study, you should have a schedule that includes fun and physical activity. It is your choice— aerobics, walking, weight lifting, bowling, or whatever makes you feel good about yourself. Time spent away from the hard study schedule and devoted to some fun and physical exercise pays you back a hundredfold. You will be more energetic with a schedule that includes these activities.

Establish healthy eating habits. Be sure to drink plenty of water, which will flush and clean your body cells. Stay away from fatty foods because they slow you down. Eat lighter meals and eat more frequently. Include complex carbohydrates such as oatmeal or whole grain foods in your diet for energy, and be careful not to include too much caffeine in your daily diet.

Take the time to pamper yourself with activities that make you feel even better about who you are. Make dinner reservations at your favorite restaurant with someone who is special and is supporting your goal. Take walks in a place that has a particular tranquility that enables you to reflect on the positive momentum that you have achieved and maintained. Whatever it is, wherever it takes you, allow yourself the time to do some positive pampering.

Final Preparation

You have established the foundation of your Pyramid to Success. You have developed your list of goals and your study plan, and you have maintained your positive momentum. You are moving forward, and in control. When you receive your date and time for the NCLEX-RN examination, you may immediately think, “I am not ready!” Stop! Reflect on all you have achieved. Think about your goal achievement and the organization of the positive life momentum with which you have surrounded yourself. Think about all of the people who love and support your effort to become a registered nurse. Believe that the challenge that awaits you is one that you have successfully prepared for and will lead you to your goal of becoming a registered nurse.

Take a deep breath and organize the remaining days so that they support your educational and personal needs. Support your positive momentum with a visual technique. Write your name in large letters, and write the letters “RN” after it. Post 1 or more of these visual reinforcements in areas that you frequent. This is a visual motivational technique that works for many nursing graduates preparing for this examination.

It is imperative that you not fall into the trap of expecting too much of yourself. The idea of perfection must not drive you to a point that causes your positive momentum to falter. You must believe and stay focused on your goal. The date and time are at hand. Write the date and time, and underneath write the word “YES!” Post this next to your name plus “RN.”

Ensure that you have command over how to get to the testing center. A test run is a must. Time the drive, and allow for road construction or other factors that might
occur to slow traffic down. On the test run, when you arrive at the test facility, walk into it and become familiar with the lobby and the surroundings. This may help alleviate some of the peripheral nervousness associated with entering an unknown building. Remember that you must do whatever it takes to keep yourself in control. If familiarizing yourself with the facility will help you maintain positive momentum, by all means be sure to do so.

It is time to check your study plan and make the necessary adjustments now that a firm date and time are set. Adjust your review so that your study plan ends 2 days before the examination. The mind is like a muscle. If it is overworked, it has no strength or stamina. Your strategy is to rest the body and mind on the day before the examination. Your strategy is to stay in control and allow yourself the opportunity to be absolutely fresh and attentive on the day of the examination. This will help you control the nervousness that is natural, achieve the clear thought processes required, and feel confident that you have done all that is necessary to prepare for and conquer this challenge. The day before the examination is to be one of pleasure. Treat yourself to what you enjoy the most.

Relax! Take a deep breath, hold to a count of 4, and exhale slowly. You have prepared yourself well for the challenge of tomorrow. Allow yourself a restful night’s sleep, and wake up on the day of the examination knowing that you are absolutely prepared to succeed. Look at your name with “RN” after it and the word “YES!”

**Day of the Examination (Box 2-3)**

Wake up believing in yourself and that all you have accomplished is about to propel you to the professional level of registered nurse. Allow yourself plenty of time, eat a nutritious breakfast, and groom yourself for success. You are ready to meet the challenges of the day and overcome any obstacle that may face you. Today will soon be history, and tomorrow will bring you the envelope on which you read your name with the words “Registered Nurse” after it.

**Box 2-3**

**Day of the Examination**

- **Breathe:** Inhale deeply, hold your breath to a count of 4, exhale slowly.
- **Believe:** Have positive thoughts today and keep those thoughts focused on your achievements.
- **Control:** You are in command.
- **Believe:** This is your day.
- **Visualize:** “RN” with your name.

Be proud and confident of your achievements. You have worked hard to achieve your goal of becoming a registered nurse. If you believe in yourself and your goals, no one person or obstacle can move you off the pathway that leads to success! Congratulations, and I wish you the very best in your career as a registered nurse!
1. What are the factors needed to ensure a productive study environment? Select all that apply.
   1. Secure a location that offers solitude.
   2. Plan breaks during your study session.
   3. Establish a realistic study schedule that includes your goals.
   4. Continue with the study pattern that has worked best for you.

   Answer: 1, 2, 3, 4

   Rationale: A location of solitude helps to ensure concentration. Taking breaks during your study session helps to clear your mind and increase your ability to concentrate and focus. Establishing a realistic study pattern will keep you in control. Do not vary your study pattern. It has been successful for you, so why change now?

2. What are key factors in your final preparation? Select all that apply.
   1. Remain focused on the study plan.
   2. Visualize the “RN” after your name.
   3. Avoid studying on the day before the exam and relax.
   4. Know where the testing center is and how long it takes to get there.

   Answers: 1, 2, 3, 4

   Rationale: Focus on your plan of study and success will follow. Enact positive reinforcement: Write your name in large letters on a piece of paper with “RN” after your name and post it where you will see it often. Allow yourself a day of pampering before the test. Wake up on the day of the test refreshed and ready to succeed. Ensure that you know where the testing center is; map out your route and the average time it takes to arrive.

3. What key points do the “Pathways to Success” emphasize to help ensure your success? Select all that apply.
   1. A strong positive attitude
   2. Believing in your ability to succeed
   3. Being proud and confident in your achievements
   4. Maintaining control of your mind, surrounding environment, and physical being

   Answers: 1, 2, 3, 4

   Rationale: A strong positive attitude leads to success. Believe in who you are and the goals you have set for yourself. Be “proud and confident.” If you believe in yourself, you will achieve success. Maintain control, and all of your goals are attainable.
Your grade: A +
Continue to "Believe" and you will succeed.
RN belongs to you!
Congrats new grad! You made it through nursing school...that place where you can get a question on an exam wrong even if your answer is correct, BUT just not the most correct. You have more than likely endured several trying challenges during the program with moments of intense self-doubt due to the difficult content and pace of the program. In the end, though, the memories and the friends that are made in school make it all worth it, and despite all those negative feelings, you made it this far!

Nursing school is a journey that not just anyone is able to complete. You may feel extremely relieved to be closing this chapter in your life, and you are now one step closer to becoming a registered nurse. Now the only thing standing between you and adding RN to the end of your name is the NCLEX. Spending late nights studying and stressing over tests and sterile technique has become the new norm during your nursing program; however, the NCLEX is an exam in its own league. It is important to remember that nursing school has been preparing you to take this test throughout its entirety. Taking the NCLEX can be a less stressful experience by preparing yourself throughout nursing school and not just once you schedule a testing date.

While in my nursing program, I strongly disliked studying for exams by going back through chapters I had already read for lecture. My mind would always wander, and I would get distracted because that study method does not engage my mind to think about material in a different way. I would prepare for my lecture exams, and also for my standardized exams, by doing practice questions from the *Saunders RN-Q&A Review for the NCLEX-RN®,* paying close attention to the rationales while taking down succinct notes. By looking at the content area codes I was also able to organize my notes into different sections, which was extremely helpful when I had an exam coming up on a certain subject. I also paid close attention to the test-taking strategy. I came to find if I happened upon a question that I was not sure on, I was able to use the strategies I learned to narrow down the options and arrive at the correct answer. Half the battle is figuring out what exactly a question is trying to ask you, and reading the test-taking strategy was helpful in allowing me to focus in on the subject of the question. I feel studying in this manner during my program made taking the NCLEX a much less stressful experience.

Applying to take the NCLEX is quite the process. I applied through the Nevada State Board of Nursing. I had to make an appointment to get my fingerprints taken at the state board office, which I was able to do while I was still in my nursing
program. An application also has to be filled out and turned in, along with an application fee. Doing these two steps as early as possible is important, as getting the paperwork processed can take a few weeks to a few months. Then, once I graduated and received my degree, I sent in my official transcripts to the state board, as this must be done to receive your authorization to test (ATT) from a third-party testing administrator called Pearson Vue. Once you turn in your information to your state board, it will be sent to Pearson Vue, who will then contact you with your ATT once everything is verified. This requirement may vary from state to state. I remember waiting to get my ATT to be the most frustrating part of the application process. I would check my e-mail obsessively multiple times a day, refreshing it and hoping that magical e-mail with ATT in the subject line would pop up. At this point, it was early August, and the day I finally got my ATT I rushed home to look for the earliest available test date. The Las Vegas testing center was booked until the end of September. I had already been studying for several weeks doing at least 300 practice questions a day and I was frustrated. I did not want to wait more than a month to take the exam.

I then began the search for testing centers in neighboring states, including Arizona, Utah, and California. I even went so far as to look at testing centers in Washington state. No luck in Arizona, Utah, or Washington. I found a date in a testing center in California about 4.5 hours away. The testing appointment was for the next day. I called my sister to ask for her advice on signing up for it, and she told me to just go for it. I had been preparing for the exam for at least the past several weeks and I felt I was ready. I booked the appointment, hoping I had not just made a terrible mistake. My sister and cousin said they would ride with me and help me review on the way. The appointment was for 2:00 PM, so we made a plan to leave Las Vegas at 5:00 AM to make sure we had plenty of time. I packed a travel bag with a change of clothes and toiletries, as we planned to go to a workout class before the exam. We arrived near the testing center at about 9:30 AM and worked out for an hour and showered. I was dropped off at the testing center about an hour ahead of the scheduled exam time to give me ample time to check in. I remember three other people in the office when I had checked in. It was clear to me that not everyone was there for the NCLEX, and so I made it a point to not become anxious if I saw one or all of them get up and leave before me. The anxiety level in the room was tangible as we all sat and waited for our names to be called. I brought my driver’s license and had to verify my ATT. My picture was taken, and I was told to put my belongings in a locker. A palm vein scan was done and then I was being brought into the testing room. I sat down at the computer with my heart racing. There was a camera beside the computer that was watching my every move. All the hard work I had put in the past 16 months had led me to this moment. I had to remind myself to take a deep breath and just relax. I clicked the button to begin the exam.

The hardest part for me during the exam was to not read each question too quickly because of my anxiety. Remember to slow down, take a deep breath, and recenter yourself, and say something positive in your head, then reapproach the question if you find yourself lost in what the question is asking or getting overwhelmed. I relied on the test-taking strategies I had learned while studying to help me analyze what the question was really asking. I felt the questions were getting harder and harder, and the one thought in my head was, “How am I getting this many select-all-that-apply questions?!” The computer shut down when I submitted question 75, and I
did not know what to think. I spent the ride home thinking about all the questions I was not sure about and soon enough I was feeling anxiety about questions I thought I should have answered differently. However, I knew at the end of the day I did the best I could, and it was out of my hands now.

I took the NCLEX on Friday, and Sunday I had the option to view my exam results early on the National Council of State Boards of Nursing (NCSBN) website for a small fee. I remember entering my debit card information, and I had to have my sister click submit because I could not bring myself to do it. I shut my eyes while the screen loaded, and to my relief, it said I had passed! I was now a registered nurse. I could not believe it. All of my hard work had brought me to this point, and since I now had RN next to my name, the next task was to find a job to put my practice into play. I went to a career fair for “Experienced RNs” with my two nursing school friends, and all three of us got hired despite being new graduates. As a new graduate RN, I learn something new every day at work and love the nursing profession. Now that you are done, you will notice that even in regard to everyday matters, you will be thinking like a nurse and you might not realize it. I have caught myself doing it on multiple occasions and assessing random people I see in public.

A few important things to remember, both as a nursing student and as a new graduate RN: Do tasks in a way that works best for you and stick with it, do not be too hard on yourself, do not be afraid to ask questions (there is no stupid question), and do not give up. I have had days both in nursing school and in my career where I thought to myself, “Is this really worth it?” The answer is yes. You will grow immensely as a human being. I remember being scared to even turn a patient or give a bed bath in my fundamentals course, and now I have the strength to hold a deteriorating patient’s hand and look in their eyes as they are rushed to the intensive care unit after I assessed the patient was in distress. As a nurse, you are in the position to care for sick people who will remember your face and the way you made them feel for the rest of their lives. The impact you have as a nurse is bigger than you realize. Nursing is not an easy profession, but your passion has brought you this far, and it will bring you farther than you can imagine. Congratulations on making it this far, and good luck on the NCLEX and your future career! As a nurse, you will make a difference wherever you go!
CHAPTER 4

Test-Taking Strategies

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

If you would like to read more about test-taking strategies after completing this chapter, Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam focuses on the test-taking strategies that will help you pass your nursing examinations while in nursing school and will prepare you for the NCLEX-RN® examination.

I. Key Test-Taking Strategies (Box 4-1)

<table>
<thead>
<tr>
<th>Box 4-1</th>
<th>Key Test-Taking Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>The Question</strong></td>
<td></td>
</tr>
<tr>
<td>• Focus on the data, read every word, and make a decision about what the question is asking.</td>
<td></td>
</tr>
<tr>
<td>• Note the subject and determine what content is being tested.</td>
<td></td>
</tr>
<tr>
<td>• Visualize the event; note whether an abnormality exists in the data provided.</td>
<td></td>
</tr>
<tr>
<td>• Look for the strategic words; strategic words make a difference in determining what the question is asking.</td>
<td></td>
</tr>
<tr>
<td>• Determine whether the question presents a positive or negative event query.</td>
<td></td>
</tr>
<tr>
<td>• Avoid asking yourself, “Well, what if…?” because this will lead you to reading into the question.</td>
<td></td>
</tr>
</tbody>
</table>

| **The Options** | | |
| • Always use the process of elimination when choices or options are presented and read each option carefully; once you have eliminated options, reread the question before selecting your final choice or choices. | | |
| • Look for comparable or alike options and eliminate these. | | |
| • Determine whether there is an umbrella or encompassing option; if so, this could be the correct option. | | |
| • Identify any closed-ended words; if present, the option is likely incorrect. | | |
| • Use the ABCs—airway, breathing, and circulation—Maslow’s Hierarchy of Needs, and the steps of the Nursing Process to answer questions that require prioritizing. | | |
| • Use therapeutic communication techniques to answer communication questions and remember to focus on the client’s thoughts, feelings, concerns, anxieties, and fears. | | |
| • Use delegating and assignment-making guidelines to match the client’s needs with the scope of practice of the health care provider. | | |
| • Use pharmacology guidelines to select the correct option if the question or options address a medication. | | |

II. How to Avoid Reading into the Question (Box 4-2)

<table>
<thead>
<tr>
<th>Box 4-2</th>
<th>Practice Question: Avoiding the “What if ...?” Syndrome and Reading into the Question</th>
</tr>
</thead>
<tbody>
<tr>
<td>The nurse is caring for a hospitalized client with a diagnosis of heart failure who suddenly complains</td>
<td></td>
</tr>
</tbody>
</table>
of shortness of breath and dyspnea during activity. After assisting the client to bed and placing the client in high-Fowler’s position, the nurse should take which immediate action?

1. Administer high-flow oxygen to the client.
2. Call the consulting cardiologist to report the findings.
3. Prepare to administer an additional dose of furosemide.
4. Obtain a set of vital signs and perform focused respiratory and cardiovascular assessments.

Answer: 4

Test-Taking Strategy

You may immediately think that the client has developed pulmonary edema, a complication of heart failure, and needs additional diuresis. In pulmonary edema, one may see this as an emergency, and might think an action should be taken before further assessment, which may lead them to choose option 3. Although pulmonary edema is a complication of heart failure, the question does not specifically state that pulmonary edema has developed; the client could be experiencing shortness of breath or dyspnea as a symptom of heart failure exacerbation, which may be expected, particularly on exertion or during activity. This is why it is important to base your answer only on the information presented, without assuming something else could be occurring. Read the question carefully. Note the strategic word, immediate, and focus on the data in the question, the client’s complaints. Use the nursing process, and note that vital signs and assessment data would be needed before administering oxygen, administering medications, or contacting the cardiologist. Although the cardiologist may need to be notified, this is not the immediate action. Because there are no data in the question that indicate the presence of pulmonary edema, option 4 is correct. Additionally, focus on what the question is asking. The question is asking you for a nursing action, so that is what you need to look for as you eliminate the incorrect options. Use nursing knowledge and test-taking strategies to assist in answering the question. Remember to focus on the data in the question, focus on what the question is asking, and avoid the “What if …?” syndrome and reading into the question.

A. Pyramid points

1. Avoid asking yourself the forbidden words, “Well, what if …?” because this will lead you to the “forbidden” area: reading into the question.
2. Focus only on the data in the question, read every word, and make a decision about what the question is asking. Reread the question more than one time; ask yourself, “What is this question asking?” and “What content is this question testing?” (see Box 4-2).
3. Look for the strategic words in the question, such as immediate, initial, first, priority, best, need for follow-up, or need for further teaching; strategic words make a difference regarding what the question is asking. Use the nursing process to guide your thinking when strategic words are noted (see VI.G).
4. In multiple-choice questions, multiple-response questions, or questions that require you to arrange nursing interventions or other data in order of priority, read every choice or option presented before answering.
5. Always use the process of elimination when choices or options are presented; after you have eliminated options, reread the question before selecting your final choice or choices. Focus on the data in both the question and the options to assist in the process of elimination and directing you to the correct answer (see Box 4-2).
6. With questions that require you to fill in the blank,
focus on the data in the question and determine what
the question is asking; if the question requires you to
calculate a medication dose, an intravenous flow rate,
or intake and output amounts, recheck your work in
calculating and always use the on-screen calculator to
verify the answer.

B. Ingredients of a question (Box 4-3)

<table>
<thead>
<tr>
<th>Box 4-3</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ingredients of a Question: Event, Event Query, and Options</strong></td>
</tr>
</tbody>
</table>

**Event**
The nurse is caring for a client with terminal cancer.

**Event Query**
The nurse should consider which factor when planning pain relief?

**Options**
1. Not all pain is real.
2. Opioid analgesics are highly addictive.
3. Opioid analgesics can cause tachycardia.
4. Around-the-clock dosing gives better pain relief than as-needed dosing.

**Answer:** 4

**Test-Taking Strategy**
Focus on what the question is asking, the factor to consider when planning pain relief, and consider the client’s diagnosis of terminal cancer. Around-the-clock dosing provides increased pain relief and decreases stressors associated with pain, such as anxiety and fear. Pain is what the client describes it as, and any indication of pain should be perceived as real for the client. Opioid analgesics may be addictive, but this is not a concern for a client with terminal cancer. Not all opioid analgesics cause tachycardia. Remember to focus on what the question is asking.

1. The ingredients of a question include the event, which is a client or clinical situation; the event query; and the options or answers.
2. The event provides you with the content about the client or clinical situation that you need to think about when answering the question.
3. The event query asks something specific about the content of the event.
4. The options are all of the answers provided with the question.
5. In a multiple-choice question, there will be 4 options and you must select one; read every option carefully and think about the event and the event query as you use the process of elimination.
6. In a multiple-response question, there will be several options and you must select all options that apply to the event in the question. Each option provided is a true or false statement; choose the true statements. Also, visualize the event and use your nursing knowledge and clinical experiences to answer the
7. In an ordered-response (prioritizing) or drag-and-drop question, you will be required to arrange in order of priority nursing interventions or other data; visualize the event and use your nursing knowledge and clinical experiences to answer the question.

8. A fill-in-the-blank question will not contain options, and some figure/illustration questions and audio or video item formats may or may not contain options. A graphic option item will contain options in the form of a picture or graphic.

9. A chart/exhibit question will most likely contain options; read the question carefully and all of the information in the chart or exhibit before selecting an answer. In this question type, there will be information that is pertinent to how the question is answered, and there may also be information that is not pertinent. It is necessary to discern what information is important and what the “distractors” are.

10. A Testlet is also known as a Case Study. Information about a client or event is presented in the Testlet followed by several questions that relate to the information. These questions can be in a multiple-choice format or an alternate-item format. It is important to read all of the data in the question and look for abnormalities in the information presented before answering the accompanying questions.

11. Next Generation NCLEX (NGN)® item types include cloze items, extended drag and drop, dynamic exhibits, constructed response, enhanced hot spot, enhanced multiple response, and rich media scenarios. Examples of these item types can be found in Chapter 1. The test-taking strategies discussed in this chapter are applicable and helpful in answering NGN item types.

III. Strategic Words (Boxes 4-4 and 4-5)

**Box 4-4**

*Common Strategic Words: Words That Indicate the Need to Prioritize and Words That Reflect Assessment*

<table>

- Obtain information
- Recognize

Box 4-5

Practice Question: Strategic Words

The nurse is caring for a client who just returned from the recovery room after undergoing abdominal surgery. The nurse should monitor for which *early* sign of hypovolemic shock?

1. Sleepiness
2. Increased pulse rate
3. Increased depth of respiration
4. Increased orientation to surroundings

**Answer:** 2

**Test-Taking Strategy**

Note the *strategic word*, *early*, in the query and the word *just* in the event. Think about the pathophysiology that occurs in hypovolemic shock to direct you to the correct option. Restlessness is one of the earliest signs followed by cardiovascular changes (increased heart rate and a decrease in blood pressure). Sleepiness is expected in a client who has just returned from surgery. Although increased depth of respirations occurs in hypovolemic shock, it is not an early sign. Rather, it occurs as the shock progresses. This is why it is important to recognize the *strategic word*, *early*, when you read the question. It requires the ability to discern between early and late signs of impending shock. Increased orientation to surroundings is expected and will occur as the effects of anesthesia resolve. Remember to look for *strategic words*, in both the event and the query of the question.

A. Strategic words focus your attention on a critical point to consider when answering the question and will assist you in eliminating the incorrect options. These words can be located in either the event or the query of the question.

B. Some strategic words may indicate that all options are correct and that it will be necessary to prioritize to select the correct option; words that reflect the process of assessment are also important to note (see Box 4-4). Words that reflect assessment usually indicate the need to look for an option that is a first step, since assessment is the first step in the nursing process.

C. As you read the question, look for the strategic words; strategic words make a difference regarding the focus of the question. Throughout this book, *strategic words* presented in the question, such as those that indicate the need to prioritize, are bolded. If the
A test-taking strategy is to focus on strategic words, then strategic words is highlighted in blue where it appears in the test-taking strategy.

IV. Subject of the Question (Box 4-6)

**Box 4-6**

**Practice Question: Subject of the Question**
The nurse is teaching a client in skeletal leg traction about measures to increase bed mobility. Which item would be most helpful for this client?

1. Television
2. Fracture bedpan
3. Overhead trapeze
4. Reading materials

**Answer:** 3

**Test-Taking Strategy**
Focus on the subject, increasing bed mobility. Also note the strategic word, most. The use of an overhead trapeze is extremely helpful in assisting a client to move about in bed and to get on and off the bedpan. Television and reading materials are helpful in reducing boredom and providing distraction, and a fracture bedpan is useful in reducing discomfort with elimination; these items are helpful for a client in traction, but they are not directly related to the subject of the question. Remember to focus on the subject.

A. The subject of the question is the specific topic or what the question is asking about.
B. Identifying the subject of the question will assist in eliminating the incorrect options and direct you in selecting the correct option. Throughout this book, if the subject of the question is a specific strategy to use in answering the question correctly, it is highlighted in blue in the test-taking strategy.
C. The highlighting of the strategy will provide you with guidance on what strategies to review in Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam.

V. Positive and Negative Event Queries (Boxes 4-7 and 4-8)

**Box 4-7**

**Practice Question: Positive Event Query**
The nurse provides medication instructions to a client about digoxin. Which statement by the client indicates an understanding of its adverse effects?

1. “Blurred vision is expected.”
2. “If my pulse rate drops below 60 beats per minute, I should let my cardiologist know.”
3. “This medication may cause headache and weakness but that is nothing to worry about.”
4. “If I am nauseated or vomiting, I should stay on liquids and take some liquid antacids.”

**Answer:** 2

**Test-Taking Strategy**
This question is an example of a positive event query question. Note the words indicates an understanding, and focus on the subject, adverse effects. Additionally, focus on the data provided in the options. Digoxin is a cardiac glycoside and works by increasing contractility of the heart. This medication has a narrow therapeutic range, and is a major concern is toxicity. Currently, it is considered second-line treatment for heart failure because of its narrow therapeutic range and potential for adverse effects. Adverse effects that indicate toxicity include gastrointestinal disturbances, neurological abnormalities, bradycardia or other cardiac irregularities, and ocular disturbances. If any of these occur, the cardiologist is notified. Additionally, the client should notify the cardiologist if the pulse rate drops below 60 beats per minute, because serious dysrhythmias are
another potential adverse effect of digoxin therapy. Remember to focus on the data provided and note positive event queries.

**Box 4-8**

**Practice Question: Negative Event Query**

The nurse has reinforced discharge instructions to a client who has undergone a right mastectomy with axillary lymph node dissection. Which statement by the client indicates a need for further teaching regarding home care measures?

1. “I should use a straight razor to shave under my arms.”
2. “I need to be sure that I do not have blood pressures or blood drawn from my right arm.”
3. “I should inform all of my other health care providers that I have had this surgical procedure.”
4. “I need to be sure to wear thick mitt hand covers or use thick pot holders when I am cooking and touching hot pans.”

**Answer:** 1

**Test-Taking Strategy**

This question is an example of a negative event query. Note the strategic words, need for further teaching. These strategic words indicate that you need to select an option that identifies an incorrect client statement. Recall that edema and infection are concerns with this client due to the removal of lymph nodes in the surgical area. Lymphadenopathy with associated lymphedema can result, and the client needs to be instructed in the measures that will avoid trauma to the affected arm. Recalling that trauma to the affected arm could potentially result in edema and/or infection will direct you to the correct option. Remember to watch for negative event queries.

A. A positive event query uses strategic words that ask you to select an option that is correct; for example, the event query may read, “Which statement by a client indicates an understanding of the side effects of the prescribed medication?”

B. A negative event query uses strategic words that ask you to select an option that is an incorrect item or statement; for example, the event query may read, “Which statement by a client indicates a need for further teaching about the side effects of the prescribed medication?”

**VI. Questions That Require Prioritizing**

A. Many questions on the examination will require you to use the skill of prioritizing nursing actions.

B. Look for the strategic words in the question that indicate the need to prioritize (see Box 4-4).

C. Remember that when a question requires prioritization, all options may be correct and you need to determine the correct order of action.

D. Strategies to use to prioritize include the ABCs (airway–breathing–circulation), Maslow’s Hierarchy of Needs theory, and the steps of the nursing process.

E. The ABCs (Box 4-9)

**Box 4-9**

**Practice Question: Use of the ABCs**

A client with a diagnosis of cancer is receiving morphine sulfate for pain. The nurse should employ which priority action in the care of the client?

1. Monitor stools.
3. Encourage fluid intake.
4. Encourage the client to cough and deep breathe.

Answer: 4

**Test-Taking Strategy**
Use the ABCs—airway, breathing, circulation—as a guide to direct you to the correct option and note the strategic word, priority. Recall that morphine sulfate suppresses the cough reflex and the respiratory reflex, and a common adverse effect is respiratory depression. Coughing and deep breathing can assist with ensuring adequate oxygenation, since the number of respirations per minute can potentially be decreased in a client receiving this medication. Although options 1, 2, and 3 are components of the plan of care, the correct option addresses airway and breathing. Remember to use the ABCs—airway, breathing, circulation—to prioritize.

1. Use the ABCs—airway–breathing–circulation—when selecting an answer or determining the order of priority.
2. Remember the order of priority: airway–breathing–circulation.
3. Airway is always the first priority. Note that an exception occurs when cardiopulmonary resuscitation is performed; in this situation, the nurse follows the CAB (compressions/circulation–airway–breathing) guidelines.

F. Maslow’s Hierarchy of Needs theory *(Box 4-10; Fig. 4-1)*

<table>
<thead>
<tr>
<th>Box 4-10</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Practice Question: Maslow’s Hierarchy of Needs Theory</strong></td>
</tr>
<tr>
<td>The nurse caring for a client experiencing dystocia determines that the priority is which action?</td>
</tr>
<tr>
<td>1. Position changes and providing comfort measures</td>
</tr>
<tr>
<td>2. Explanations about what is happening to the client</td>
</tr>
<tr>
<td>3. Monitoring for changes in the condition of the mother and fetus</td>
</tr>
<tr>
<td>4. Reinforcement of breathing techniques learned in childbirth preparatory classes</td>
</tr>
</tbody>
</table>

**Answer:** 3

**Test-Taking Strategy**
All the options are correct and would be implemented during the care of this client. Note the strategic word, priority, and use Maslow’s Hierarchy of Needs theory to prioritize, remembering that physiological needs come first. Also, the correct option is the only one that addresses both the mother and the fetus. Remember to use Maslow’s Hierarchy of Needs theory to prioritize.
1. According to Maslow’s Hierarchy of Needs theory, physiological needs are the priority, followed by safety and security needs, love and belonging needs, self-esteem needs, and, finally, self-actualization needs; select the option or determine the order of priority by addressing physiological needs first.

2. When a physiological need is not addressed in the question or noted in one of the options, continue to use Maslow’s Hierarchy of Needs theory sequentially as a guide and look for the option that addresses safety.

G. Steps of the nursing process
1. Use the steps of the nursing process to prioritize.
2. The steps include assessment, analysis, planning, implementation, and evaluation (AAPIE) and are followed in this order.

3. Assessment

   a. Assessment questions address the process of gathering subjective and objective data relative to the client, confirming the data, and communicating and documenting the data.

   b. Remember that assessment is the first step in the nursing process.

   c. When you are asked to select your first, immediate, or initial nursing action, follow the steps of the nursing process to prioritize when selecting the correct option.

   d. Look for words in the options that reflect assessment (see Box 4-4).

   e. If an option contains the concept of assessment or the collection of client data, the best choice is to select that option (Box 4-11).

---

**Box 4-11**

**Practice Question: The Nursing Process—Assessment**

A client who had an application of a right arm cast complains of pain at the wrist when the arm is passively moved. What action should the nurse take first?

1. Elevate the arm.
2. Document the findings.
3. Medicate with an additional dose of an opioid.
4. Check for paresthesias and paralysis of the right arm.

**Answer:** 4

**Test-Taking Strategy**

Note the strategic word, first. Based on the data in the question, determine whether an abnormality exists. The question event indicates that the client complains of pain at the wrist when the arm is passively moved. This could indicate an abnormality; therefore, further assessment or intervention is required. Use the steps of the nursing process, remembering that assessment is the first step. The only option that addresses assessment is the correct option. Options 1, 2, and 3 address the implementation step of the nursing process. Also, these options are incorrect first actions. The arm in a cast should have already been elevated. The client may be experiencing
compartment syndrome, a complication following trauma to the extremities and application of a cast. Additional data need to be collected to determine whether this complication is present. Remember that assessment is the first step in the nursing process.

f. If an assessment action is not one of the options, follow the steps of the nursing process as your guide to select your next best action.

g. Possible exception to the guideline—if the question presents an emergency situation, read carefully; in an emergency situation, an intervention may be the priority rather than taking the time to assess further.

4. Analysis (Box 4-12)

**Box 4-12**

**Practice Question: The Nursing Process—Analysis**

The nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45, P$_{CO_2}$ 30 mm Hg, and HCO$_3^-$ 22 mEq/L (22 mmol/L).
The nurse analyzes these results as indicating which condition?
1. Metabolic acidosis, compensated
2. Respiratory alkalosis, compensated
3. Metabolic alkalosis, uncompensated
4. Respiratory acidosis, uncompensated

**Answer:** 2

**Test-Taking Strategy**

Use the steps of the nursing process and analyze the values. The question does not require further assessment; therefore, it is appropriate to move to the next step in the nursing process, analysis. The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the P$_{CO_2}$. In this situation, the pH is at the high end of the normal value and the P$_{CO_2}$ is low. So, you can eliminate options 1 and 3. In an alkalytic condition, the pH is elevated. The values identified indicate a respiratory alkalosis. Compensation occurs when the pH returns to a normal value. Because the pH is in the normal range at the high end, compensation has occurred. Remember that analysis is the second step in the nursing process.

a. Analysis questions are the most difficult questions because they require understanding of the principles of physiological responses and require interpretation of the assessment data.
b. Analysis questions require critical thinking and determining the rationale for therapeutic prescriptions or interventions that may be addressed in
c. Analysis questions may address the formulation of a statement that identifies a client need or problem. Analysis questions may also include the communication and documentation of the results from the process of the analysis.

d. Often, these types of questions require assimilation of more than one piece of information and application to a client scenario.

5. Planning (Box 4-13)

Box 4-13

Practice Question: The Nursing Process—Planning

The nurse developing a plan of care for a client with a cataract understands that which problem is the priority?

1. Concern about the loss of eyesight
2. Altered vision due to opacity of the ocular lens
3. Difficulty moving around because of the need for glasses
4. Becoming lonely because of decreased community immersion

Answer: 2

Test-Taking Strategy

Note the strategic word, priority, and use the steps of the nursing process. This question relates to planning nursing care and asks you to identify the priority problem. Use Maslow’s Hierarchy of Needs theory to answer the question, remembering that physiological needs are the priority. Concern and becoming lonely are psychosocial needs and would be the last priorities. Note that the correct option directly addresses the client’s problem. Remember that planning is the third step of the nursing process.

6. Implementation (Box 4-14)

Box 4-14

Practice Question: The Nursing Process—Implementation

The nurse is caring for a hospitalized client with angina pectoris who begins to experience chest pain. The nurse administers a nitroglycerin
tablet sublingually as prescribed, but the pain is unrelieved. The nurse should take which action next?

1. Reposition the client.
2. Call the client’s family.
3. Contact the health care provider.
4. Administer another nitroglycerin tablet.

Answer: 4

Test-Taking Strategy

Note the strategic word, next, and use the steps of the nursing process. Implementation questions address the process of organizing and managing care. This question also requires that you prioritize nursing actions. Additionally, focus on the data in the question to assist in avoiding reading into the question. You may think it is necessary to check the blood pressure before administering another tablet, which is correct. However, there are no data in the question indicating that the blood pressure is abnormal and could not sustain if another tablet were given. In addition, checking the blood pressure is not one of the options. Recalling that the nurse would administer 3 nitroglycerin tablets 5 minutes apart from each other to relieve chest pain in a hospitalized client will assist in directing you to the correct option. Remember that implementation is the fourth step of the nursing process.

a. Implementation questions address the process of organizing and managing care, counseling and teaching, providing care to achieve established goals, supervising and coordinating care, and communicating and documenting nursing interventions.
b. Focus on a nursing action rather than on a medical action when you are answering a question, unless the question is asking you what prescribed medical action is anticipated.
c. On the NCLEX-RN® exam, the only client that you need to be concerned about is the client in the question that you are answering; avoid the “What if …?” syndrome and remember that the client in the question on the computer screen is your only assigned client.
d. Answer the question from a textbook and ideal point of view; remember that the nurse has all of the time and all of the equipment needed to care for the client readily available at the bedside; remember that you do not need to run to the supply room to obtain, for example, sterile gloves because the sterile gloves will be at the client’s bedside.

7. Evaluation (Box 4-15)
Practice Question: The Nursing Process—Evaluation

The nurse is evaluating the client’s response to treatment of a pleural effusion with a chest tube. The nurse notes a respiratory rate of 20 breaths per minute, fluctuation of the fluid level in the water seal chamber, and a decrease in the amount of drainage by 30 mL since the previous shift. Based on this information, which interpretation should the nurse make?

1. The client is responding well to treatment.
2. Suction should be decreased to the system.
3. The system should be assessed for an air leak.
4. Water should be added to the water seal chamber.

Answer: 1

Test-Taking Strategy

Use the steps of the nursing process and note that the nurse needs to evaluate the client’s response to treatment. Focus on the subject and the data in the question. Also, determine whether an abnormality exists based on these data. Remember that fluctuation in the water seal chamber is a normal and expected finding with a chest tube. Because the client is being treated for a pleural effusion, it can be determined that he or she is responding well to treatment if the amount of drainage is gradually decreasing because the fluid from the pleural effusion is being effectively removed. If the drainage were to stop suddenly, the chest tube should be assessed for a kink or blockage. There is no indication based on the data in the question to decrease suction to the system; in fact, it is unclear as to whether the client is on suction at all. There are also no data in the question indicating an air leak. Lastly, there are no data in the question indicating the need to add water to the water seal chamber; again, it is unclear as to whether the client has this type of chest tube versus a dry suction chest tube. Remember that evaluation is the fifth step of the nursing process.

a. Evaluation questions focus on comparing the actual outcomes of care with the expected outcomes and on communicating and documenting findings.

b. These questions focus on assisting in determining the client’s response to care and identifying factors that may interfere with achieving expected outcomes.

c. In an evaluation question, watch for negative event queries, because they are frequently used in evaluation-type questions.

H. Determine Whether an Abnormality Exists (Box 4-16)

Practice Question: Determine Whether an Abnormality Exists

The nurse is caring for a client being admitted to the emergency department with a chief
complaint of anorexia, nausea, and vomiting. The nurse asks the client about the home medications being taken. The nurse would be most concerned if the client stated that which medication was being taken at home?

1. Digoxin
2. Captopril
3. Losartan
4. Furosemide

Answer: 1

Test-Taking Strategy
Note the strategic word, most. The first step in approaching the answer to this question is to determine whether an abnormality exists. The client is complaining of anorexia, nausea, and vomiting; therefore, an abnormality does exist. This tells you that this could be an adverse or toxic effect of one of the medications listed. Although gastrointestinal distress can occur as an expected side effect of many medications, anorexia, nausea, and vomiting are hallmark signs of digoxin toxicity. Therefore, the nurse would be most concerned with this medication if taken at home by the client. Remember to first determine whether an abnormality exists in the event before choosing the correct option.

1. In the event, the client scenario will be described. Use your nursing knowledge to determine whether any of the information presented is indicating an abnormality.
2. If an abnormality exists, either further assessment or further intervention will be required. Therefore, continuing to monitor or documenting will not be a correct answer; don’t select these options if they are presented!

VII. Client Needs
A. Safe and Effective Care Environment
1. According to the National Council of State Boards of Nursing (NCSBN), these questions test the concepts of providing safe nursing care and collaborating with other health care team members to facilitate effective client care; these questions also focus on the protection of clients, significant others, and health care personnel from environmental hazards.
2. Focus on safety with these types of questions, and remember the importance of hand washing, call lights or bells, bed positioning, appropriate use of side rails, asepsis, use of standard and other precautions, triage, and emergency response planning.

B. Physiological Integrity
1. The NCSBN indicates that these questions test the concepts that the nurse provides care as it relates to comfort and assistance in the performance of activities of daily living as well as care related to the administration of medications and parenteral therapies.
2. These questions also address the nurse’s ability to reduce the client’s potential for developing complications or health problems related to
treatments, procedures, or existing conditions and to provide care to clients with acute, chronic, or life-threatening physical health conditions.

3. Focus on Maslow’s Hierarchy of Needs theory in these types of questions and remember that physiological needs are a priority and are addressed first.

4. Use the ABCs—airway–breathing–circulation—and the steps of the nursing process when selecting an option addressing Physiological Integrity.

C. Psychosocial Integrity

1. The NCSBN notes that these questions test the concepts of nursing care that promote and support the emotional, mental, and social well-being of the client and significant others.

2. Content addressed in these questions relates to supporting and promoting the client’s or significant others’ ability to cope, adapt, or problem-solve in situations such as illnesses; disabilities; or stressful events including abuse, neglect, or violence.

3. In this Client Needs category, you may be asked communication-type questions that relate to how you would respond to a client, a client’s family member or significant other, or other health care team members.

4. Use therapeutic communication techniques to answer communication questions because of their effectiveness in the communication process.

5. Remember to select the option that focuses on the thoughts, feelings, concerns, anxieties, or fears of the client, client’s family member, or significant other (Box 4-17).

**Box 4-17**

**Practice Question: Communication**

A client scheduled for surgery states to the nurse, “I’m not sure if I should have this surgery.” Which response by the nurse is appropriate?

1. “It’s your decision.”
2. “Don’t worry. Everything will be fine.”
3. “Why don’t you want to have this surgery?”
4. “Tell me what concerns you have about the surgery.”

**Answer:** 4

**Test-Taking Strategy**

Use therapeutic communication techniques to answer communication questions and remember to focus on the client’s thoughts, feelings, concerns, anxieties, and fears. The correct option is the only one that addresses the client’s concern. Additionally, asking the client about what specific concerns he or she has about the surgery will allow for further decisions in the treatment process to be made. Option 1 is a blunt response and does not address the client’s concern. Option 2 provides false reassurance. Option 3 can make the client feel defensive and uses the nontherapeutic communication technique of asking “why.” Remember to use therapeutic communication techniques and
D. Health Promotion and Maintenance

1. According to the NCSBN, these questions test the concepts that the nurse provides and assists in directing nursing care to promote and maintain health.

2. Content addressed in these questions relates to assisting the client and significant others during the normal expected stages of growth and development, and providing client care related to the prevention and early detection of health problems.

3. Use the Teaching and Learning theory if the question addresses client teaching, remembering that the client’s willingness, desire, and readiness to learn is the first priority.

4. Watch for negative event queries, because they are frequently used in questions that address Health Promotion and Maintenance and client education.

VIII. Eliminate Comparable or Alike Options (Box 4-18)

Box 4-18

Practice Question: Eliminate Comparable or Alike Options

The nurse is caring for a group of clients. On review of the clients’ medical records, the nurse determines that which client is at risk for excess fluid volume?

1. The client taking diuretics
2. The client with an ileostomy
3. The client with kidney disease
4. The client undergoing gastrointestinal suctioning

Answer: 3

Test-Taking Strategy

Focus on the subject, the client at risk for excess fluid volume. Think about the pathophysiology associated with each condition identified in the options. The only client who retains fluid is the client with kidney disease. The client taking diuretics, the client with an ileostomy, and the client undergoing gastrointestinal suctioning all lose fluid; these are comparable or alike options. Remember to eliminate comparable or alike options.

A. When reading the options in multiple-choice or multiple-response questions, look for options that are comparable or alike.

B. Comparable or alike options can be eliminated as possible answers, because it is not likely for both options to be correct.

IX. Eliminate Options Containing Closed-Ended Words (Box 4-19)

Box 4-19

Practice Question: Eliminate Options That Contain Closed-Ended Words

A client is to undergo a computed tomography (CT) scan of the abdomen with oral contrast, and the nurse provides preprocedure instructions. The nurse instructs the client to take which action in the preprocedure period?

1. Avoid eating or drinking for at least 3 hours before the test.
2. Limit self to only 2 cigarettes on the morning of the test.
3. Have a clear liquid breakfast only on the morning of the test.
4. Take all routine medications with a glass of water on the morning of the test.

Test-Taking Strategy
Note the closed-ended words “only” in options 2 and 3 and “all” in option 4. Eliminate options that contain closed-ended words, because these options are usually incorrect. Also, note that options 2, 3, and 4 are comparable or alike options in that they all involve taking in something on the morning of the test. Remember to eliminate options that contain closed-ended words.

A. Some closed-ended words are “all,” “always,” “every,” “must,” “none,” “never,” and “only.”
B. Eliminate options that contain closed-ended words, because these words imply a fixed or extreme meaning; these types of options are usually incorrect.
C. Options that contain open-ended words, such as “may,” “usually,” “normally,” “commonly,” or “generally,” should be considered as possible correct options.

X. Look for the Umbrella Option (Box 4-20)

Box 4-20
Practice Question: Look for the Umbrella Option
A client admitted to the hospital is diagnosed with a pressure injury on the coccyx with a wound vac. The wound culture results indicate *methicillin-resistant staphylococcus aureus* is present. The wound dressing and wound vac foam is due to be changed. The nurse should employ which protective precautions to prevent contraction of the infection during care?

1. Gown and gloves
2. Gloves and a mask
3. Contact precautions
4. Airborne precautions

Answer: 3
Test-Taking Strategy
Focus on the client’s diagnosis and recall that this infection is through direct contact. Recall that contact precautions involves the use of gown and gloves for routine care, and the use of gown, gloves, and face shield if splashing is anticipated during care. Note that the correct option is the umbrella option. Remember to look for the umbrella option, a broad or universal option that includes the concepts of the other options in it.

A. When answering a question, look for the umbrella option.
B. The umbrella option is one that is a broad or universal statement and that usually encompasses the concepts of the other options within it.
C. The umbrella option will be the correct answer.

XI. Use the Guidelines for Delegating and Assignment Making (Box 4-21)

Box 4-21
Practice Question: Use Guidelines for Delegating and Assignment Making
The nurse in charge of a long-term care facility is planning the client assignments for the day. Which client should be assigned to the assistive personnel (AP)?

1. A client on strict bed rest
2. A client with dyspnea who is receiving oxygen therapy
3. A client scheduled for transfer to the hospital for surgery
4. A client with a gastrostomy tube who requires tube feedings every 4 hours
Test-Taking Strategy
Note the subject of the question, the assignment to be delegated to the AP. When asked questions about delegation, think about the role description and scope of practice of the employee and the needs of the client. A client with dyspnea who is receiving oxygen therapy, a client scheduled for transfer to the hospital for surgery, or a client with a gastrostomy tube who requires tube feedings every 4 hours has both physiological and psychosocial needs that require care by a licensed nurse. The AP has been trained to care for a client on bed rest. Remember to match the client’s needs with the scope of practice of the health care provider.

A. You may be asked a question that will require you to decide how you will delegate a task or assign clients to other health care providers (HCPs).
B. Focus on the information in the question and what task or assignment is to be delegated.
C. When you have determined what task or assignment is to be delegated, consider the client’s needs and match the client’s needs with the scope of practice of the HCPs identified in the question.
D. The Nurse Practice Act and any practice limitations define which aspects of care can be delegated and which must be performed by a registered nurse. Use nursing scope of practice as a guide to assist in answering questions. Remember that the NCLEX is a national exam and national standards rather than agency-specific standards must be followed when delegating.
E. In general, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to an assistive personnel (AP).
F. A licensed practical nurse (LPN) can perform the tasks that a AP can perform and can usually perform certain invasive tasks, such as dressings, suctioning, urinary catheterization, and administering medications orally or by the subcutaneous or intramuscular route; some selected piggyback intravenous medications may also be administered.
G. A registered nurse can perform the tasks that an LPN can perform and is responsible for assessment and planning care, analyzing client data, implementing and evaluating client care, supervising care, initiating teaching, and administering medications intravenously.

XII. Answering Pharmacology Questions (Box 4-22)

**Box 4-22**

**Practice Question: Answering Pharmacology Questions**
Quinapril hydrochloride is prescribed as adjunctive therapy in the treatment of heart failure. After administering the first dose, the nurse should monitor which item as the priority?

1. Weight
2. Urine output
3. Lung sounds
4. Blood pressure

**Answer:** 4

**Test-Taking Strategy**
Focus on the name of the medication and note the strategic word, priority. Recall that the medication
names of most angiotensin-converting enzyme (ACE) inhibitors end with “-pril,” and one of the indications for use of these medications is hypertension. Excessive hypotension (“first-dose syncope”) can occur in clients with heart failure or in clients who are severely sodium-depleted or volume-depleted. Although weight, urine output, and lung sounds would be monitored, monitoring the blood pressure is the priority. Remember to use pharmacology guidelines to assist in answering questions about medications and note the strategic words.

A. If you are familiar with the medication, use nursing knowledge to answer the question.
B. Remember that the question only will identify the generic name of the medication on most occasions.
C. If the question identifies a medical diagnosis, try to form a relationship between the medication and the diagnosis; for example, you can determine that cyclophosphamide is an antineoplastic medication if the question refers to a client with breast cancer who is taking this medication.
D. Try to determine the classification of the medication being addressed to assist in answering the question. Identifying the classification will assist in determining a medication’s action or side effects or both.
E. Recognize the common side effects and adverse effects associated with each medication classification and relate the appropriate nursing interventions to each effect; for example, if a side effect is hypertension, the associated nursing intervention would be to monitor the blood pressure.
F. Focus on what the question is asking or the subject of the question; for example: intended effect, side effect, adverse effect, or toxic effect. It is helpful to learn the most common side effects, adverse effects, and toxic effects by medication classification.
G. Learn medications that belong to a classification by commonalities in their medication names; for example, medications that act as beta blockers end with “-lol” (e.g., atenolol).
H. If the question requires a medication calculation, remember that a calculator is available on the computer; talk yourself through each step to be sure the answer makes sense, and recheck the calculation before answering the question, particularly if the answer seems like an unusual dosage.
I. Pharmacology: Pyramid Points to remember
   1. In general, the client should not take an antacid with medication, because the antacid will affect the absorption of the medication, either increasing or decreasing the absorption.
   2. Enteric-coated and sustained-release tablets should not be crushed; also, capsules should not be opened.
   3. The client should never adjust or change a medication dose or abruptly stop taking a medication.
   4. The nurse never adjusts or changes the client’s medication dosage and never discontinues a medication.
   5. The client needs to avoid taking any over-the-counter
medications or any other medications, such as herbal preparations, unless they are approved for use by the primary health care provider.

6. The client needs to avoid consuming alcohol.

7. Medications are never administered if the prescription is difficult to read, is unclear, or identifies a medication dose that is not a normal one. It is safer if medications are prescribed electronically.

8. Additional strategies for answering pharmacology questions are presented in Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam.

XIII. Answering Complex Questions Using Clinical Judgment

A. You may encounter questions on the NCLEX exam that present a scenario with information or data. Included in the scenario may be demographic information such as age and gender, chief concern, admitting diagnosis, history of present illness, past medical history, surgical history, family history, social history, allergies, and medications, which provides the situation and background for the case.

B. These scenarios may also include data such as vital signs, physical assessment findings, laboratory and diagnostic test results, client prescriptions, and a medication administration record.

C. The candidate may be required to discern between important, relevant data to the clinical situation and data that, although it is important to be aware of, may not have any bearing, relevance, or effect on nursing interventions for the client and the current medical problems.

D. While reviewing the case, try to look at each piece of data in a step-by-step fashion and decide whether it has bearing, relevance, or a potential effect on nursing interventions for the client (see Box 4-23).

Box 4-23
Case Scenario: Strategies for Analyzing Data Using Clinical Judgment

<table>

<td>O2Sat: 93% RA (room air) before nebulizer O2Sat: 97% RA after nebulizer and during interview</td>
<td>Waist Circumference: Deferred</td>
</tr>
</tbody>
</table>

General Appearance:
75-year-old Caucasian female, appears short of breath while coughing. During interview, client kept eyes closed and appeared fatigue. Speaking in fragmented sentences.

Skin:
Skin color white, consistent with ethnic background. Skin intact throughout. Skin uniformly warm and dry. No diaphoresis.

ENT:
Bilateral obstructing cerumen noted in both ear canals. Purulent nasal discharge noted. Oropharynx reddened, tonsillar pillars 2+ without exudates. Sputum noted, 1 tsp, yellow.

Neck:
Neck symmetrical, trachea midline. No lymphadenopathy, neck supple.

Breast:
Deferred.

Cardiovascular:
Regular rate and rhythm, S1, S2, no S3, S4. +2 pitting edema in bilateral lower extremities. Radial pulses +2 bilaterally. Dorsalis pedis and posterior tibial pulses 1+ bilaterally.

Respiratory:
L (left) sided rhonchi, inspiratory and expiratory. R (right) sided diminished in upper lobes. Coarse crackles in bilateral bases. Wheezing noted in bilateral upper lobes. Productive cough noted frequently throughout exam.

Gastrointestinal:
Deferred.

Genitourinary:
Deferred.

Musculoskeletal:
Full active range of motion of all joints and spine. Muscle strength testing deferred.

Neurological:
Alert and oriented to person, place, time, and situation. Gait is weak, walks with cane.

Psych:
Physical appearance and behavior appropriate.

Laboratory/Diagnostic Test Results
Recent outpatient chest x-ray (CXR) from 4 days ago shows bilateral pneumonia with small bilateral pleural effusions

Assessment (Diagnosis)
1. Bilateral pneumonia, unspecified organism
2. Bilateral pleural effusion, not elsewhere classified
3. Rule out heart failure exacerbation
4. Impacted cerumen, bilateral
5. History of heart disease with pacemaker/defibrillator placement, hypertension, heart failure, type 2 diabetes, pneumonia with thoracentesis, CKD-stage unknown

Recommendation:
Plan
1. Admit to medical-telemetry
2. Admitting dx: bilateral pneumonia with bilateral pleural effusions
3. Two-view CXR
4. Echocardiogram
5. Sputum culture
6. CBC w/ diff, CMP, BNP, A1C, ABG, U/A & C + S
7. Levofoxacin 750 mg IV every 24 hr
8. Electrolyte replacement protocol
9. Inhaled respiratory treatments every 6 hr prn SOB/wheezing
10. Titrate oxygen to maintain SpO2 greater than 92%
11. Incentive spirometer 10 times every 1 hr while awake
12. Cardiac/renal diet
13. Continue home medications
14. Furosemide 40 mg IV every 8 hours
15. Strict I&O monitoring
16. Up ad lib with assistance
Sequential compression devices for prevention of venous thromboembolism

PT/OT evaluation

Further prescriptions to follow

Test-Taking Strategy:
In analyzing this case scenario, important information for the nurse to note that may have bearing, relevance, or an effect on the care provided is noted below, with an accompanying rationale.

CC:
This information is important for the nurse to note because it could indicate that the causative bacteria of the client’s pneumonia is not sensitive to the prescribed antibiotic, cephalexin, which is a cephalosporin.

HPI:
The symptoms described are in alignment with the client’s admitting diagnosis. Of note is that the client describes cerumen impaction. This is not of priority concern at this time and can be addressed with her primary health care provider on an outpatient basis.

PMH:
The client’s medical history makes her a likely candidate for heart failure exacerbation due to her comorbid conditions and history of complicated pneumonia. Additionally, she is at risk for fluid volume overload because of the presence of pleural effusions, the likelihood of heart failure, as well as likelihood of renal failure, in particular, chronic kidney disease.

Surgical Hx:
The placement of a defibrillator/pacemaker and thoracentesis make this client a likely candidate for acute coronary syndrome and cardiorespiratory compromise. Furthermore, the fact that this client had a right-sided mastectomy in 2008 should alert the nurse to the fact that blood pressures, blood draws, and IVs should not be done on this side. Further complicating the case, is the idea that the client may have some degree of chronic kidney disease and therefore should have an arm preserved in case there was ever a need for a fistula for dialysis. Conferral with a nephrologist should be suggested at this time.

Medications:
The client is on medications to manage her comorbid conditions. She is continuing her home medications while in the hospital. Based on the medications to be administered, the nurse should be assessing pulse rate, blood pressure, potassium level, as well as for signs of fluid volume overload and cardiovascular compromise such as chest pain to determine whether medications are appropriate and safe to administer.

SH:
The client is married and has a support system. It may be important for the nurse to know the setup of the home and whether it would be conducive for a safe discharge home. Orthopnea is a very sensitive indicator of a fluid volume overload state, and the nurse should be prepared to initiate emergency measures if needed.

ROS:
Other subjective findings that are important include complaints of generalized weakness and fatigue, intermittent headache, nasal congestion, throat pain, shortness of breath with productive cough, sleeping elevated at night, sitting at the side of the bed to breathe during the night, incontinence of loose stool during coughing, and history of defibrillator/pacemaker placement. These findings should indicate to the nurse that the client likely has pneumonia secondary to an upper respiratory infection, in addition to heart failure exacerbation and fluid volume overload. The client is at risk for decreased cardiac output; problems with oxygenation and perfusion; sepsis; and compromised safety due to weakness, fatigue, and hypoxemia.

Physical Exam:
Of note is that the client is obese, afebrile, moderately hypertensive, with signs of decreased oxygenation, which is improved with a nebulizer treatment. This may suggest the airway is reacting to insult or injury by constricting. The general appearance of the client, and the fact that she is speaking in fragmented sentences, also should alert the nurse to the potential for clinical deterioration. Yellow sputum is consistent with the diagnosis of pneumonia. The nurse should collect the sputum for analysis. The client has + 2 pitting edema in the lower extremities, with diminished peripheral pulses. This may suggest heart or renal failure. The adventitious lung sounds should also be a concern for the nurse, and these findings should be closely monitored.

Laboratory and Diagnostic Test Results:
The nurse should note the previous result of the CXR and compare this result to the new one, which is particularly helpful in monitoring the resolution or worsening of the pneumonia and pleural effusion. The nurse should note that a sputum culture is very important, and a urinalysis has been prescribed, because the client has been incontinent of stool placing the client at risk for urinary tract infection. The nurse should follow-up on new results as they become available.

**Assessment (Diagnosis):**
The nurse should note the diagnosis of bilateral pneumonia, unspecified organism. The nurse is tasked with obtaining a sputum culture, which is important in directing the medical management of this client because it indicates the type of bacteria present, as well as its sensitivity to specific antibiotics. The nurse should also note the diagnosis of pleural effusion, which could become infected and may require thoracentesis or chest tube placement. The nurse should note that the plan is to rule out heart failure exacerbation and diagnostic results, such as, but not limited to, the BNP, CXR result, and the echocardiogram require follow-up and review.

**Plan:**
The nurse should ensure all prescriptions are implemented within a timely manner and report any abnormal or new findings to the primary health care provider. The nurse should ensure the plan of care for the client is logical, and that any consulting specialists are in communication with the primary health care provider. In reviewing the specific plan of care, the nurse should perform an admission assessment and place the client on telemetry. The heart rhythm should be monitored throughout the shift. The nurse should ensure the chest x-ray and echocardiogram are completed and should follow-up on the results. The nurse should collect the sputum culture and should use a suction device if needed or elicit the assistance of the respiratory therapist to ensure the sample obtained is expectorated or taken from the lower airway. A lower airway sample is not contaminated by oral mucosa. The nurse should collect a clean-catch urine sample or obtain a prescription to use a straight catheter if needed to ensure the sample is not contaminated. The nurse should also follow-up on the results of the CBC, CMP, BNP, A1C, and ABGs and report any abnormal results. The nurse will need to administer the levofloxacin IV after sputum specimen collection, and should assess the IV site prior to, during, and after administration. The nurse should ensure that the client is not administered continuous fluids through the IV at any time due to the risk of fluid volume overload. The nurse should administer any depleted electrolytes following the electrolyte protocol if needed based on lab results. The nurse should address any change in oxygenation by titrating oxygen as needed. An incentive spirometer should be given to the client to prevent atelectasis. It is important for clients with pneumonia to use an incentive spirometer to help with oxygenation. The nurse will administer the IV furosemide and should pay attention to the potassium level, blood pressure, and intake and output. The output specifically is what helps the nurse know if the medication is having the intended effect. Assisting the client to walk and applying sequential compression devices are important to prevent venous thromboembolism, which could occur as a result of immobility. Physical and occupational therapy (PT/OT) evaluation is important to evaluate for a safe discharge to home.

Analyzing complex case scenarios in a step-by-step fashion helps make important connections, which contribute to the provision of safe and effective client care.
Introduction

Pyramid to Success

Nurses often care for clients who come from ethnic, cultural, or religious backgrounds that are different from their own. Nurses are also in a primary and unique position to address the individualized needs and care for various special population groups. Awareness of and sensitivity to the unique health and illness beliefs and practices of people of different backgrounds and those of special population groups are essential for the delivery of safe and effective care. Acknowledgment and acceptance of personal, cultural, religious, and spiritual differences with a nonjudgmental attitude are essential to providing culturally sensitive care. The NCLEX-RN® exam test plan is unique and individualized to the client’s personal and cultural beliefs. The nurse needs to avoid stereotyping and needs to be aware that there are several special population groups, subcultures within cultures, and there are several dialects within languages. In nursing practice, the nurse should assess the client’s perceived needs before planning and implementing a plan of care.

Across all settings in the practice of nursing, nurses frequently are confronted with ethical and legal issues related to client care. The professional nurse has the responsibility to be aware of the ethical principles, laws, and guidelines related to providing safe and quality care to clients. In the Pyramid to Success, focus on ethical practices; the Nurse Practice Act and clients’ rights, particularly confidentiality, information security, and informed consent; advocacy, documentation, and advance directives; and cultural, religious, and spiritual issues. Knowledgeable use of information technology, such as an electronic health record, is also an important role of the nurse.

The National Council of State Boards of Nursing (NCSBN) defines management of care as the nurse directing nursing care to enhance the care delivery setting to protect the client and health care personnel. As described in the NCLEX-RN exam test plan, a professional nurse needs to provide integrated, cost-effective care to clients by coordinating, supervising, and collaborating or consulting with members of the interprofessional health care team. A primary Pyramid Point focuses on the skills required to prioritize client care activities. Pyramid Points also focus on concepts of leadership and management, the process of delegation, emergency response planning, and triaging clients.

Client Needs: Learning Objectives

Safe and Effective Care Environment
Acting as a client advocate
Integrating advance directives into the plan of care
Becoming familiar with the emergency response plan
Delegating client care activities and providing continuity of care
Ensuring ethical practices are implemented
Ensuring informed consent has been obtained
Ensuring legal rights and responsibilities are maintained
Collaborating with interprofessional teams
Establishing priorities related to client care activities
Instituting quality improvement procedures
Integrating case management concepts
Maintaining confidentiality and information security issues related to the client’s health care
Supervising the delivery of client care
Triaging clients
Upholding client rights
Using information technology in a confidential manner
Using leadership and management skills effectively

Health Promotion and Maintenance

Considering cultural, religious, and spiritual issues related to family systems and family planning
Considering personal viewpoints and individualized health care needs of special population groups
Identifying high-risk behaviors of the client
Performing physical assessment techniques
Promoting health and preventing disease
Promoting the client’s ability to perform self-care
Providing health screening and health promotion programs
Respecting client preferences and lifestyle choices

Psychosocial Integrity

Addressing needs based on the client’s preferences and beliefs
Assessing the use of effective coping mechanisms
Becoming aware of personal, cultural, religious, and spiritual preferences and incorporating these preferences when planning and implementing care
Identifying abuse and neglect issues
Identifying clients who do not speak or understand English and determining how language needs will be met by the use of agency-approved interpreters
Identifying family dynamics as they relate to the client
Identifying support systems for the client
Providing a therapeutic environment and building a relationship based on trust

Physiological Integrity
Ensuring that emergencies are handled using a prioritization procedure
Identifying client preferences for providing holistic client care
Implementing therapeutic procedures considering individual preferences
Providing nonpharmacological comfort interventions
Providing nutrition and oral hydration, considering client preferences
Monitoring for alterations in body systems or unexpected responses to therapy
I. Special Population Groups
   A. The literature identifies numerous groups that may be designated as a special population group.
   B. For this chapter, the authors have identified certain special groups that would most commonly be encountered in the health care environment and require sensitivity regarding their health care needs.
   C. Vulnerable groups typically experience health disparities and inequalities and include people of color, those who are uninsured, those living in poverty or homeless, those with chronic illness or disabilities, immigrants, refugees, those with limited English proficiency, those who are incarcerated, and members of the LGBTQ (lesbian, gay, bisexual, transgender, queer or questioning) community.
   D. See Box 5-1 for a list of special populations.
   E. See Box 5-2 for a comprehensive nursing assessment tool written by the authors of this chapter, titled Special Populations Needs Assessment Tool, that can be used to obtain information from the client about his or her special needs in order to plan care. This tool can be adapted, based on the individual being cared for.
   F. Health care providers’ self-awareness of their own culture, values, beliefs, ethics, personality, and communication style promotes optimal health outcomes for clients of diverse cultures. Recognizing one’s own biases or prejudices and being respectful to all people despite differences can influence satisfaction of care.

G. It is imperative for health care providers to understand that cultural groups share dominant characteristic however subcultures exist and stereotyping must be avoided.
II. Racial and Ethnic Minorities
   A. Due to the increasing diversity of the United States population, minorities are projected to become the majority.
   B. Racial and ethnic minorities are affected more often than their white counterparts by health care disparities and inequalities.
   C. Social determinants of health are conditions in which persons are born, grow, live, work, and age, including the health care system, and are correlated with health and health inequities.
   D. Cultural competence is a necessary ability for health care professionals to provide care for a diverse population and can help improve health outcomes and quality of care.
   E. Family members and friends should not be asked to be an interpreter for the client because of confidentiality, the potential for conflict of interest, and the risk associated with relaying inaccurate information; only specified individuals as designated by the health care agency should be asked to interpret for a client.
   F. Return explanation and demonstration (teach-back) are of particular importance when working with clients of various backgrounds to ensure safety and mutual understanding.

Some ethnic minorities report hesitancy in seeking health care due to a language barrier. Ineffective communication between the health care provider and the client can affect client safety or the client's ability to comply with follow-up care.

G. Description and population-based risk factors
   1. African Americans or Blacks
      a. This population has origins in Africa and the Caribbean.
      b. Some in this population may be less likely to have health insurance coverage or a regular source of health care.
      c. Nearly 50% of adults have chronic health conditions. For additional information, refer to https://cdn.americanprogress.org/wp-content/uploads/issues/2010/12/pdf/disparities_factsheet.pdf
      d. Obesity, diabetes mellitus, hypertension, heart disease, asthma, and cancer are prevalent among this population.
      e. Some leading causes of death among this population are heart disease, cancer, and stroke.
   2. Hispanics/Latinos
      a. This population has origins in Mexico,
Puerto Rico, Cuba, South or Central America, or other Spanish culture or origin.

b. Multiple subcultures have unique practices and behaviors. Providers must avoid stereotyping to ensure the delivery of culturally competent care to optimize health outcomes.

c. Some in this population may not have health insurance coverage or a regular source of health care.

d. Language barriers and lack of access to preventative care influence health.

f. Lack routine health care and delay seeking health care for illness are common.

g. Obesity, diabetes mellitus, end-stage renal disease secondary to diabetes, and cervical cancer are prevalent among this population.

h. Some leading causes of death among this population are heart disease, cancer, and accidents.

i. Important health topics include but are not limited to discussions surrounding diet and meal planning, exercise, and safe sex practices.

3. Native Hawaiian or other Pacific Islander

a. This population has origins in the Pacific Islands, including Polynesia, Micronesia, and Melanesia.

b. This population is noted to have higher rates of smoking, alcohol consumption, obesity, and diabetes mellitus.

c. Some leading causes of death among this population are cancer, heart disease, accidents, stroke, and diabetes.

d. There is a higher incidence of infant mortality and sudden infant death syndrome (SIDS).

e. Hepatitis B, human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS),
and tuberculosis are other diseases prevalent among this population.

4. American Indians and Alaska Natives
   a. This population has origins in North, Central, and South America and have tribal or community attachment.
   b. Some in this population may not have health insurance coverage or a regular source of health care.
   c. Cultural barriers, geographic isolation, and low income prevent this population from receiving quality health care.
   d. Smoking is a common practice; nearly one-third of this population older than age 18 years smokes and some consume alcohol in large amounts.
   e. This population is noted to have higher incidence of diabetes mellitus and stroke.
   f. Some leading causes of death among this population are heart disease, cancer, malignant neoplasm, cerebrovascular disease, and accidents.
   g. This population is at high risk for altered mental health, suicide, sudden infant death syndrome (SIDS), teenage pregnancy, liver disease, and hepatitis.
   h. There is a high incidence of infant mortality.

5. Asian American
   a. This population has origins in eastern Eurasia, Southeast Asia, or the Indian subcontinent.
   b. This population is disproportionately noted to have different types of cancer, tuberculosis, and hepatitis.
   c. Some leading causes of death among this population are cancer, heart disease, and stroke.
   d. Some older Asian-American women are at an increased risk for suicide.

H. Health care considerations for racial and ethnic minorities

   1. Cultural competence is a mainstay in the effort to reduce racial and ethnic health care disparity.
   2. The nurse and other health care professionals should be trained in health care variations and risk factors for
various populations in order to facilitate access to needed health care services.

3. It is important for the nurse to examine his or her own cultural preferences in order to competently care for someone of a differing culture; emotional intelligence is a useful tool in caring for these special populations.

4. Knowledge of the various racial and ethnic groups in terms of cultural preferences, health risks, and health preferences is needed to deliver culturally competent health care.

III. Lesbian, Gay, Bisexual, Transgender, and queer or questioning Individuals
A. Commonly referred to as the LGBTQ community, this group is represented by a wide range of varying characteristics in terms of race, ethnicity, age, socioeconomic status, and identity.
B. Unfortunately, stigma and discrimination is a reason for their identification as a special population.
C. Often, there is a lack of awareness and understanding among health care professionals in managing the health care needs of this population, therefore access to health care to meet their needs is less compared with other population groups.

D. Descriptions
1. The term sexual orientation is an encompassing term used to describe a person’s behavior, identity, and desire. A variety of words may be used to describe sexual orientation, including men-who-have-sex-with-men (MSM), women-who-have-sex-with-women (WSW), or gay, lesbian, asexual, bisexual, pansexual, queer, or same-gender loving.
2. The term transgender is used to describe individuals who do not identify as a person with their birth sex. Other terms to describe transgender individuals, include male-to-female (MTF), female-to-male (FTM). For additional information, refer to GLAAD Media Reference Guide: Transgender at https://www.glaad.org/reference/transgender.
3. Important research is needed with regard to the health care needs of various gender identities.
4. Using the preferred pronoun when addressing these clients is important in developing and maintaining a rapport.

E. Risk factors
1. Some LGBTQ persons may be less likely to
access health care than other population groups due to stigmatization and fear of being viewed as different.

2. There are no health disparities specifically associated with this population as a group; however, there are members within this population who experience inequity in health care management due to a variety of other factors.

3. Some in this group may not have health insurance.

4. Transgender individuals may be less likely than other groups to have certain screenings completed, such as mammograms, breast exams, cervical cancer screening, testicular cancer exams, and prostate screening.

5. Sexually transmitted infections are of concern in this population.

6. HIV and AIDS are more prevalent among certain members of this group, particularly MSM and MTF transgender persons.

7. Additionally, syphilis and gonorrhea, human papilloma virus (HPV), and anal cancer rates are higher among this population.

8. Lesbians are more likely to be overweight or obese.

9. Gay and bisexual men may be more likely to have eating disorders and body image disorders.

10. Breast cancer and cervical cancer rates tend to be higher among lesbian and bisexual women, likely a result of decreased screening and nulliparity.

11. The LGBTQ population is more likely to smoke than other population groups. Additionally, alcohol and drug abuse may be more common in some individuals.

12. Depression and suicide rates tend to be higher in this group than other population groups.

13. Rejection from friends, family members, and social support systems may be a stressor.

14. Teenage members of the LGBTQ population are more likely to be threatened, bullied, injured, raped, and victimized. For these reasons, school absenteeism can be a problem.

15. LGBTQ youth are at risk for physical abuse by family members due to their sexual orientation.

16. Many same sex couples desire children; there may be some barriers to child-rearing for this population, such as the expenses associated with adoption, artificial insemination, and surrogacy.
Members of the LGBTQ population are less likely to have family members who can assist them with elder or disability care. Additionally, certain benefits may not be available to them, such as spousal death benefits, which could impact their ability to manage finances and expenses associated with health.

17. Health promotion measures should focus on depression screening, assessing for suicide, educating on safe sex practices, and counseling for alcohol and drug use.

F. Health care considerations for the LGBTQ population

1. Health care professionals need to create a welcoming, nonjudgmental environment when caring for this population.
2. Measures such as altering signage on paperwork, such as documents asking for gender identification, will better serve the health needs of this population; additionally, the health care facility should develop institutional polices inclusive of all gender identities and preferences. Such measures will allow the health care provider to treat the client according to their preferences while also maintaining an understanding of their risk factors based on biological drivers of health.
3. Training to work respectfully with the LGBTQ population should be provided for all health care personnel.
4. Use of open-ended questions and refraining from making judgments during client encounters are important.
5. Health promotion measures should focus on screening for depression, assessing for suicide, and educating on safe sex practices.
6. Additional screening within this population should include HIV blood testing, syphilis blood testing, urine Neisseria gonorrhoeae and anal Chlamydia trachomatis for those with insertive intercourse in the last year, rectal N. gonorrhoeae and C. trachomatis for those with receptive anal intercourse in the last year, and pharyngeal N. gonorrhoeae for those with receptive oral intercourse in the last year.
7. Hepatitis A vaccination is recommended for MSM.
8. Anoscopy should be used to examine the anus and rectum as indicated, with particular attention paid to those infected with HIV.
9. Mammography and cervical cancer screening should be initiated for lesbian and bisexual women.
10. A careful sexual history and appropriate counseling is important for all members of the LGBTQ population.

11. Nonoccupational postexposure prophylaxis (nPEP) or the use of prophylactic antiretrovirals before and after potential HIV exposure should be initiated.

12. Transgender persons taking hormone therapy need to be monitored at regular intervals; associated complications, such as polycythemia occurring with exogenous testosterone use, should be detected and treated early.

13. Transgender persons who have undergone sexual reassignment surgery should have the respective preventive screenings. For example, MTF should have breast cancer screening by way of mammography if they are older than 50 years. Additionally, FTM should still have mammography routinely as indicated due to the risk for residual breast tissue to develop cancerous growth.

IV. Homeless

A. Affects men, women, children, and persons of all racial and ethnic backgrounds.

B. Family units can be affected as a whole.

C. Risk factors

1. There is a risk for early death related to chronic illness, substance abuse, environment exposures, communicable diseases, cardiovascular and respiratory disorders, skin disorders, and mental illness.

2. Nearly half of this population experiences mental health issues and coexisting substance abuse disorders.

3. Malnutrition and poor dentition are common and can lead to further health complications.

4. Disability often results from illness; disability becomes a barrier to employment, which further augments the problem of homelessness.

5. Infants affected by homelessness often have low birth weights and are more likely to die within the first 12 months of life.

6. Children affected by homelessness are sick more often with illnesses such as asthma, iron deficiency, lead poisoning, ear infections, gastrointestinal illness, and mental health and behavioral problems.

7. Children may begin to act out or become less attentive in the classroom when basic needs are not met.

8. Youth experience health problems related to risk-taking behaviors such as alcohol and drug abuse,
depression, suicide, unintended pregnancy, and sexually transmitted infections (STIs), including HIV/AIDS.

9. Women experience high rates of unintended pregnancy and physical and sexual abuse.

D. Health care considerations for the homeless

1. Identification of those who are homeless should be done through avenues such as outreach programs.
2. The initial health care visit and every visit thereafter need to be done with a nonjudgmental, nonthreatening approach.
3. The nurse should focus on reported symptoms first—that this will encourage adherence and follow-up.
4. Subsequent care should include health maintenance, attention to social problems and/or mental health problems, and establishing an emergency contact person if available.

Homeless individuals often experience poor nutrition, sleep deprivation, violence, physical trauma, emotional trauma, and long-term exposure to toxic agents.

5. Homeless individuals may not adhere to medical treatment recommendations and therefore require close follow-up.
6. This population tends to lack health insurance, have longer hospital stays, and have poorer health outcomes.
7. Common conditions in the homeless population are listed in Box 5-3.
8. Certain medications should be avoided in the homeless population due to the potential for serious interactions with alcohol and recreational drugs; the potential for abuse; risk for dehydration; and contraindications in chronic conditions (Box 5-4 lists some of these medications).
9. Multiple resources are available to increase access to health care for the homeless population. See https://www.aafp.org/afp/2014/0415/p634.html for more information.

V. Socioeconomically Disadvantaged Individuals and Families

A. Disadvantage in the socioeconomic sense can correlate with poor health outcomes.
B. Education level, income, family, social support, and community safety are factors that can influence health and health outcomes.
C. In addition to healthy lifestyle and access to routine, quality care,
the social determinants of health are equally as important in promoting positive health outcomes.

D. Risk factors

1. Individuals of low socioeconomic status (SES) are more likely to engage in risky health behaviors such as smoking, alcohol use, recreational drug use, physical inactivity, poor nutrition, and engagement in criminal violence.
2. Due to limited financial means to purchase health insurance, pay for health care services, and afford healthy foods and other resources, these individuals are at a higher risk for chronic disease and any diseases associated with primary prevention.
3. The health of children can be affected later in life due to risk factors.

E. Health care considerations for socioeconomically disadvantaged individuals and families

1. Social work services are helpful in connecting this population to needed health care services, as well as resources to assist in paying for health care.
2. Direct-pay clinics, an emerging model of health care, offer access to affordable health care services.

VI. Uninsured and Underinsured Individuals

A. Individuals with low incomes are most at risk for being uninsured or underinsured.
B. Intuitively, those who are uninsured or underinsured are at increased risk for health complications due to lack of access to care and the likelihood that preventive care services and chronic disease management will not be sought.
C. Most individuals receive health insurance coverage through an employer. If the employer doesn’t offer this coverage, the employee is at risk for being uninsured or underinsured.
D. Medicaid is an option for some low-income families who meet eligibility criteria. Commercial insurance is another option but may still be cost prohibitive depending on the individual circumstance. The client should be referred to social work or financial services to apply for Medicaid.
E. Risk factors: Refer to risk factors for socioeconomically disadvantaged individuals and families.
F. Health care considerations for uninsured and underinsured individuals: Refer to health care considerations for socioeconomically disadvantaged individuals and families.

VII. Intellectually Disabled Individuals

A. Intellectually disabled individuals are at high risk for certain health disorders.
B. Often, these disorders go untreated due to atypical symptom presentation, which leads to secondary problems later in life.
C. Communication barriers between health care professionals and those with an intellectual disability presents a unique challenge in identifying and managing health care needs in this population.

D. These clients tend to be poor historians, and it may be necessary to take more time to ask questions in a variety of different ways.

E. Risk factors

1. Common health conditions include motor deficits, epilepsy, allergies, otitis media, gastroesophageal reflux disease (GERD), dysmenorrhea, sleep problems, mental illness, vision and hearing impairments, constipation, and oral health problems.

2. These clients tend to eat quickly, so choking and aspiration presents a safety risk.

3. Certain conditions can cause changes in behavior; for example, there may be eating disturbances due to GERD or self-injury due to presence of an ear infection.

F. Health care considerations for intellectually disabled individuals

1. Functional behavioral assessment is important in identifying existing health problems.

2. Awareness of altered behavior as a manifestation of an illness is important in early identification and prevention of secondary problems.

3. Health interventions should be focused on treating a medical condition, followed by behavioral interventions to prevent continued behavioral response to an illness.

VIII. Battered Individuals and Victims of Abuse or Neglect

Health care professionals are often the first point of contact for victims of abuse or neglect.

A. Abuse of the older client (refer to Chapter 19 and Chapter 67)

B. Child abuse: Consequences are long lasting, both impacting initial development and influencing health as an adult. (refer to Chapter 67).

C. Females are affected more than men.

D. Sequelae of abuse or neglect include physical, somatic, psychological, behavioral, sexual, and pregnancy-related effects.

E. Risk factors

1. Children birth to 1 year of age are at risk for maltreatment—the majority are victims of neglect; maternal socioeconomic status and parental behavioral issues impact a child’s risk.

2. Victims are prone to certain health effects as a result of the abuse or negligence; these effects can include
bruises, sprains or broken bones, chronic fatigue, shortness of breath, muscle tension, involuntary shaking, changes in eating and sleeping patterns, sexual dysfunction, and fertility issues.

3. Mental health issues can arise, including post-traumatic stress disorder (PTSD), nightmares, anxiety, uncontrollable thoughts, depression, anxiety, low self-esteem, and alcohol and drug abuse.

4. Feelings of hopelessness, lack of worth, apprehension, discouragement, inability to trust others, questioning spiritual faith, and lack of motivation are common.

5. Children who witness violence are prone to fearfulness, anxiety, depression, and problems in school.

F. Health care considerations for battered individuals and victims of abuse or neglect

1. Treat victims with compassion and respect.
2. Acknowledge and respect the dignity of each person.
3. It may be necessary to take photographs of injuries for legal reasons.
4. Nurses are mandated reporters of domestic violence and abuse incidents.
5. Cleaning and dressing wounds, administering pain medications, use of assistive devices such as for sprains or fractures, education for self-management and seeking safety, and emotional support may be needed in the care of these victims.
6. Provide parental education and support programs and increase awareness of potential child maltreatment.

IX. Single Parents

A. Women are usually the single parent.
B. Single parenthood places individuals at increased risk for disability and resultant poor health later in life.
C. These individuals may be living in poverty and may be less likely to have health insurance coverage.
D. Children may also be afflicted by health problems when raised by a single parent.
E. Risk factors

1. Single parents are at increased risk for cardiovascular events, mental health problems, and overall increased mortality.
2. Children growing up in a single-parent household may be at increased risk for dropping out of school, be idle in school, have lower grade point averages, have lower aspiration for higher education, and experience poorer attendance in school.
F. Health care considerations for single parents

1. Access to community organizations can assist in alleviating some burden and provide needed services such as child care, food security, health care including immunizations, and employment.
2. Assist single parents with a child of the opposite sex to address the child’s sexual development.
3. Preventive screenings are important in this population due to risk factors and the negative effects of stress from single parenting.

X. Foster Children

A. As a result of childhood adversity and trauma, this population is at increased risk for health problems later in life.
B. Needs that often go unmet for children in foster care include physical, mental, behavioral, and dental health.
C. Risk factors
   1. Some children in foster care may have complex health conditions, including asthma, diabetes mellitus, food allergies, seizure disorder, organ transplant, HIV, immunosuppression, renal disease, congenital diseases, cystic fibrosis, prematurity, and those requiring assistive devices and technology.
   2. Other conditions may include dental problems, eating disorders, encopresis, enuresis, and mental health concerns (Box 5-5).

D. Health care considerations for foster children

1. Community resources are important for this population and facilitate the provision of health, safety, stability, and permanency.
2. Social workers should be included in the care of a foster child to facilitate access to community resources.
3. Medically equipped homes may be needed, as well as in-home nursing care services.
4. Frequent health visits may be needed for children transitioning from foster care to home.

XI. Individuals With Mental Illness

A. Lifestyle choices, disease processes, psychotropic medications, and limited access to health care contribute to a shorter life span.
B. Many clients with mental illness do not receive preventive screenings.
C. Risk factors
   1. Cardiovascular disease, metabolic disease, nutritional problems, musculoskeletal disease, sexual dysfunction, pregnancy complications, and obesity-
related cancers are prevalent diseases among this population. Additionally, family history is a significant risk factor for mental illness.

2. Side effects of psychotropic medications may contribute to an altered health state.

3. Obesity is linked to lifestyle factors in this population, such as lack of exercise and poor diet, as well as features of their illness noted as depression or disorganized thought processes.

4. Certain psychotropic medications can contribute to weight gain.

5. Metabolic syndrome is prevalent among clients with schizophrenia.

6. Clients with schizophrenia, schizoaffective disorder, and bipolar disorder have a higher incidence of diabetes mellitus.

7. Side effects from psychotropic medications, such as sedation, weight gain, and increased appetite, contribute to the incidence of diabetes mellitus in this population.

8. Diabetic ketoacidosis is more prevalent in those with schizophrenia, and it may be due to an interaction with psychotropic medications.

9. Cardiovascular disease appears to be higher in individuals with major depression, bipolar disorder, and schizophrenia and is associated with greater morbidity and mortality. This may be associated with excessive sleep, lack of exercise, and poor nutrition.

10. Coronary artery disease, cerebrovascular disease, and sudden cardiac death occur at a higher rate in those with schizophrenia.

11. Due to the higher frequency of substance abuse, risky sexual behaviors, and lack of knowledge regarding risks, individuals with mental illness are at increased risk for viral illness, particularly HIV and hepatitis.

12. Respiratory diseases are more prevalent in individuals with mental illness, including tuberculosis, pneumonia, and chronic obstructive pulmonary disease (COPD).

13. Cancer risk is higher due to lifestyle choices, medications, and comorbidities.

14. There is an association with low bone mineral density and osteoporosis development in individuals with schizophrenia, schizoaffective disorder, major depression, and bipolar disorder.

15. Sexual dysfunction can result from mental illness as well as the medication used to treat it.

16. Obstetric complications can occur in women with
schizophrenia.

17. Dental health tends to be poor in individuals with mental illness.

18. Xerostomia from reduction in salivary gland flow due to medications can result in difficulty maintaining oral hygiene and overall health.

D. Health care considerations for individuals with mental illness

1. Due to lack of insurance by many, individuals with mental illness have a difficult time accessing needed health care services.

2. Family and social service support are important for these individuals.

3. Governmental insurance has expanded to cover individuals in need of mental health care.

4. Mental health screenings should be completed regularly for all individuals, which allows for prompt and accurate treatment strategies to prevent further health complications.

5. Refer to Unit 18, Mental Health Disorders, for additional information about this special population.

XII. Older Adults

A. Elder abuse is a concern for this population; health care providers are mandated to report if there is suspicion of elder abuse. The most common type of abuse is neglect.

B. There are many health problems that can occur in the older client (Box 5-6 lists some of these health problems).

C. See Chapter 19 for more information on common health conditions experienced by older adults and care of the older adult.

XIII. Military Veterans

A. This population is at increased risk for injury-related and stress-related health illnesses.

B. Risk factors

1. Mental health or behavioral adjustment disorders are common.

2. Substance use disorder with tobacco, alcohol, or other drugs is a risk in this population.

3. PTSD is extremely common among this population.

4. Traumatic brain injury can occur as a result of external force injuries.

5. Limb amputations and disfigurement are common.

6. Long-term health problems may result from exposure to chemicals and environmental irritants.

7. Military veterans can experience issues leading to homelessness.
C. Health care considerations for military veterans

1. Identifying and treating mental health disorders assists in mitigating suicide risk.
2. Treatment of comorbid conditions such as PTSD may help address substance use disorder.
3. Use of screening tools in identifying substance use disorder is helpful.
4. Treatment of PTSD includes exposure therapy, psychotherapy, and family/group therapy as appropriate.
5. Suicide among this population occurs on a daily basis.
6. Veterans’ Affairs Services can assist in managing some of the health issues experienced by these individuals.

XIV. Prisoners

The environment of a prison can predispose a person to different health conditions, such as tuberculosis, HIV, STIs, or other infectious diseases.

A. Rape is a concern for this population.
B. Social determinants of poor health are often present in prisoners.
C. Risk factors: Prisoners are more likely to have asthma, diabetes, hypertension, heart disease, and mental illness.
D. Communicable diseases are also a concern for this population: human immunodeficiency virus (HIV), hepatitis, and tuberculosis (TB).
E. Health care considerations for prisoners

1. The correctional facility is usually the sole provider of health care for this population.
2. Screening protocols and procedures for individuals in this setting need to be consistent.
3. Educational and vocational programs may help mitigate the health problems associated with living in a prison.
4. History of incarceration increases risk of poor health due to limited opportunities to reform; inadequate housing, employment, and education; and lack of family stability.
5. Failure to address mental health issues among this population may contribute to repeated crimes when released from prison.

XV. Immigrants and Refugees

A. Mental health problems are a primary issue for this population as a result of tortuous events.
B. Additional challenges include learning to speak English, raising children, employment, housing, accessing health care, transportation, and overcoming cultural barriers.
C. Risk factors

1. **Acculturation** to the U.S. culture increases risk for poor health. This includes eating a less healthy diet, increased smoking, drug and alcohol abuse, and lack of family support.

2. Common health problems include accidental injuries, hypothermia, burns, gastrointestinal illness, cardiovascular events, pregnancy complications, diabetes, poor nutrition, and hypertension.

3. Other conditions that could result from the process of migration include tuberculosis, HIV, hepatitis, influenza, vector-borne disease, Middle Eastern respiratory syndrome, coronavirus, measles, mumps, rubella, polio, as well as antimicrobial resistance.

4. Refugees are at increased risk for STIs (HIV), lead poisoning, malaria, parasitic disease, and mental health issues due to war, violence, and rape occurring in camps.

D. Health care considerations for immigrants and refugees

1. A process for offering services and treating immigrants and refugees should be available regardless of insurance status.

2. This population may be eligible for short-term medical assistance in the United States but then may lack health care coverage due to ineligibility for state medical assistance or inability to afford private health insurance.

3. Vaccinations should be provided.

4. Breast-feeding should be encouraged to help prevent future health problems and to promote immunity.

5. An individual with a communicable health condition should be treated before entering the new country of residence.

XVI. Individuals With Chronic Illness

A. Individuals with multiple chronic illnesses are a health concern.

B. Chronic illness is the leading cause of death and disability in the U.S.; the prevalence increases with age, and it is a major cause of disability.

C. Chronic illnesses include cardiovascular disease, cancer, respiratory disease, diabetes, mental disorders, vision and hearing impairment, oral diseases, bone and joint disorders, and genetic disorders.

D. Often, more than one chronic illness exists at one time, and new chronic illnesses develop as a result of previous illness.

E. Poor health outcomes and high health care costs are associated
with chronic illness.

F. Optimal care for individuals with multiple chronic illnesses may be limited because of multiple health needs present.

G. Many health professionals do not feel adequately prepared to manage individuals with multiple chronic illnesses.

H. Risk factors

1. Individuals with one chronic illness are at risk for developing multiple chronic illnesses.
2. Modifiable factors include an unhealthy diet, physical inactivity, and tobacco use.
3. Nonmodifiable factors include age and genetics.
4. Other risk factors include globalization; urbanization; population aging; elevated blood pressure, blood glucose, and blood lipids; and increased weight.

I. Health care considerations for individuals with chronic illness

1. Follow-up care is important in promoting health for individuals with chronic illness.
2. Focusing on a single illness does not effectively manage an individual with multiple chronic diseases — rather, the “big picture” needs to be understood in managing these clients.
3. Interprofessional collaboration is important in safely managing individuals with chronic diseases.
4. Nurses play a key role in facilitating communication between providers and specialists.
5. Inclusion of the client and support person(s) in health care decisions helps increase adherence to a complex health care regimen.

Box 5-1

Some Special Population Groups

- Racial and ethnic minorities
- Lesbian, gay, bisexual, transgender, and queer or questioning individuals
- Homeless
- Socioeconomically disadvantaged individuals and families
- Intellectually disabled individuals
- Battered individuals and victims of abuse or neglect
- Single parents
- Foster children
- Individuals with mental illness
- Older adults
- Military veterans
- Prisoners
- Immigrants and refugees
Individuals with chronic illness

Box 5-2

Special Populations: Needs Assessment Tool

Not all questions listed in the assessment tool will need to be used for the assessment. The nurse should make a judgment on appropriate questions for each population and should ask questions within that list, if appropriate for the client, based on the General Background Questions. Use the General Background Questions as a guide to determine additional questions that need to be included in the assessment.

Initial

• Introduce self and describe your role.
• I would like to ask you some questions so that we have information about your individualized needs. Do I have your permission to ask you some questions?

General Background Questions

• Are you comfortable talking to me?
• What name would you like us to use to address you?
• Do you feel you are able to adequately answer questions regarding your health?
• What is your age?
• Is there a specific gender in which you identify yourself with?
• What is your ethnicity?
• What is your primary language spoken?
• Do you understand and speak English?
• In which language do you wish to communicate?
• Do you need an interpreter?
• Do you have any cultural, religious, or spiritual preferences you would like us to consider in your plan of care?
• Do you have any dietary preferences that you would like us to include in your plan of care? Describe your eating patterns in a 24-hour period.
• Do you exercise? What do you do and how often?
• Do you use any remedies when you are sick?
• What do you do when you are sick?
• What is your living situation? Where do you live? Who do you live with? Do you have children?
• Do you have a support system?
• Would you like to name a support person or emergency contact person?
• Do you have access to financial resources needed to live?
• Do you have health insurance?
Do you feel safe at home or where you live? Have you been abused within the last 12 months? Do you encounter crime or violence in your life? Is anyone hurting you, physically or emotionally or in any other way? Have you ever or are you being bullied?

Do you smoke, drink alcohol, or use any type of drug?
Do you have or need a health care proxy?
Do you have an advance directive? If not, would you like more information about this?
When was the last time you sought health care? For what reason?
Do you have any fears about seeing your provider?
Do you currently or have you ever had a communicable disease?
Have you traveled outside of the country recently?
Do you have a history of mental illness?
Have you ever had feelings of committing suicide?
Are you a veteran or member of the military?
Do you have any chronic, long-term illness, disability, or other past medical history?
Have you ever been incarcerated?
Are you an immigrant or refugee?

Further Questions Based on Living Situation

Do you have a home? Do you live alone? Who do you live with at home?
Do you drink alcohol? Any other type of drug use?
Have you been exposed to environmental irritants?
Have you had problems with asthma, anemia, lead exposure, ear infections, gastrointestinal illness, or mental illness?
Are you willing to follow-up on your health care recommendations if given the necessary resources?

Further Questions Based on Financial Status and Access to Resources

What is your education level?
What is your income?
Do you have family you are in contact with?
Is anyone in your immediate family disabled?
Do you have a support system?
Do you live in a safe community?
Do you seek health care on a routine basis?
Are you willing to work with a social worker to increase your access to community resources?

Further Questions Based on Health Insurance Coverage
• What health insurance do you have?
• Do you have the financial means to pay for your health care?
• Are you willing to work with a social worker to seek health coverage?

Further Questions Related to Abuse

• Do you have or have you had any bruises, sprains, broken bones, fatigue, shortness of breath, muscle tension, involuntary shaking, changes in eating or sleeping, sexual dysfunction, or fertility problems?
• Do you experience nightmares, anxiety, uncontrollable thoughts, depression, anxiety, or low self-esteem?
• Do you have anxiety or depression? Felt suicidal?
• Do you ever feel hopeless, worthless, apprehensive, discouraged, lack motivation, lack faith, or question your trust for others?
• If a child: do you have any problems at school? Are you bullied?

Further Questions Based on Racial/Ethnic Background

• Are there any resources you need to ensure your ability to follow-up on your health care recommendations?
• Do you have any past medical history or family history of chronic diseases such as diabetes mellitus, hypertension, heart disease, stroke, cancer, renal disease, injuries or accidents, depression, or anxiety?

Further Questions Based on Gender and Sexual Orientation

• Can you describe your sexual orientation preferences?
• Which pronoun would you like to be referred to by (he, she, other)?
• Do you seek regular and routine health care? When were you last seen?
• When was your last breast exam, mammogram, Pap smear, testicular exam, prostate exam?
• Do you do a breast self-examination or a testicular self-examination?
• Do you have any past medical history?
• Are you sexually active? If so, how many partners do you have?
• Do you have any difficulties with eating or maintaining a stable weight?
• Do you smoke, drink alcohol, or use any other type of drugs?
• Do you ever feel suicidal? If so, do you have a plan?
• Do you have any problems with depression or anxiety? Have you ever felt suicidal?
• Do you take hormone therapy?
• Are you up-to-date on your immunizations?
• Do you have children? If not, do you wish to or plan on having children?
• Do you feel you have access to necessary resources such as health care or other
Further Questions Related to Mental Illness

• Do you seek routine health care?
• Describe your eating habits in a 24-hour period.
• Describe your activity level.
• Do you have any past medical history?
• Do you take any medications? If so, do you experience any side effects?
• Do you smoke, drink, or use any other type of drugs?
• Do you experience depression or anxiety? Have you ever had thoughts of suicide?
• Are you sexually active? If so, do you employ safe sex practices? How many partners do you have?

Further Questions Related to Veteran/Military Status

• Do you have any problems with mental illness, such as post-traumatic stress disorder?
• Have you had any traumatic brain injuries?
• Have you had any injuries?
• Describe your living situation.
• Are you interested in any community support groups?

Further Questions Related to Incarceration

• Have you ever been a victim of abuse or rape?
• Do have any past medical history, particularly asthma, diabetes mellitus, hypertension, heart disease, mental illness, or communicable diseases?

Further Questions Related to Immigration

• Do you have problems with mental illness?
• Are you able to speak English?
• Do you have access to resources such as housing, transportation, health care, education services?
• Do you have any past medical history such as accidents, injuries, hypothermia, gastrointestinal illness, heart problems, pregnancy complications, diabetes, hypertension, malnutrition, or infectious or communicable disease?

Further Questions Related to Chronic Illness

• Do you have access to a primary health care provider?
• Do you see a specialist on a regular basis?
• Are you able to follow-up on the recommendations made by your primary health care provider and/or specialist?

Summary

• Is there anything else you would like to share regarding your ability to maintain your health or any other issue or concern?

Authors of the *Special Populations: Needs Assessment Tool*: Linda A. Silvestri, Angela E. Silvestri, and Paula Richards

---

**Box 5-3**

**Common Problems in the Homeless Population**

- Anxiety
- Bipolar disorder
- Cognitive disorders
- Communicable diseases
- Complications from poor hygiene, poor living conditions, prolonged sun exposure, and prolonged standing
- Coronary artery disease
- Dental problems
- Diabetes mellitus
- Domestic violence and rape
- Frostbite
- Heart failure
- Heat exhaustion
- Hyperlipidemia
- Hypertension
- Injury from violence
- Lice, scabies, bacterial infections
- Major depressive disorders
- Peripheral vascular disease
- Post-traumatic stress disorder
- Schizophrenia
- Sexually transmitted infection
- Skin and foot conditions
- Substance abuse
- Suicide
- Traumatic brain injury
- Unintended pregnancy
Box 5-4

Some Medications That Should Be Avoided in the Homeless Population

- Albuterol
- Benzodiazepines
- Beta blockers
- Bupropion
- Calcium channel blockers
- Clonidine
- Nonsteroidal antiinflammatory drugs
- Quetiapine
- Some diabetic medications, particularly sulfonylureas
- Statins

Box 5-5

Mental Health Concerns for Foster Children

- Attention-deficit hyperactivity disorder
- Aggressive behavior
- Anxiety disorder
- Bipolar disorder
- Depression
- Mood disorder
- Post-traumatic stress disorder
- Reactive detachment disorder
- Sleep problems
- Personality disorder
- Prenatal drug and alcohol exposure effects

Box 5-6

Some Health Problems That Occur in Older Adults

- Alzheimer’s disease
- Arthritis
- Cancer
- Dementia
- Depression
Practice Questions

1. Which teaching method is **most effective** when providing instruction to members of special populations?
   1. Teach-back
   2. Video instruction
   3. Written materials
   4. Verbal explanation

2. Which health concern(s) should the nurse be aware of as risk factors when caring for clients of African American descent? **Select all that apply.**
   - [ ] 1. Cancer
   - [ ] 2. Obesity
   - [ ] 3. Hypertension
   - [ ] 4. Heart disease
   - [ ] 5. Hypothyroidism
   - [ ] 6. Diabetes mellitus

3. The nurse is planning care for a client of Native Hawaiian descent who recently had a baby. The nurse develops a teaching plan and includes information about which measure that is related to a newborn complication within this ethnic group?
   1. Safe sleeping
   2. Car seat safety
   3. Breast-feeding
   4. Baby-proofing

4. The nurse is planning care for an assigned client. The nurse should include information in the plan of care about prevention of human immunodeficiency virus (HIV) for which individuals specifically at risk?
   1. Lesbian persons
   2. Men-who-have-sex-with-men (MSM)
   3. Women-who-have-sex-with-women (WSW)
4. Female-to-male (FTM) transgender persons

5. Which therapeutic communication technique is **most** helpful when working with transgender persons?
   1. Using open-ended questions
   2. Using their first name to address them
   3. Using pronouns associated with birth sex
   4. Anticipating the client’s needs and making suggestions

6. Which special population should be targeted for breast cancer screening by way of mammography? **Select all that apply.**
   1. Male-to-female (MTF)
   2. Female-to-male (FTM)
   3. Men-who-have-sex-with-men (MSM)
   4. Women-who-have-sex-with-men (WSM)
   5. Women-who-have-sex-with-women (WSW)

7. The nurse is volunteering with an outreach program to provide basic health care for homeless people. Which finding, if noted, should be addressed **first**?
   1. Blood pressure 154/72 mm Hg
   2. Visual acuity of 20/200 in both eyes
   3. Random blood glucose level of 206 mg/dL (11.47 mmol/L)
   4. Complaints of pain associated with numbness and tingling in both feet

8. The nurse is preparing discharge resources for a client being discharged to the homeless shelter. When looking at the discharge medication reconciliation form, the nurse determines there is a **need for follow-up** if which medication was prescribed?
   1. Glipizide
   2. Lisinopril
   3. Metformin
   4. Beclomethasone

9. The nurse is completing the admission assessment for a client who is intellectually disabled. Which part of the client encounter may require more time to complete?
   1. The history
   2. The physical assessment
   3. The nursing plan of care
   4. The readmission risk assessment

10. The nurse working in a correctional facility is caring for a new prisoner. The client asks about health risks associated with living in a prison. How should the nurse respond?
    1. “Health care is very limited in the prison setting.”
    2. “Living in a prison isn’t different than living at home.”
    3. “Living in a prison can predispose a person to different health conditions.”
    4. “Living in a prison is similar to living in a condominium complex or dormitory.”
11. The nurse is caring for a female client in the emergency department who presents with a complaint of fatigue and shortness of breath. Which physical assessment findings, if noted by the nurse, warrant a need for follow-up?
   1. Reddened sclera of the eyes
   2. Dry flaking noted on the scalp
   3. A reddish-purple mark on the neck
   4. A scaly rash noted on the elbows and knees

12. The nurse working in a community outreach program for foster children plans care knowing that which health conditions are common in this population? Select all that apply.
   1. Asthma
   2. Claustrophobia
   3. Sleep problems
   4. Bipolar disorder
   5. Aggressive behavior
   6. Attention-deficit hyperactivity disorder (ADHD)

13. The nurse planning care for a military veteran should prioritize nursing interventions targeted at managing which condition, if present, that commonly occurs in this population?
   1. Hypertension
   2. Hyperlipidemia
   3. Substance abuse disorder
   4. Post-traumatic stress disorder

14. The nurse caring for a refugee considers which health care need a priority for this client?
   1. Access to housing
   2. Access to clean water
   3. Access to transportation
   4. Access to mental health care services

15. Which action by the nurse will best facilitate adherence to the treatment regimen for a client with a chronic illness?
   1. Arranging for home health care
   2. Focusing on managing a single illness at a time
   3. Communicating with one provider only to avoid confusion for the client
   4. Allowing the client to teach a support person about their treatment regimen

**Answers**

1. **Answer:** 1

**Rationale:** When providing education to members of special populations, return
explanation and demonstration (teach-back) are of particular importance to ensure safety and mutual understanding. This method is the most reliable in confirming client understanding of the instructions. Video instruction, written materials, and verbal explanation are helpful and may be incorporated with the teach-back method.

**Test-Taking Strategy:** Note the strategic words, most effective. Note that the correct option—the teach-back method—is the umbrella option, and encompasses all other options. Recall that asking the client to perform return demonstration is the best way to confirm understanding.

**Level of Cognitive Ability:** Applying
**Client Needs:** Health Promotion and Maintenance
**Integrated Process:** Teaching and Learning
**Content Area:** Foundations of Care: Special Populations
**Health Problem:** N/A
**Priority Concepts:** Client Education; Health Promotion
**Reference:** Lewis et al. (2017), p. 56.

2. **Answer:** 1, 2, 3, 4, 6

**Rationale:** Obesity, diabetes mellitus, hypertension, heart disease, asthma, and cancer are prevalent among this population. Hypothyroidism is not a particular risk factor. It is important to understand risk factors associated with health and the interplay of genetics, which can result in trends or patterns for specific ethnic groups.

**Test-Taking Strategy:** Note the subject, health concerns for African Americans. It is necessary to know the health risks associated with this group and that hypothyroidism is not a concern in order to answer this question correctly.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Health Promotion and Maintenance
**Integrated Process:** Nursing Process: Assessment

**Health Problem:** N/A
**Priority Concepts:** Caregiving; Health Promotion

3. **Answer:** 1

**Rationale:** The Native Hawaiian population has a disproportionately higher rate of infant mortality compared with other ethnic groups. Sudden infant death syndrome (SIDS) is a major cause of infant mortality. Safe sleeping is an important measure to prevent this newborn complication. Car seat safety, breast-feeding, and baby-proofing are important safety measures but are not specific to Native Hawaiians.

**Test-Taking Strategy:** Note the subject, newborn teaching and a newborn complication for the Native Hawaiian population. It is necessary to know that infant mortality and SIDS is higher in this population. Recalling that safe sleeping is an
important measure in decreasing infant mortality will direct you to the correct option.

4. Answer: 2

Rationale: MSM (men-who-have-sex-with-men) are at a higher risk for HIV and acquired immunodeficiency syndrome (AIDS). Although anyone who is sexually active should be counseled on prevention of sexually transmitted infection, the other populations mentioned are not at an increased risk for HIV/AIDS.

Test-Taking Strategy: Note that options 1 and 3 are comparable or alike and therefore can be eliminated. Recalling that MTF (male-to-female) rather than FTM (female-to-male) are at risk for HIV/AIDS will assist you in eliminating option 4.

Level of Cognitive Ability: Analyzing
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Foundations of Care: Special Populations
Health Problem: Adult Health: Immune: Immunodeficiency Syndrome
Priority Concepts: Client Education; Safety

5. Answer: 1

Rationale: The use of open-ended questions is most helpful in communicating with transgender persons because it assists in refraining from judgment and allows the client the opportunity to express their thoughts and feelings. The nurse should address the client with the name that the client prefers, so the first name may not necessarily be their preference. For the transgender person, it is likely that they would like to be addressed using pronouns associated with the sex they identify with now, which typically is not their birth sex. Anticipating the client’s needs and making suggestions may be seen as passing judgment, so the nurse should refrain from doing this.

Test-Taking Strategy: Note the strategic word, most. Recalling that clarification with the client regarding name preference for any client will assist you in eliminating option 2. Recalling that use of pronouns associated with birth sex is inappropriate will assist you in eliminating option 3. Noting the words making
suggestions in option 4 will assist you in eliminating this option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Psychosocial Integrity  
**Integrated Process:** Caring  
**Content Area:** Foundations of Care: Special Populations  
**Health Problem:** N/A  
**Priority Concepts:** Professional Identity; Safety  

6. **Answer:** 1, 2, 4, 5

**Rationale:** Transgender persons who have undergone sexual reassignment surgery should have the respective preventive screenings. For example, MTF should have breast cancer screening by way of mammography if they are older than 50 years. Additionally, FTM should still have mammography routinely as indicated due to the risk for residual breast tissue to develop cancerous growth. WSW and WSM should have screening as well.

**Test-Taking Strategy:** Note the **subject**, indications for mammography. Recalling that this test is primarily indicated for females will direct you to the correct options.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Foundations of Care: Special Populations  
**Health Problem:** Adult Health: Cancer: Breast  
**Priority Concepts:** Health Promotion; Self-Management  

7. **Answer:** 4

**Rationale:** The nurse should address the complaints of pain and numbness and tingling in both feet first with this population. If the client perceives value to the service provided, they will be more likely to return for follow-up care. While the blood pressure, blood glucose, and vision results are concerning, the client’s stated concern should be addressed first.

**Test-Taking Strategy:** Note the **subject**, the finding to be addressed, and focus on the **strategic word**, first. Recalling that adherence is a problem for this population will direct you to the correct option. Also note that the correct option is the only subjective finding.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Assessment
8. **Answer:** 1

**Rationale:** There are a number of medications that should be avoided, if possible, for the homeless person due to the safety risks. Glipizide is an oral hypoglycemic medication and is classified as a sulfonylurea. A major side effect of this medication is hypoglycemia, which presents a safety risk to the homeless person. Lisinopril is an angiotensin-converting enzyme inhibitor. Although there are side effects that should be included in discharge instructions, there is less of a threat to safety with this medication, and the benefits of it are important. Metformin is an oral biguanide and is used for type 2 diabetes mellitus. Hypoglycemia is less of a concern with this medication compared with other oral hypoglycemics. Beclomethasone is an inhaled corticosteroid used for obstructive lung disease, and although there are side effects that the client should know about, there is not a particular safety risk associated with this medication for the homeless person.

**Test-Taking Strategy:** Note the strategic words, need for follow-up. Specific knowledge about the medications identified in the options and knowledge of the medications that should be avoided with the homeless clients is needed to answer this question. Remember that sulfonylureas present the risk of hypoglycemia.

**Health Problem:** N/A

**Priority Concepts:** Health Promotion; Safety

9. **Answer:** 1

**Rationale:** Intellectually disabled clients tend to be poor historians, and it may be necessary to take more time to ask questions in a variety of different ways when collecting the history data. The physical assessment, nursing plan of care, and readmission risk assessment portions, although they rely on the history, take less time because they require less client questioning.

**Test-Taking Strategy:** Note the subject, conducting an admission assessment for an intellectually disabled client and the part that may take more time to complete. Recalling that individuals in this special population group are poor historians and that use of questioning in a variety of ways may be necessary will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity
Integrated Process: Nursing Process—Assessment  
Content Area: Foundations of Care: Special Populations  
Health Problem: N/A  
Priority Concepts: Communication; Functional Ability  

10. Answer: 3

Rationale: The environment of a prison can predispose a person to different health conditions, such as tuberculosis, human immunodeficiency syndrome, sexually transmitted infections, or other infectious diseases. Option 1 does not address the client’s question. Options 2 and 4 convey incorrect information.

Test-Taking Strategy: Note the subject, health conditions associated with living in a prison. Remember that the prison is a confined environment, and a variety of infectious diseases are prevalent.

Level of Cognitive Ability: Applying  
Client Needs: Safe and Effective Care Environment  
Integrated Process: Teaching and Learning  
Content Area: Foundations of Care: Special Populations  
Health Problem: N/A  
Priority Concepts: Communication; Health Promotion  

11. Answer: 3

Rationale: The client in this question should be screened for abuse. Battered women experience bruises, particularly around the eyes, red or purple marks on the neck, sprained or broken wrists, chronic fatigue, shortness of breath, muscle tension, involuntary shaking, changes in eating and sleeping, sexual dysfunction, and fertility issues. Mental health issues can also arise, including post-traumatic stress disorder, nightmares, anxiety, uncontrollable thoughts, depression, anxiety, low self-esteem, and alcohol and drug abuse. Reddened sclera, a dry rash on the elbows, and flaking of the scalp do not pose an indication of abuse.

Test-Taking Strategy: Note the strategic words, need for follow-up. Also focus on the data in the question and select the option that indicates the most concern and is indicative of abuse. Remember that battered women often present with bruising around the eyes or on the neck.

Level of Cognitive Ability: Analyzing  
Client Needs: Safe and Effective Care Environment

Content Area: Foundations of Care: Special Populations  
Health Problem: Mental Health: Violence  
Priority Concepts: Communication; Health Promotion  
Reference: Very Well MInd (2019). *Top warning signs of domestic abuse*
12. **Answer:** 3, 4, 5, 6

**Rationale:** Foster children are at risk for a variety of health conditions later in life, including ADHD, aggressive behavior, anxiety disorder, bipolar disorder, depression, mood disorder, post-traumatic stress disorder, reactive detachment disorder, sleep problems, prenatal drug and alcohol exposure, and personality disorder. Claustrophobia and asthma are not specifically associated with foster children.

**Test-Taking Strategy:** Note the subject, health concerns for foster children. Recall that mental health is a major concern for this population. This will assist in directing you to the correct options.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Planning

**Content Area:** Foundations of Care: Special Populations

**Health Problem:** N/A

**Priority Concepts:** Development; Health Promotion

13. **Answer:** 4

**Rationale:** Post-traumatic stress disorder (PTSD) is extremely common in this population. Identifying and treating mental health disorders assists in mitigating suicide risk. Treatment of comorbid conditions such as PTSD may also help address any substance use disorder. Use of screening tools in identifying substance use disorder is helpful. Treatment of PTSD includes exposure therapy, psychotherapy, and family/group therapy. Hypertension and hyperlipidemia are important but not the priority; the risk of suicide and other safety concerns associated with PTSD are the priority for this population.

**Test-Taking Strategy:** Note the strategic word, prioritize. This phrase indicates that although all options may be important, one option is a priority due to safety considerations. Also note that options 1 and 2 are comparable or alike and therefore can be eliminated. Although substance abuse may be a concern, PTSD is the priority.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Planning

**Content Area:** Foundations of Care: Special Populations

**Health Problem:** Mental Health: Post-Traumatic Stress Disorder

**Priority Concepts:** Health Promotion; Safety

14. **Answer:** 4
**Rationale:** Mental health problems are the primary issue for this population as a result of tortuous events. While all other options are important for all clients, they do not address the specific needs of this special population.

**Test-Taking Strategy:** Note the **strategic word**, *priority*. This indicates that all options are important and are most likely correct. It is necessary to recall that due to the potential trauma experienced by refugees, mental health is a priority.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Psychosocial Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Foundations of Care: Special Populations  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Health Promotion  

15. **Answer:** 1

**Rationale:** Nursing follow-up visits are important in promoting health for individuals with chronic illness; therefore, arranging for home health care is an important strategy.

Focusing on a single illness does not effectively manage an individual with multiple chronic diseases—rather, the “big picture” needs to be understood in managing these clients. Interprofessional collaboration is important in safely managing individuals with chronic diseases, and often involves consulting with specialist providers. Nurses play a key role in facilitating communication between providers and specialists. Inclusion of the client and support person(s) in health care decisions helps increase adherence to a complex health care regimen, and the nurse should be the facilitator of this communication.

**Test-Taking Strategy:** Note the **strategic word**, *best*. Recalling that these clients often have complex histories and health care needs will assist you in choosing the option that relates to nursing support services.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Foundations of Care: Special Populations  
**Health Problem:** N/A  
**Priority Concepts:** Health Promotion; Safety  
CHAPTER 6

Ethical and Legal Issues

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Ethics; Health Care Law

I. Ethics

A. Description: The branch of philosophy concerned with the distinction between right and wrong on the basis of a body of knowledge, not only on the basis of opinions
B. Morals: Behavior in accordance with customs or tradition, usually reflecting personal or religious beliefs
C. Ethical principles: Codes that direct or govern nursing actions (Box 6-1)
D. Values: Beliefs and attitudes that may influence behavior and the process of decision making
E. Values clarification: Process of analyzing one’s own values to understand oneself more completely regarding what is truly important
F. Ethical codes

1. Ethical codes provide broad principles for determining and evaluating client care.
2. These codes are not legally binding, but the board of nursing has authority in most states to reprimand nurses for unprofessional conduct that results from violation of the ethical codes.
3. Specific ethical codes are as follows:
   b. The American Nurses Association Code of Ethics can be viewed on the American Nurses Association; Web site: http://www.nursingworld.org/codeofet

G. Ethical dilemma
1. An ethical dilemma occurs when there is a conflict between two or more ethical principles.
2. No correct decision exists, and the nurse must make a choice between two alternatives that are equally unsatisfactory.
3. Such dilemmas may occur as a result of differences in cultural or religious beliefs.
4. Ethical reasoning is the process of thinking through what one should do in an orderly and systematic manner to provide justification for actions based on principles; the nurse should gather all information to determine whether an ethical dilemma exists, examine his or her own values, verbalize the problem, consider possible courses of action, negotiate the outcome, and evaluate the action taken.

H. Advocate

1. An advocate is a person who speaks up for or acts on the behalf of the client, protects the client’s right to make his or her own decisions, and upholds the principle of fidelity.
2. An advocate represents the client’s viewpoint to others.
3. An advocate avoids letting personal values influence advocacy for the client and supports the client’s decision, even when it conflicts with the advocate’s own preferences or choices.

I. Ethics committees

1. Ethics committees take an interprofessional approach to facilitate dialogue regarding ethical dilemmas.
2. These committees develop and establish policies and procedures to facilitate the prevention and resolution of dilemmas.

An important nursing responsibility is to act as a client advocate and protect the client’s rights.

II. Regulation of Nursing Practice

A. Nurse Practice Act

1. A nurse practice act is a series of statutes that have been enacted by each state legislature to regulate the practice of nursing in that state.
2. Nurse practice acts set educational requirements for the nurse, distinguish between nursing practice and medical practice, and define the scope of nursing practice.
3. Additional issues covered by nurse practice acts include licensure requirements for protection of the public, grounds for disciplinary action, rights of the nurse licensee if a disciplinary action is taken, and related topics.
4. All nurses are responsible for knowing the provisions of the act of the state or province in which they work.

B. Standards of care
1. Standards of care are guidelines that identify what the client can expect to receive in terms of nursing care.
2. The guidelines determine whether nurses have performed duties in an appropriate manner.
3. If the nurse does not perform duties within accepted standards of care, the nurse may be in jeopardy of legal action.
4. If the nurse is named as a defendant in a **malpractice** lawsuit and proceedings show that the nurse followed neither the accepted standards of care outlined by the state or province nurse practice act nor the policies of the employing institution, the nurse’s legal liability is clear; he or she is liable.

C. Employee guidelines
1. Respondeat superior: The employer is held liable for any negligent acts of an employee if the alleged negligent act occurred during the employment relationship and was within the scope of the employee’s responsibilities.
2. Contracts
   a. Nurses are responsible for carrying out the terms of a contractual agreement with the employing agency and the client.
   b. The nurse–employee relationship is governed by established employee handbooks and client care policies and procedures that create obligations, rights, and duties between those parties.
3. Institutional policies
   a. Written policies and procedures of the employing institution detail how nurses are to perform their duties.
   b. Policies and procedures are usually specific and describe the expected behavior on the part of the nurse.
   c. Although policies are not laws, courts generally rule against nurses
who violate policies.

d. If the nurse practices nursing according to client care policies and procedures established by the employer, functions within the job responsibility, and provides care consistently in a nonnegligent manner, the nurse minimizes the potential for liability.

The nurse must follow the guidelines identified in the Nurse Practice Act and agency policies and procedures when delivering client care.

D. Hospital staffing

1. Charges of abandonment may be made against nurses who “walk out” when staffing is inadequate.
2. Nurses in short staffing situations are obligated to make a report to the nursing administration.

E. Floating

1. Floating is an acceptable practice used by health care facilities to alleviate understaffing and overstaffing.
2. Legally, the nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove lack of knowledge for the performance of assigned tasks.
3. Nurses in a floating situation must not assume responsibility beyond their level of experience or qualification.
4. Nurses who float should inform the supervisor of any lack of experience in caring for the type of clients on the new nursing unit.
5. A resource nurse who is skilled in the care of clients on the unit should also be assigned to the float nurse; in addition, the float nurse should be given an orientation of the unit and the standards of care for the unit should be reviewed (the float nurse should care for clients whose acuity level more closely match the nurses’ experience).

F. Disciplinary action

1. Boards of nursing may deny, revoke, or suspend any license to practice as a registered nurse, according to their statutory authority.
2. Some causes for disciplinary action are as follows:
   a. Unprofessional conduct
   b. Conduct that could affect the health
and welfare of the public adversely

c. Breach of client confidentiality
d. Failure to use sufficient knowledge, skills, or nursing judgment
e. Physically or verbally abusing a client
f. Assuming duties without sufficient preparation
g. Knowingly delegating to unlicensed personnel nursing care that places the client at risk for injury
h. Failure to maintain an accurate record for each client
i. Falsifying a client’s record
j. Leaving a nursing assignment without properly notifying appropriate personnel

III. Legal Liability

A. Laws

1. Nurses are governed by civil and criminal law in roles as providers of services, employees of institutions, and private citizens.
2. The nurse has a personal and legal obligation to provide a standard of client care expected of a reasonably competent professional nurse.
3. Professional nurses are held responsible (liable) for harm resulting from their negligent acts or their failure to act.

B. Types of laws (Box 6-2; Fig. 6-1)

C. Negligence and malpractice (Box 6-3)

1. Negligence is conduct that falls below the standard of care.
2. Negligence can include acts of commission and acts of omission.
3. The nurse who does not meet appropriate standards of care may be held liable.
4. Malpractice is negligence on the part of the nurse.
5. Malpractice is determined if the nurse owed a duty to the client and did not carry out the duty and the client was injured because the nurse failed to perform the duty.

6. Proof of liability

a. Duty: At the time of injury, a duty existed between the plaintiff and the defendant.

b. Breach of duty: The defendant breached
duty of care to the plaintiff.
c. Proximate cause: The breach of the duty was the legal cause of injury to the client.
d. Damage or injury: The plaintiff experienced injury or damages or both and can be compensated by law.

D. Professional liability insurance

1. Nurses need their own liability insurance for protection against malpractice lawsuits.
2. Having their own insurance provides nurses protection as individuals; this allows the nurse to have an attorney, who has only the nurse’s interests in mind, present if necessary.

E. Good Samaritan laws

1. State legislatures pass Good Samaritan laws, which may vary from state to state.
2. These laws encourage health care professionals to assist in emergency situations and limit liability and offer legal immunity for persons helping in an emergency, provided that they give reasonable care.
3. Immunity from suit applies only when all conditions of the state law are met, such as that the health care provider (HCP) receives no compensation for the care provided and the care given is not intentionally negligent.

F. Controlled substances

1. The nurse should adhere to facility policies and procedures concerning administration of controlled substances, which are governed by federal and state laws.
2. Controlled substances must be kept locked securely, and only authorized personnel should have access to them.
3. Controlled substances must be properly signed out for administration and a correct inventory must be maintained.

IV. Collective Bargaining

A. Collective bargaining is a formalized decision-making process
between representatives of management and representatives of labor to negotiate wages and conditions of employment.

B. When collective bargaining breaks down because the parties cannot reach an agreement, the employees may call a strike or take other work actions.

C. Striking presents a moral dilemma to many nurses, because nursing practice is a service to people.

V. Legal Risk Areas

A. Assault

1. Assault occurs when a person puts another person in fear of a harmful or offensive contact.
2. The victim fears and believes that harm will result because of the threat.

B. Battery is an intentional touching of another’s body without the other’s consent.

C. Invasion of privacy includes violating confidentiality, intruding on private client or family matters, and sharing client information with unauthorized persons.

D. False imprisonment

1. False imprisonment occurs when a client is not allowed to leave a health care facility when there is no legal justification to detain the client.
2. False imprisonment also occurs when restraining devices are used without an appropriate clinical need.
3. A client can sign an Against Medical Advice form when the client refuses care and is competent to make decisions.
4. The nurse should document circumstances in the medical record to avoid allegations by the client that cannot be defended.

E. Defamation is a false communication that causes damage to someone’s reputation, either in writing (libel) or verbally (slander).

F. Fraud results from a deliberate deception intended to produce unlawful gains.

G. There may be exceptions to certain legal risks areas, such as assault, battery, and false imprisonment, when caring for a client with a mental health disorder experiencing acute distress who poses a risk to themself or others. In this situation, the nurse must assess the client to determine loss of control and intervene accordingly; the nurse should use the least restrictive methods initially, but then use interventions such as restraint if the client’s behavior indicates the need for this intervention.

VI. Client’s Rights

A. Description

1. The client’s rights document, also called the Client’s
(Patient’s) Bill of Rights, reflects acknowledgment of a client’s right to participate in their health care with an emphasis on client autonomy.

2. The document provides a list of the rights of the client and responsibilities that the hospital cannot violate (Box 6-4).

3. The Client’s Bill of Rights protects the client’s ability to determine the level and type of care received; all health care agencies are required to have a Client’s Bill of Rights posted in a visible area.

4. Several laws and standards pertain to client’s rights (Box 6-5).

B. Rights for the mentally ill (Box 6-6)

1. The Mental Health Systems Act created rights for mentally ill people.

2. The Joint Commission has developed policy statements on the rights of mentally ill people.

3. Psychiatric facilities are required to have a Client’s Bill of Rights posted in a visible area.

C. Organ donation and transplantation

1. A client has the right to decide to become an organ donor and a right to refuse organ transplantation as a treatment option.

2. An individual who is at least 18 years old may indicate a wish to become a donor on their driver’s license (state-specific) or in an advance directive.

3. The Uniform Anatomical Gift Act provides a list of individuals who can provide informed consent for the donation of a deceased individual’s organs.

4. The United Network for Organ Sharing sets the criteria for organ donations.

5. Some organs, such as the heart, lungs, and liver, can be obtained only from a person who is on mechanical ventilation and has suffered brain death, whereas other organs or tissues can be removed several hours after death.

6. A donor must be free of infectious disease and cancer.

7. Requests to the deceased’s family for organ donation usually are done by the primary health care provider (PHCP) or nurse specially trained for making such requests.

8. Donation of organs does not delay funeral arrangements; no obvious evidence that the organs were removed from the body shows when the body is dressed; and the family incurs no cost for removal of the organs donated.

D. Religious beliefs: Organ donation and transplantation
1. Catholic Church: Organ donation and transplants are acceptable.
2. Orthodox Church: Church usually discourages organ donation.
3. Islam (Muslim) beliefs: Body parts should not be removed or donated for transplantation.
4. Jehovah’s Witness: An organ transplant may be accepted, but the organ must be cleansed with a nonblood solution before transplantation.
5. Orthodox Judaism
   a. All body parts removed during autopsy must be buried with the body because it is believed that the entire body must be returned to the earth; organ donation may not be considered by family members.
   b. Organ transplantation may be allowed with the rabbi’s approval.
6. Refer to Chapter 18 for additional information regarding end-of-life care.

VII. Consents

A. Description

1. Consents, or releases, are legal documents that indicate the client’s permission to perform surgery, perform a treatment or procedure, or give information to a third party.
2. There are different types of consents (Box 6-7).
3. Informed consent indicates the client’s participation in the decision regarding health care. It is the client’s approval (or that of the client’s legal representative) to have their body touched by a specific individual.
4. The client must be informed, in understandable terms, of the risks and benefits of the surgery or treatment, what the consequences are for not having the surgery or procedure performed, treatment options, and the name of the HCP performing the surgery or procedure.
5. A client’s questions about the surgery or procedure must be answered before signing the consent.
6. A consent must be signed freely by the client without threat or pressure and must be witnessed (the witness must be an adult).
7. A client who has been medicated with sedating medications or any other medications that can affect the client’s cognitive abilities must not be asked to sign a consent.
8. Legally, the client must be mentally and emotionally
competent to give consent.

9. If a client is declared mentally or emotionally incompetent, the next of kin, appointed guardian (appointed by the court), or durable power of attorney for health care has legal authority to give consent (Box 6-8).

10. A competent client 18 years of age or older must sign the consent.

11. In most states, when the nurse is involved in the informed consent process, the nurse is witnessing only the signature of the client on the informed consent form.

12. An informed consent can be waived for urgent medical or surgical intervention as long as institutional policy so indicates.

13. A client has the right to refuse information and waive the informed consent and undergo treatment, but this decision must be documented in the medical record.

14. A client may withdraw consent at any time.

---

An informed consent is a legal document, and the client must be informed by the PHCP (i.e., physician, surgeon), in understandable terms, of the risks and benefits of surgery, treatments, procedures, and plan of care. The client needs to be a participant in decisions regarding health care.

B. Minors

1. A minor is a client under legal age as defined by state statute (usually younger than 18 years).

2. A minor may not give legal consent, and consent must be obtained from a parent or the legal guardian; agreement by the minor is important because it allows for communication of the minor’s thoughts and feelings.

3. Parental or guardian consent should be obtained before treatment is initiated for a minor except in the following cases: in an emergency; in situations in which the consent of the minor is sufficient, including treatment related to substance abuse, treatment of a sexually transmitted infection, human immunodeficiency virus (HIV) testing and acquired immunodeficiency syndrome (AIDS) treatment, birth control services, pregnancy, or psychiatric services; the minor is an emancipated minor; or a court order or other legal authorization has been obtained. Refer to the Guttmacher Report on Public Policy for additional information: http://www.guttmacher.org/pubs/tgr/03/4/gr030404.html

162
C. Emancipated minor
   1. An emancipated minor has established independence from his or her parents through marriage, pregnancy, or service in the armed forces, or by a court order.
   2. An emancipated minor is considered legally capable of signing an informed consent.

VIII. Health Insurance Portability and Accountability Act

A. Description
   1. The Health Insurance Portability and Accountability Act (HIPAA) describes how personal health information (PHI) may be used and how the client can obtain access to the information.
   2. PHI includes individually identifiable information that relates to the client’s past, present, or future health; treatment; and payment for health care services.
   3. The act requires health care agencies to keep PHI private, provides information to the client about the legal responsibilities regarding privacy, and explains the client’s rights with respect to PHI.
   4. The client has various rights as a consumer of health care under HIPAA, and any client requests may need to be placed in writing; a fee may be attached to certain client requests.
   5. The client may file a complaint if the client believes that privacy rights have been violated.

B. Client’s rights include the right to do the following:
   1. Inspect a copy of PHI.
   2. Ask the health care agency to amend the PHI that is contained in a record if the PHI is inaccurate.
   3. Request a list of disclosures made regarding the PHI as specified by HIPAA.
   4. Request to restrict how the health care agency uses or discloses PHI regarding treatment, payment, or health care services, unless information is needed to provide emergency treatment.
   5. Request that the health care agency communicate with the client in a certain way or at a certain location; the request must specify how or where the client wishes to be contacted.
   6. Request a paper copy of the HIPAA notice.

C. Health care agency use and disclosure of PHI
   1. The health care agency obtains PHI in the course of providing or administering health insurance benefits.
   2. Use or disclosure of PHI may be done for the following:
      a. Health care payment purposes
      b. Health care operations purposes
c. Treatment purposes
d. Providing information about health care services
e. Data aggregation purposes to make health care benefit decisions
f. Administering health care benefits

3. There are additional uses or disclosures of PHI (Box 6-9).

IX. Confidentiality/Information Security

A. Description
1. In the health care system, confidentiality/information security refers to the protection of privacy of the client’s PHI.
2. Clients have a right to privacy in the health care system.
3. A special relationship exists between the client and nurse, in which information discussed is not shared with a third party who is not directly involved in the client’s care.
4. Violations of privacy occur in various ways (Box 6-10).

B. Nurse’s responsibility
1. Nurses are bound to protect client confidentiality by most nurse practice acts, by ethical principles and standards, and by institutional and agency policies and procedures.
2. Disclosure of confidential information exposes the nurse to liability for invasion of the client’s privacy.
3. The nurse needs to protect the client from indiscriminate disclosure of health care information that may cause harm (Box 6-11).

C. Social networks and health care (Box 6-12)

D. Medical records
1. Medical records are confidential.
2. The client has the right to read the medical record and have copies of the record.
3. Only staff members directly involved in care have legitimate access to a client’s record; these may include PHCPs and nurses caring for the client, technicians, therapists, social workers, unit secretaries, client advocates, and administrators (e.g., for statistical analysis, staffing, quality care review). Others must ask permission from the client to review a record.
4. Per health care facility procedures, the medical record is stored in the records or the health information
department after discharge of the client from the facility.

E. Information technology/computerized medical records
1. Health care employees should have access only to the client’s records in the nursing unit or work area.
2. Confidentiality/information security can be protected by the use of special computer access codes to limit what employees have access to in computer systems.
3. The use of a password or identification code is needed to enter and sign off a computer system.
4. A password or identification code should never be shared with another person.
5. Personal passwords should be changed periodically to prevent unauthorized computer access.

F. When conducting research, any information provided by the client is not to be reported in any manner that identifies the client and is not to be made accessible to anyone outside the research team.

X. Legal Safeguards
A. Risk management
1. Risk management is a planned method to identify, analyze, and evaluate risks, followed by a plan for reducing the frequency of accidents and injuries.
2. Programs are based on a systematic reporting system for unusual occurrences.

B. Occurrence reports (Box 6-13)
1. The occurrence report is used as a means of identifying risk situations and improving client care.
2. Follow specific documentation guidelines.
3. Fill out the report completely, accurately, and factually.
4. The report form should not be copied or placed in the client’s record.
5. Make no reference to the occurrence report form in the client’s record.
6. The report is not a substitute for a complete entry in the client’s record regarding the occurrence.
7. If a client injury or error in care occurred, assess the client frequently.

C. The PHCP must be notified of the incident and the client’s condition.

D. Safeguarding valuables
1. Client’s valuables should be given to a family member
or secured for safekeeping in a stored and locked designated location, such as the agency’s safe; facility security may handle the safeguarding of valuables. The location of the client’s valuables should be documented per agency policy.

2. Many health care agencies require a client to sign a release to free the agency of the responsibility for lost valuables.

3. A client’s wedding band can be taped in place unless a risk exists for swelling of the hands or fingers.

4. Religious items, such as medals, may be pinned to the client’s gown if allowed by agency policy.

E. PHCP’s prescriptions

1. The nurse is obligated to carry out a PHCP’s prescription except when the nurse believes a prescription to be inappropriate or inaccurate.

2. The nurse carrying out an inaccurate prescription may be legally responsible for any harm suffered by the client.

3. If no resolution occurs regarding the prescription in question, the nurse should contact the nurse manager or supervisor.

4. The nurse should follow specific guidelines for telephone prescriptions (Box 6-14).

5. The nurse should ensure that all components of a medication prescription are documented (Box 6-15).

The nurse should never carry out a prescription if it is unclear or inappropriate. The person who wrote the prescription should be contacted immediately.

F. Documentation

1. Documentation is legally required by accrediting agencies, state licensing laws, and state nurse and medical practice acts.

2. The nurse should follow agency guidelines and procedures (Box 6-16).

G. Client and family teaching

1. Provide complete instructions in a language that the client or family can understand.

2. Document client and family teaching, what was taught, evaluation of understanding, and who was
XI. Advance Directives

A. Patient Self-Determination Act

1. The Patient Self-Determination Act is a law that requires clients be provided with information about their right to have written directions about the care that they wish to receive in the event that they become incapacitated and are unable to make health care decisions.

2. On admission to a health care facility, the client is asked about the existence of an advance directive, and if one exists, it must be documented and included as part of the medical record; if the client signs an advance directive at the time of admission, it must be documented in the client’s medical record.

3. The two basic types of advance directives include instructional directives and durable power of attorney for health care.
   a. Instructional directives: Lists the medical treatment that a client chooses to omit or refuse if the client becomes unable to make decisions and is terminally ill.
   b. Durable power of attorney for health care: Appoints a person (health care proxy) chosen by the client to make health care decisions on the client’s behalf when the client can no longer make decisions.

B. Do not resuscitate (DNR) prescriptions

1. The PHCP writes a DNR prescription if the client and PHCP have made the decision that the client’s health is deteriorating and the client chooses not to undergo cardiopulmonary resuscitation if needed.

2. The client or his or her legal representative must provide informed consent for the DNR status.

3. The DNR prescription must be defined clearly so that other treatment, not refused by the client, will be continued.

4. Some states offer DNR Comfort Care and DNR Comfort Care Arrest protocols; these protocols list specific actions that HCPs will take when providing cardiopulmonary resuscitation (CPR).
5. All health care personnel must know whether a client has a DNR prescription; if a client does not have a DNR prescription, HCPs need to make every effort to revive the client.

6. A DNR prescription needs to be reviewed regularly according to agency policy and may need to be changed if the client’s status changes.

7. DNR protocols may vary from state to state, and it is important for the nurse to know their state’s protocols.

C. The nurse’s role

1. Discussing advance directives with the client opens the communication channel to establish what is important to the client and what the client may view as promoting life versus prolonging dying.

2. The nurse needs to ensure that the client has been provided with information about the right to identify written directions about the care that the client wishes to receive.

3. On admission to a health care facility, the nurse determines whether an advance directive exists and ensures that it is part of the medical record; the nurse also offers information about advance directives if the client indicates he or she wants more information.

4. The nurse ensures that the PHCP is aware of the presence of an advance directive.

5. All health care workers need to follow the directions of an advance directive to be safe from liability.

6. Some agencies have specific policies that prohibit the nurse from signing as a witness to a legal document, such as an instructional directive.

7. If allowed by the agency, when the nurse acts as a witness to a legal document, the nurse must document the event and the factual circumstances surrounding the signing in the medical record; documentation as a witness should include who was present, any significant comments by the client, and the nurse’s observations of the client’s conduct during this process.

XII. Reporting Responsibilities

A. Nurses are required to report certain communicable diseases or criminal activities such as child or elder abuse or domestic violence; dog bite or other animal bite, gunshot or stab wounds, assaults, and homicides; and suicides to the appropriate authorities.

B. Impaired nurse

1. If the nurse suspects that a coworker is abusing
chemicals and potentially jeopardizing a client’s safety, the nurse must report the individual to the nursing supervisor/nursing administration in a confidential manner. (Client safety is always the first priority.)

2. Nursing administration notifies the board of nursing regarding the nurse’s behavior.
3. Many institutions have policies that allow for drug testing if impairment is suspected.

C. Occupational Safety and Health Act (OSHA)
1. OSHA requires that an employer provide a safe workplace for employees according to regulations.
2. Employees can confidentially report working conditions that violate regulations.
3. An employee who reports unsafe working conditions cannot be retaliated against by the employer.

D. Sexual harassment
1. Sexual harassment is prohibited by state and federal laws.
2. Sexual harassment includes unwelcome conduct of a sexual nature.
3. Follow agency policies and procedures to handle reporting a concern or complaint.

Box 6-1

Ethical Principles

Autonomy: Respect for an individual’s right to self-determination
Nonmaleficence: The obligation to do or cause no harm to another
Beneficence: The duty to do good to others and to maintain a balance between benefits and harms; paternalism is an undesirable outcome of beneficence, in which the health care provider decides what is best for the client and encourages the client to act against his or her own choices
Justice: The equitable distribution of potential benefits and tasks determining the order in which clients should be cared for
Veracity: The obligation to tell the truth
Fidelity: The duty to do what one has promised

Box 6-2

Types of Law

Contract Law
Contract law is concerned with enforcement of agreements among private
individuals.

**Civil Law**
Civil law is concerned with relationships among persons and the protection of a person’s rights. Violation may cause harm to an individual or property, but no grave threat to society exists.

**Criminal Law**
Criminal law is concerned with relationships between individuals and governments, and with acts that threaten society and its order; a crime is an offense against society that violates a law and is defined as a misdemeanor (less serious nature) or felony (serious nature).

**Tort Law**
A tort is a civil wrong, other than a breach in contract, in which the law allows an injured person to seek damages from a person who caused the injury.
Sources of Law

The Constitution
- Legislative branch: Statutory law
- Executive branch: Administrative law
- Judicial branch: Common law (Case law)

Types of law applicable to nurses:
- Civil Law
- Criminal Law
- Administrative Law

Civil
- Standard of proof is preponderance of the evidence
- Contracts:
  - Nurse-patient relationship

Criminal
- Standard of proof is guilt beyond a reasonable doubt
- Felony:
  - Manslaughter
  - Assault and battery
  - Fraud
  - Nurse Practice Act violations
  - Torts
    - Intentional (action is substantially certain to cause an effect)
      - Fraud
      - Defamation
      - Assault and battery
      - False imprisonment
      - Invasion of privacy
  - Misdemeanor
    - Unintentional (violation of standard of care)
      - Negligence
      - Malpractice
Box 6-3

Examples of Negligent Acts

- Medication errors that result in injury to the client
- Intravenous administration errors, such as incorrect flow rates, failure to monitor a flow rate that results in injury to the client, infiltration, or phlebitis
- Falls that occur as a result of failure to provide safety to the client
- Failure to use aseptic technique when indicated
- Failure to check equipment for proper functioning
- Burns sustained by the client as a result of failure to monitor bath temperature or equipment, protect the client from spills of hot liquids or foods
- Errors in sponge, instrument, or needle counts in surgical cases, meaning that an item was left in a client
- Failure to adequately monitor a client’s condition
- Failure to report changes in the client’s condition to the primary health care provider
- Failure to give a report or giving an incomplete report to the oncoming shift personnel

Box 6-4

Client’s Rights When Hospitalized

- Right to considerate and respectful care
- Right to be informed about diagnosis, possible treatments, and likely outcome, and to discuss this information with the health care provider
- Right to know the names and roles of the persons who are involved in care
- Right to consent or refuse a treatment
- Right to have an advance directive
- Right to privacy
- Right to expect that medical records are confidential
- Right to review the medical record and to have information explained
- Right to expect that the hospital will provide necessary health services
- Right to know if the hospital has relationships with outside parties that may influence treatment or care
- Right to consent or refuse to take part in research
- Right to be told of realistic care alternatives when hospital care is no longer appropriate
- Right to know about hospital rules that affect treatment and about charges and payment methods

From Christensen B, Kockrow E: *Foundations of nursing*, ed 6, St. Louis, 2010, Mosby; and adapted from American Hospital Association: *The patient care partnership: understanding expectations, rights and responsibilities*. Available at www.aha.org/content/00-10/pcp_english_030730.pdf.

**Box 6-5**

**Laws and Standards**

**American Hospital Association**
Issued Patient’s Bill of Rights

**American Nurses Association**
Developed the Code of Ethics for Nurses, which defines the nurse’s responsibility for upholding client’s rights

**Mental Health Systems Act**
Developed rights for mentally ill clients

**The Joint Commission**
Developed policy statements on the rights of mentally ill individuals

**Americans With Disabilities Act**
Prohibits discrimination against an individual with disabilities in all areas of public life

**Box 6-6**

**Rights for the Mentally Ill**

- Right to be treated with dignity and respect
- Right to communicate with persons outside the hospital
- Right to keep clothing and personal effects with them
- Right to religious freedom
- Right to be employed
- Right to manage property
• Right to execute wills
• Right to enter into contractual agreements
• Right to make purchases
• Right to education
• Right to habeas corpus (written request for release from the hospital)
• Right to an independent psychiatric examination
• Right to civil service status, including the right to vote
• Right to retain licenses, privileges, or permits
• Right to sue or be sued
• Right to marry or divorce
• Right to treatment in the least restrictive setting
• Right not to be subject to unnecessary restraints
• Right to privacy and confidentiality
• Right to informed consent
• Right to treatment and to refuse treatment
• Right to refuse participation in experimental treatments or research

**Box 6-7**

**Types of Consents**

**Admission Agreement**
Admission agreements are obtained at the time of admission and identify the health care agency’s responsibility to the client.

**Immunization Consent**
An immunization consent may be required before the administration of certain immunizations; the consent indicates that the client was informed of the benefits and risks of the immunization.

**Blood Transfusion Consent**
A blood transfusion consent indicates that the client was informed of the benefits and risks of the transfusion. Some clients hold religious beliefs that would prohibit them from receiving a blood transfusion, even in a life-threatening situation.

**Surgical Consent**
Surgical consent is obtained for all surgical or invasive procedures or diagnostic tests that are invasive. The primary health care provider, surgeon, or anesthesiologist who performs the operative or other procedure is responsible for explaining the procedure, its risks and benefits, and possible alternative options.
Research Consent
The research consent obtains permission from the client regarding participation in a research study. The consent informs the client about the possible risks, consequences, and benefits of the research.

Special Consents
Special consents are required for the use of restraints, photographing the client, disposal of body parts during surgery, donating organs after death, or performing an autopsy.

Mentally or Emotionally Incompetent Clients
- Declared incompetent
- Unconscious
- Under the influence of chemical agents such as alcohol or drugs
- Chronic dementia or other mental deficiency that impairs thought processes and ability to make decisions

Uses or Disclosures of Personal Health Information
- Compliance with legal proceedings or for limited law enforcement purposes
- To a family member or significant other in a medical emergency
- To a personal representative appointed by the client or designated by law
- For research purposes in limited circumstances
- To a coroner, medical examiner, or funeral director about a deceased person
- To an organ procurement organization in limited circumstances
- To avert a serious threat to the client’s health or safety or the health or safety of others
- To a governmental agency authorized to oversee the health care system or government programs
- To the Department of Health and Human Services for the investigation of compliance with the Health Insurance Portability and Accountability Act or to fulfill another lawful request
- To federal officials for lawful intelligence or national security purposes
- To protect health authorities for public health purposes
- To appropriate military authorities if a client is a member of the armed forces
- In accordance with a valid authorization signed by the client
Box 6-10

Violations and Invasion of Client Privacy

- Taking photographs of the client
- Release of medical information to an unauthorized person, such as a member of the press, family, friend, or neighbor of the client, without the client’s permission
- Use of the client’s name or picture for the health care agency’s sole advantage
- Intrusion by the health care agency regarding the client’s affairs
- Publication of information about the client or photographs of the client, including on a social networking site
- Publication of embarrassing facts
- Public disclosure of private information
- Leaving the curtains or room door open while a treatment or procedure is being performed
- Allowing individuals to observe a treatment or procedure without the client’s consent
- Leaving a confused or agitated client sitting in the nursing unit hallway
- Interviewing a client in a room with only a curtain between clients or where conversation can be overheard
- Accessing medical records when unauthorized to do so

Box 6-11

Maintenance of Confidentiality

- Not discussing client issues with other clients or staff uninvolved in the client’s care
- Not sharing health care information with others without the client’s consent (includes family members or friends of the client and social networking sites)
- Keeping all information about a client private, and not revealing it to someone not directly involved in care
- Discussing client information only in private and secluded areas
- Protecting the medical record from all unauthorized readers

Box 6-12
Social Networking and Health Care

▪ Specific social networking sites can be beneficial to health care providers (HCPs) and clients; misuse of social networking sites by the HCP can lead to Health Insurance Portability and Accountability Act (HIPAA) violations and subsequent termination of the employee.

▪ Nurses need to adhere to the code of ethics, confidentiality rules, and social media rules. Additional information about these codes and rules can be located at the American Nurses Association Web site at https://www.nursingworld.org/practice-policy/nursing-excellence/social-networking-Principles/

▪ Standards of professionalism need to be maintained, and any information obtained through any nurse-client relationship cannot be shared in any way.

▪ The nurse is responsible for reporting any identified breach of privacy or confidentiality.

Box 6-13
Examples of Occurrences That Need to Be Reported

▪ Accidental omission of prescribed therapies
▪ Circumstances that led to injury or a risk for client injury
▪ Client falls
▪ Medication administration errors
▪ Needle-stick injuries
▪ Procedure-related or equipment-related accidents
▪ A visitor injury that occurred on the health care agency premises
▪ A visitor who exhibits symptoms of a communicable disease

Box 6-14
Telephone Prescription Guidelines

▪ Date and time the entry.
▪ Repeat the prescription to the primary health care provider (PHCP), and record the prescription.
▪ Sign the prescription; begin with “t.o.” (telephone order), write the PHCP’s name, and sign the prescription.
▪ If another nurse witnessed the prescription, that nurse’s signature follows.
▪ The PHCP needs to countersign the prescription within a time frame according
Box 6-15

Components of a Medication Prescription

- Date and time prescription was written
- Medication name
- Medication dosage
- Route of administration
- Frequency of administration
- Primary health care provider’s signature

Box 6-16

Do’s and Don’ts Documentation Guidelines: Narrative and Information Technology

- Date and time entries.
- Provide objective, factual, and complete documentation.
- Document care, medications, treatments, and procedures as soon as possible after completion.
- Document client responses to interventions.
- Document consent for or refusal of treatments.
- Document calls made to other primary health care providers.
- Use quotes as appropriate for subjective data.
- Use correct spelling, grammar, and punctuation.
- Sign and title each entry.
- Follow agency policies when an error is made.
- Follow agency guidelines regarding late entries.
- Use only the user identification code, name, or password for computerized documentation.
- Maintain privacy and confidentiality of documented information printed from the computer.
- Do not document for others or change documentation for other individuals.
- Do not use unacceptable abbreviations.
- Do not use judgmental or evaluative statements, such as “uncooperative client.”
- Do not leave blank spaces on documentation forms.
- Do not lend access identification computer codes to another person; change password at regular intervals.
Practice Questions

16. The nurse hears a client calling out for help, hurries down the hallway to the client’s room, and finds the client lying on the floor. The nurse performs an assessment, assists the client back to bed, notifies the primary health care provider, and completes an occurrence report. Which statement should the nurse document on the occurrence report?
   1. The client fell out of bed.
   2. The client climbed over the side rails.
   3. The client was found lying on the floor.
   4. The client became restless and tried to get out of bed.

17. A client is brought to the emergency department by emergency medical services (EMS) after being hit by a car. The name of the client is unknown, and the client has sustained a severe head injury and multiple fractures and is unconscious. An emergency craniotomy is required. Regarding informed consent for the surgical procedure, which is the best action?
   1. Obtain a court order for the surgical procedure.
   2. Ask the EMS team to sign the informed consent.
   3. Transport the victim to the operating room for surgery.
   4. Call the police to identify the client and locate the family.

18. The nurse has just assisted a client back to bed after a fall. The nurse and primary health care provider have assessed the client and have determined that the client is not injured. After completing the occurrence report, the nurse should implement which action next?
   1. Reassess the client.
   2. Conduct a staff meeting to describe the fall.
   3. Contact the nursing supervisor to update information regarding the fall.
   4. Document in the nurse’s notes that an occurrence report was completed.

19. The nurse arrives at work and is told to report (float) to the intensive care unit (ICU) for the day because the ICU is understaffed and needs additional nurses to care for the clients. The nurse has never worked in the ICU. The nurse should take which best action?
   1. Refuse to float to the ICU based on lack of unit orientation.
   2. Clarify the ICU client assignment with the team leader to ensure that it is a safe assignment.
   3. Ask the nursing supervisor to review the hospital policy on floating.
   4. Submit a written protest to nursing administration, and then call the hospital lawyer.

20. The nurse who works on the night shift enters the medication room and finds a coworker with a tourniquet wrapped around the upper arm. The coworker is about to insert a needle, attached to a syringe containing a clear liquid, into the antecubital area. Which is the most appropriate action by the nurse?
   1. Call security.
   2. Call the police.
3. Call the nursing supervisor.
4. Lock the coworker in the medication room until help is obtained.

21. A hospitalized client tells the nurse that an instructional directive is being prepared and that the lawyer will be bringing the document to the hospital today for witness signatures. The client asks the nurse for assistance in obtaining a witness to the will. Which is the most appropriate response to the client?
   1. “I will sign as a witness to your signature.”
   2. “You will need to find a witness on your own.”
   3. “Whoever is available at the time will sign as a witness for you.”
   4. “I will call the nursing supervisor to seek assistance regarding your request.”

22. The nurse has made an error in documentation of the dose administered of an opioid pain medication in the client’s record. The nurse draws 1 mg from the vial and another registered nurse (RN) witnesses wasting of the remaining 1 mg. When scanning the medication, the nurse entered into the medication administration record (MAR) that 2 mg of hydromorphone was administered instead of the actual dose administered, which was 1 mg. The nurse should take which action(s) to correct the error in the MAR? Select all that apply.
   1. Complete and file an occurrence report.
   2. Right-click on the entry and modify it to reflect the correct information.
   3. Document the correct information and end with the nurse’s signature and title.
   4. Obtain a cosignature from the RN who witnessed the waste of the remaining 1 mg.
   5. Document in a nurse’s note in the client’s record detailing the corrected information.

23. Which identifies accurate nursing documentation notation(s)? Select all that apply.
   1. The client slept through the night.
   2. Abdominal wound dressing is dry and intact without drainage.
   3. The client seemed angry when awakened for vital sign measurement.
   4. The client appears to become anxious when it is time for respiratory treatments.
   5. The client’s left lower medial leg wound is 3 cm in length without redness, drainage, or edema.

24. A nursing instructor delivers a lecture to nursing students regarding the issue of clients’ rights and asks a nursing student to identify a situation that
represents an example of invasion of client privacy. Which situation, if identified by the student, indicates an understanding of a violation of this client right?

1. Performing a procedure without consent
2. Threatening to give a client a medication
3. Telling the client that he or she cannot leave the hospital
4. Observing care provided to the client without the client’s permission

25. Nursing staff members are sitting in the lounge taking their morning break. An assistive personnel (AP) tells the group that she thinks that the unit secretary has acquired immunodeficiency syndrome (AIDS) and proceeds to tell the nursing staff that the secretary probably contracted the disease from her husband, who is supposedly a drug addict. The registered nurse should inform the AP that making this accusation has violated which legal tort?

1. Libel
2. Slander
3. Assault
4. Negligence

26. An older woman is brought to the emergency department for treatment of a fractured arm. On physical assessment, the nurse notes old and new ecchymotic areas on the client’s chest and legs and asks the client how the bruises were sustained. The client, although reluctant, tells the nurse in confidence that her son frequently hits her if supper is not prepared on time when he arrives home from work. Which is the most appropriate nursing response?

1. “Oh, really? I will discuss this situation with your son.”
2. “Let’s talk about the ways you can manage your time to prevent this from happening.”
3. “Do you have any friends who can help you out until you resolve these important issues with your son?”
4. “As a nurse, I am legally bound to report abuse. I will stay with you while you give the report and help find a safe place for you to stay.”

27. The nurse calls the primary health care provider (PHCP) regarding a new medication prescription, because the dosage prescribed is higher than the recommended dosage. The nurse is unable to locate the PHCP, and the medication is due to be administered. Which action should the nurse take?

1. Contact the nursing supervisor.
2. Administer the dose prescribed.
3. Hold the medication until the PHCP can be contacted.
4. Administer the recommended dose until the PHCP can be located.

28. The nurse employed in a hospital is waiting to receive a report from the laboratory via the facsimile (fax) machine. The fax machine activates and the nurse expects the report, but instead receives a sexually oriented photograph. Which is the most appropriate initial nursing action?

1. Call the police.
2. Cut up the photograph and throw it away.
3. Call the nursing supervisor and report the occurrence.
4. Call the laboratory and ask for the name of the individual who sent the photograph.

Answers

16. **Answer:** 3

*Rationale:* The occurrence report should contain a factual description of the occurrence, any injuries experienced by those involved, and the outcome of the situation. The correct option is the only one that describes the facts as observed by the nurse. Options 1, 2, and 4 are interpretations of the situation and are not factual information as observed by the nurse.

*Test-Taking Strategy:* Focus on the subject, documentation of events, and note the data in the question to select the correct option. Remember to focus on factual information when documenting, and avoid including interpretations. This will direct you to the correct option.

*Level of Cognitive Ability:* Applying
*Client Needs:* Safe and Effective Care Environment
*Integrated Process:* Communication and Documentation
*Content Area:* Leadership/Management: Ethical/Legal
*Health Problem:* N/A
*Priority Concepts:* Communication; Health Care Law

17. **Answer:** 3

*Rationale:* In general, there are two situations in which informed consent of an adult client is not needed. One is when an emergency is present and delaying treatment for the purpose of obtaining informed consent would result in injury or death to the client. The second is when the client waives the right to give informed consent. Option 1 will delay emergency treatment, and option 2 is inappropriate. Although option 4 may be pursued, it is not the best action because it delays necessary emergency treatment.

*Test-Taking Strategy:* Note the **strategic word**, best. Also note that an emergency is present. Recalling that a delay in treatment for the purpose of obtaining informed consent could result in injury or death will direct you to the correct option.

*Level of Cognitive Ability:* Applying
*Client Needs:* Safe and Effective Care Environment
*Integrated Process:* Nursing Process—Implementation
*Content Area:* Leadership/Management: Ethical/Legal
*Health Problem:* Adult Health: Neurological: Head Injury/Trauma
*Priority Concepts:* Ethics; Health Care Law

18. **Answer:** 1
Rationale: After a client’s fall, the nurse must frequently reassess the client, because potential complications do not always appear immediately after the fall. The client’s fall should be treated as private information and shared on a “need to know” basis. Communication regarding the event should involve only the individuals participating in the client’s care. An occurrence report is a problem-solving document; however, its completion is not documented in the nurse’s notes. If the nursing supervisor has been made aware of the occurrence, the supervisor will contact the nurse if status update is necessary.

Test-Taking Strategy: Note the strategic word, next. Using the steps of the nursing process will direct you to the correct option. Remember that assessment is the first step. Additionally, use Maslow’s Hierarchy of Needs theory, recalling that physiological needs are the priority. The correct option is the only option that addresses a potential physiological need of the client.

Level of Cognitive Ability: Applying
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Foundations of Care: Safety
Health Problem: N/A
Priority Concepts: Communication; Safety

19. Answer: 2

Rationale: Floating is an acceptable practice used by hospitals to solve understaffing problems. Legally, the nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove the lack of knowledge for the performance of assigned tasks. When encountering this situation, the nurse should set priorities and identify potential areas of harm to the client. That is why clarifying the client assignment with the team leader to ensure that it is a safe one is the best option. The nursing supervisor is called if the nurse is expected to perform tasks that he or she cannot safely perform. Submitting a written protest and calling the hospital lawyer is a premature action.

Test-Taking Strategy: Note the strategic word, best. Eliminate option 1 first because of the word refuse. Next, eliminate options 3 and 4 because they are premature actions.

Level of Cognitive Ability: Applying
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Leadership/Management: Ethical/Legal
Health Problem: N/A
Priority Concepts: Care Coordination; Professionalism

20. Answer: 3

Rationale: Nurse practice acts require reporting impaired nurses. The board of nursing has jurisdiction over the practice of nursing and may develop plans for
treatment and supervision of the impaired nurse. This occurrence needs to be reported to the nursing supervisor, who will then report to the board of nursing and other authorities, such as the police, as required. The nurse may call security if a disturbance occurs, but no information in the question supports this need, and so this is not the appropriate action. Option 4 is an inappropriate and unsafe action.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*. Eliminate option 4 first, because this is an inappropriate and unsafe action. Recall the lines of organizational structure to assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** Mental Health: Addictions  
**Priority Concepts:** Ethics; Professionalism  

21. **Answer:** 4

**Rationale:** Instructional directives (living wills) are required to be in writing and signed by the client. The client’s signature must be witnessed by specified individuals or notarized. Laws and guidelines regarding instructional directives vary from state to state, and it is the responsibility of the nurse to know the laws. Many states prohibit any employee, including the nurse of a facility where the client is receiving care, from being a witness. Option 2 is nontherapeutic and not a helpful response. The nurse should seek the assistance of the nursing supervisor.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*. Options 1 and 3 are comparable or alike and should be eliminated first. Option 2 is eliminated because it is a nontherapeutic response.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** N/A  
**Priority Concepts:** Health Care Law; Professionalism  

22. **Answer:** 2, 3, 4, 5

**Rationale:** Electronic health records (EHR) will have a time date stamp that indicates an amendment has been entered. If the nurse makes an error in the MAR, the nurse should follow agency policies to correct the error. In the MAR, the nurse can click on the entry (usually right-click) and modify it to reflect the corrected information. Since this is an opioid medication, the nurse should obtain a cosignature from the RN who witnessed the wasting of the excess medication, to validate that 1 mg, rather than 2 mg, was given. A nurse’s note should be used to detail the event and the corrections made, and the nurse’s name and title will be
stamped on the entry in the EHR. An occurrence report is not necessary in this situation.

**Test-Taking Strategy:** Focus on the **subject**, correcting a documentation error, and use principles related to documentation. Recalling the purpose of an occurrence report will assist in eliminating option 1. From the remaining options, focusing on the **subject** of the question and using knowledge regarding the principles related to documentation will direct you to the correct options.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Communication and Documentation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** N/A  
**Priority Concepts:** Communication; Professionalism  
**References:** Potter et al. (2017), p. 358.

23. **Answer:** 1, 2, 5

**Rationale:** Factual documentation contains descriptive, objective information about what the nurse sees, hears, feels, or smells. The use of inferences without supporting factual data is not acceptable, because it can be misunderstood. The use of vague terms, such as *seemed* or *appears*, is not acceptable because these words suggest that the nurse is stating an opinion.

**Test-Taking Strategy:** Focus on the **subject**, accurate documentation notations. Eliminate options 3 and 4 because they are **comparable or alike** and include vague terms (seemed, appears).

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Communication and Documentation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** N/A  
**Priority Concepts:** Communication; Professionalism  

24. **Answer:** 4

**Rationale:** Invasion of privacy occurs with unreasonable intrusion into an individual’s private affairs. Performing a procedure without consent is an example of battery. Threatening to give a client a medication constitutes assault. Telling the client that the client cannot leave the hospital constitutes false imprisonment.

**Test-Taking Strategy:** Focus on the **subject**, invasion of privacy. Noting the words *without the client’s permission* will direct you to this option.

**Level of Cognitive Ability:** Evaluating  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Teaching and Learning  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** N/A  
**Priority Concepts:** Ethics; Professionalism
25. **Answer:** 2

**Rationale:** Defamation is a false communication or a careless disregard for the truth that causes damage to someone’s reputation, either in writing (libel) or verbally (slander). An assault occurs when a person puts another person in fear of a harmful or offensive contact. Negligence involves the actions of professionals that fall below the standard of care for a specific professional group.

**Test-Taking Strategy:** Note the **subject**, the legal tort that was violated. Focus on the **data in the question** and eliminate options 3 and 4 first because their definitions are unrelated to the data. Recalling that slander constitutes verbal defamation will direct you to the correct option from the remaining options.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership/Management: Ethical/Legal

**Health Problem:** N/A

**Priority Concepts:** Health Care Law; Professionalism

**Reference:** Potter et al. (2017), pp. 308-309.

26. **Answer:** 4

**Rationale:** The nurse must report situations related to child or elder abuse, gunshot wounds and other criminal acts, and certain infectious diseases. Confidential issues are not to be discussed with nonmedical personnel or the client’s family or friends without the client’s permission. Clients should be assured that information is kept confidential, unless it places the nurse under a legal obligation. Options 1, 2, and 3 do not address the legal implications of the situation and do not ensure a safe environment for the client.

**Test-Taking Strategy:** Note the **strategic words**, **most appropriate**. Focus on the **data in the question** and note that an older woman is receiving physical abuse by her son. Recall the nursing responsibilities related to client safety and reporting obligations. Options 1, 2, and 3 should be eliminated because they are **comparable** or alike in that they do not protect the client from injury.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership/Management: Ethical/Legal

**Health Problem:** Mental Health: Abusive Behaviors

**Priority Concepts:** Health Care Law; Interpersonal Violence

**References:** Potter et al. (2017), pp. 35, 188-189.

27. **Answer:** 1

**Rationale:** If the PHCP writes a prescription that requires clarification, the nurse’s responsibility is to contact the PHCP. If there is no resolution regarding the
prescription because the PHCP cannot be located or because the prescription remains as it was written after talking with the PHCP, the nurse should contact the nurse manager or nursing supervisor for further clarification as to what the next step should be. Under no circumstances should the nurse proceed to carry out the prescription until obtaining clarification.

**Test-Taking Strategy:** Eliminate options 2 and 4 first because they are comparable or alike and are unsafe actions. Holding the medication can result in client injury. The nurse needs to take action. The correct option clearly identifies the required action in this situation.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Safety  
**Reference:** Potter et al. (2017), pp. 624-625, 628.

28. **Answer:** 3

**Rationale:** Ensuring a safe workplace is a responsibility of an employing institution. Sexual harassment in the workplace is prohibited by state and federal laws. Sexually suggestive jokes, touching, pressuring a coworker for a date, and open displays of or transmitting sexually oriented photographs or posters are examples of conduct that could be considered sexual harassment by another worker and is an abusive behavior. If the nurse believes that he or she is being subjected to unwelcome sexual conduct, these concerns should be reported to the nursing supervisor immediately. Option 1 is unnecessary at this time. Options 2 and 4 are inappropriate initial actions.

**Test-Taking Strategy:** Note the strategic words, most appropriate initial. Remember that using the organizational channels of communication is best. This will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** Mental Health: Abusive Behaviors  
**Priority Concepts:** Health Care Law; Professionalism  
CHAPTER 7

Prioritizing Client Care: Leadership, Delegation, and Emergency Response Planning

Priority Concepts

Leadership; Health Care Organizations

I. Health Care Delivery Systems
A. Managed care
1. Managed care is a broad term used to describe strategies used in the health care delivery system that reduce the costs of health care.
2. Client care is outcome driven and is managed by a case management process.

B. Case management
1. Case management is a health care delivery strategy that supports managed care; it uses an interprofessional health care delivery approach that provides comprehensive client care throughout the client’s illness, using available resources to promote high-quality and cost-effective care.
2. Case management includes assessment and development of a plan of care, coordination of all services, referral, and follow-up.
3. Critical pathways are used, and variation analysis is conducted.
4. The core functions of case management are assessment, treatment planning, linking, advocacy, and monitoring.
Case management involves consultation and collaboration with an interprofessional health care team.

C. Case manager

1. A case manager is a professional nurse who assumes responsibility for coordinating the client’s care at admission and after discharge.
2. The case manager establishes a plan of care with the client, coordinates any interprofessional consultations and referrals, and facilitates discharge.
3. A case manager is knowledgeable in various types of health insurance, which allows them to assist clients in navigating health care options covered by insurance.

D. Health Insurance

1. There are state and federal insurance plans.
2. An aim of the Affordable Care Act is to reduce the amount of uncompensated care the average U.S. family pays for by requiring everyone to have health insurance or pay a tax penalty. Its goals are to expand access to health insurance, reduce costs, and protect clients against arbitrary actions by insurance companies.
3. There are many insurance companies that provide state marketplace insurance; some include Aetna, Blue Cross Blue Shield, Cigna, Humana, Kaiser, United, and TriCare/Humana.
4. Types of insurance plans include health maintenance organizations (HMOs), preferred provider organizations (PPOs), exclusive provider organizations (EPOs), point-of-service (POS) plans, high-deductible health plans (HDHPs), and health savings accounts (HSAs); these offer varying options in terms of insurance coverage and out-of-pocket costs and premiums.
5. Medicare is a federal health insurance program for persons aged 65 or older, certain younger people with disabilities, and people with end-stage renal disease (ESRD) requiring dialysis or renal transplant. Certain premiums are attached to each part.
   a. Part A: covers hospital stays, skilled nursing facility stays, hospice care, and some home health care
   b. Part B: helps pay for some services not covered by Part A. Medicare usually covers 80% for approved services;
remaining 20% is the client’s responsibility and a supplemental insurance needs to be obtained
c. Part C: a health plan offered by a private insurance agency that contracts with Medicare to supplement coverage
d. Part D: covers prescription medication needs

6. Medicaid is a joint federal and state program that provides health benefits to eligible low-income adults, children, pregnant women, elderly individuals, and people with disabilities. A concern associated with these programs is fraud and abuse; a case manager needs to know how to complete insurance, state, and federal applications and be astute enough to know if an individual is reporting incorrect information.

E. Critical pathway
1. A critical pathway is a clinical management care plan for providing client-centered care and for planning and monitoring the client’s progress within an established time frame; interprofessional collaboration and teamwork ensure shared decision making and quality client care.
2. Critical pathways are based on evidence-based practice and include evidence-based medical practice, budgetary, organizational, and systems-wide information.
3. Variation analysis is a continuous process that the case manager and other caregivers conduct by comparing the specific client outcomes with the expected outcomes described on the critical pathway.
4. The goal of a critical pathway is to anticipate and recognize negative variance (i.e., client problems) early so that appropriate action can be taken and positive client outcomes can result.
5. Critical pathways are used to ensure medical care is consistent within budget constraints and to allow providers to care for more complex clients. For example, some ambulatory practices have critical pathways for certain conditions such as blood pressure monitoring or urinary tract infections.

F. Nursing Care Plan
1. A nursing care plan is a written guideline and communication tool that identifies the client’s pertinent assessment data, problems and nursing diagnoses, goals, interventions, and expected outcomes.
II. Nursing Delivery Systems

A. Functional nursing
1. Functional nursing involves a task approach to client care, with tasks being delegated by the charge nurse to individual members of the team.
2. This type of system is task-oriented, and the team member focuses on the delegated task rather than the total client; this results in fragmentation of care and lack of accountability by the team member.

B. Team nursing
1. The team generally is led by a registered nurse (team leader) who is responsible for assessing clients, analyzing client data, planning, and evaluating each client’s plan of care.
2. The team leader determines the work assignment; each staff member works fully within the realm of his or her educational and clinical expertise and job description.
3. Each staff member is accountable for client care and outcomes of care delivered in accordance with the licensing and practice scope as determined by health care agency policy and state law.
4. Modular nursing is similar to team nursing but takes into account the structure of the unit; the unit is divided into modules, allowing nurses to care for a group of clients who are geographically close by.

C. Relationship-based practice (primary nursing)
1. Relationship-based practice (primary nursing) is concerned with keeping the nurse at the bedside, actively involved in client care, while planning goal-directed, individualized care.
2. One (primary) nurse is responsible for managing and coordinating the client’s care while in the hospital and for discharge, and an associate nurse cares for the client when the primary nurse is off-duty.

D. Client-focused care
1. This is also known as the total care or case method; the
registered nurse assumes total responsibility for planning and delivering care to a client.

2. The client may have different nurses assigned during a 24-hour period; the nurse provides all necessary care needed for the assigned time period.

III. Professional Responsibilities

A. Accountability

1. The process in which individuals have an obligation (or duty) to act and are answerable for their choices, decisions, and actions.
2. Involves assuming only the responsibilities that are within one’s scope of practice and not assuming responsibility for activities in which competence has not been achieved.
3. Involves admitting mistakes rather than blaming others and evaluating the outcomes of one’s own actions.
4. Includes a responsibility to the client to be competent and provide nursing care in accordance with standards of nursing practice while adhering to the professional ethics codes.

Accountability is the acceptance of responsibility for one’s choices, decisions, and actions. The nurse is always responsible for their actions when providing care to a client.

B. Leadership and management

1. Leadership is the interpersonal process that involves influencing others (followers) to achieve goals.
2. Management is the accomplishment of tasks or goals by oneself or by directing others.

C. Theories of leadership and management (Box 7-1)

D. Leader and manager approaches

1. Authoritarian leadership
   a. The leader or manager is focused and maintains strong control, makes decisions, and addresses all problems.
   b. The leader or manager dominates the group and commands rather than seeks suggestions or input.

2. Democratic leadership
   a. This is also called participative management.
   b. It is based on the belief that every group member should have input into
problem solving and the development of goals; leader obtains participation from group and then makes best decision for the organization, based on the input from group.

c. The democratic style is a more “talk with the members” style and much less authoritarian than the autocratic style.

3. Laissez-faire leadership
   a. A laissez-faire leader or manager assumes a passive, nondirective, and inactive approach and relinquishes part or all of the responsibilities to the members of the group.
   b. Decision making is left to the group, with the laissez-faire leader or manager providing little, if any, guidance, support, or feedback.

4. Situational leadership
   a. Situational approach uses a combination of styles based on the current circumstances and events.
   b. Situational styles are assumed according to the needs of the group and the tasks to be achieved.

5. Bureaucratic leadership
   a. The leader or manager believes that individuals are motivated by external forces.
   b. The leader or manager relies on organizational policies and procedures for decision making.

6. Transformational leadership
   a. Focused on building relationships.
   b. Motivates staff members through a shared vision and mission.
   c. Encourages and praises staff members and inspires them to improve performance levels while earning staff respect and loyalty.

7. Servant leadership
   a. Servant leaders influence and motivate others by building relationships and developing the skills of individual team members.
   b. Servant leaders make sure to meet the needs of the individual team members.
and to give each person input in decisions.

E. Effective leader and manager behaviors and qualities (Box 7-2)

F. Functions of management (Box 7-3)

G. Problem-solving process and decision making
   1. Problem solving involves obtaining information and using it to reach an acceptable solution to a problem.
   2. Decision making involves identifying a problem and deciding which alternatives can best achieve objectives.
   3. Steps of the problem-solving process are similar to the steps of the nursing process (Table 7-1).

H. Types of managers
   1. Front-line manager
      a. Front-line managers function in supervisory roles of those involved with delivery of client care. Front-line managers may temporarily assume a client care role.
      b. Front-line roles usually include charge nurse, team leader, and client care coordinator.
      c. Front-line managers coordinate the activity of all staff who provide client care and supervise team members during the manager’s period of accountability.
   2. Middle manager
      a. Middle manager roles usually include unit manager and supervisor.
      b. A middle manager’s responsibilities may include supervising staff, preparing budgets, preparing work schedules, writing and implementing policies that guide client care and unit operations, and maintaining the quality of client services.
   3. Nurse executive
      a. The nurse executive is a top-level nurse manager and may be the director of nursing services or the vice president for client care services that assists with carrying out the mission of a health care organization.
      b. The nurse executive supervises numerous departments and works closely with the administrative team of
the organization to ensure that nursing staff provide optimal client care.

c. The nurse executive ensures that all client care provided by nurses is consistent with the objectives of the health care organization.

IV. Power

A. Power is the ability to influence others and control their actions to achieve desired results.

B. Powerful people are able to modify behavior and influence others to change, even when others are resistant to change.

C. Powerful people are change agents that lead or create positive change to support or maintain high-quality care and decrease adverse effects.

D. Effective nurse leaders use power to improve the delivery of care and to enhance the profession.

E. There are different types of power (Box 7-4).

V. Empowerment

A. Empowerment is an interpersonal process of enabling others to do for themselves.

B. Empowerment occurs when individuals are able to influence what happens to them more effectively.

C. Empowerment involves open communication, mutual goal setting, and shared decision making.

D. Nurses can empower clients and others through teaching and advocacy.

VI. Formal Organizations

A. An organization’s mission statement communicates in broad terms its reason for existence and the attitudes, beliefs, and values by which the organization functions.

B. Goals and objectives are measurable activities specific to the development of designated services and programs of an organization.

C. The organizational chart depicts and communicates how activities are arranged, how authority relationships are defined, and how communication channels are established.

D. Policies, procedures, and protocols

1. Policies are guidelines that define the organization’s directives on courses of action.

2. Procedures are based on policy and define methods for tasks.

3. Protocols prescribe a specific course of action for a specific type of client or problem.
   a. Centralization is the making of decisions by a few individuals at the
top of the organization or by managers of a department or unit, and decisions are communicated thereafter to the employees.

b. Decentralization is the distribution of authority throughout the organization to allow for increased responsibility and **delegation** in decision making; decentralization tries to move the decision making as close to the client as possible.

The nurse must follow policies, procedures, and protocols of the health care agency in which he or she is employed.

### VII. Evidence-Based Practice

A. Research is an important role of the professional nurse. Research provides a foundation for improvement in nursing practice.

B. Evidence-based practice is an approach to client care in which the nurse integrates the client’s preferences, clinical expertise, and the best research evidence to deliver quality care.

C. Determining the client’s personal, social, cultural, and religious preferences ensures individualization and is a component of implementing evidence-based practice.

D. The nurse needs to be an observer and identify and question situations that require change or result in a less than desirable outcome.

E. Use of information technology such as online resources, including research publications, provides current research findings related to areas of practice.

F. The nurse needs to follow evidence-based practice protocols developed by the institution and question the rationale for nursing approaches identified in the protocols as necessary. The nurse should use appropriate evaluation criteria when determining areas in need of research (Table 7-2).

Evidence-based practice requires that the nurse base nursing practice on the best and most applicable evidence from clinical research studies. The nurse should also be alert to clinical issues that warrant investigation and develop a researchable question about the problem.

### VIII. Quality Improvement

A. Also known as performance improvement, quality improvement focuses on processes or systems that significantly contribute to
client safety and effective client care outcomes; criteria are used to monitor outcomes of care and to determine the need for change to improve the quality of care.

B. Quality improvement processes or systems may be named quality assurance, continuous quality management, or continuous quality improvement.

C. When quality improvement is part of the philosophy of a health care agency, every staff member becomes involved in ways to improve client care and outcomes.

D. A retrospective (“looking back”) audit is an evaluation method used to inspect the medical record after the client’s discharge for documentation of compliance with the standards.

E. A concurrent (“at the same time”) audit is an evaluation method used to inspect compliance of nurses with predetermined standards and criteria while the nurses are providing care during the client’s stay.

F. Peer review is a process in which nurses employed in an organization evaluate the quality of nursing care delivered to the client.

G. The quality improvement process is similar to the nursing process and involves an interprofessional approach.

H. An outcome describes the response to care; comparison of client responses with the expected outcomes indicates whether the interventions are effective, whether the client has progressed, how well standards are met, and whether changes are necessary.

I. The nurse is responsible for recognizing trends in nursing practice, identifying recurrent problems, and initiating opportunities to improve the quality of care.

IX. Change Process

A. Change is a dynamic process that leads to an alteration in behavior.

B. A change agent can be used to effectively facilitate change. Change agents appropriately assess and manage the reactions of staff members. They can connect and balance all aspects of the organization that will be affected by change.

C. Leadership style influences the approach to initiating the change process.

D. Lewin’s basic concept of the change process includes 3 elements for successful change: unfreezing, moving and changing, and refreezing (Fig. 7-1).

1. Unfreezing is the first phase of the process, during which the problem is identified and individuals involved gather facts and evidence supporting a basis
for change.
2. During the moving and changing phase, change is planned and implemented.
3. Refreezing is the last phase of the process, during which the change becomes stabilized.

E. Types of change
1. Planned change: A deliberate effort to improve a situation
2. Unplanned change: A reactive response that is required because of a disruption. The change is beneficial and may go unnoticed.

F. Resistance to change (Box 7-5)
1. Resistance to change occurs when an individual rejects proposed new ideas without critically thinking about the proposal.
2. Change requires energy.
3. The change process does not guarantee positive outcomes.

G. Overcoming barriers
1. Create a flexible and adaptable environment.
2. Encourage the people involved to plan and set goals for change.
3. Include all involved in the plan for change.
4. Focus on the benefits of the change in relation to improvement of client care.
5. Delineate the drawbacks from failing to make the change in relation to client care.
6. Evaluate the change process on an ongoing basis and keep everyone informed of progress.
7. Provide positive feedback to all involved.
8. Commit to the time it takes to change.

X. Conflict
A. Conflict is an internal or external friction that arises from a perception of incompatibility or difference in beliefs, attitudes, values, goals, priorities, or decisions.

B. Types of conflict
1. Intrapersonal: Occurs within a person
2. Interpersonal: Occurs between and among clients, nurses, or other staff members
3. Organizational: Occurs when an employee confronts the policies and procedures of the organization

C. Modes of conflict resolution
1. Avoidance
   a. Avoiders are unassertive and uncooperative.
   b. Avoiders do not pursue their own needs, goals, or concerns, and they do
not assist others to pursue theirs.
c. Avoiders postpone dealing with the issue.

2. Accommodation
   a. Accommodators neglect their own needs, goals, or concerns (unassertive) while trying to satisfy those of others.
   b. Accommodators obey and serve others and often feel resentment and disappointment because they “get nothing in return.”

3. Competition
   a. Competitors pursue their own needs and goals at the expense of others.
   b. Competitors also may stand up for rights and defend important principles.

4. Compromise
   a. Compromisers are assertive and cooperative.
   b. Compromisers work creatively and openly to find the solution that most fully satisfies all important objectives and goals to be achieved.

XI. Roles of Health Care Team Members

A. Nurse roles are as follows:
   1. Promote health and prevent disease
   2. Provide comfort and care to clients
   3. Make decisions
   4. Act as client advocate
   5. Lead and manage the nursing team
   6. Serve as case manager
   7. Function as a rehabilitator
   8. Communicate effectively
   9. Educate clients, families, and communities and health care team members
   10. Act as a resource person
   11. Allocate resources in a cost-effective manner

B. Primary health care provider (PHCP): A PHCP or specialist diagnoses and treats disease.

C. Physician’s assistant
   1. A physician’s assistant (PA) acts to a limited extent in the role of the physician during the physician’s absence.
   2. The PA conducts physical examinations, performs diagnostic procedures, assists in the operating room and emergency department, and performs treatments.
3. Certified and licensed PAs in some states have prescriptive powers.

D. Nurse practitioner: an advanced practice registered nurse (APRN) who is educated to diagnose and treat acute illness and chronic conditions; health promotion and maintenance is a focus.
   1. An APRN may work in a variety of specialty areas including family practice, internal medicine, acute gerontology, women’s health or obstetrics, acute care, pediatrics, or other specialty areas.
   2. APRNs have independent practice authority in most states.

E. Physical therapist: A physical therapist assists in examining, testing, and treating clients recuperating from injuries, illness, or surgery and physically disabled clients.

F. Occupational therapist: An occupational therapist develops adaptive devices that help chronically ill clients or clients with a disability perform activities of daily living.

G. Respiratory therapist: A respiratory therapist delivers treatments designed to improve the client’s ventilation and oxygenation status.

H. Speech therapist: A speech therapist evaluates a client’s ability to swallow safely and evaluates speech and communication ability. The speech therapist develops a plan to treat communication and swallowing disorders. These therapists also work to prevent, assess, diagnose, and treat speech, language, social communication, and cognitive communication in children and adults.

I. Nutritionist: A nutritionist or dietitian assists in planning dietary measures to improve or maintain a client’s nutritional status.

J. Continuing care nurse: This nurse coordinates discharge plans for the client.

K. Assistive personnel, help the registered nurse with specified tasks and functions.

L. Pharmacist: A pharmacist formulates and dispenses medications.

M. Social worker: A social worker counsels clients and families about home care services and assists the continuing care nurse with planning and facilitating discharge.

N. Chaplain: A chaplain (or trained layperson) offers spiritual support and guidance to clients and families.

O. Administrative staff: Administrative or support staff members organize and schedule diagnostic tests and procedures and arrange for services needed by the client and family.

XII. Interprofessional Collaboration

A. Client care planning can be accomplished through referrals, consultations, or interprofessional collaborations with other health care specialists and through client care conferences, which involve members from all health care disciplines. This approach helps ensure continuity of care.
B. Reports

1. Reports should be factual, accurate, current, complete, and organized.

2. Reports should include essential background information, subjective data, objective data, any changes in the client’s status, client problems or nursing diagnoses as appropriate, treatments and procedures, medication administration, client teaching, discharge planning, family information, the client’s response to treatments and procedures, and the client’s priority needs.

3. Change-of-shift (handoff) report
   a. The report facilitates continuity of care among nurses who are responsible for a client.
   b. The report may be written, oral, audiotaped, or provided during walking rounds at the client’s bedside.
   c. The report describes the client’s health status and informs the nurse who assumes care about the client’s needs and priorities for care.
   d. The report may be done at the client’s bedside to allow the client to participate in care planning, as well as to establish the stability of the client before the oncoming nurse assumes care.

4. Telephone reports
   a. Purposes include informing a PHCP of a client’s change in status, communicating information about a client’s transfer to or from another unit or facility, and obtaining results of laboratory or diagnostic tests.
   b. The telephone report should be documented and should include when the call was made, who made the call, who was called, to whom information was given, what information was given, and what information was received.

5. Transfer reports
   a. Transferring nurse reports provide continuity of care and may be given by telephone or in person (Box 7-6).
   b. Receiving nurse should repeat transfer
information to ensure client safety and ask questions to clarify information about the client’s status.

6. Situation, Background, Assessment, Recommendation (SBAR)

a. SBAR, a communication model, is a structured and standardized communication technique that improves communication among team members when sharing information on a client.

b. SBAR includes up-to-date information about the client’s situation, associated background information, assessment data, and recommendations for care, such as treatments, medications, or services needed.

c. Refer to Chapter 12 for SOAP (subjective, objective, assessment, plan) notes

XIII. Interprofessional Consultation

A. Consultation is a process in which a specialist is sought to identify methods of care or treatment plans to meet the needs of a client.

B. Consultation is needed when the nurse encounters a problem that cannot be solved using nursing knowledge, skills, and available resources.

C. Consultation also is needed when the exact problem remains unclear; a consultant can objectively and more clearly assess and identify the exact nature of the problem.

D. Rapid-response teams are being developed within hospitals to provide nursing staff with internal consultative services provided by expert clinicians.

E. Rapid-response teams are used to assist nursing staff with early detection and resolution of client problems.

F. Rapid-response teams are also teams of health care providers that respond to hospitalized clients with early signs of deterioration on non–intensive care units to prevent respiratory or cardiac arrest.

G. Medication reconciliation includes collaboration among the client, PHCPs, nurses, and pharmacists to ensure medication accuracy when clients experience changes in health care settings or levels of care or are transferred from one care unit to another, and upon discharge (Box 7-7).

XIV. Discharge Planning

A. Discharge planning begins when the client is admitted to the hospital or health care facility.

B. Discharge planning is an interprofessional process that ensures
that the client has a plan for continuing care after leaving the health care facility and assists in the client’s transition from one environment to another.

C. All caregivers need to be involved in discharge planning, and referrals to other PHCPs or agencies may be needed. A PHCP’s prescription may be needed for the referral, and the referral needs to be approved by the client’s health care insurer.

D. The nurse should anticipate the client’s discharge needs and make the required referral as soon as possible (involving the client and family in the referral process).

E. The nurse needs to educate the client and family regarding care at home (Box 7-8).

XV. Delegation and Assignments

A. Delegation

1. Delegation is a process of transferring performance of a selected nursing task in a situation to an individual who is competent and has the authority to perform that specific task.

2. Delegation involves achieving outcomes and sharing activities with other individuals who have the authority to accomplish the task.

3. The nurse practice act and any practice limitations (institutional policies and procedures, and job descriptions of personnel provided by the institution) define which aspects of care can be delegated and which must be performed by a registered nurse.

4. Even though a task may be delegated to someone, the nurse who delegates maintains ultimate accountability for the task.

5. The nurse cannot delegate any activity that involves nursing judgment or critical decision making.

6. The 5 rights of delegation include the right task, right circumstances, right person, right direction/communication, and right supervision/evaluation.

The nurse delegates only tasks for which he or she is responsible. The nurse who delegates is accountable for the task; the person who assumes responsibility for the task is also accountable.

B. Principles and guidelines of delegating (Box 7-9)

C. Assignments

1. Assignment is the transfer of performance of client care activities to specific staff members.

2. Guidelines for client care assignments

   a. Always ensure client safety.
b. Be aware of individual variations in work abilities.
c. Determine which tasks can be delegated and to whom.
d. Match the task to the delegatee on the basis of the nurse practice act and any practice limitations (institutional policies and procedures, and job descriptions of personnel provided by the institution).
e. Provide directions that are clear, concise, accurate, and complete.
f. Validate the delegatee’s understanding of the directions.
g. Communicate a feeling of confidence to the delegatee, and provide feedback promptly after the task is performed.
h. Maintain continuity of care as much as possible when assigning client care.

XVI. Time Management

A. Description

1. Time management is a technique designed to assist in completing tasks within a definite time period.
2. Learning how, when, and where to use one’s time and establishing personal goals and time frames are part of time management.
3. Time management requires an ability to anticipate the day’s activities, to combine activities when possible, and to not be interrupted by nonessential activities.
4. Time management involves efficiency in completing tasks as quickly as possible and effectiveness in deciding on the most important task to do (i.e., prioritizing) and doing it correctly.

B. Principles and guidelines

1. Identify tasks, obligations, and activities and write them down.
2. Organize the workday; identify which tasks must be completed in specified time frames.
3. Prioritize client needs according to importance.
4. Anticipate the needs of the day and provide time for unexpected and unplanned tasks that may arise.
5. Focus on beginning the daily tasks, working on the most important first while keeping goals in mind; look at the final goal for the day to help break down tasks into manageable parts.
6. Begin client rounds at the beginning of the shift, collecting data on each assigned client.
7. Delegate tasks when appropriate.
8. Keep a daily hour-by-hour log to assist in providing structure to the tasks that must be accomplished, and cross tasks off the list as they are accomplished.
9. Use health care agency resources wisely, anticipating resource needs, and gather the necessary supplies before beginning the task.
10. Organize paperwork and continuously document task completion and necessary client data throughout the day (i.e., documentation should be concurrent with completion of a task or observation of pertinent client data).
11. At the end of the day, evaluate the effectiveness of time management.

XVII. Prioritizing Care

A. Prioritizing is deciding which needs or problems require immediate action and which ones could tolerate a delay in response until a later time because they are not urgent.

B. Guidelines for prioritizing (Box 7-10)

C. Setting priorities for client teaching
1. Determine the client’s immediate learning needs.
2. Identify the type of learning needs for the individual; for example, consider the client’s age, cognitive age, language needs, and generational concerns.
3. Review the learning objectives established for the client.
4. Determine what the client perceives as important.
5. Assess the client’s anxiety level and the time available to teach.

D. Prioritizing when caring for a group of clients
1. Identify the problems of each client.
2. Review the problems and any nursing diagnoses.
3. Determine which client problems are most urgent based on basic needs, the client’s changing or unstable status, and complexity of the client’s problems.
4. Anticipate the time that it may take to care for the priority needs of the clients.
5. Combine activities, if possible, to resolve more than one problem at a time.
6. Involve the client in his or her care as much as possible (see Priority Nursing Actions).

Use the ABCs—airway, breathing, and circulation—Maslow’s Hierarchy of Needs theory, and the steps of the nursing process.
(assessment is first) to prioritize. Also consider the acuity level of clients when applying these guidelines. If cardiopulmonary resuscitation (CPR) needs to be initiated, use CAB—compressions, airway, breathing—as the priority guideline.

Priority Nursing Actions

Assessing a Group of Clients in Order of Priority

The nurse is assigned to the following clients. The order of priority in assessing the clients is as follows:

1. A client with heart failure who has a 4-lb weight gain since yesterday and is experiencing shortness of breath
2. A 24-hour postoperative client who had a wedge resection of the lung and has a closed chest tube drainage system
3. A client admitted to the hospital for observation who has absent bowel sounds
4. A client who is undergoing surgery for a hysterectomy on the following day

Potter et al. (2017), pp. 284-285

XVIII. Disasters and Emergency Response Planning

A. Description

1. A disaster is any human-made or natural event that causes destruction and devastation that cannot be alleviated without assistance (Box 7-11).
2. Internal disasters are disasters that occur within a health care agency (e.g., health care agency fire, structural collapse, radiation spill), whereas external disasters are disasters that occur outside the health care agency (e.g., mass transit accident that could send hundreds of victims to emergency departments).
3. A multicasualty event involves a limited number of victims or casualties and can be managed by a hospital with available resources; a mass casualty event involves a number of casualties that exceeds the resource capabilities of the hospital, and is also known as a disaster.
4. An emergency response plan is a formal plan of action for coordinating the response of the health care agency staff in the event of a disaster in the health care agency or surrounding community.

B. American Red Cross (ARC)

1. The ARC has been given authority by the federal government to provide disaster relief.
2. All ARC disaster relief assistance is free, and local offices are located across the United States.
3. The ARC participates with the government in developing and testing community disaster plans.
4. The ARC identifies and trains personnel for emergency response.
5. The ARC works with businesses and labor organizations to identify resources and individuals for disaster work.
6. The ARC educates the public about ways to prepare for a disaster.
7. The ARC operates shelters, provides assistance to meet immediate emergency needs, and provides disaster health services, including crisis counseling.
8. The ARC handles inquiries from family members.
9. The ARC coordinates relief activities with other agencies.
10. Nurses are involved directly with the ARC and assume functions such as managers, supervisors, and educators of first aid; they also participate in emergency response plans and disaster relief programs and provide services, such as blood collection drives and immunization programs.

C. HAZMAT (hazardous materials) team
1. HAZMAT teams are typically composed of emergency department health care providers and nursing staff, because they will be the first individuals to encounter the potential exposure.
2. Members of HAZMAT teams have been educated on how to recognize patterns of illness that may be indicative of nuclear, biological, and chemical exposure; protocols for pharmacological treatment of infectious disease agents; availability of decontamination facilities and personal protective gear; safety measures; and the methods of responding to an exposure.

D. Phases of disaster management
1. The Federal Emergency Management Agency (FEMA) identifies 4 disaster management phases: mitigation, preparedness, response, and recovery.
2. Mitigation encompasses the following:
   a. Actions or measures that can prevent the occurrence of a disaster or reduce the damaging effects of a disaster
   b. Determination of the community hazards and community risks (actual and potential threats) before a disaster occurs
   c. Awareness of available community resources and community health
personnel to facilitate mobilization of activities and minimize chaos and confusion if a disaster occurs.
d. Determination of the resources available for care to infants, older adults, disabled individuals, and individuals with chronic health problems.

3. Preparedness encompasses the following:
   a. Plans for rescue, evacuation, and caring for disaster victims
   b. Plans for training disaster personnel and gathering resources, equipment, and other materials needed for dealing with the disaster
   c. Identification of specific responsibilities for various emergency response personnel
   d. Establishment of a community emergency response plan and an effective public communication system
   e. Development of an emergency medical system and a plan for activation
   f. Verification of proper functioning of emergency equipment
   g. Collection of anticipatory provisions and creation of a location for providing food, water, clothing, shelter, other supplies, and needed medicine
   h. Inventory of supplies on a regular basis and replenishment of outdated supplies
   i. Practice of community emergency response plans (mock disaster drills)

4. Response encompasses the following:
   a. Putting disaster planning services into action and the actions taken to save lives and prevent further damage
   b. Primary concerns include safety and the physical and mental health of victims and members of the disaster response team

5. Recovery encompasses the following:
   a. Actions taken to return to a normal situation after the disaster
   b. Preventing debilitating effects and restoring personal, economic, and environmental health and stability to
E. Levels of disaster
1. FEMA identifies three levels of disaster with FEMA response (Box 7-12).
2. When a federal emergency has been declared, the federal response plan may take effect and activate emergency support functions.
3. The emergency support functions of the ARC include performing emergency first aid, sheltering, feeding, providing a disaster welfare information system, and coordinating bulk distribution of emergency relief supplies.
4. Disaster medical assistant teams (teams of specially trained personnel) can be activated and sent to a disaster site to provide triage and medical care to victims until they can be evacuated to a hospital.

F. Nurse’s role in disaster planning

1. Personal and professional preparedness
   a. Make personal and family preparations (Box 7-13).
   b. Be aware of the disaster plan at the place of employment and in the community.
   c. Maintain certification in disaster training and in CPR.
   d. Participate in mock disaster drills, including bomb threat and active shooter drills.
   e. Prepare professional emergency response items, such as a copy of nursing license, personal health care equipment such as a stethoscope, cash, warm clothing, recordkeeping materials, and other nursing care supplies.

2. Disaster response
   a. In the health care agency setting, if a disaster occurs, the agency disaster preparedness plan (emergency response plan) is activated immediately, and the nurse responds by following the directions identified in the plan.
   b. In the community setting, if the nurse is the first responder to a disaster, the nurse cares for the victims by attending to the victims with life-
threatening problems first; when rescue workers arrive at the scene, immediate plans for triage should begin.

In the event of a disaster, activate the emergency response plan immediately.

G. Triage

1. In a disaster or war, triage consists of a brief assessment of victims that allows the nurse to classify victims according to the severity of the injury, urgency of treatment, and place for treatment (see Priority Nursing Actions).

Priority Nursing Actions

Triaging Victims at the Site of an Accident
The nurse is the first responder at the scene of a school bus accident. The nurse triages the victims from highest to lowest priority as follows:
1. Confused child with bright red blood pulsating from a leg wound
2. Child with a closed head wound and multiple compound fractures of the arms and legs
3. Child with a simple fracture of the arm complaining of arm pain
4. Sobbing child with several minor lacerations on the face, arms, and legs

Reference
Ignatavicius. Workman, Rebar. 2018;151–152.

2. Simple Triage and Rapid Treatment (START) is a strategy used to evaluate the severity of injury of each victim as quickly as possible and tag the victims in about 30 to 60 seconds.

3. In an emergency department, triage consists of a brief assessment of clients that allows the nurse to classify clients according to their need for care and establish priorities of care; the type of illness or injury, the severity of the problem, and the resources available govern the process.

H. Emergency department triage system

1. A commonly used rating system in an emergency department is a 3-tier system that uses the categories of emergent, urgent, and nonurgent; these categories may be identified by color coding or
numbers (Box 7-14).
2. The nurse needs to be familiar with the triage system of the health care agency.
3. When caring for a client who has died, the nurse needs to recognize the importance of family and cultural and religious rituals and provide support to loved ones.
4. Organ donation procedures of the health care agency need to be addressed if appropriate.

Think survivability. If you are the first responder to a scene of a disaster, such as a train crash, a priority victim is one whose life can be saved.

I. Client assessment in the emergency department

1. Primary assessment
   a. The purpose of primary assessment is to identify any client problem that poses an immediate or potential threat to life.
   b. The nurse gathers information primarily through objective data and, on finding any abnormalities, immediately initiates interventions.
   c. The nurse uses the ABCs—airway, breathing, and circulation—as a guide in assessing a client’s needs and assesses a client who has sustained a traumatic injury for signs of a head injury or cervical spine injury. If CPR needs to be initiated, use CAB—compressions, airway, breathing—as the priority guideline.
   d. Agonal breathing does not provide effective respiration and ventilation and indicates a need for ventilatory support.
   e. Only central pulses, such as the carotid or femoral pulses, should be used to assess circulation; they should be checked for at least 5 seconds but no longer than 10 seconds so as to not delay chest compressions.

2. Secondary assessment
   a. The nurse performs secondary assessment after the primary assessment and after treatment for any primary problems identified.
   b. Secondary assessment identifies any other life-threatening problems that a client might be experiencing.
   c. The nurse obtains subjective and objective data, including a history, general overview, vital sign measurements, neurological assessment, pain assessment, and complete or focused physical assessment.
Box 7-1

Theories of Leadership and Management

Charismatic: Based on personal beliefs and characteristics of influence
Quantum: Based on the concepts of chaos theory; maintaining a balance
between tension and order prevents an unstable environment and promotes
creativity
Relational: Based on collaboration and teamwork
Servant: Based on a desire to serve others; the leader emerges when another’s
needs assume priority
Shared: Based on the belief that several individuals share the responsibility for
achieving the health care agency’s goals
Transactional: Based on the principles of social exchange theory
Transformational: Based on the individual’s commitment to the health care
agency’s vision; focuses on promoting change

Box 7-2

Effective Leader and Manager Behaviors and Qualities

Behaviors

Treats followers as unique individuals
Inspires followers and stimulates critical thinking
Shows followers how to think about old problems in new ways and assists with
adapting to change
Is visible to followers; is flexible; and provides guidance, assistance, and
feedback
Communicates a vision, establishes trust, and empowers followers
Motivates followers to achieve goals

Qualities

Effective communicator; promotes interprofessional collaboration
Credible
Critical thinker
Initiator of action
Risk taker
Is persuasive and influences employees

Adapted from Huber D: Leadership and nursing care management, ed 5, Philadelphia,
2014, Saunders.
Box 7-3

Functions of Management

**Planning:** Determining objectives and identifying methods that lead to achievement of objectives

**Organizing:** Using resources (human and material) to achieve predetermined outcomes

**Directing:** Guiding and motivating others to meet expected outcomes

**Controlling:** Using performance standards as criteria for measuring success and taking corrective action

Table 7-1

| Similarities of the Problem-Solving Process and the Nursing Process |
|------------------------------------------------------|------------------|
| Problem-Solving Process                   | Nursing Process   |
| Identifying a problem and collecting data about the problem | Assessment       |
| Determining the exact nature of the problem | Analysis (Diagnosis) |
| Deciding on a plan of action               | Planning         |
| Carrying out the plan                      | Implementation   |
| Evaluating the plan                        | Evaluation       |

Box 7-4

Types of Power

**Reward:** Ability to provide incentives

**Coercive:** Ability to punish

**Referent:** Based on attraction, loyalty, and respect

**Expert:** Based on having an expert knowledge foundation and skill level

**Legitimate:** Based on a position in society

**Personal:** Derived from a high degree of self-confidence

**Informational:** When one person provides explanations why another should behave in a certain way

Table 7-2

| Evaluation Criteria for Evidence for Clinical Questions |
|-------------------------------------------------------|------------------------------------------------------|
| **Level** | **Definition**                                                                 |
| Level I   | Evidence comes from a review of a number of randomized controlled trials (RCTs) or from clinical practice guidelines that are based on such a review. |
| Level II  | Evidence comes from at least one well-designed RCT.                           |
| Level III | Evidence comes from well-designed controlled studies that are not randomized. |
| Level IV  | Evidence comes from well-designed case-controlled and cohort studies.        |
| Level     | Evidence comes from a number of descriptive or qualitative studies.           |
Level VI  Evidence comes from a single descriptive or qualitative study.

Level VII  Evidence comes from the opinion of authorities and/or reports of expert committees.

**FIG. 7-1** Elements of a successful change.

---

**Box 7-5**  
**Reasons for Resisting Change**

**Conformity**  
One goes along with others to avoid conflict.

**Dissimilar Beliefs and Values**  
Differences can impede positive change.
**Habit**
Routine, set behaviors are often hard to change.

**Secondary Gains**
Benefits or payoff are present, so there is no incentive to change.

**Threats to Satisfying Basic Needs**
Change may be perceived as a threat to self-esteem, security, or survival.

**Fear**
One fears failure or has fear of the unknown.

---

**Box 7-6**

**Transfer Reports**

- Client’s name, age, health care provider, and diagnoses
- Current health status and plan of care
- Client’s needs and priorities for care
- Any assessments or interventions that need to be performed after transfer, such as laboratory tests, medication administration, or dressing changes
- Need for any special equipment
- Additional considerations such as allergies, resuscitation status, precautionary considerations, cultural or religious issues, or family issues

---

**Box 7-7**

**Process for Medication Reconciliation**

1. Obtain a list of current medications from the client.
2. Develop an accurate list of newly prescribed medications.
3. Compare new medications to the list of current medications.
4. Identify and investigate any discrepancies and collaborate with the health care provider as necessary.
5. Communicate the finalized list with the client, caregivers, primary health care provider, and other team members.

Discharge Teaching

▪ How to administer prescribed medications
▪ Side and adverse effects of medications that need to be reported to the primary health care provider (PHCP)
▪ Prescribed dietary and activity measures
▪ Complications of the medical condition that need to be reported to the PHCP
▪ How to perform prescribed treatments
▪ How to use special equipment prescribed for the client
▪ Schedule for home care services that are planned
▪ How to access available community resources
▪ When to obtain follow-up care

Box 7-9

Principles and Guidelines of Delegating

▪ Delegate the right task to the right delegatee. Be familiar with the experience of the delegatees, their scopes of practice, their job descriptions, agency policy and procedures, and the state nurse practice act.
▪ Provide clear directions about the task and ensure that the delegatee understands the expectations.
▪ Determine the degree of supervision that may be required.
▪ Provide the delegatee with the authority to complete the task; provide a deadline for completion of the task.
▪ Evaluate the outcome of care that has been delegated.
▪ Provide feedback to the delegatee regarding his or her performance.
▪ In general, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to the assistive personnel (AP).
▪ In general, a licensed practical nurse (LPN) or vocational nurse (VN) can perform not only the tasks that an AP can perform, but also certain invasive tasks, such as dressing changes, suctioning, urinary catheterization, and medication administration (oral, subcutaneous, intramuscular, and selected piggyback medications), according to the education and job description of the LPN or VN. The LPN or VN can data collect and also review with the client teaching plans that were initiated by the registered nurse.
▪ A registered nurse (RN) can perform the tasks that an LPN or VN can perform and is responsible for assessment and planning care, initiating teaching, and administering medications intravenously.
▪ An RN can care for stable and unstable clients.
▪ An LPN or VN cares for stable clients.
An AP provides basic care that does not require any type of assessment; they can perform routine tasks in client care.

### Box 7-10

#### Guidelines for Prioritizing

- The nurse and the client mutually rank the client’s needs in order of importance based on the client’s preferences and expectations, safety, and physical and psychological needs; what the client sees as his or her priority needs may be different from what the nurse sees as the priority needs.
- Priorities are classified as high, intermediate, or low.
- Client needs that are life-threatening or that could result in harm to the client if they are left untreated are high priorities.
- Nonemergency and non–life-threatening client needs are intermediate priorities.
- Client needs that are not related directly to the client’s illness or prognosis are low priorities.
- The nurse can use the ABCs—airway, breathing, and circulation—as a guide when determining priorities; client needs related to maintaining a patent airway are always the priority.
- If cardiopulmonary resuscitation (CPR) is necessary, the order of priority is CAB—compressions, airway, and breathing—this is the exception to using the ABCs when determining priorities.
- When providing care, the nurse needs to decide which needs or problems require immediate action and which ones could be delayed until a later time because they are not urgent.
- The nurse considers client problems that involve actual or life-threatening concerns before potential health-threatening concerns.
- The nurse can use Maslow’s Hierarchy of Needs theory as a guide to determine priorities and to identify the levels of physiological needs, safety, love and belonging, self-esteem, and self-actualization (basic needs are met before moving to other needs in the hierarchy).
- When prioritizing care, the nurse must consider time constraints and available resources.
- Problems identified as important by the client must be given high priority.
- The nurse can use the steps of the nursing process as a guide to determine priorities, remembering that assessment is the first step of the nursing process.
- Prioritization may be different in a disaster or emergency situation, where an action should be taken before gathering further information.

### Box 7-11

#### Types of Disasters
### Human-Made Disasters

- Dam failures resulting in flooding
- Hazardous substance accidents such as pollution, chemical spills, or toxic gas leaks
- Accidents involving release of radioactive material
- Resource shortages such as food, water, and electricity
- Structural collapse, fire, or explosions
- Terrorist attacks such as bombing, riots, and bioterrorism
- Mass transportation accidents

### Natural Disasters

- Avalanches
- Blizzards
- Communicable disease epidemics
- Cyclones
- Droughts
- Earthquakes
- Floods
- Forest fires
- Hailstorms
- Hurricanes
- Landslides
- Mudslides
- Tidal waves
- Tornadoes
- Volcanic eruptions

### Box 7-12

#### Federal Emergency Management Agency (FEMA) Levels of Disaster

**Level I Disaster**
Massive disaster that involves significant damage and results in a presidential disaster declaration, with major federal involvement and full engagement of federal, regional, and national resources

**Level II Disaster**
Moderate disaster that is likely to result in a presidential declaration of an emergency, with moderate federal assistance

**Level III Disaster**
Minor disaster that involves a minimal level of damage but could result in a presidential declaration of an emergency
Box 7-13

Emergency Plans and Supplies

- Plan a meeting place for family members.
- Identify where to go if an evacuation is necessary.
- Determine when and how to turn off water, gas, and electricity at main switches.
- Locate the safe spots in the home for each type of disaster.
- Replace stored water supply every 3 months and stored food supply every 6 months.
- Include the following supplies:
  - Backpack, clean clothing, sturdy footwear
  - Pocket knife or multi-tool
  - A 3-day supply of water (1 gallon per person per day)
  - A 3-day supply of nonperishable food
  - Blankets/sleeping bags/pillows
  - First-aid kit with over-the-counter medications and vitamins
  - Adequate supply of prescription medication
  - Battery-operated radio
  - Flashlight and batteries
  - Credit card, cash, or traveler’s checks
  - Personal ID card, list of emergency contacts, allergies, medical information, list of credit card numbers and bank accounts (all sealed in a water-tight package)
  - Extra set of car keys and a full tank of gas in the car
  - Sanitation supplies for washing, toileting, and disposing of trash; hand sanitizer
  - Extra pair of eyeglasses/sunglasses
  - Special items for infants, older adults, or disabled individuals
  - Items needed for a pet such as food, water, and leash
  - Paper, pens, pencils, maps
  - Cell phone
  - Work gloves
  - Rain gear
  - Roll of duct tape and plastic sheeting
  - Radio and extra batteries
  - Toiletries (basic daily needs, sunscreen, insect repellent, toilet paper)
  - Plastic garbage bags and resealable bags
  - Household bleach for disinfection
  - Whistle
  - Matches in a waterproof container

Emergency Department Triage

**Emergent (Red): Priority 1 (Highest)**
This classification is assigned to clients who have life-threatening injuries and need immediate attention and continuous evaluation but have a high probability for survival when stabilized.

- Such clients include trauma victims, clients with chest pain, clients with severe respiratory distress or cardiac arrest, clients with limb amputation, clients with acute neurological deficits, and clients who have sustained chemical splashes to the eyes.

**Urgent (Yellow): Priority 2**
This classification is assigned to clients who require treatment and whose injuries have complications that are not life-threatening, provided that they are treated within 30 minutes to 2 hours; these clients require continuous evaluation every 30 to 60 minutes thereafter.

- Such clients include clients with an open fracture with a distal pulse and large wounds.

**Nonurgent (Green): Priority 3**
This classification is assigned to clients with local injuries who do not have immediate complications and who can wait at least 2 hours for medical treatment; these clients require evaluation every 1 to 2 hours thereafter.

- Such clients include clients with conditions such as a closed fracture, minor lacerations, sprains, strains, or contusions.

*Note:* Some triage systems include tagging a client “Black” if the victim is dead or soon will be deceased because of severe injuries; these are victims that would not benefit from any care because of the severity of injuries.

**Practice Questions**

29. The nurse is assigned to care for four clients. In planning client rounds, which client should the nurse assess *first*?

1. A postoperative client preparing for discharge with a new medication
2. A client requiring daily dressing changes of a recent surgical incision
3. A client scheduled for a chest x-ray after insertion of a nasogastric tube
4. A client with asthma who requested a breathing treatment during the previous shift
30. The nurse employed in an emergency department is assigned to triage clients coming to the emergency department for treatment on the evening shift. The nurse should assign priority to which client?
   1. A client complaining of muscle aches, a headache, and history of seizures
   2. A client who twisted her ankle when rollerblading and is requesting medication for pain
   3. A client with a minor laceration on the index finger sustained while cutting an eggplant
   4. A client with chest pain who states that he just ate pizza that was made with a very spicy sauce

31. A nursing graduate is attending an agency orientation regarding the nursing model of practice implemented in the health care facility. The nurse is told that the nursing model is a team nursing approach. The nurse determines that which scenario is characteristic of the team-based model of nursing practice?
   1. Each staff member is assigned a specific task for a group of clients.
   2. A staff member is assigned to determine the client’s needs at home and begin discharge planning.
   3. A single registered nurse (RN) is responsible for providing care to a group of 6 clients with the aid of an assistive personnel (AP).
   4. An RN leads 2 licensed practical nurses (LPNs) and 3 APs in providing care to a group of 12 clients.

32. The nurse has received the assignment for the day shift. After making initial rounds and checking all of the assigned clients, which client should the nurse plan to care for first?
   1. A client who is ambulatory demonstrating steady gait
   2. A postoperative client who has just received an opioid pain medication
   3. A client scheduled for physical therapy for the first crutch-walking session
   4. A client with a white blood cell count of $14,000 \text{ mm}^3 (14 \times 10^9/L)$ and a temperature of $38.4^\circ C$

33. The nurse is giving a bed bath to an assigned client when an assistive personnel (AP) enters the client’s room and tells the nurse that another assigned client is in pain and needs pain medication. Which is the most appropriate nursing action?
   1. Finish the bed bath and then administer the pain medication to the other client.
   2. Ask the AP to find out when the last pain medication was given to the client.
   3. Ask the AP to tell the client in pain that medication will be administered as soon as the bed bath is complete.
   4. Cover the client, raise the side rails, tell the client that you will return shortly, and administer the pain medication to the other client.

34. The nurse manager has implemented a change in the method of the nursing delivery system from functional to team nursing. An assistive personnel (AP)
is resistant to the change and is not taking an active part in facilitating the process of change. Which is the best approach in dealing with the AP?

1. Ignore the resistance.
2. Exert coercion on the AP.
3. Provide a positive reward system for the AP.
4. Confront the AP to encourage verbalization of feelings regarding the change.

35. The registered nurse is planning the client assignments for the day. Which is the most appropriate assignment for an assistive personnel (AP)?

- A client requiring a colostomy irrigation
- A client receiving continuous tube feedings
- A client who requires urine specimen collections
- A client with difficulty swallowing food and fluids

36. The nurse manager is discussing the facility protocol in the event of a tornado with the staff. Which instructions should the nurse manager include in the discussion? Select all that apply.

- Open doors to client rooms.
- Move beds away from windows.
- Close window shades and curtains.
- Place blankets over clients who are confined to bed.
- Relocate ambulatory clients from the hallways back into their rooms.

37. The nurse employed in a long-term care facility is planning assignments for the clients on a nursing unit. The nurse needs to assign four clients and has a licensed practical nurse and 3 assistive personnel (APs) on a nursing team. Which client would the nurse most appropriately assign to the licensed practical nurse?

- A client who requires a bed bath
- An older client requiring frequent ambulation
- A client who requires hourly vital sign measurements
- A client requiring abdominal wound irrigations and dressing changes every 3 hours

38. The charge nurse is planning the assignment for the day. Which factors should the nurse remain mindful of when planning the assignment? Select all that apply.

- The acuity level of the clients
- Specific requests from the staff
- The clustering of the rooms on the unit
- The number of anticipated client discharges
- Client needs and workers' needs and abilities
29. **Answer:** 4

**Rationale:** Airway is always the highest priority, and the nurse would attend to the client with asthma who requested a breathing treatment during the previous shift. This could indicate that the client was experiencing difficulty breathing. The clients described in options 1, 2, and 3 have needs that would be identified as intermediate priorities.

**Test-Taking Strategy:** Note the strategic word, *first*. Use the ABCs—airway, breathing, and circulation—to answer the question. Remember that airway is always the highest priority. This will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership/Management: Prioritizing

**Health Problem:** N/A

**Priority Concepts:** Care Coordination; Clinical Judgment

30. **Answer:** 4

**Rationale:** In an emergency department, triage involves brief client assessment to classify clients according to their need for care and includes establishing priorities of care. The type of illness or injury, the severity of the problem, and the resources available govern the process. Clients with trauma, chest pain, severe respiratory distress or cardiac arrest, limb amputation, and acute neurological deficits and those who have sustained chemical splashes to the eyes are classified as emergent and are the highest priority. Clients with conditions such as a simple fracture, asthma without respiratory distress, fever, hypertension, abdominal pain, or a renal stone have urgent needs and are classified as a second priority. Clients with conditions such as a minor laceration, sprain, or cold symptoms are classified as nonurgent and are a third priority.

**Test-Taking Strategy:** Note the strategic word, *priority*. Use the ABCs—airway, breathing, and circulation—to direct you to the correct option. A client experiencing chest pain is always classified as priority 1 until a myocardial infarction has been ruled out.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Leadership/Management: Prioritizing

**Health Problem:** N/A

**Priority Concepts:** Care Coordination; Clinical Judgment

31. **Answer:** 4
**Rationale:** In team nursing, nursing personnel are led by a registered nurse leader in providing care to a group of clients. Option 1 identifies functional nursing. Option 2 identifies a component of case management. Option 3 identifies primary nursing (relationship-based practice).

**Test-Taking Strategy:** Focus on the subject, team nursing. Keep this subject in mind and select the option that best describes a team approach. The correct option is the only one that identifies the concept of a team approach.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership/Management: Delegating/Supervising

**Health Problem:** N/A

**Priority Concepts:** Care Coordination; Collaboration

32. **Answer:** 4

**Rationale:** The nurse should plan to care for the client who has an elevated white blood cell count and a fever first, because this client’s needs are the priority. The client who is ambulatory with steady gait and the client scheduled for physical therapy for a crutch-walking session do not have priority needs. Waiting for pain medication to take effect before providing care to the postoperative client is best.

**Test-Taking Strategy:** Note the strategic word, first, and use principles related to prioritizing. Recalling the normal white blood cell count is 5000 to 10,000 mm\(^3\) (5 to 10 \(\times\) 10\(^9\)/L) and the normal temperature range 97.5° F to 98.6° F (36.4° C to 37° C) will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership/Management: Prioritizing

**Health Problem:** N/A

**Priority Concepts:** Care Coordination; Clinical Judgment

33. **Answer:** 4

**Rationale:** The nurse is responsible for the care provided to assigned clients. The appropriate action in this situation is to provide safety to the client who is receiving the bed bath and prepare to administer the pain medication. Options 1 and 3 delay the administration of medication to the client in pain. Option 2 is not a responsibility of the AP.

**Test-Taking Strategy:** Note the strategic words, most appropriate, and use principles related to priorities of care. Options 1 and 3 are comparable or alike and delay the administration of pain medication, and option 2 is not a responsibility of the AP. The most appropriate action is to plan to administer the medication.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Leadership/Management: Prioritizing  
**Health Problem:** N/A  
**Priority Concepts:** Care Coordination; Clinical Judgment  

34. **Answer:** 4

**Rationale:** Confrontation is an important strategy to meet resistance head-on. Face-to-face meetings to confront the issue at hand will allow verbalization of feelings, identification of problems and issues, and development of strategies to solve the problem. Option 1 will not address the problem. Option 2 may produce additional resistance. Option 3 may provide a temporary solution to the resistance but will not address the concern specifically.

**Test-Taking Strategy:** Note the **strategic word**, *best*. Options 1 and 2 can be eliminated first because of the words *ignore* in option 1 and *coercion* in option 2. From the remaining options, select the correct option over option 3 because the correct option specifically addresses problem-solving measures.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Leadership/Management: Ethical/Legal  
**Health Problem:** N/A  
**Priority Concepts:** Leadership; Professional Identity  

35. **Answer:** 3

**Rationale:** The nurse must determine the most appropriate assignment based on the skills of the staff member and the needs of the client. In this case, the most appropriate assignment for the AP would be to care for the client who requires urine specimen collections. The AP is skilled in this procedure. Colostomy irrigations and tube feedings are not performed by APs because these are invasive procedures. The client with difficulty swallowing food and fluids is at risk for aspiration.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*, and note the **subject**, an assignment to the AP. Eliminate option 4 first because of the words *difficulty swallowing*. Next, eliminate options 1 and 2 because they are **comparable or alike** and are both invasive procedures and as such an AP cannot perform these procedures.

**Level of Cognitive Ability:** Creating  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Leadership/Management: Delegating/Supervising  
**Health Problem:** N/A  
**Priority Concepts:** Care Coordination; Clinical Judgment  
36. **Answer:** 2, 3, 4

**Rationale:** In this weather event, the appropriate nursing actions focus on protecting clients from flying debris or glass. The nurse should close doors to each client’s room and move beds away from windows, and close window shades and curtains to protect clients, visitors, and staff from shattering glass and flying debris. Blankets should be placed over clients confined to bed. Ambulatory clients should be moved into the hallways from their rooms, away from windows.

**Test-Taking Strategy:** Focus on the subject, protecting the client in the event of a tornado. Visualize each of the actions in the options to determine whether these actions would assist in protecting the client and preventing an accident or injury.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Leadership/Management: Management of Care

**Health Problem:** N/A

**Priority Concepts:** Leadership; Professional Identity

**Reference:** Potter et al. (2017), pp. 381, 394.

37. **Answer:** 4

**Rationale:** When delegating nursing assignments, the nurse needs to consider the skills and educational level of the nursing staff. Giving a bed bath, assisting with frequent ambulation, and taking vital signs can be provided most appropriately by an AP. The licensed practical nurse is skilled in wound irrigations and dressing changes and most appropriately would be assigned to the client who needs this care.

**Test-Taking Strategy:** Focus on the subject, assignment to a licensed practical nurse, and note the strategic words, most appropriately. Recall that education and job position as described by the nurse practice act and employee guidelines need to be considered when delegating activities and making assignments. Options 1, 2, and 3 can be eliminated because they are noninvasive tasks that the AP can perform.

**Level of Cognitive Ability:** Creating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership/Management: Delegating/Supervising

**Health Problem:** N/A

**Priority Concepts:** Care Coordination; Clinical Judgment

38. **Answer:** 1, 5

**Rationale:** There are guidelines that the nurse should use when delegating and planning assignments. These include the following: ensure client safety; be aware of individual variations in work abilities; determine which tasks can be delegated and to whom; match the task to the delegatee on the basis of the nurse practice act and appropriate position descriptions; provide directions that are clear, concise, accurate, and complete; validate the delegatee’s understanding of the directions; communicate
a feeling of confidence to the delegatee and provide feedback promptly after the task is performed; and maintain continuity of care as much as possible when assigning client care. Staff requests, convenience as in clustering client rooms, and anticipated changes in unit census are not specific guidelines to use when delegating and planning assignments.

**Test-Taking Strategy:** Focus on the **subject**, guidelines to use when delegating and planning assignments. Read each option carefully and use **Maslow’s Hierarchy of Needs theory**. Note that the correct options directly relate to the client’s needs and client safety.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Leadership/Management: Delegating/Supervising

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Professionalism

**References:** Potter et al. (2017), p. 288.
Introduction

Pyramid to Success

Pyramid Points focus on fluids and electrolytes, acid–base balance, vital signs, laboratory reference intervals, and nutrition. Fluids and electrolytes and acid–base balance constitute a content area that is sometimes complex and difficult to understand. For a client who is experiencing these imbalances, it is important to remember that maintenance of a patent airway is a priority, and the nurse needs to monitor vital signs, physiological status, intake and output, laboratory reference intervals, and arterial blood gas values. Be certain to know the normal vital sign values and the baseline values for each client that you are caring for so that you are able to determine changes in the client status. Remember that pain is also a vital sign, and to assess each client for verbal and nonverbal signs of pain. It is also important to remember that normal laboratory reference levels may vary slightly, depending on the laboratory setting and equipment used in testing. If you are familiar with the normal reference intervals, you will be able to determine whether an abnormality exists when a laboratory value is presented in a question. The specific laboratory reference levels identified in the NCLEX® test plan that you need to know include arterial blood gases known as ABGs (pH, PO₂, Pco₂, SaO₂, HCO₃⁻), blood urea nitrogen (BUN), cholesterol (total), glucose, hematocrit, hemoglobin, glycosylated hemoglobin (HgbA1C), platelets, potassium, sodium, white blood cell (WBC) count, creatinine, prothrombin time (PT), activated partial thromboplastin time (aPTT), and international normalized ratio (INR). The questions on the NCLEX-RN examination related to laboratory reference intervals will require you to identify whether the laboratory value is normal or abnormal, and then you will be required to think critically about the effects of the laboratory value in terms of the client. Note the disorder presented in the question and the associated body organ affected as a result of the disorder. This process will assist you in determining the correct answer.

Nutrition is a basic need that must be met for all clients. The NCLEX-RN examination addresses the dietary measures required for basic needs and for particular body system alterations. When presented with a question related to nutrition, consider the client’s diagnosis and the particular requirement or restriction necessary for treatment of the disorder.

On the NCLEX-RN, safety and infection control concepts, including standard precautions and transmission-based precautions related to client care, are a priority focus. Medication or intravenous (IV) calculation questions are also a focus on the NCLEX-RN examination. Fill-in-the-blank questions may require that you calculate a medication dose or an IV flow rate. Use the on-screen calculator for these medications and IV problems, and then recheck the calculation before selecting an option or typing the answer.
The Pyramid to Success also focuses on the assessment techniques for a health and physical assessment of the adult client and collecting both subjective and objective data. Perioperative nursing care and monitoring for postoperative complications is also a priority. Client safety related to positioning and ambulation are important concepts addressed on the NCLEX. Because many surgical procedures are performed through ambulatory care units (1-day-stay units), Pyramid Points also focus on preparing the client for discharge, assisting with teaching related to the prescribed treatments and medications, follow-up care, and the mobilization of home care support services.

### Client Needs: Learning Objectives

**Safe and Effective Care Environment**

- Acting as an advocate regarding the client’s wishes
- Applying principles of infection control
- Collaborating with interprofessional teams
- Ensuring environmental, personal, and home safety
- Ensuring that the client’s rights, including informed consent, are upheld
- Establishing priorities of client assessment and interventions
- Following advance directives regarding the client’s documented requests
- Following guidelines regarding the use of safety devices
- Handling hazardous and infectious materials safely to prevent injury to health care personnel and others
- Identifying the client with at least two identifiers (e.g., name and identification number)
- Informing the client of the surgical process and ensuring that informed consent for a surgical procedure and other procedures has been obtained
- Knowing the emergency response plan and actions to take for exposure to biological and chemical warfare agents
- Maintaining confidentiality
- Maintaining continuity of care and initiating referrals to home care and other support services
- Maintaining asepsis and preventing infection in the client when samples for laboratory studies are obtained
- Maintaining precautions to prevent errors, accidents, and injury
- Positioning the client appropriately and safely
- Preparing and administering medications, using the rights of medication administration
- Preventing accidents and ensuring safety of the client when a fluid or electrolyte imbalance exists, particularly when changes in cardiovascular, respiratory, gastrointestinal, neuromuscular, renal, or central nervous systems occur, or when the client is at risk for complications such as seizures, respiratory depression, or dysrhythmias
- Preventing a surgical infection
- Protecting the medicated client from injury
Providing information to the client about community classes for nutrition education
Providing safety for the client during implementation of treatments
Using equipment such as electronic IV infusion devices safely
Using ergonomic principles and body mechanics when moving a client
Using special equipment safely
Upholding client rights
Using standard, transmission-based precautions, and surgical asepsis procedures to prevent infection and the transmission of infection to self and others

**Health Promotion and Maintenance**

- Assessing the client’s ability to perform self-care
- Assisting clients and families to identify environmental hazards in the home
- Assessing home safety and the need for modifications
- Discussing high-risk behaviors and lifestyle choices
- Evaluating the client’s home environment for self-care modifications
- Identifying clients at risk for an acid–base imbalance
- Identifying community resources available for follow-up
- Implementing health screening and monitoring for the potential risk for a fluid and electrolyte imbalance
- Performing physical assessment techniques
- Providing education related to medication and diet management
- Providing education related to the potential risk for a fluid and electrolyte imbalance, measures to prevent an imbalance, signs and symptoms of an imbalance, and actions to take if signs and symptoms develop
- Respecting lifestyle choices and health care beliefs and preferences
- Teaching clients and families about accident prevention
- Teaching clients and families about measures to be implemented in an emergency or disaster
- Teaching clients and families about preventing the spread of infection and preventing diseases
- Teaching the client and family about prevention, early detection, and treatment measures for health disorders
- Teaching the client to monitor for signs and symptoms that indicate the need to notify the primary health care provider

**Psychosocial Integrity**

- Assessing the client’s emotional response to treatment
- Considering cultural, religious, and spiritual preferences related to nutritional patterns and lifestyle choices and other factors influencing health
- Promoting an environment that will allow the client to express concerns
- Providing emotional support to the client during testing
- Providing reassurance to the client who is experiencing a fluid or electrolyte imbalance
imbalance
Providing support and continuously informing the client of the purposes for prescribed interventions

Physiological Integrity

Assessing for expected and unexpected responses to therapeutic interventions and documenting findings
Assessing the mobility level of the client
Assisting the client with activities of daily living
Assisting with obtaining an ABG specimen and analyzing the results
Calculating medication doses and IV flow rates
Handling medical or surgical emergencies
Identifying clients who are at risk for a fluid or electrolyte imbalance
Implementing priority nursing actions in an emergency or disaster
Initiating nursing interventions when surgical complications arise
Managing and providing care to clients with infectious diseases
Monitoring for changes in status and for complications; taking actions if a complication arises
Monitoring laboratory reference intervals; determining the significance of an abnormal laboratory value and the need to implement specific actions based on the laboratory results
Monitoring nutritional intake and oral hydration
Monitoring for surgical complications
Monitoring for wound infection
Preventing complications of immobility
Providing comfort and assistance to the client
Providing nutrition and oral intake
Providing interventions compatible with the client’s age; cultural, religious, spiritual and health care beliefs; education level; and language
Providing personal hygiene as needed
Providing site care following arterial blood draw
Recognizing changes in the client’s condition that indicate a potential complication and intervening appropriately
Reducing the likelihood that an acid–base imbalance will occur
Using assistive devices to prevent injury
I. Concepts of Fluid and Electrolyte Balance
   A. Electrolytes
      1. Description: An electrolyte is a substance that, on dissolving in solution, ionizes; that is, some of its molecules split or dissociate into electrically charged atoms or ions (Box 8-1).
      2. Measurement
         a. The metric system is used to measure volumes of fluids—liters (L) or milliliters (mL).
         b. The unit of measure that expresses the combining activity of an electrolyte is the milliequivalent (mEq).
         c. One milliequivalent (1 mEq) of any cation always reacts chemically with 1 mEq of an anion.
         d. Milliequivalents provide information about the number of anions or cations available to combine with other anions or cations.
   
   B. Body fluid compartments (Fig. 8-1)
      1. Description
         a. Fluid in each of the body compartments contains electrolytes.
         b. Each compartment has a particular composition of electrolytes, which differs from that of other compartments.
         c. To function normally, body cells must have fluids and electrolytes in the right compartments and in the right amounts.
d. Whenever an electrolyte moves out of a cell, another electrolyte moves in to take its place.

e. The numbers of cations and anions must be the same for homeostasis to exist.

f. Compartments are separated by semipermeable membranes.

2. Intravascular compartment: Refers to fluid inside a blood vessel

3. Intracellular compartment
   a. The intracellular compartment refers to all fluid inside the cells.
   b. Most bodily fluids are inside the cells.

4. Extracellular compartment
   a. Refers to fluid outside the cells.
   b. The extracellular compartment includes the interstitial fluid, which is fluid between cells (sometimes called the third space), blood, lymph, bone, connective tissue, water, and transcellular fluid.

C. Third-spacing

1. Third-spacing is the accumulation and sequestration of trapped extracellular fluid in an actual or potential body space as a result of disease or injury.

2. The trapped fluid represents a volume loss and is unavailable for normal physiological processes.

3. Fluid may be trapped in body spaces such as the pericardial, pleural, peritoneal, or joint cavities; the bowel; the abdomen; or within soft tissues after trauma or burns.

4. Assessing the intravascular fluid loss caused by third-spacing is difficult. The loss may not be reflected in weight changes or intake and output records and may not become apparent until after organ malfunction occurs.

D. Edema

1. Edema is an excess accumulation of fluid in the interstitial space; it occurs as a result of alterations in oncotic pressure, hydrostatic pressure, capillary permeability, and lymphatic obstruction (see F. Body fluid transport, for descriptions).

2. Localized edema occurs as a result of traumatic injury from accidents or surgery, local inflammatory
processes, or burns.

3. Generalized edema, also called *anasarca*, is an excessive accumulation of fluid in the interstitial space throughout the body and occurs as a result of conditions such as cardiac, renal, or liver failure.

E. Body fluid

1. Description
   a. Body fluids transport **nutrients** to the cells and carry waste products from the cells.
   b. Total body fluid (intracellular and extracellular) amounts to about 60% of body weight in the adult, 55% in the older adult, and 80% in the infant.
   c. Thus infants and older adults are at a higher risk for fluid-related problems than younger adults; children have a greater proportion of body water than adults, and the older adult has the least proportion of body water.

2. Constituents of body fluids
   a. Body fluids consist of water and dissolved substances.
   b. The largest single fluid constituent of the body is water.
   c. Some substances, such as glucose, urea, and creatinine, do not dissociate in solution; that is, they do not separate from their complex forms into simpler substances when they are in solution.
   d. Other substances do dissociate; for example, when sodium chloride is in a solution, it dissociates, or separates, into 2 parts or elements.

F. Body fluid transport

1. Diffusion
   a. Diffusion is the process whereby a solute (substance that is dissolved) may spread through a solution or solvent (solution in which the solute is dissolved).
b. Diffusion of a solute spreads the molecules from an area of higher concentration to an area of lower concentration.

c. A permeable membrane allows substances to pass through it without restriction.

d. A selectively permeable membrane allows some solutes to pass through without restriction but prevents other solutes from passing freely.

e. Diffusion occurs within fluid compartments and from one compartment to another if the barrier between the compartments is permeable to the diffusing substances.

2. Osmosis

a. Osmosis is the movement of solvent molecules across a membrane in response to a concentration gradient, usually from a solution of lower to one of higher solute concentration.

b. Osmotic pressure is the force that draws the solvent from a less concentrated solute through a selectively permeable membrane into a more concentrated solute, thus tending to equalize the concentration of the solvent.

c. If a membrane is permeable to water but not to all solutes present, the membrane is a selective or semipermeable membrane.

d. When a more concentrated solution is on one side of a selectively permeable membrane and a less concentrated solution is on the other side, a pull called *osmotic pressure* draws the water through the membrane to the more concentrated side, or the side with more solute.

3. Filtration

a. Filtration is the movement of solutes and solvents by hydrostatic pressure.

b. The movement is from an area of higher pressure to an area of lower pressure.

4. Hydrostatic pressure
a. Hydrostatic pressure is the force exerted by the weight of a solution.
b. When a difference exists in the hydrostatic pressure on two sides of a membrane, water and diffusible solutes move out of the solution that has the higher hydrostatic pressure by the process of filtration.
c. At the arterial end of the capillary, the hydrostatic pressure is higher than the osmotic pressure; therefore, fluids and diffusible solutes move out of the capillary.
d. At the venous end, the osmotic pressure, or pull, is higher than the hydrostatic pressure, and fluids and some solutes move into the capillary.
e. The excess fluid and solutes remaining in the interstitial spaces are returned to the intravascular compartment by the lymph channels.

5. Osmolality
   a. Osmolality refers to the number of osmotically active particles per kilogram of water; it is the concentration of a solution.
   b. In the body, osmotic pressure is measured in milliosmoles (mOsm).
   c. The normal osmolality of plasma is 275 to 295 mOsm/kg (275 to 295 mmol/kg).

G. Movement of body fluid
   1. Description
      a. Cell membranes and capillary walls separate body compartments.
      b. Cell membranes are selectively permeable; that is, the cell membrane and the capillary wall allow water and some solutes free passage through them.
      c. Several forces affect the movement of water and solutes through the walls of cells and capillaries; for example, the greater the number of particles within the cell, the more pressure exists to force the water through the cell membrane out of the cell.
      d. If the body loses more electrolytes than fluids, as can happen in diarrhea, then
the extracellular fluid contains fewer electrolytes or less solute than the intracellular fluid.

e. Fluids and electrolytes must be kept in balance for health; when they remain out of balance, death can occur.

2. Isotonic solutions

a. When the solutions on both sides of a selectively permeable membrane have established equilibrium or are equal in concentration, they are isotonic.

b. Isotonic solutions are isotonic to human cells, and thus very little osmosis occurs; isotonic solutions have the same osmolality as body fluids.

c. Refer to Chapter 69, Table 69-1, for a list of solutions, types, and uses.

3. Hypotonic solutions

a. When a solution contains a lower concentration of salt or solute than another, more concentrated solution, it is considered hypotonic.

b. A hypotonic solution has less salt or more water than an isotonic solution; these solutions have lower osmolality than body fluids.

c. Hypotonic solutions are hypotonic to the cells; therefore, osmosis would continue in an attempt to bring about balance or equality.

d. Refer to Chapter 69, Table 69-1, for a list of solutions, types, and uses.

4. Hypertonic solutions

a. A solution that has a higher concentration of solutes than another, less concentrated solution is hypertonic; these solutions have a higher osmolality than body fluids.

b. Refer to Chapter 69, Table 69-1, for a list of solutions, types, and uses.

5. Osmotic pressure

a. The amount of osmotic pressure is determined by the concentration of solutes in solution.

b. When the solutions on each side of a selectively permeable membrane are equal in concentration, they are isotonic.
c. A hypotonic solution has less solute than an isotonic solution, whereas a hypertonic solution contains more solute.

6. Active transport
a. If an ion is to move through a membrane from an area of lower concentration to an area of higher concentration, an active transport system is necessary.
b. An active transport system moves molecules or ions against concentration and osmotic pressure.
c. Metabolic processes in the cell supply the energy for active transport.
d. Substances that are transported actively through the cell membrane include ions of sodium, potassium, calcium, iron, and hydrogen; some of the sugars; and the amino acids.

H. Body fluid intake and output (Fig. 8-2)

1. Body fluid intake
a. Water enters the body through 3 sources—orally ingested liquids, water in foods, and water formed by oxidation of foods.
b. About 10 mL of water is released by the metabolism of each 100 calories of fat, carbohydrates, or proteins.

2. Body fluid output
a. Water lost through the skin is called insensible loss (the individual is unaware of losing that water).
b. The amount of water lost by perspiration varies according to the temperature of the environment and of the body.
c. Water lost from the lungs is called insensible loss and is lost through expired air that is saturated with water vapor.
d. The amount of water lost from the lungs varies with the rate and the depth of respiration.
e. Large quantities of water are secreted into the gastrointestinal tract, but almost all of this fluid is reabsorbed.
f. A large volume of electrolyte-containing liquids moves into the gastrointestinal tract and then returns again to the extracellular fluid.
g. Severe diarrhea results in the loss of large quantities of fluids and electrolytes.
h. The kidneys play a major role in regulating fluid and electrolyte balance and excrete the largest quantity of fluid.
i. Normal kidneys can adjust the amount of water and electrolytes leaving the body.
j. The quantity of fluid excreted by the kidneys is determined by the amount of water ingested and the amount of waste and solutes excreted.
k. As long as all organs are functioning normally, the body is able to maintain balance in its fluid content.

II. Maintaining Fluid and Electrolyte Balance
   A. Description
      1. Homeostasis is a term that indicates the relative stability of the internal environment.
      2. Concentration and composition of body fluids must be nearly constant.
      3. When one of the substances in a client is deficient—either fluids or electrolytes—the substance must be replaced normally by the intake of food and water or by therapy such as intravenous (IV) solutions and medications.
      4. When the client has an excess of fluid or electrolytes, therapy is directed toward assisting the body to eliminate the excess.

B. The kidneys play a major role in controlling balance in fluid and electrolytes.
C. The adrenal glands, through the secretion of aldosterone, also aid in controlling extracellular fluid volume by regulating the amount of sodium reabsorbed by the kidneys.
D. Antidiuretic hormone from the pituitary gland regulates the osmotic pressure of extracellular fluid by regulating the amount of water reabsorbed by the kidneys.
If the client has a fluid or an electrolyte imbalance, the nurse must closely monitor the client’s cardiovascular, respiratory, neurological, musculoskeletal, renal, integumentary, and gastrointestinal status.

III. Fluid Volume Deficit
   A. Description
      1. Dehydration occurs when the fluid intake of the body is not sufficient to meet the fluid needs of the body.
      2. The goal of treatment is to restore fluid volume, replace electrolytes as needed, and eliminate the cause of the fluid volume deficit.

   B. Types of fluid volume deficits
      1. Isotonic dehydration
         a. Water and dissolved electrolytes are lost in equal proportions.
         b. Known as hypovolemia, isotonic dehydration is the most common type of dehydration.
         c. Isotonic dehydration results in decreased circulating blood volume and inadequate tissue perfusion.
      2. Hypertonic dehydration
         a. Water loss exceeds electrolyte loss.
         b. The clinical problems that occur result from alterations in the concentrations of specific plasma electrolytes.
         c. Fluid moves from the intracellular compartment into the plasma and interstitial fluid spaces, causing cellular dehydration and shrinkage.
      3. Hypotonic dehydration
         a. Electrolyte loss exceeds water loss.
         b. The clinical problems that occur result from fluid shifts between compartments, causing a decrease in plasma volume.
         c. Fluid moves from the plasma and interstitial fluid spaces into the cells, causing a plasma volume deficit and causing the cells to swell.

   C. Causes of fluid volume deficits
      1. Isotonic dehydration
         a. Inadequate intake of fluids and solutes
         b. Fluid shifts between compartments
c. Excessive losses of isotonic body fluids

2. Hypertonic dehydration—conditions that increase fluid loss, such as excessive perspiration, hyperventilation, ketoacidosis, prolonged fevers, diarrhea, early-stage kidney disease, and diabetes insipidus

3. Hypotonic dehydration
   a. Chronic illness
   b. Excessive fluid replacement (hypotonic)
   c. Kidney disease
   d. Chronic malnutrition

D. Assessment (Table 8-1)

E. Interventions
1. Prevent further fluid losses and increase fluid compartment volumes to normal ranges.
2. Provide oral rehydration therapy if possible and IV fluid replacement if the dehydration is severe; monitor intake and output.
3. In general, isotonic dehydration is treated with isotonic fluid solutions, hypertonic dehydration with hypotonic fluid solutions, and hypotonic dehydration with hypertonic fluid solutions.
4. Administer medications, such as antidiarrheal, antimicrobial, antiemetic, and antipyretic medications, as prescribed to correct the cause and treat any symptoms.
5. Monitor electrolyte values and prepare to administer medication to treat an imbalance, if present.

IV. Fluid Volume Excess
A. Description
1. Fluid intake or fluid retention exceeds the fluid needs of the body.
2. Fluid volume excess is also called overhydration or fluid overload.
3. The goal of treatment is to restore fluid balance, correct electrolyte imbalances if present, and eliminate or control the underlying cause of the overload.

B. Types
1. Isotonic overhydration
   a. Known as hypervolemia, isotonic
overhydration results from excessive fluid in the extracellular fluid compartment.

b. Only the extracellular fluid compartment is expanded, and fluid does not shift between the extracellular and intracellular compartments.

c. Isotonic overhydration causes circulatory overload and interstitial edema; when severe or when it occurs in a client with poor cardiac function, heart failure and pulmonary edema can result.

2. Hypertonic overhydration

a. The occurrence of hypertonic overhydration is rare and is caused by an excessive sodium intake.

b. Fluid is drawn from the intracellular fluid compartment; the extracellular fluid volume expands, and the intracellular fluid volume contracts.

3. Hypotonic overhydration

a. Hypotonic overhydration is known as water intoxication.

b. The excessive fluid moves into the intracellular space, and all body fluid compartments expand.

c. Electrolyte imbalances occur as a result of dilution.

C. Causes

1. Isotonic overhydration

a. Inadequately controlled IV therapy
b. Kidney disease
c. Long-term corticosteroid therapy

2. Hypertonic overhydration

a. Excessive sodium ingestion
b. Rapid infusion of hypertonic saline
c. Excessive sodium bicarbonate therapy

3. Hypotonic overhydration

a. Early kidney disease
b. Heart failure
c. Syndrome of inappropriate antidiuretic hormone secretion
d. Inadequately controlled IV therapy
e. Replacement of isotonic fluid loss with hypotonic fluids
f. Irrigation of wounds and body cavities with hypotonic fluids

D. Assessment (see Table 8-1)

A client with acute kidney injury, chronic kidney disease, and heart failure is at high risk for fluid volume excess.

E. Interventions

1. Prevent further fluid overload and restore normal fluid balance.
2. Administer diuretics; osmotic diuretics may be prescribed initially to prevent severe electrolyte imbalances.
3. Restrict fluid and sodium intake as prescribed.
4. Monitor intake and output; monitor weight.
5. Monitor electrolyte values and prepare to administer medication to treat an imbalance if present.

V. Hypokalemia

The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L).

A. Description

1. Hypokalemia is a serum potassium level lower than 3.5 mEq/L (3.5 mmol/L)
2. Potassium deficit is potentially life-threatening because every body system is affected

B. Causes

1. Actual total body potassium loss
   a. Excessive use of medications such as diuretics or corticosteroids
   b. Increased secretion of aldosterone, such as in Cushing’s syndrome
   c. Vomiting, diarrhea
   d. Wound drainage, particularly gastrointestinal
   e. Prolonged nasogastric suction
   f. Excessive diaphoresis
g. Kidney disease impairing reabsorption of potassium
2. Inadequate potassium intake: Fasting; nothing by mouth status
3. Movement of potassium from the extracellular fluid to the intracellular fluid
   a. Alkalosis
   b. Hyperinsulinism
4. Dilution of serum potassium
   a. Water intoxication
   b. IV therapy with potassium-deficient solutions

C. Assessment (Tables 8-2 and 8-3)

D. Interventions
1. Monitor electrolyte values.
2. Administer potassium supplements orally or intravenously, as prescribed.
3. Oral potassium supplements
   a. Oral potassium supplements may cause nausea and vomiting and should not be taken on an empty stomach; if the client complains of abdominal pain, distention, nausea, vomiting, diarrhea, or gastrointestinal bleeding, the supplement may need to be discontinued.
   b. Liquid potassium chloride has an unpleasant taste and should be taken with juice or another liquid.
4. Intravenously administered potassium (Box 8-2)
5. Institute safety measures for the client experiencing muscle weakness.
6. If the client is taking a potassium-losing diuretic, it may be discontinued; a potassium-sparing (retaining) diuretic may be prescribed.
7. Instruct the client about foods that are high in potassium content (see Box 11-2).

Potassium is never administered by IV push, intramuscular, or
VI. Hyperkalemia
   A. Description
   1. Hyperkalemia is a serum potassium level that exceeds 5.0 mEq/L (5.0 mmol/L)
   2. Pseudohyperkalemia: a condition that can occur due to methods of blood specimen collection and cell lysis; if an increased serum value is obtained in the absence of clinical symptoms, the specimen should be redrawn and evaluated.

   B. Causes
   1. Excessive potassium intake
      a. Overingestion of potassium-containing foods or medications, such as potassium chloride or salt substitutes
      b. Rapid infusion of potassium-containing IV solutions
   2. Decreased potassium excretion
      a. Potassium-sparing (retaining) diuretics
      b. Kidney disease
      c. Adrenal insufficiency, such as in Addison’s disease
   3. Movement of potassium from the intracellular fluid to the extracellular fluid
      a. Tissue damage
      b. Acidosis
      c. Hyperuricemia
      d. Hypercatabolism

   C. Assessment (see Tables 8-2 and 8-3)

   Monitor the client closely for signs of a potassium imbalance. A potassium imbalance can cause cardiac dysrhythmias that can be life-threatening, leading to cardiac arrest!

   D. Interventions
   1. Discontinue IV potassium (keep the IV catheter patent) and withhold oral potassium supplements.
   2. Initiate a potassium-restricted diet.
   3. Prepare to administer potassium-excreting diuretics if renal function is not impaired.
   4. If renal function is impaired, prepare to administer sodium polystyrene sulfonate (oral or rectal route), a cation-exchange resin that promotes gastrointestinal
sodium absorption and potassium excretion.
5. Prepare the client for dialysis if potassium levels are critically high.
6. Prepare for the administration of IV calcium if hyperkalemia is severe, to avert myocardial excitability.
7. Prepare for the IV administration of hypertonic glucose with regular insulin to move excess potassium into the cells.
8. When blood transfusions are prescribed for a client with a potassium imbalance, the client should receive fresh blood, if possible; transfusions of stored blood may elevate the potassium level because the breakdown of older blood cells releases potassium.
9. Teach the client to avoid foods high in potassium (see Box 11-2).
10. Instruct the client to avoid the use of salt substitutes or other potassium-containing substances.
11. Monitor the serum potassium level closely when a client is receiving a potassium-sparing (retaining) diuretic.

VII. Hyponatremia

The normal sodium level is 135 to 145 mEq/L (135 to 145 mmol/L)

A. Description
1. Hyponatremia is a serum sodium level lower than 135 mEq/L (135 mmol/L).
2. Sodium imbalances usually are associated with fluid volume imbalances.

B. Causes
1. Increased sodium excretion
   a. Excessive diaphoresis
   b. Diuretics
   c. Vomiting
   d. Diarrhea
   e. Wound drainage, especially gastrointestinal
   f. Kidney disease
   g. Decreased secretion of aldosterone
2. Inadequate sodium intake
   a. Fasting; nothing by mouth status
   b. Low-salt diet
3. Dilution of serum sodium
   a. Excessive ingestion of hypotonic fluids or irrigation with hypotonic fluids
b. Kidney disease
c. Freshwater drowning
d. Syndrome of inappropriate antidiuretic hormone secretion
e. Hyperglycemia
f. Heart failure

C. Assessment (Table 8-4)

D. Interventions
1. If hyponatremia is accompanied by a fluid volume deficit (hypovolemia), IV sodium chloride infusions are administered to restore sodium content and fluid volume.
2. If hyponatremia is accompanied by fluid volume excess (hypervolemia), osmotic diuretics may be prescribed to promote the excretion of water rather than sodium.
3. If hyponatremia is caused by inappropriate or excessive secretion of antidiuretic hormone, medications that antagonize antidiuretic hormone may be administered.
4. Instruct the client to increase oral sodium intake as prescribed and inform the client about the foods to include in the diet (see Box 11-2).
5. If the client is taking lithium, monitor the lithium level, because hyponatremia can cause diminished lithium excretion, resulting in toxicity.

VIII. Hypernatremia
A. Description: Hypernatremia is a serum sodium level that exceeds 145 mEq/L (145 mmol/L).

B. Causes
1. Decreased sodium excretion
   a. Corticosteroids
   b. Cushing’s syndrome
   c. Kidney disease
   d. Hyperaldosteronism
2. Increased sodium intake: Excessive oral sodium ingestion or excessive administration of sodium-containing IV fluids
3. Decreased water intake: Fasting; nothing-by-mouth
status
4. Increased water loss: Increased rate of metabolism, fever, hyperventilation, infection, excessive diaphoresis, watery diarrhea, diabetes insipidus

C. Assessment (see Table 8-4)

D. Interventions
1. If the cause is fluid loss, prepare to administer IV infusions.
2. If the cause is inadequate renal excretion of sodium, prepare to administer diuretics that promote sodium loss.
3. Restrict sodium and fluid intake as prescribed.

IX. Hypocalcemia

The normal calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L)

A. Description: Hypocalcemia is a serum calcium level lower than 9.0 mg/dL (2.25 mmol/L).

B. Causes

1. Inhibition of calcium absorption from the gastrointestinal tract
   a. Inadequate oral intake of calcium
   b. Lactose intolerance
   c. Malabsorption syndromes such as celiac sprue or Crohn’s disease
   d. Inadequate intake of vitamin D
   e. End-stage kidney disease
2. Increased calcium excretion
   a. Kidney disease, polyuric phase
   b. Diarrhea
   c. Steatorrhea
   d. Wound drainage, especially gastrointestinal
3. Conditions that decrease the ionized fraction of calcium
   a. Hyperproteinemia
   b. Alkalosis
   c. Medications such as calcium chelators or binders
   d. Acute pancreatitis
   e. Hyperphosphatemia
   f. Immobility
   g. Removal or destruction of the
parathyroid glands

C. Assessment (Table 8-5 and Fig. 8-3; also see Table 8-3)

D. Interventions

1. Administer calcium supplements orally or calcium intravenously.

2. When administering calcium intravenously, warm the injection solution to body temperature before administration and administer slowly; monitor for electrocardiographic changes, observe for infiltration, and monitor for hypercalcemia.

3. Administer medications that increase calcium absorption.
   a. Aluminum hydroxide reduces phosphorus levels, causing the countereffect of increasing calcium levels.
   b. Vitamin D aids in the absorption of calcium from the intestinal tract.

4. Provide a quiet environment to reduce environmental stimuli.

5. Initiate seizure precautions.

6. Move the client carefully, and monitor for signs of a pathological fracture.

7. Keep 10% calcium gluconate available for treatment of acute calcium deficit.

8. Instruct the client to consume foods high in calcium (see Box 11-2).

X. Hypercalcemia

A. Description: Hypercalcemia is a serum calcium level that exceeds 10.5 mg/dL (2.75 mmol/L).

B. Causes

1. Increased calcium absorption
   a. Excessive oral intake of calcium
   b. Excessive oral intake of vitamin D

2. Decreased calcium excretion
   a. Kidney disease
   b. Use of thiazide diuretics

3. Increased bone resorption of calcium
   a. Hyperparathyroidism
   b. Hyperthyroidism
c. Malignancy (bone destruction from metastatic tumors)
d. Immobility
e. Use of glucocorticoids

4. Hemoconcentration
   a. Dehydration
   b. Use of lithium
   c. Adrenal insufficiency

C. Assessment (see Tables 8-3 and 8-5)

D. Interventions

A client with a calcium imbalance is at risk for a pathological fracture. Move the client carefully and slowly; assist the client with ambulation.

1. Discontinue IV infusions of solutions containing calcium and oral medications containing calcium or vitamin D.
2. Thiazide diuretics may be discontinued and replaced with diuretics that enhance the excretion of calcium.
3. Administer medications as prescribed that inhibit calcium resorption from the bone, such as phosphorus, calcitonin, bisphosphonates, and prostaglandin synthesis inhibitors (acetylsalicylic acid, nonsteroidal antiinflammatory medications).
4. Prepare the client with severe hypercalcemia for dialysis if medications fail to reduce the serum calcium level.
5. Move the client carefully and monitor for signs of a pathological fracture.
6. Monitor for flank or abdominal pain, and strain the urine to check for the presence of urinary stones.
7. Instruct the client to avoid foods high in calcium (see Box 11-2).

XI. Hypomagnesemia

The normal magnesium level is 1.8 to 2.6 mEq/L (0.74 to 1.07 mmol/L).

A. Description: Hypomagnesemia is a serum magnesium level lower than 1.8 mEq/L (0.74 mmol/L).

B. Causes
1. Insufficient magnesium intake
   a. Malnutrition and starvation
   b. Vomiting or diarrhea
   c. Malabsorption syndrome
   d. Celiac disease
   e. Crohn’s disease
2. Increased magnesium excretion
   a. Medications such as diuretics
   b. Chronic alcoholism
3. Intracellular movement of magnesium
   a. Hyperglycemia
   b. Insulin administration
   c. Sepsis

C. Assessment (Table 8-6; also see Table 8-3)

D. Interventions
1. Because hypocalcemia frequently accompanies hypomagnesemia, interventions also aim to restore normal serum calcium levels.
2. Oral preparations of magnesium may cause diarrhea and increase magnesium loss.
3. Magnesium sulfate by the IV route may be prescribed in ill clients when the magnesium level is low (intramuscular injections cause pain and tissue damage); initiate seizure precautions, monitor serum magnesium levels frequently, and monitor for diminished deep tendon reflexes, suggesting hypermagnesemia, during the administration of magnesium.
4. Instruct the client to increase the intake of foods that contain magnesium (see Box 11-2).

XII. Hypermagnesemia
A. Description: Hypermagnesemia is a serum magnesium level that exceeds 2.6 mEq/L (1.07 mmol/L).

B. Causes
1. Increased magnesium intake
   a. Magnesium-containing antacids and laxatives
   b. Excessive administration of magnesium intravenously
2. Decreased renal excretion of magnesium as a result of renal insufficiency

C. Assessment (see Tables 8-3 and 8-6)

D. Interventions
Calcium gluconate is the antidote for magnesium overdose.

1. Diuretics are prescribed to increase renal excretion of magnesium.

2. Intravenously administered calcium chloride or calcium gluconate may be prescribed to reverse the effects of magnesium on cardiac muscle.

3. Instruct the client to restrict dietary intake of magnesium-containing foods (see Box 11-2).

4. Instruct the client to avoid the use of laxatives and antacids containing magnesium.

XIII. Hypophosphatemia

A. Description

1. Hypophosphatemia is a serum phosphorus (phosphate) level lower than 3.0 mg/dL (0.97 mmol/L).

2. A decrease in the serum phosphorus level is accompanied by an increase in the serum calcium level.

B. Causes

1. Insufficient phosphorus intake: Malnutrition and starvation

2. Increased phosphorus excretion
   a. Hyperparathyroidism
   b. Malignancy
   c. Use of magnesium-based or aluminum hydroxide–based antacids

3. Intracellular shift
   a. Hyperglycemia
   b. Respiratory alkalosis

C. Assessment

1. Cardiovascular
   a. Decreased contractility and cardiac output
   b. Slowed peripheral pulses

2. Respiratory: Shallow respirations

3. Neuromuscular
   a. Weakness
   b. Decreased deep tendon reflexes
   c. Decreased bone density that can cause fractures and alterations in bone shape
4. Central nervous system
   a. Irritability
   b. Confusion
   c. Seizures
5. Hematological
   a. Decreased platelet aggregation and increased bleeding
   b. Immunosuppression

D. Interventions
1. Discontinue medications that contribute to hypophosphatemia.
2. Administer phosphorus orally along with a vitamin D supplement.
3. Prepare to administer phosphorus intravenously when serum phosphorus levels fall below 1 mg/dL and when the client experiences critical clinical manifestations; administer IV phosphorus slowly because of the risks associated with hyperphosphatemia.
4. Assess the renal system before administering phosphorus.
5. Move the client carefully, and monitor for signs of a pathological fracture.
6. Instruct the client to increase the intake of the phosphorus-containing foods while decreasing the intake of any calcium-containing foods (see Box 11-2).

A decrease in the serum phosphorus level is accompanied by an increase in the serum calcium level, and an increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level. This is called a reciprocal relationship.

XIV. Hyperphosphatemia
A. Description
1. Hyperphosphatemia is a serum phosphorus level that exceeds 4.5 mg/dL (1.45 mmol/L).
2. Most body systems tolerate elevated serum phosphorus levels well.
3. An increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level.
4. The problems that occur in hyperphosphatemia center
on the hypocalcemia that results when serum phosphorus levels increase.

B. Causes

1. Decreased renal excretion resulting from renal insufficiency
2. Tumor lysis syndrome
3. Increased intake of phosphorus, including dietary intake or overuse of phosphate-containing laxatives or enemas
4. Hypoparathyroidism

C. Assessment: Refer to assessment of hypocalcemia.

D. Interventions

1. Interventions entail the management of hypocalcemia.

2. Administer phosphate-binding medications that increase fecal excretion of phosphorus by binding phosphorus from food in the gastrointestinal tract.

3. Instruct the client to avoid phosphate-containing medications, including laxatives and enemas.

4. Instruct the client to decrease the intake of food that is high in phosphorus (see Box 11-2).

5. Instruct the client in medication administration: Take phosphate-binding medications, emphasizing that they should be taken with meals or immediately after meals.

---

**Box 8-1**

**Properties of Electrolytes and Their Components**

**Atom**

An atom is the smallest part of an element that still has the properties of the element.

The atom is composed of particles known as the *proton* (positive charge), *neutron* (neutral), and *electron* (negative charge).

Protons and neutrons are in the nucleus of the atom; therefore, the nucleus is positively charged. Electrons carry a negative charge and revolve around the nucleus.

As long as the number of electrons is the same as the number of protons, the atom has no net charge; that is, it is neither positive nor negative. Atoms that gain, lose, or share electrons are no longer neutral.
Molecule

A molecule is 2 or more atoms that combine to form a substance.

Ion

An ion is an atom that carries an electrical charge because it has gained or lost electrons. Some ions carry a negative electrical charge and some carry a positive charge.

Cation

A cation is an ion that has given away or lost electrons and therefore carries a positive charge. The result is fewer electrons than protons, and the result is a positive charge.

Anion

An anion is an ion that has gained electrons and therefore carries a negative charge. When an ion has gained or taken on electrons, it assumes a negative charge and the result is a negatively charged ion.

### Box 8-2

**Precautions With Intravenously Administered Potassium**
Potassium is never given by intravenous (IV) push or by the intramuscular or subcutaneous route.

A dilution of no more than 1 mEq/10 mL (1 mmol/10 mL) of solution is recommended.

Many health care agencies supply prepared IV solutions containing potassium; before administering and frequently during infusion of the IV solution, rotate and invert the bag to ensure that the potassium is distributed evenly throughout the IV solution.

Ensure that the IV bag containing potassium is properly labeled.

The maximum recommended infusion rate is 5 to 10 mEq/hr (5 to 10 mmol/hr), never to exceed 20 mEq/hr (20 mmol/hr) under any circumstances.

A client receiving more than 10 mEq/hr (10 mmol/hr) should be placed on a cardiac monitor and monitored for cardiac changes, and the infusion should be controlled by an infusion device.

Potassium infusion can cause phlebitis; therefore, the nurse should assess the IV site frequently for signs of phlebitis or infiltration. If either occurs, the infusion should be stopped immediately.

The nurse should assess renal function before administering potassium and monitor intake and output during administration.

</table>
39. The nurse is caring for a client with heart failure. On assessment, the nurse notes that the client is dyspneic, and crackles are audible on auscultation. What additional manifestations would the nurse expect to note in this client if excess fluid volume is present?

1. Weight loss and dry skin
2. Flat neck and hand veins and decreased urinary output
3. An increase in blood pressure and increased respirations
4. Weakness and decreased central venous pressure (CVP)

40. The nurse reviews a client’s record and determines that the client is at risk for developing a potassium deficit if which situation is documented?

1. Sustained tissue damage
2. Requires nasogastric suction
3. Has a history of Addison’s disease
4. Uric acid level of 9.4 mg/dL (557 mcmol/L)

41. The nurse reviews a client’s electrolyte laboratory report and notes that the potassium level is 2.5 mEq/L (2.5 mmol/L). Which patterns should the nurse watch for on the electrocardiogram (ECG) as a result of the laboratory value? Select all that apply.

1. U waves
2. Absent P waves
3. Inverted T waves
4. Depressed ST segment
5. Widened QRS complex

42. Potassium chloride intravenously is prescribed for a client with heart failure experiencing hypokalemia. Which actions should the nurse take to plan for preparation and administration of the potassium? Select all that apply.

1. Obtain an intravenous (IV) infusion pump.
2. Monitor urine output during administration.
3. Prepare the medication for bolus administration.
4. Monitor the IV site for signs of infiltration or phlebitis.
5. Ensure that the medication is diluted in the appropriate volume of fluid.
6. Ensure that the bag is labeled so that it reads the volume of potassium in the solution.

43. The nurse is assessing a client with a lactose intolerance disorder for a suspected diagnosis of hypocalcemia. Which clinical manifestation would the nurse expect to note in the client?
   1. Twitching
   2. Hypoactive bowel sounds
   3. Negative Trousseau’s sign
   4. Hypoactive deep tendon reflexes

44. The nurse is caring for a client with Crohn’s disease who has a calcium level of 8 mg/dL (2 mmol/L). Which patterns would the nurse watch for on the electrocardiogram? **Select all that apply.**
   1. U waves
   2. Widened T wave
   3. Prominent U wave
   4. Prolonged QT interval
   5. Prolonged ST segment

45. The nurse reviews the electrolyte results of a client with chronic kidney disease and notes that the potassium level is 5.7 mEq/L (5.7 mmol/L). Which patterns would the nurse watch for on the cardiac monitor as a result of the laboratory value? **Select all that apply.**
   1. ST depression
   2. Prominent U wave
   3. Tall peaked T waves
   4. Prolonged ST segment
   5. Widened QRS complexes

46. Which client is at risk for the development of a sodium level at 130 mEq/L (130 mmol/L)?
   1. The client who is taking diuretics
   2. The client with hyperaldosteronism
   3. The client with Cushing’s syndrome
   4. The client who is taking corticosteroids

47. The nurse is caring for a client with heart failure who is receiving high doses of a diuretic. On assessment, the nurse notes that the client has flat neck veins, generalized muscle weakness, and diminished deep tendon reflexes. The nurse suspects hyponatremia. What additional signs would the nurse expect to note in a client with hyponatremia?
   1. Muscle twitches
   2. Decreased urinary output
   3. Hyperactive bowel sounds
   4. Increased specific gravity of the urine

48. The nurse reviews a client’s laboratory report and notes that the client’s serum phosphorus (phosphate) level is 1.8 mg/dL (0.58 mmol/L). Which
condition most likely caused this serum phosphorus level?
  1. Malnutrition
  2. Renal insufficiency
  3. Hypoparathyroidism
  4. Tumor lysis syndrome

49. The nurse is reading a primary health care provider’s (PHCP’s) progress notes in the client’s record and reads that the PHCP has documented “insensible fluid loss of approximately 800 mL daily.” The nurse makes a notation that insensible fluid loss occurs through which type of excretion?
  1. Urinary output
  2. Wound drainage
  3. Integumentary output
  4. The gastrointestinal tract

50. The nurse is assigned to care for a group of clients. On review of the clients’ medical records, the nurse determines that which client is most likely at risk for a fluid volume deficit?
  1. A client with an ileostomy
  2. A client with heart failure
  3. A client on long-term corticosteroid therapy
  4. A client receiving frequent wound irrigations

51. The nurse caring for a client who has been receiving intravenous (IV) diuretics suspects that the client is experiencing a fluid volume deficit. Which assessment finding would the nurse note in a client with this condition?
  1. Weight loss and poor skin turgor
  2. Lung congestion and increased heart rate
  3. Decreased hematocrit and increased urine output
  4. Increased respirations and increased blood pressure

52. On review of the clients’ medical records, the nurse determines that which client is at risk for fluid volume excess?
  1. The client taking diuretics who has tenting of the skin
  2. The client with an ileostomy from a recent abdominal surgery
  3. The client who requires intermittent gastrointestinal suctioning
  4. The client with kidney disease and a 12-year history of diabetes mellitus

53. Which client is at risk for the development of a potassium level of 5.5 mEq/L (5.5 mmol/L)?
  1. The client with colitis
  2. The client with Cushing’s syndrome
  3. The client who has been overusing laxatives
  4. The client who has sustained a traumatic burn

**Answers**

39. **Answer:** 3

**Rationale:** A fluid volume excess is also known as overhydration or fluid overload and occurs when fluid intake or fluid retention exceeds the fluid needs of the body.
Assessment findings associated with fluid volume excess include cough, dyspnea, crackles, tachypnea, tachycardia, elevated blood pressure, bounding pulse, elevated CVP, weight gain, edema, neck and hand vein distention, altered level of consciousness, and decreased hematocrit. Dry skin, flat neck and hand veins, decreased urinary output, and decreased CVP are noted in fluid volume deficit. Weakness can be present in either fluid volume excess or deficit.

Test-Taking Strategy: Focus on the subject, fluid volume excess. Remember that when there is more than one part to an option, all parts need to be correct in order for the option to be correct. Think about the pathophysiology associated with a fluid volume excess to assist in directing you to the correct option. Also, note that the incorrect options are comparable or alike in that each includes manifestations that reflect a decrease.

Level of Cognitive Ability: Synthesizing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Foundations of Care: Fluids & Electrolytes
Health Problem: Adult Health: Cardiovascular: Heart Failure
Priority Concepts: Fluids and Electrolytes; Perfusion

40. Answer: 2

Rationale: The normal serum potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A potassium deficit is known as hypokalemia. Potassium-rich gastrointestinal fluids are lost through gastrointestinal suction, placing the client at risk for hypokalemia. The client with tissue damage or Addison’s disease and the client with hyperuricemia are at risk for hyperkalemia. The normal uric acid level for a female is 2.7 to 7.3 mg/dL (160 to 430 mcmol/L) and for a male is 4.0 to 8.5 mg/dL (240 to 501 mcmol/L).

Test-Taking Strategy: Note the subject, causes of potassium deficit. First recall the normal uric acid levels and the causes of hyperkalemia to assist in eliminating option 4. For the remaining options, note that the correct option is the only one that identifies a loss of body fluid.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Foundations of Care: Fluids & Electrolytes
Health Problem: N/A
Priority Concepts: Clinical Judgment; Fluids and Electrolytes

41. Answer: 1, 3, 4

Rationale: The normal serum potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level lower than 3.5 mEq/L (3.5 mmol/L) indicates hypokalemia. Potassium deficit is an electrolyte imbalance that can be potentially life-threatening. Electrocardiographic changes include shallow, flat, or inverted T
waves; ST segment depression; and prominent U waves. Absent P waves are not a characteristic of hypokalemia but may be noted in a client with atrial fibrillation, junctional rhythms, or ventricular rhythms. A widened QRS complex may be noted in hyperkalemia and in hypermagnesemia.

**Test-Taking Strategy:** Focus on the subject, the ECG patterns that may be noted with a client with a potassium level of 2.5 mEq/L (2.5 mmol/L). From the information in the question, you need to determine that the client is experiencing severe hypokalemia. From this point, you must know the electrocardiographic changes that are expected when severe hypokalemia exists.

**Content Area:** Foundations of Care: Fluids & Electrolytes

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Fluid and Electrolytes

42. **Answer:** 1, 2, 4, 5, 6

**Rationale:** Potassium chloride administered intravenously must always be diluted in IV fluid and infused via an infusion pump. Potassium chloride is never given by bolus (IV push). Giving potassium chloride by IV push can result in cardiac arrest. The nurse should ensure that the potassium is diluted in the appropriate amount of diluent or fluid. The IV bag containing the potassium chloride should always be labeled with the volume of potassium it contains. The IV site is monitored closely, because potassium chloride is irritating to the veins and there is risk of phlebitis. In addition, the nurse should monitor for infiltration. The nurse monitors urinary output during administration and contacts the primary health care provider if the urinary output is less than 30 mL/hr.

**Test-Taking Strategy:** Focus on the subject, the preparation and administration of potassium chloride intravenously. Think about this procedure and the effects of potassium. Note the word *bolus* in option 3 to assist in eliminating this option.

**Health Problem:** Adult Health: Cardiovascular: Heart Failure

**Priority Concepts:** Clinical Judgment; Safety

**References:** Lewis et al. (2017), p. 282.

43. **Answer:** 1

**Rationale:** A client with lactose intolerance is at risk for developing hypocalcemia, because food products that contain calcium also contain lactose. The normal serum calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L). A serum calcium level lower than 9 mg/dL (2.25 mmol/L) indicates hypocalcemia. Signs of hypocalcemia include paresthesias followed by numbness, hyperactive deep tendon reflexes, and a
positive Trousseau’s or Chvostek’s sign. Additional signs of hypocalcemia include increased neuromuscular excitability, muscle cramps, twitching, tetany, seizures, irritability, and anxiety. Gastrointestinal symptoms include increased gastric motility, hyperactive bowel sounds, abdominal cramping, and diarrhea.

**Test-Taking Strategy:** Note that the three incorrect options are comparable or alike in that they reflect a hypoactivity. The option that is different is the correct option.

**Health Problem:** Adult Health: Gastrointestinal: Nutrition Problems
**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes
**Reference:** Lewis et al. (2017), p. 284.

44. **Answer:** 4, 5

**Rationale:** A client with Crohn’s disease is at risk for hypocalcemia. The normal serum calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L). A serum calcium level lower than 9 mg/dL (2.25 mmol/L) indicates hypocalcemia. Electrocardiographic changes that occur in a client with hypocalcemia include a prolonged QT interval and prolonged ST segment. A shortened ST segment and a widened T wave occur with hypercalcemia. ST depression and prominent U waves occur with hypokalemia.

**Test-Taking Strategy:** Focus on the subject, the electrocardiographic patterns that occur in a client with Crohn’s disease who has a calcium level of 8 mg/dL (2 mmol/L). It is necessary to know this client is at risk for hypocalcemia and that a level of 8 mg/dL (2 mmol/L) is low. Then it is necessary to recall the electrocardiographic changes that occur in hypocalcemia. Remember that hypocalcemia causes a prolonged ST segment and prolonged QT interval.

45. **Answer:** 3, 5

**Rationale:** The client with chronic kidney disease is at risk for hyperkalemia. The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level greater than 5.0 mEq/L (5.0 mmol/L) indicates hyperkalemia. Electrocardiographic changes associated with hyperkalemia include flat P waves, prolonged PR intervals, widened QRS complexes, and tall peaked T waves. ST depression and a prominent U wave occurs in hypokalemia. A prolonged ST segment occurs in hypocalcemia.
**Test-Taking Strategy:** Focus on the subject, a client with chronic kidney disease and the electrocardiographic changes that occur in a potassium imbalance. From the information in the question you need to determine that this condition is a hyperkalemic one. From this point, you must know the electrocardiographic changes that are expected when hyperkalemia exists. Remember that tall peaked T waves, flat P waves, widened QRS complexes, and prolonged PR interval are associated with hyperkalemia.

**Health Problem:** Adult Health: Renal and Urinary: Chronic Kidney Disease  
**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes  
**Reference:** Lewis et al. (2017), p. 281.

46. **Answer:** 1

**Rationale:** The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). A serum sodium level of 130 mEq/L (130 mmol/L) indicates hyponatremia. Hyponatremia can occur in the client taking diuretics. The client taking corticosteroids and the client with hyperaldosteronism or Cushing’s syndrome are at risk for hypernatremia.

**Test-Taking Strategy:** Focus on the subject, the causes of a sodium level of 130 mEq/L (130 mmol/L). First, determine that the client is experiencing hyponatremia. Next, you must know the causes of hyponatremia to direct you to the correct option. Also, recall that when a client takes a diuretic, the client loses fluid and electrolytes.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Foundations of Care: Fluids & Electrolytes  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes  

47. **Answer:** 3

**Rationale:** The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). Hyponatremia is evidenced by a serum sodium level lower than 135 mEq/L (135 mmol/L). Hyperactive bowel sounds indicate hyponatremia. The remaining options are signs of hypernatremia. In hyponatremia, muscle weakness, increased urinary output, and decreased specific gravity of the urine would be noted.

**Test-Taking Strategy:** Focus on the data in the question and the subject of the question, signs of hyponatremia. It is necessary to know the signs of hyponatremia to answer correctly. Also, think about the action and effects of sodium on the body to answer correctly. Remember that increased bowel motility and hyperactive bowel...
sounds indicate hyponatremia.

**Reference:** Lewis et al. (2017), p. 279.

48. **Answer:** 1

**Rationale:** The normal serum phosphorus (phosphate) level is 3.0 to 4.5 mg/dL (0.97 to 1.45 mmol/L). The client is experiencing hypophosphatemia. Causative factors relate to malnutrition or starvation and the use of aluminum hydroxide–based or magnesium-based antacids. Renal insufficiency, hypoparathyroidism, and tumor lysis syndrome are causative factors of hyperphosphatemia.

**Test-Taking Strategy:** Note the strategic words, most likely. Focus on the subject, a serum phosphorus level of 1.8 mg/dL (0.58 mmol/L). First, you must determine that the client is experiencing hypophosphatemia. From this point, think about the effects of phosphorus on the body and recall the causes of hypophosphatemia in order to answer correctly.

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes

49. **Answer:** 3

**Rationale:** Insensible losses may occur without the person’s awareness. Insensible losses occur daily through the skin and the lungs. Sensible losses are those of which the person is aware, such as through urination, wound drainage, and gastrointestinal tract losses.

**Test-Taking Strategy:** Note that the subject of the question is insensible fluid loss. Note that urination, wound drainage, and gastrointestinal tract losses are comparable or alike in that they can be measured for accurate output. Fluid loss through the skin cannot be measured accurately; it can only be approximated.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Content Area:** Foundations of Care: Fluids & Electrolytes

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes

**References:** Lewis et al. (2017), p. 274.
50. Answer: 1

**Rationale:** A fluid volume deficit occurs when the fluid intake is not sufficient to meet the fluid needs of the body. Causes of a fluid volume deficit include vomiting, diarrhea, conditions that cause increased respirations or increased urinary output, insufficient intravenous fluid replacement, draining fistulas, and the presence of an ileostomy or colostomy. A client with heart failure or on long-term corticosteroid therapy or a client receiving frequent wound irrigations is most at risk for fluid volume excess.

**Test-Taking Strategy:** Note the strategic words, most likely. Read the question carefully, noting the subject, the client at risk for a deficit. Read each option and think about the fluid imbalance that can occur in each. The clients with heart failure, on long-term corticosteroid therapy, and receiving frequent wound irrigations retain fluid. The only condition that can cause a deficit is the condition noted in the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Fluids & Electrolytes

**Health Problem:** Adult Health: Gastrointestinal: Dehydration

**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes

**Reference:** Lewis et al. (2017), p. 276.

51. Answer: 1

**Rationale:** A fluid volume deficit occurs when the fluid intake is not sufficient to meet the fluid needs of the body. Assessment findings in a client with a fluid volume deficit include increased respirations and heart rate, decreased central venous pressure (CVP), weight loss, poor skin turgor, dry mucous membranes, decreased urine volume, increased specific gravity of the urine, increased hematocrit, and altered level of consciousness. Lung congestion, increased urinary output, and increased blood pressure are all associated with fluid volume excess.

**Test-Taking Strategy:** Focus on the subject, assessment findings in a fluid volume deficit. Think about the pathophysiology for fluid volume deficit and fluid volume excess to answer correctly. Note that options 2, 3, and 4 are comparable or alike and are manifestations associated with fluid volume excess.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Fluids & Electrolytes

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes

**Reference:** Lewis et al. (2017), p. 276.

52. Answer: 4

**Rationale:** A fluid volume excess is also known as overhydration or fluid overload.
and occurs when fluid intake or fluid retention exceeds the fluid needs of the body. The causes of fluid volume excess include decreased kidney function, heart failure, use of hypotonic fluids to replace isotonic fluid losses, excessive irrigation of wounds and body cavities, and excessive ingestion of sodium. The client taking diuretics, the client with an ileostomy, and the client who requires gastrointestinal suctioning are at risk for fluid volume deficit.

**Test-Taking Strategy:** Focus on the subject, fluid volume excess. Think about the pathophysiology associated with fluid volume excess. Read each option and think about the fluid imbalance that can occur in each. Clients taking diuretics or having ileostomies or gastrointestinal suctioning all lose fluid. The only condition that can cause an excess is the condition noted in the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Fluids & Electrolytes

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes

53. **Answer:** 4

**Rationale:** The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level higher than 5.0 mEq/L (5.0 mmol/L) indicates hyperkalemia. Clients who experience cellular shifting of potassium in the early stages of massive cell destruction, such as with trauma, burns, sepsis, or metabolic or respiratory acidosis, are at risk for hyperkalemia. The client with Cushing’s syndrome or colitis and the client who has been overusing laxatives are at risk for hypokalemia.

**Test-Taking Strategy:** Eliminate the client with colitis and the client overusing laxatives first, because they are comparable or alike, with both reflecting a gastrointestinal loss. From the remaining options, recalling that cell destruction causes potassium shifts will assist in directing you to the correct option. Also, remember that Cushing’s syndrome presents a risk for hypokalemia and that Addison’s disease presents a risk for hyperkalemia.

CHAPTER 9

Acid-Base Balance

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Acid-Base Balance; Oxygenation

I. Hydrogen Ions, Acids, and Bases
   A. Hydrogen ions
      1. Vital to life because hydrogen ions determine the pH of the body, which must be maintained in a narrow range
      2. Expressed as pH; the pH scale is determined by the number of hydrogen ions and goes from 1 to 14; 7 is considered neutral.
      3. The number of hydrogen ions in the body fluid determines whether it is acid (acidosis), alkaline (alkalosis), or neutral.
      4. The pH of body fluid is between 7.35 and 7.45.
   B. Acids
      1. Produced as end products of metabolism
      2. Contain hydrogen ions
      3. Are hydrogen ion donors; they give up hydrogen ions to neutralize or decrease the strength of an acid or to form a weaker base.
   C. Bases
      1. Contain no hydrogen ions
      2. Are hydrogen ion acceptors; they accept hydrogen\(^+\) ions from acids to neutralize or decrease the strength of a base or to form a weaker acid.
      3. Normal serum levels of bicarbonate (HCO\(_3\)) are 21 to 28 mEq/L (21 to 28 mmol/L).

II. Regulatory Systems for Hydrogen Ion Concentration in the Blood
   A. Buffers
      1. Buffers are the fastest-acting regulatory system.
      2. Buffers provide immediate protection against changes in hydrogen ion concentration in the extracellular fluid.
      3. Buffers are reactors that function only to keep the pH within the narrow limits of stability when too much
acid or base is released into the system, and buffers absorb or release hydrogen ions as needed.

4. Buffers serve as a transport mechanism that carries excess hydrogen ions to the lungs.

5. Once the primary buffer systems react, they are consumed, leaving the body less able to withstand further stress until the buffers are replaced.

The underlying cause of an acid-base imbalance needs to be identified and the cause needs to be treated to resolve the imbalance.

B. Primary buffer systems in extracellular fluid

1. Hemoglobin system
   a. System maintains acid-base balance by a process called chloride shift.
   b. Chloride shifts in and out of the cells in response to the level of oxygen (O\textsubscript{2}) in the blood.
   c. For each chloride ion that leaves a red blood cell, a bicarbonate ion enters.
   d. For each chloride ion that enters a red blood cell, a bicarbonate ion leaves.

2. Plasma protein system
   a. The system functions along with the liver to vary the amount of hydrogen ions in the chemical structure of plasma proteins.
   b. Plasma proteins have the ability to attract or release hydrogen ions.

3. Carbonic acid–bicarbonate system
   a. Primary buffer system in the body
   b. The system maintains a pH of 7.4 with a ratio of 20 parts bicarbonate (\textit{HCO}_\textsubscript{3}\textsuperscript{-}) to 1 part carbonic acid (H\textsubscript{2}CO\textsubscript{3}) (Fig. 9-1).
   c. This ratio (20:1) determines the hydrogen ion concentration of body fluid.
   d. Carbonic acid concentration is controlled by the excretion of CO\textsubscript{2} by the lungs; the rate and depth of respiration change in response to changes in the CO\textsubscript{2}.
   e. The kidneys control the bicarbonate concentration and selectively retain or excrete bicarbonate in response to bodily needs.

274
4. Phosphate buffer system
   a. System is present in cells and body fluids and is especially active in the kidneys.
   b. System acts like bicarbonate and neutralizes excess hydrogen ions.

C. Lungs
1. The lungs are the second defense of the body; they interact with the buffer system to maintain acid-base balance.
2. During acidosis, the pH decreases and the respiratory rate and depth increase in an attempt to exhale acids. The carbonic acid created by the neutralizing action of bicarbonate can be carried to the lungs, where it is reduced to CO₂ and water and is exhaled; thus, hydrogen ions are inactivated and exhaled.
3. During alkalosis, the pH increases and the respiratory rate and depth decrease; CO₂ is retained and carbonic acid increases to neutralize and decrease the strength of excess bicarbonate.
4. The action of the lungs is reversible in controlling an excess or deficit.
5. The lungs can hold hydrogen ions until the deficit is corrected or can inactivate hydrogen ions, changing the ions to water molecules to be exhaled along with CO₂, thus correcting the excess.
6. The process of correcting a deficit or excess takes 10 to 30 seconds to complete.
7. The lungs are capable of inactivating only hydrogen ions carried by carbonic acid; excess hydrogen ions created by other mechanisms must be excreted by the kidneys.

Monitor the client’s respiratory status closely. During acidosis, the respiratory rate and depth increase in an attempt to exhale acids. During alkalosis, the respiratory rate and depth decrease; CO₂ is retained to neutralize and decrease the strength of excess bicarbonate.

D. Kidneys
1. The kidneys provide a more inclusive corrective response to acid-base disturbances than other corrective mechanisms, even though the renal excretion of acids and alkalis occurs more slowly.
2. Compensation requires a few hours to several days;
however, the compensation is more thorough and selective than that of other regulators, such as the buffer systems and lungs.

3. During acidosis, the pH decreases and excess hydrogen ions are secreted into the tubules and combine with buffers for excretion in the urine.

4. During alkalosis, the pH increases and excess bicarbonate ions move into the tubules, combine with sodium, and are excreted in the urine.

5. Selective regulation of bicarbonate occurs in the kidneys.
   
   a. The kidneys restore bicarbonate by excreting hydrogen ions and retaining bicarbonate ions.
   
   b. Excess hydrogen ions are excreted in the urine in the form of phosphoric acid.
   
   c. The alteration of certain amino acids in the renal tubules results in a diffusion of ammonia into the kidneys; the ammonia combines with excess hydrogen ions and is excreted in the urine.

E. Potassium (K\(^+\))

1. Potassium plays an exchange role in maintaining acid-base balance.

2. The body changes the potassium level by drawing hydrogen ions into the cells or by pushing them out of the cells (potassium movement across cell membranes is facilitated by transcellular shifting in response to acid-base patterns).

3. The potassium level changes to compensate for hydrogen ion level changes (Fig. 9-2).
   
   a. During acidosis, the body protects itself from the acidic state by moving hydrogen ions into the cells. Therefore, potassium moves out to make room for hydrogen ions and the potassium level increases.

   b. During alkalosis, the cells release hydrogen ions into the blood in an attempt to increase the acidity of the blood; this forces the potassium into the cells and potassium levels decrease.
When the client experiences an acid-base imbalance, monitor the potassium level closely, because the potassium moves in or out of the cells in an attempt to maintain acid-base balance. The resulting hypokalemia or hyperkalemia predisposes the client to associated complications.

III. Respiratory Acidosis

A. Description: The total concentration of buffer base is lower than normal, with a relative increase in hydrogen ion concentration; thus, a greater number of hydrogen ions is circulating in the blood than can be absorbed by the buffer system.

B. Causes (Box 9-1)

1. Respiratory acidosis is caused by primary defects in the function of the lungs or changes in normal respiratory patterns.
2. Any condition that causes an obstruction of the airway leading to hypoventilation or depresses the respiratory system can cause respiratory acidosis.

C. Assessment (Table 9-1)

For any acid-base imbalance, it is important to closely monitor the client’s level of consciousness, use protective measures to ensure safety, and monitor electrolyte levels and follow-up ABG test results.

D. Interventions

1. Monitor for signs of respiratory distress.
2. Administer O₂ as prescribed.
3. Place the client in a semi-Fowler’s position.
4. Encourage and assist the client to turn, cough, and deep breathe.
5. Encourage hydration to thin secretions.
6. Reduce restlessness by improving ventilation rather than by administering tranquilizers, sedatives, or opioids, because these medications further depress respirations.
7. Prepare to administer respiratory treatments as prescribed; suction the client’s airway, if necessary.
8. Prepare for endotracheal intubation and mechanical ventilation if CO₂ levels rise above 50 mm Hg and signs of acute respiratory distress are present.

If the client has a condition that causes an obstruction of the airway or depresses the respiratory system, monitor the client for
IV. **Respiratory Alkalosis**

A. **Description:** A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids.

B. **Causes:** Respiratory alkalosis results from conditions that cause overstimulation of the respiratory system (Box 9-2).

C. **Assessment** (Table 9-2)

D. **Interventions**
   1. Monitor for signs of respiratory distress.
   2. Provide emotional support and reassurance to the client.
   3. Encourage appropriate breathing patterns.
   4. Assist with breathing techniques and breathing aids if needed and as prescribed (voluntary holding of breath, using a rebreathing mask, CO$_2$ breaths with rebreathing into a paper bag).
   5. Provide cautious care with ventilator clients so that they are not forced to take breaths too deeply or rapidly.
   6. Prepare to administer calcium gluconate for tetany as prescribed.

V. **Metabolic Acidosis**

A. **Description:** A total concentration of buffer base that is lower than normal, with a relative increase in the hydrogen ion concentration, resulting from loss of too much base and/or retention of too much acid.

B. **Causes** (Box 9-3)

C. **Assessment** (see Table 9-1)

D. **Interventions**
   1. Monitor for signs of respiratory distress.
   2. Monitor intake and output and assist with fluid and electrolyte replacement as prescribed.
   3. Prepare to administer solutions intravenously as prescribed to increase the buffer base.
   4. Initiate seizure precautions.

*An insufficient supply of insulin in a client with diabetes mellitus can result in metabolic acidosis known as diabetic ketoacidosis.*
E. Interventions in diabetes mellitus and diabetic ketoacidosis

1. Give insulin as prescribed to hasten the movement of glucose into the cells, thereby decreasing the concurrent ketosis.
2. When glucose is being properly metabolized, the body will stop converting fats to glucose.
3. Monitor for circulatory collapse caused by polyuria, which may result from the hyperglycemic state; osmotic diuresis may lead to extracellular volume deficit.

Monitor the client experiencing severe diarrhea for manifestations of metabolic acidosis.

F. Interventions in kidney disease

1. Dialysis may be necessary to remove protein and waste products, thereby lessening the acidotic state.
2. A diet low in protein and high in calories decreases the amount of protein waste products, which in turn lessens the acidosis.

VI. Metabolic Alkalosis

A. Description: A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids.

B. Causes: Metabolic alkalosis results from a dysfunction of metabolism that causes an increased amount of available base solution in the blood or a decrease in available acids in the blood (Box 9-4).

C. Assessment (see Table 9-2)

Monitor the client experiencing excessive vomiting or the client with gastrointestinal suctioning for manifestations of metabolic alkalosis.

D. Interventions

1. Monitor for signs of respiratory distress.
2. Prepare to administer medications and intravenous fluids as prescribed to promote the kidney excretion of bicarbonate.
3. Prepare to replace potassium as prescribed.

VII. Arterial Blood Gases (ABGs) (Table 9-3)
A. Collection of an ABG specimen
1. Obtain vital signs.
2. Determine whether the client has an arterial line in place (allows for arterial blood sampling without further puncture to the client).
3. Perform the **Allen’s test** to determine the presence of collateral circulation (see *Priority Nursing Actions*).
4. Assess factors that may affect the accuracy of the results, such as changes in the O₂ settings, suctioning within the past 20 minutes, and the client’s activities.
5. Provide emotional support to the client.
6. Assist with the specimen draw; prepare a heparinized syringe (if not already prepackaged). After obtaining a specimen, prevent any air entering the syringe, because air can cause a blood gas analysis alteration.
7. Apply pressure immediately to the puncture site following the blood draw; maintain pressure for 5 minutes or for 10 minutes if the client is taking an anticoagulant to decrease the risk of hematoma. Reassess the radial pulse after removing the pressure.
8. Appropriately label the specimen and transport it on ice to the laboratory.
9. On the laboratory form, record the client’s temperature and the type of supplemental O₂ that the client is receiving.

B. Respiratory acid-base imbalances (*Table 9-4*)
1. Remember that the respiratory function indicator is the Pa\textsubscript{CO₂}.
2. In a respiratory imbalance, you will find an opposite relationship between the pH and the Pa\textsubscript{CO₂}; in other words, the pH will be elevated with a decreased Pa\textsubscript{CO₂} (alkalosis) or the pH will be decreased with an elevated Pa\textsubscript{CO₂} (acidosis).
3. Look at the pH and the Pa\textsubscript{CO₂} to determine whether the condition is a respiratory problem.
4. Respiratory acidosis: The pH is decreased; the Pa\textsubscript{CO₂} is elevated.
5. Respiratory alkalosis: The pH is elevated; the Pa\textsubscript{CO₂} is decreased.

C. Metabolic acid-base imbalances (see *Table 9-4*)
1. Remember, the metabolic function indicator is the bicarbonate ion (H\textsubscript{CO₃}⁻).
2. In a metabolic imbalance, there is a corresponding relationship between the pH and the H\textsubscript{CO₃}⁻; in other words, the pH will be elevated and H\textsubscript{CO₃}⁻ will be
elevated (alkalosis), or the pH will be decreased and HCO$_3^-$ will be decreased (acidosis).

3. Look at the pH and the HCO$_3^-$ to determine whether the condition is a metabolic problem.

4. Metabolic acidosis: The pH is decreased; the HCO$_3^-$ is decreased.

5. Metabolic alkalosis: The pH is elevated; the HCO$_3^-$ is elevated.

In a respiratory imbalance, the ABG result indicates an opposite relationship between the pH and the Pa$_{CO_2}$. In a metabolic imbalance, the ABG result indicates a corresponding relationship between the pH and the HCO$_3^-$.

D. Compensation (see Table 9-4)

1. Compensation refers to the body processes that occur to counterbalance the acid-base disturbance.

2. When full compensation has occurred, the pH is within normal limits.

E. Steps for analyzing ABG results (Box 9-5)

F. Mixed acid-base disorders

1. Occurs when 2 or more disorders are present at the same time.

2. The pH will depend on the type and severity of the disorders involved, including any compensatory mechanisms at work, e.g., respiratory acidosis combined with metabolic acidosis will result in a greater decrease in pH than either imbalance occurring alone.

3. Example: Mixed alkalosis can occur if a client begins to hyperventilate due to postoperative pain (respiratory alkalosis) and is also losing acid due to gastric suctioning (metabolic alkalosis).

Priority Nursing Actions

Performing the Allen’s Test Before Radial Artery Puncture

1. Explain the procedure to the client.
2. Apply pressure over the ulnar and radial arteries simultaneously.
3. Ask the client to open and close the hand repeatedly.
4. Release pressure from the ulnar artery while compressing the radial artery.
5. Assess the color of the extremity distal to the pressure point.
6. Document the findings.
Acid-base balance. In the healthy state, a ratio of 1 part carbonic acid to 20 parts bicarbonate provides a normal serum pH between 7.35 and 7.45. Any deviation to the left of 7.35 results in an acidotic state. Any deviation to the right of 7.45 results in an alkalotic state.

**FIG. 9-1** Acid-base balance. In the healthy state, a ratio of 1 part carbonic acid to 20 parts bicarbonate provides a normal serum pH between 7.35 and 7.45. Any deviation to the left of 7.35 results in an acidotic state. Any deviation to the right of 7.45 results in an alkalotic state.

**FIG. 9-2** Movement of potassium in response to changes in the extracellular fluid hydrogen ion concentration.
Causes of Respiratory Acidosis

- Asthma: Spasms resulting from allergens, irritants, or emotions cause the smooth muscles of the bronchioles to constrict, resulting in ineffective gas exchange.
- Atelectasis: Excessive mucus collection, with the collapse of alveolar sacs caused by mucous plugs, infectious drainage, or anesthetic medications, results in ineffective gas exchange.
- Brain trauma: Excessive pressure on the respiratory center or medulla oblongata depresses respirations.
- Bronchiectasis: Bronchi become dilated as a result of inflammation, and destructive changes and weakness in the walls of the bronchi occur.
- Bronchitis: Inflammation causes airway obstruction, resulting in inadequate gas exchange.
- Central nervous system depressants: Depressants such as sedatives, opioids, and anesthetics depress the respiratory center, leading to hypoventilation (excessive sedation from medications may require reversal by opioid antagonist medications); carbon dioxide (CO$_2$) is retained and the hydrogen ion concentration increases.
- Emphysema and chronic obstructive pulmonary disease: Loss of elasticity of alveolar sacs restricts air flow in and out, primarily out, leading to an increased CO$_2$ level.
- Hypoventilation: CO$_2$ is retained and the hydrogen ion concentration increases, leading to the acidotic state; carbonic acid is retained and the pH decreases.
- Pneumonia: Excess mucus production and lung congestion cause airway obstruction, resulting in inadequate gas exchange.
- Pulmonary edema: Extracellular accumulation of fluid in pulmonary tissue causes disturbances in alveolar diffusion and perfusion.
- Pulmonary emboli: Emboli cause obstruction in a pulmonary artery resulting in airway obstruction and inadequate gas exchange.

Table 9-1

Clinical Manifestations of Acidosis
Box 9-2

Causes of Respiratory Alkalosis

- Fever: Causes increased metabolism, resulting in overstimulation of the respiratory system.
- Hyperventilation: Rapid respirations cause the blowing off of carbon dioxide (CO₂), leading to a decrease in carbonic acid.
- Hypoxia: Stimulates the respiratory center in the brainstem, which causes an increase in the respiratory rate in order to increase oxygen (O₂); this causes hyperventilation, which results in a decrease in the CO₂ level.
- Overventilation by mechanical ventilators: The administration of O₂ and the depletion of CO₂ can occur from mechanical ventilation, causing the client to be hyperventilated.
- Pain: Overstimulation of the respiratory center in the brainstem results in a carbonic acid deficit.
- Severe anxiety and hysteria: Often is neurogenic and related to a psychoneurosis; however, this condition leads to vigorous breathing and excessive exhaling of CO₂.

Box 9-3
Causes of Metabolic Acidosis

- Diabetes mellitus or diabetic ketoacidosis: An insufficient supply of insulin causes increased fat metabolism, leading to an excess accumulation of ketones or other acids; the bicarbonate then ends up being depleted.
- Excessive ingestion of acetylsalicylic acid: Causes an increase in the hydrogen ion concentration.
- High-fat diet: Causes a much too rapid accumulation of the waste products of fat metabolism, leading to a buildup of ketones and acids.
- Insufficient metabolism of carbohydrates: When the oxygen supply is not sufficient for the metabolism of carbohydrates, lactic acid is produced and lactic acidosis results.
- Malnutrition: Improper metabolism of nutrients causes fat catabolism, leading to an excess buildup of ketones and acids.
- Renal insufficiency, acute kidney injury, or chronic kidney disease: Increased
waste products of protein metabolism are retained; acids increase, and bicarbonate is unable to maintain acid-base balance.

- Severe diarrhea: Intestinal and pancreatic secretions are normally alkaline; therefore, excessive loss of base leads to acidosis.

**Box 9-4**

**Causes of Metabolic Alkalosis**

- Diuretics: The loss of hydrogen ions and chloride from diuresis causes a compensatory increase in the amount of bicarbonate in the blood.
- Excessive vomiting or gastrointestinal suctioning: Leads to an excessive loss of hydrochloric acid.
- Hyperaldosteronism: Increased renal tubular reabsorption of sodium occurs, with the resultant loss of hydrogen ions.
- Ingestion of and/or infusion of excess sodium bicarbonate: Causes an increase in the amount of base in the blood.
- Massive transfusion of whole blood: The citrate anticoagulant used for the storage of blood is metabolized to bicarbonate.

kPa, Kilopascal; mmol, millimole (10⁻³ mole); PaCO₂, partial pressure of carbon dioxide in arterial blood; PaO₂, partial pressure of oxygen in arterial blood; PvO₂, partial pressure of oxygen in venous blood. Note: Because arterial blood gases are influenced by altitude, the value for PaO₂ decreases as altitude increases.

**Table 9-4**

**Acid-Base Imbalances: Usual Laboratory Value Changes**
If you can remember the following Pyramid Points and Pyramid Steps, you will be able to analyze any blood gas report.

**Pyramid Points**

In acidosis, the pH is decreased.
In alkalosis, the pH is elevated.
The respiratory function indicator is the \( \text{Pa}_2 \).
The metabolic function indicator is the bicarbonate ion (\( \text{HCO}_3^- \)).

**Pyramid Steps**

**Pyramid Step 1**
Look at the arterial blood gas results. Look at the pH. Is the pH elevated or decreased? If the pH is elevated, it reflects alkalosis. If the pH is decreased, it reflects acidosis.

**Pyramid Step 2**
Look at the \( \text{Pa}_2 \). Is the \( \text{Pa}_2 \) elevated or decreased? If the \( \text{Pa}_2 \) reflects an opposite relationship to the pH, the condition is a respiratory imbalance. If the \( \text{Pa}_2 \) does not reflect an opposite relationship to the pH, go to Pyramid Step 3.

**Pyramid Step 3**
Look at the \( \text{HCO}_3^- \). Does the \( \text{HCO}_3^- \) reflect a corresponding relationship with the pH? If it does, the condition is a metabolic imbalance.

**Pyramid Step 4**
Full compensation has occurred if the pH is in a normal range of 7.35 to 7.45. If the pH is not within normal range, look at the respiratory or metabolic function indicators.

If the condition is a respiratory imbalance, look at the \( \text{HCO}_3^- \) to determine the state of compensation.
If the condition is a metabolic imbalance, look at the Pa$_{CO_2}$ to determine the state of compensation. Refer to Table 9-4 for laboratory results in partially compensated and uncompensated conditions.

**Practice Questions**

54. The nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45, Pa$_{CO_2}$ of 30 mm Hg (30 mm Hg), and HCO$_3^-$ of 20 mEq/L (20 mmol/L). The nurse analyzes these results as indicating which condition?
   1. Metabolic acidosis, compensated
   2. Respiratory alkalosis, compensated
   3. Metabolic alkalosis, uncompensated
   4. Respiratory acidosis, uncompensated

55. The nurse is caring for a client with a nasogastric tube that is attached to low suction. The nurse monitors the client for manifestations of which disorder that the client is at risk for?
   1. Metabolic acidosis
   2. Metabolic alkalosis
   3. Respiratory acidosis
   4. Respiratory alkalosis

56. A client with a 3-day history of nausea and vomiting presents to the emergency department. The client is hypoventilating and has a respiratory rate of 10 breaths per minute. The electrocardiogram (ECG) monitor displays tachycardia, with a heart rate of 120 beats per minute. Arterial blood gases are drawn and the nurse reviews the results, expecting to note which finding?
   1. A decreased pH and an increased Pa$_{CO_2}$
   2. An increased pH and a decreased Pa$_{CO_2}$
   3. A decreased pH and a decreased HCO$_3^-$
   4. An increased pH and an increased HCO$_3^-$

57. The nurse is caring for a client having respiratory distress related to an anxiety attack. Recent arterial blood gas values are pH = 7.53, Pa$_{O_2}$ = 72 mm Hg (72 mm Hg), Pa$_{CO_2}$ = 32 mm Hg (32 mm Hg), and HCO$_3^-$ = 28 mEq/L (28 mmol/L). Which conclusion about the client should the nurse make?
   1. The client has acidotic blood.
   2. The client is probably overreacting.
   3. The client is fluid volume overloaded.
   4. The client is probably hyperventilating.

58. The nurse is caring for a client with diabetic ketoacidosis and documents that the client is experiencing Kussmaul’s respirations. Which patterns did the nurse observe? **Select all that apply.**
   1. Respirations that are shallow
   2. Respirations that are increased in rate

288
3. Respirations that are abnormally slow
4. Respirations that are abnormally deep
5. Respirations that cease for several seconds

59. A client who is found unresponsive has arterial blood gases drawn and the results indicate the following: pH is 7.12, Pa\textsubscript{CO\textsubscript{2}} is 90 mm Hg (90 mm Hg), and \textit{HCO\textsubscript{3}}\textsuperscript{-} is 22 mEq/L (22 mmol/L). The nurse interprets the results as indicating which condition?
   1. Metabolic acidosis with compensation
   2. Respiratory acidosis with compensation
   3. Metabolic acidosis without compensation
   4. Respiratory acidosis without compensation

60. The nurse notes that a client’s arterial blood gas (ABG) results reveal a pH of 7.50 and a Pa\textsubscript{CO\textsubscript{2}} of 30 mm Hg (30 mm Hg). The nurse monitors the client for which clinical manifestations associated with these ABG results? Select all that apply.
   1. Nausea
   2. Confusion
   3. Bradypnea
   4. Tachycardia
   5. Hyperkalemia
   6. Lightheadedness

61. The nurse reviews the blood gas results of a client with atelectasis. The nurse analyzes the results and determines that the client is experiencing respiratory acidosis. Which result validates the nurse’s findings?
   1. pH 7.25, Pa\textsubscript{CO\textsubscript{2}} 50 mm Hg (50 mm Hg)
   2. pH 7.35, Pa\textsubscript{CO\textsubscript{2}} 40 mm Hg (40 mm Hg)
   3. pH 7.50, Pa\textsubscript{CO\textsubscript{2}} 52 mm Hg (52 mm Hg)
   4. pH 7.52, Pa\textsubscript{CO\textsubscript{2}} 28 mm Hg (28 mm Hg)

62. The nurse is caring for a client who is on a mechanical ventilator. Blood gas results indicate a pH of 7.50 and a Pa\textsubscript{CO\textsubscript{2}} of 30 mm Hg (30 mm Hg). The nurse has determined that the client is experiencing respiratory alkalosis. Which laboratory value would most likely be noted in this condition?
   1. Sodium level of 145 mEq/L (145 mmol/L)
   2. Potassium level of 3.0 mEq/L (3.0 mmol/L)
   3. Magnesium level of 1.8 (0.74 mmol/L)
   4. Phosphorus level of 3.0 mg/dL (0.97 mmol/L)

63. The nurse is caring for a client with several broken ribs. The client is most likely to experience what type of acid-base imbalance?
   1. Respiratory acidosis from inadequate ventilation
   2. Respiratory alkalosis from anxiety and hyperventilation
   3. Metabolic acidosis from calcium loss due to broken bones
   4. Metabolic alkalosis from taking analgesics containing base
54. **Answer:** 2

**Rationale:** The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the $\text{PaCO}_2$. In this situation, the pH is at the high end of the normal value and the $\text{PCO}_2$ is low. In an alkalotic condition, the pH is elevated. Therefore, the values identified in the question indicate a respiratory alkalosis that is compensated by the kidneys through the renal excretion of bicarbonate. Because the pH has returned to a normal value, compensation has occurred.

**Test-Taking Strategy:** Focus on the data in the question, noting the arterial blood gas results. Remember that in a respiratory imbalance you will find an opposite response between the pH and the $\text{PCO}_2$ as indicated in the question. Therefore, you can eliminate the options reflective of a primary metabolic problem. Also, remember that the pH increases in an alkalotic condition and compensation can be evidenced by a normal pH. The correct option reflects a respiratory alkalotic condition and compensation and describes the blood gas values as indicated in the question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Acid-Base

**Health Problem:** N/A

**Priority Concepts:** Acid-Base Balance; Clinical Judgment

55. **Answer:** 2

**Rationale:** Metabolic alkalosis is defined as a deficit or loss of hydrogen ions or acids or an excess of base (bicarbonate) that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions resulting in hypovolemia, the loss of gastric fluid, excessive bicarbonate intake, the massive transfusion of whole blood, and hyperaldosteronism. Loss of gastric fluid via nasogastric suction or vomiting causes metabolic alkalosis as a result of the loss of hydrochloric acid. The remaining options are incorrect interpretations.

**Test-Taking Strategy:** Focus on the data in the question, a client with a nasogastric tube attached to suction. Remembering that a client receiving nasogastric suction loses hydrochloric acid will direct you to the option identifying an alkalotic condition. Because the question addresses a situation other than a respiratory one, the acid-base disorder would be a metabolic condition.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Acid-Base
Health Problem: Adult Health: Gastrointestinal: Upper GI Disorder
Priority Concepts: Acid-Base Balance; Clinical Judgment

56. Answer: 4

Rationale: Clients experiencing nausea and vomiting would most likely present with metabolic alkalosis resulting from loss of gastric acid, thus causing the pH and HCO$_3^-$ to increase. Symptoms experienced by the client would include a decrease in the respiratory rate and depth, and tachycardia. Option 1 reflects a respiratory acidotic condition. Option 2 reflects a respiratory alkalotic condition, and option 3 reflects a metabolic acidotic condition.

Test-Taking Strategy: Focus on the subject, expected arterial blood gas findings. Note the data in the question and that the client is vomiting. Recalling that vomiting most likely causes metabolic alkalosis will assist in directing you to the correct option.

Level of Cognitive Ability: Synthesizing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Foundations of Care: Acid-Base
Health Problem: Adult Health: Gastrointestinal: Upper GI Disorder
Priority Concepts: Acid-Base Balance; Clinical Judgment

57. Answer: 4

Rationale: The ABG values are abnormal, which supports a physiological problem. The ABGs indicate respiratory alkalosis as a result of hyperventilating, not acidosis. Concluding that the client is overreacting is an inaccurate analysis. No conclusion can be made about a client’s fluid volume status from the information provided.

Test-Taking Strategy: Focus on the data in the question. Note the ABG values and use knowledge to interpret them. Note that the pH is elevated and the Pa$_{CO_2}$ is decreased from normal. This will assist you in determining that the client is experiencing respiratory alkalosis. Next, think about the causes of respiratory alkalosis to answer correctly.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Analysis
Content Area: Foundations of Care: Acid-Base
Health Problem: Mental Health: Anxiety Disorder
Priority Concepts: Acid-Base Balance; Clinical Judgment

58. Answer: 2, 4

Rationale: Kussmaul’s respirations are abnormally deep and increased in rate.
These occur as a result of the compensatory action by the lungs. In bradypnea, respirations are regular but abnormally slow. Apnea is described as respirations that cease for several seconds.

**Test-Taking Strategy:** Focus on the subject, the characteristics of Kussmaul’s respirations. Use knowledge of the description of Kussmaul’s respirations. Recalling that this type of respiration occurs in diabetic ketoacidosis will assist you in answering correctly.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Acid-Base

**Health Problem:** Adult Health: Endocrine: Diabetes Mellitus

**Priority Concepts:** Acid-Base Balance; Glucose Regulation

**Reference:** Lewis et al. (2017), pp. 467, 1144.

59. **Answer:** 4

**Rationale:** The acid-base disturbance is respiratory acidosis without compensation. The normal pH is 7.35 to 7.45. The normal PaCO₂ is 35 to 45 mm Hg (35 to 45 mm Hg). In respiratory acidosis the pH is decreased and the PaCO₂ is elevated. The normal bicarbonate (HCO₃⁻) level is 21 to 28 mEq/L (21 to 28 mmol/L). Because the bicarbonate is still within normal limits, the kidneys have not had time to adjust for this acid-base disturbance. In addition, the pH is not within normal limits. Therefore, the condition is without compensation. The remaining options are incorrect interpretations.

**Test-Taking Strategy:** Focus on the data in the question and the subject, interpretation of arterial blood gas results. Remember that in a respiratory imbalance you will find an opposite response between the pH and the PaCO₂. Also, remember that the pH is decreased in an acidotic condition and that compensation is reflected by a normal pH.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Acid-Base

**Health Problem:** N/A

**Priority Concepts:** Acid-Base Balance; Clinical Judgment

**Reference:** Lewis et al. (2017), pp. 291, 457.

60. **Answer:** 1, 2, 4, 6

**Rationale:** Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Clinical manifestations of respiratory alkalosis include lethargy, lightheadedness, confusion, tachycardia, dysrhythmias related to hypokalemia, nausea, vomiting, epigastric pain, and numbness and tingling of the extremities. Hyperventilation (tachypnea)
occurs. Bradypnea describes respirations that are regular but abnormally slow. Hyperkalemia is associated with acidosis.

**Test-Taking Strategy:** Focus on the subject, the interpretation of ABG values. Note the data in the question to determine that the client is experiencing respiratory alkalosis. Next, it is necessary to think about the pathophysiology that occurs in this acid-base condition and recall the manifestations that occur.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Foundations of Care: Acid-Base
**Health Problem:** N/A
**Priority Concepts:** Acid-Base Balance; Clinical Judgment

61. **Answer:** 1

**Rationale:** Atelectasis is a condition characterized by the collapse of alveoli, preventing the respiratory exchange of oxygen and carbon dioxide in a part of the lungs. The normal pH is 7.35 to 7.45. The normal Pa\textsubscript{CO\textsubscript{2}} is 35 to 45 mm Hg (35 to 45 mm Hg). In respiratory acidosis, the pH is decreased and the Pa\textsubscript{CO\textsubscript{2}} is elevated. Option 2 identifies normal values. Option 3 identifies an alkalotic condition, and option 4 identifies respiratory alkalosis.

**Test-Taking Strategy:** Focus on the subject, the arterial blood gas results in a client with atelectasis. Remember that in a respiratory imbalance you will find an opposite response between the pH and the Pa\textsubscript{CO\textsubscript{2}}. Also, remember that the pH is decreased in an acidotic condition. First eliminate option 2 because it reflects a normal blood gas result. Options 3 and 4 identify an elevated pH, indicating an alkalotic condition. The correct option is the only one that reflects an acidotic condition.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Foundations of Care: Acid-Base
**Health Problem:** N/A
**Priority Concepts:** Acid-Base Balance; Clinical Judgment

62. **Answer:** 2

**Rationale:** Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Some clinical manifestations of respiratory alkalosis include lightheadedness, confusion, tachycardia, dysrhythmias related to hypokalemia, nausea, vomiting, diarrhea, epigastric pain, and numbness and tingling of the extremities. All three incorrect options identify normal laboratory values. The correct option identifies the presence of hypokalemia.
Test-Taking Strategy: Note the strategic words, most likely. Focus on the data in the question and use knowledge about the interpretation of arterial blood gas values to determine that the client is experiencing respiratory alkalosis. Next, recall the manifestations that occur in this condition and the normal laboratory values. The only abnormal laboratory value is the potassium level, the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Foundations of Care: Acid-Base
Health Problem: N/A
Priority Concepts: Acid-Base Balance; Clinical Judgment

63. Answer: 1

Rationale: Respiratory acidosis is most often caused by hypoventilation. The client with broken ribs will have difficulty with breathing adequately and is at risk for hypoventilation and resultant respiratory acidosis. The remaining options are incorrect. Respiratory alkalosis is associated with hyperventilation. There are no data in the question that indicate calcium loss or that the client is taking analgesics containing base products.

Test-Taking Strategy: Note the strategic words, most likely. Focus on the data in the question. Think about the location of the ribs to determine that the client will have difficulty breathing adequately. This will assist in directing you to the correct option. Remembering that hypoventilation results in respiratory acidosis will direct you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Foundations of Care: Acid-Base
Health Problem: Adult Health: Respiratory: Chest Injuries
Priority Concepts: Acid-Base Balance; Clinical Judgment
I. Vital Signs
   A. Description: Vital signs include temperature, pulse, respirations, blood pressure (BP), oxygen saturation (pulse oximetry), and pain assessment.
   B. Guidelines for measuring vital signs
      1. Initial measurement of vital signs provides baseline data on a client’s health status and is used to help identify changes in the client’s health status.
      2. Some vital sign measurements (temperature, pulse, respirations, BP, pulse oximetry) may be delegated to assistive personnel (AP), but the nurse is responsible for interpreting the findings.
      3. The nurse collaborates with the primary health care provider (PHCP) in determining the frequency of vital sign assessment and also makes independent decisions regarding their frequency on the basis of the client’s status.

   The nurse ensures that vital sign measurements are documented correctly and always reports abnormal findings to the PHCP.

C. When vital signs are measured
   1. On initial contact with a client (e.g., when a client is admitted to a health care facility)
   2. During physical assessment of a client
   3. Before and after an invasive diagnostic procedure or surgical procedure
   4. During the administration of medication that affects the cardiac, respiratory, or temperature-controlling
functions (e.g., in a client who has a fever); may be required before, during, and after administration of the medication
5. Before, during, and after a blood transfusion
6. Whenever a client’s condition changes or the client verbalizes unusual feelings such as nonspecific symptoms of physical distress (i.e., feeling funny or different)
7. Whenever an intervention (e.g., ambulation) may affect a client’s condition
8. When a fever or known infection is present (check vital signs every 2 to 4 hours)

II. Temperature
   A. Description
      1. Normal body temperature ranges from 36.4° to 37.5° Celsius (C) (97.5° to 99.5° Fahrenheit [F]); the average in a healthy young adult is 37.0° C (98.6° F).
      2. Common measurement sites are the mouth, rectum (unless contraindicated), axilla, ear, and across the forehead (temporal artery site); various types of electronic measuring devices are commonly used to measure temperature.
      3. Rectal temperatures are usually 1° F (0.5° C) higher and tympanic and axillary temperatures about 1° F (0.5° C) lower than the normal oral temperature.
      4. Know how to convert a temperature to a Fahrenheit or Celsius value (Box 10-1).
   B. Nursing considerations
      1. Time of day
         a. Temperature is generally in the low-normal range at the time of awakening as a result of muscle inactivity.
         b. Afternoon body temperature may be high-normal as a result of the metabolic process, activity, and environmental temperature.
      2. Environmental temperature: Body temperature is lower in cold weather and higher in warm weather.
      3. Age: Temperature may fluctuate during the first year of life because the infant’s heat-regulating mechanism is not fully developed.
      4. Physical exercise: Use of the large muscles creates heat, causing an increase in body temperature.
      5. Menstrual cycle: Temperature decreases slightly just before ovulation but may increase to 1° F above normal during ovulation.
      6. Pregnancy: Body temperature may consistently stay at high-normal because of an increase in the woman’s
metabolic rate.

7. Stress: Emotions increase hormonal secretion, leading to increased heat production and a higher temperature.

8. Illness: Infective agents and the inflammatory response may cause an increase in temperature.

9. The inability to obtain a temperature should not be ignored, because it could represent a condition of hypothermia, a life-threatening condition in very young and older clients.

C. Methods of measurement

1. Oral

   a. If the client has recently consumed hot or cold foods or liquids or has smoked or chewed gum, the nurse must wait 15 to 30 minutes before taking the temperature orally.

   b. The thermometer is placed under the tongue in one of the posterior sublingual pockets; ask the client to keep the tongue down and the lips closed and to not bite down on the thermometer.

2. Rectal

   a. Place the client in the Sims’ position.

   b. The temperature is taken rectally when an accurate temperature cannot be obtained orally or via other methods including by an electronic method, or when the client has nasal congestion, has undergone nasal or oral surgery or had the jaws wired, has a nasogastric tube in place, is unable to keep the mouth closed, or is at risk for seizures.

   c. The thermometer is lubricated and inserted into the rectum, toward the umbilicus, about 1.5 inches (3.8 cm) (no more than 0.5 inch [1.25 cm] in an infant).

   *The temperature is not taken rectally in cardiac clients; the client who has undergone rectal surgery; or the client with diarrhea, fecal impaction, or rectal bleeding or who is at risk for bleeding.*

3. Axillary

   a. This method of taking the temperature
is used when the oral or other methods of temperature measurement are contraindicated.

b. Axillary measurement is not as accurate as the oral, rectal, tympanic, or temporal artery method but is used when other methods of measurement are not possible.

c. The thermometer is placed in the client’s dry axilla, and the client is asked to hold the arm tightly against the chest, resting the arm on the chest; follow the instructions accompanying the measurement device for the amount of time the thermometer should remain in the axillary area.

4. Tympanic

a. The auditory canal is checked for the presence of redness, swelling, discharge, or a foreign body before the probe is inserted; the probe should not be inserted if the client has an inflammatory condition of the auditory canal or if there is discharge from the ear.

b. The reading may be affected by an ear infection or excessive wax blocking the ear canal.

5. Temporal artery

a. Ensure that the client’s forehead is dry.

b. The thermometer probe is placed flush against the skin and slid across the forehead or placed in the area of the temporal artery and held in place.

c. If the client is diaphoretic, the temporal artery thermometer probe may be placed on the neck, just behind the earlobe.

III. Pulse

A. Description

1. Pulse is a palpable bounding of blood flow in a peripheral artery; it is an indirect indicator of circulatory status.

2. The average adult pulse (heart) rate is 60 to 100 beats per minute.

3. Changes in pulse rate are used to evaluate the client’s tolerance of interventions such as ambulation,
bathing, dressing, and exercise.
4. Pedal pulses are checked to determine whether the circulation is blocked in the artery up to that pulse point.
5. When the pedal pulse is difficult to locate, a Doppler ultrasound stethoscope (ultrasonic stethoscope) may be needed to amplify the sounds of pulse waves.

B. Nursing considerations
1. The heart rate slows with age.
2. Exercise increases the heart rate.
3. Emotions stimulate the sympathetic nervous system, increasing the heart rate.
4. Pain increases the heart rate.
5. Increased body temperature causes the heart rate to increase.
6. Stimulant medications increase the heart rate; depressants and medications affecting the cardiac system slow it.
7. When the BP is low, the heart rate is usually increased.
8. Hemorrhage increases the heart rate.

C. Assessing pulse qualities
1. When the pulse is being counted, note the rate, rhythm, strength (force or amplitude), and equality.
2. Once you have checked these parameters, use the grading scale for pulses to assess the information you have elicited (Box 10-2).

D. Pulse points and locations
1. The temporal artery can be palpated anterior to or in the front of the ear.
2. The carotid artery is located in the groove between the trachea and the sternocleidomastoid muscle, medial to and alongside the muscle.
3. The apical pulse may be detected at the left midclavicular, fifth intercostal space.
4. The brachial pulse is located above the elbow at the antecubital fossa, between the biceps and triceps muscles.
5. The radial pulse is located in the groove along the radial or thumb side of the client’s inner wrist.
6. The ulnar pulse is located on the medial side of the wrist (little finger side of the forearm at the wrist).
7. The femoral pulse is located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine.
8. The popliteal pulse is located behind the knee.
9. The posterior tibial pulse is located on the inner side of the ankle, behind and below the medial malleolus.
10. The dorsalis pedis pulse is located on the top of the foot, in line with the groove between the extensor tendons of the great and first toes.

E. Pulse deficit

1. In this condition, the peripheral pulse rate (radial pulse) is less than the ventricular contraction rate (apical pulse).
2. A pulse deficit indicates a lack of peripheral perfusion; it can be an indication of cardiac dysrhythmias.
3. One-examiner technique: Auscultate and count the apical pulse first and then immediately count the radial pulse.
4. Two-examiner technique: One person counts the apical pulse and the other counts the radial pulse simultaneously.
5. A pulse deficit indicates that cardiac contractions are ineffective, failing to send pulse waves to the periphery.
6. If a difference in pulse rate is noted, the PHCP is notified.

IV. Respiration

A. Description

1. Respiration is a mechanism the body uses to exchange gases between the atmosphere and the blood and between the blood and the cells.
2. Respiratory rates vary with age.
3. The normal adult respiratory rate is 12 to 20 breaths per minute.

B. Nursing considerations

1. Many of the factors that affect the pulse rate also affect the respiratory rate.
2. An increased level of carbon dioxide or a lower level of oxygen in the blood results in an increase in respiratory rate.
3. Head injury or increased intracranial pressure will depress the respiratory center in the brain, resulting in shallow respirations or slowed breathing.
4. Medications such as opioid analgesics depress respirations.
5. Additional factors that can affect the respiratory rate
include exercise, pain, anxiety, smoking, and body position.

C. Assessing respiratory rate
1. Count the client’s respirations after measuring the radial pulse. (Continue holding the client’s wrist while counting the respirations or position the hand on the client’s chest.)
2. One respiration includes both inspiration and expiration.
3. The rate, depth, pattern, and sounds are assessed.

The respiratory rate may be counted for 30 seconds and multiplied by 2, except in a client who is known to be very ill or is exhibiting irregular respirations, in which case respirations are counted for 1 full minute.

V. Blood Pressure
A. Description
1. Blood pressure (BP) is the force on the walls of an artery exerted by the pulsating blood under pressure from the heart.
2. The heart’s contraction forces blood under high pressure into the aorta; the peak of maximum pressure when ejection occurs is the systolic pressure; the blood remaining in the arteries when the ventricles relax exerts a force known as the diastolic pressure.
3. The difference between the systolic and diastolic pressures is called the pulse pressure.
4. For an adult (age 18 years and older), a normal BP is a systolic pressure below 120 mm Hg and a diastolic pressure below 80 mm Hg.
5. Categories of hypertension (Box 10-3).
6. In postural (orthostatic) hypotension, a normotensive client exhibits symptoms and low BP on rising to an upright position.
7. To obtain orthostatic vital sign measurements, check the BP and pulse with the client supine, sitting, and standing; readings are obtained 1 to 3 minutes after the client changes position.

B. Nursing considerations
1. Factors affecting BP
   a. BP tends to increase as the aging process progresses.
   b. Stress results in sympathetic
stimulation that increases the BP.
c. The incidence of high BP is higher among African Americans than among Americans of European descent.
d. Antihypertensive medications and opioid analgesics can decrease BP.
e. BP is typically lowest in the early morning, gradually increases during the day, and peaks in the late afternoon and evening.
f. After puberty, males tend to have higher BP than females; after menopause, women tend to have higher BP than men of the same age.
g. Additional factors affecting the BP include smoking, activity, and body weight.

2. Guidelines for measuring BP
   a. Determine the best site for assessment.
   b. Avoid applying a cuff to an extremity into which intravenous (IV) fluids are infusing, where an arteriovenous shunt or fistula is present, on the side on which breast or axillary surgery has been performed, or on an extremity that has been traumatized or is diseased.
   c. The leg may be used if the brachial artery is inaccessible; the cuff is wrapped around the thigh and the stethoscope is placed over the popliteal artery.
   d. Ensure that the client has not smoked or exercised in the 30 minutes before measurement, because both activities can yield falsely high readings.
   e. Have the client assume a sitting (with feet flat on floor) or lying position and then rest for 5 minutes before the measurement; ask the client not to speak during the measurement.
   f. Ensure that the cuff is fully deflated, then wrap it evenly and snugly around the extremity.
   g. Ensure that the stethoscope being used fits the examiner and does not impair hearing.
   h. Document the first Korotkoff sound at
phase 1 (heard as the blood pulsates through the vessel when air is released from the BP cuff and pressure on the artery is reduced) as the systolic pressure, and the beginning of the fifth Korotkoff sound at phase 5 as the diastolic pressure.

i. BP readings obtained electronically with a vital sign monitoring machine should be checked with a manual cuff if there is any concern about the accuracy of the reading.

When taking a BP, select the appropriate cuff size; a cuff that is too small will yield a falsely high reading, and a cuff that is too large will yield a falsely low one.

VI. Pulse Oximetry

A. Description

1. Pulse oximetry is a noninvasive test that registers the oxygen saturation of the client’s hemoglobin.
2. The capillary oxygen saturation \( \text{SaO}_2 \) is recorded as a percentage.
3. The normal value is 95% to 100%.
4. After a hypoxic client uses up the readily available oxygen (measured as the arterial oxygen pressure, \( \text{PaO}_2 \) on arterial blood gas [ABG] testing), the reserve oxygen—that is, oxygen attached to the hemoglobin \( \text{SaO}_2 \)—is drawn on to provide oxygen to the tissues.
5. A pulse oximeter reading can alert the nurse to hypoxemia before clinical signs occur.
6. If pulse oximetry readings are below normal, instruct the client in deep breathing technique and recheck the pulse oximetry.

B. Nursing Considerations

1. A vascular, pulsatile area, such as the fingertip or earlobe, is needed to detect the degree of change in the transmitted light that measures the oxygenated and deoxygenated hemoglobin.
2. Factors that affect light transmission also affect the measurement of \( \text{SpO}_2 \).
3. Some factors that affect light transmission can include sensor movement, fingernail polish, hypotension, anemia, or peripheral vascular disorders.

C. Procedure
1. A sensor is placed on the client’s finger, toe, nose, earlobe, or forehead to measure oxygen saturation, which then is displayed on a monitor.

2. Do not select an extremity with an impediment to blood flow.

A usual pulse oximetry reading is between 95% and 100%. A pulse oximetry reading lower than 90% necessitates PHCP notification; values below 90% are acceptable only in certain chronic conditions. Agency procedures and PHCP prescriptions are followed regarding actions to take for specific readings.

VII. Pain

A. Types of pain

1. Acute/transient pain: Usually associated with an injury, medical condition, or surgical procedure; lasts hours to a few days

2. Chronic/persistent noncancer pain: Usually associated with long-term or chronic illnesses or disorders; may continue for months or even years

3. Chronic/episodic pain: Occurs sporadically over an extended period of time. Pain episodes last for hours, days, or weeks. Examples are migraine headaches and pain related to sickle cell crisis.

4. Cancer pain: Not all people with cancer have pain. Some have acute and/or chronic pain. Cancer pain is usually caused by tumor progression and related pathological processes, invasive procedures, treatment toxicities, infection, and physical limitations.

5. Idiopathic pain: This is a chronic pain in the absence of an identifiable physical or psychological cause or pain perceived as excessive for the extent of an organic pathological condition.

B. Assessment

1. Pain is a highly individual experience.

2. Ask the client to describe pain in terms of timing, location, severity, quality, aggravating and precipitating factors, and relief measures.

3. Ask the client about the use of complementary and alternative therapies to alleviate pain.

4. Pain experienced by the older client may be manifested differently than pain experienced by members of other age groups (e.g., sleep disturbances, changes in gait and mobility, decreased socialization, depression).

5. Clients with cognitive disorders (e.g., a client with...
dementia, a comatose client) may not be able to describe their pain experiences.

6. The nurse should be alert to nonverbal indicators of pain (Box 10-4).

7. Ask the client to use a number-based pain scale (a picture-based scale may be used in children or clients who cannot verbally describe their pain) to rate the degree of pain (Fig. 10-1).

8. Evaluate client response to nonpharmacological interventions.

C. Conventional nonpharmacological interventions

1. Cutaneous stimulation
   a. Techniques include heat, cold, and pressure and vibration. Therapeutic touch and massage are also cutaneous stimulation and may be considered complementary and alternative techniques.
   b. Such treatments may require a PHCP’s prescription.

2. Transcutaneous electrical nerve stimulation (TENS)
   a. TENS is also referred to as percutaneous electrical nerve stimulation (PENS).
   b. This technique, which may require a PHCP’s prescription, involves the application of a battery-operated device that delivers a low electrical current to the skin and underlying tissues to block pain (some similar units can be purchased without a prescription).

3. Binders, slings, and other supportive devices
   a. Cloths or other materials or devices, wrapped around a limb or body part, can ease the pain of strains, sprains, and surgical incisions.
   b. Some devices may require a PHCP’s prescription.
   c. Elevation of the affected body part is another intervention that can reduce swelling; supporting an extremity on a pillow may lessen discomfort.

4. Heat and cold
a. The application of heat and cold or alternating application of the two can sooth pain resulting from muscle strain; cold reduces swelling.
b. In some conditions, such treatment may require a PHCP’s prescription.
c. Heat applications may include warm-water compresses, warm blankets, thermal pads, and tub and whirlpool baths.
d. The temperature of the application must be monitored carefully to help prevent burns; the skin of very young and older clients is extra sensitive to heat.
e. The client should be advised to remove the source of heat or cold if changes in sensation or discomfort occur. If the change in sensation or discomfort is not relieved after removal of the application, the PHCP should be notified.

Ice or heat should be applied with a towel or other barrier between the pack and the skin but should not be left in place for more than 15 to 30 minutes.

D. Complementary and alternative therapies
   1. Description: Therapies are used in addition to conventional treatment to provide healing resources and focus on the mind-body connection (Box 10-5).
   2. Nursing considerations
      a. Some complementary and alternative therapies require a PHCP’s prescription.
      b. Herbal remedies are considered pharmacological therapy by some PHCPs; because of the risk for interaction with prescription medications, it is important that the nurse ask the client about the use of such therapies.
      c. If cultural or spiritual measures are to
be employed, the nurse must elicit from the client the preferred forms of spiritual expression and learn when they are practiced so that they may be integrated into the plan of care.

VIII. Pharmacological Interventions
   A. Nonopioid analgesics
      1. Nonsteroidal antiinflammatory drugs (NSAIDs) and acetylsalicylic acid (aspirin) (Box 10-6)
         a. These medication types are contraindicated if the client has gastric irritation or ulcer disease or an allergy to the medication.
         b. Bleeding is a concern with the use of these medication types.
         c. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
         d. NSAIDs can amplify the effects of anticoagulants.
         e. Hypoglycemia may result for the client taking ibuprofen if the client is concurrently taking an oral antidiabetic agent.
         f. A high risk of toxicity exists if the client is taking ibuprofen concurrently with a calcium channel blocker.

      2. Acetaminophen
         a. Acetaminophen, commonly known as Tylenol, is contraindicated in clients with hepatic or renal disease, alcoholism, or hypersensitivity.
         b. Assess the client for a history of liver dysfunction.
         c. Monitor the client for signs of hepatic damage (e.g., nausea and vomiting, diarrhea, abdominal pain).
         d. Monitor liver function parameters.
         e. Tell the client that self-medication should not continue longer than 10 days in an adult or 5 days in a child because of the risk of hepatotoxicity.
         f. The antidote to acetaminophen is acetylcysteine.

⚠️ The major concern with acetaminophen is
B. Opioid analgesics

1. Description

a. These medications suppress pain impulses but can also suppress respiration and coughing by acting on the respiratory and cough center, located in the medulla of the brainstem.

b. Review the client’s history and note that clients with impaired renal or liver function may only be able to tolerate low doses of opioid analgesics; also assess for allergy.

c. Intravenous route administration produces a faster effect than other routes, but the effect lasts shorter to relieve pain.

d. Opioids, which produce euphoria and sedation, can cause physical dependence.

e. Administer the medication 30 to 60 minutes before painful activities.

f. Monitor the respiratory rate; if it is slower than 12 breaths per minute in an adult, withhold the medication and notify the PHCP.

g. Monitor the pulse; if bradycardia develops, withhold the medication and notify the PHCP.

h. Monitor the BP for hypotension and assess before administering pain medications to decrease the risk of adverse effects.

i. Auscultate the lungs for normal breath sounds.

j. Encourage activities such as turning, deep breathing, and incentive spirometry to help prevent atelectasis and pneumonia.

k. Monitor the client’s level of consciousness.

l. Initiate safety precautions.

m. Monitor intake and output and assess the client for urine retention; also constipation is common with opioid use.
n. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
o. Instruct the client to avoid activities that require alertness.
p. Assess the effectiveness of the medication 30 minutes after administration.
q. Have an opioid antagonist (e.g., naloxone), oxygen, and resuscitation equipment available.
r. In many states, prescriptions for opioid analgesics can be given in only very specific circumstances, and a consent form needs to be obtained from the prescribing provider. Frequent collaboration between the nurse and the provider on continued need for this type of medication should be done.

An electronic infusion device is always used for continuous or dose-demand IV infusion of opioid analgesics.

2. Codeine sulfate
   a. This medication is also used in low doses as a cough suppressant.
   b. It may cause constipation.
   c. Common medications in this class are hydrocodone and oxycodone (synthetic forms).

3. Hydromorphone
   a. The primary concern is respiration depression.
   b. Other effects include drowsiness, dizziness, and orthostatic hypotension.
   c. Monitor vital signs, especially the respiratory rate and BP.

4. Morphine sulfate
   a. Used to ease acute pain resulting from myocardial infarction or cancer, for dyspnea resulting from pulmonary edema, and as a preoperative medication.
b. The major concern is respiratory depression, but postural hypotension, urine retention, constipation, and pupillary constriction may also occur; monitor the client for adverse effects.

c. Morphine may cause nausea and vomiting by increasing vestibular sensitivity.
d. It is contraindicated in severe respiratory disorders, head injuries, severe renal disease, or seizure activity and in the presence of increased intracranial pressure.
e. Monitor the client for urine retention.
f. Monitor bowel sounds for decreased peristalsis; constipation may occur.
g. Monitor the pupil for changes; pinpoint pupils may indicate overdose.

IX. Laboratory Reference Intervals
   For reference throughout the chapter, see Fig. 10-2.
   A. Methods for drawing blood (Table 10-1)
   B. Serum sodium

   1. A major cation of extracellular fluid
   2. Maintains osmotic pressure and acid-base balance, and assists in the transmission of nerve impulses
   3. Is absorbed from the small intestine and excreted in the urine in amounts dependent on dietary intake
   4. Normal reference interval: 135 to 145 mEq/L (135 to 145 mmol/L)

   5. Elevated values occur in the following: dehydration, impaired renal function, increased dietary or IV intake of sodium, primary aldosteronism, use of corticosteroid therapy
   6. Below normal values occur in the following: Addison’s disease, decreased dietary of sodium, diabetic ketoacidosis, diuretic therapy, excessive loss from the gastrointestinal (GI) tract, excessive perspiration, water intoxication
Drawing blood specimens from an extremity in which an IV solution is infusing can produce an inaccurate result, depending on the test being performed and the type of solution infusing. Prolonged use of a tourniquet before venous sampling can increase the blood level of potassium, producing an inaccurate result.

C. Serum potassium

1. A major intracellular cation, potassium regulates cellular water balance, electrical conduction in muscle cells, and acid-base balance.
2. The body obtains potassium through dietary ingestion and the kidneys preserve or excrete potassium, depending on cellular need.
3. Potassium levels are used to evaluate cardiac function, renal function, gastrointestinal function, and the need for IV replacement therapy.
4. If the client is receiving a potassium supplementation, this needs to be noted on the laboratory form.
5. Normal reference interval: 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L)
6. Elevated values occur in the following: acute kidney injury or chronic kidney disease, Addison’s disease, dehydration, diabetic ketoacidosis, excessive dietary or IV intake of potassium, massive tissue destruction, metabolic acidosis
7. Below normal values occur in the following: Burns, Cushing’s syndrome, deficient dietary intake of potassium, diarrhea (severe), diuretic therapy, GI fistula, insulin administration, pyloric obstruction, starvation, vomiting
8. Clients with elevated white blood cell (WBC) counts and platelet counts may have falsely elevated potassium levels.

D. Activated partial thromboplastin time (aPTT)

1. The aPTT evaluates how well the coagulation sequence (intrinsic clotting system) is functioning by measuring the amount of time it takes in seconds for recalciﬁed citrated plasma to clot after partial thromboplastin is added to it.
2. The test screens for deficiencies and inhibitors of all factors, except factors VII and XIII.
3. Usually, the aPTT is used to monitor the effectiveness of heparin therapy and screen for
coagulation disorders.

4. Normal reference interval: 30 to 40 seconds (conventional and SI units [International System of Units]), depending on the type of activator used.

5. If the client is receiving intermittent heparin therapy, draw the blood sample 1 hour before the next scheduled dose.

6. Do not draw samples from an arm into which heparin is infusing.

7. Transport specimen to the laboratory immediately.

8. Provide direct pressure to the venipuncture site for 3 to 5 minutes.

9. The aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy.

10. Elevated values occur in the following: Deficiency of one or more of the following: factor I, II, V, or VIII; factors IX and X; factor XI; and factor XII; hemophilia; heparin therapy; liver disease.

E. Prothrombin time (PT) and international normalized ratio (INR)

1. Prothrombin is a vitamin K–dependent glycoprotein produced by the liver that is necessary for fibrin clot formation.

2. Each laboratory establishes a normal or control value based on the method used to perform the PT test.

3. The PT measures the amount of time it takes in seconds for clot formation and is used to monitor response to warfarin sodium therapy or to screen for dysfunction of the extrinsic clotting system resulting from liver disease, vitamin K deficiency, or disseminated intravascular coagulation.

4. A PT value within 2 seconds (plus or minus) of the control is considered normal.

5. The INR is a frequently used test to measure the effects of some anticoagulants.

6. The INR standardizes the PT ratio and is calculated in the laboratory setting by raising the observed PT ratio to the power of the international sensitivity index specific to the thromboplastin reagent used.

7. If a PT is prescribed, baseline specimen should be drawn before anticoagulation therapy is started; note the time of collection on the laboratory form.

8. Provide direct pressure to the venipuncture site for 3 to 5 minutes.
9. Concurrent warfarin therapy with heparin therapy can lengthen the PT for up to 5 hours after dosing.

10. Diets high in green leafy vegetables can increase the absorption of vitamin K, which shortens the PT.

11. Orally administered anticoagulation therapy usually maintains the PT at 1.5 to 2 times the laboratory control value.

12. Normal reference intervals
   a. PT: 11 to 12.5 seconds (conventional and SI units)
   b. INR: 0.81 to 1.20 (conventional and SI units)

13. For both the PT and INR, elevated values occur in the following: deficiency of one or more of the following: factor I, II, V, VII, or X; liver disease; vitamin K deficiency; warfarin therapy

   ![Warning]
   If the PT value is longer than 25 seconds and the INR is greater than 3.0 in a client receiving standard warfarin therapy (or per agency policy), initiate bleeding precautions.

F. Platelet count

1. Platelets function in hemostatic plug formation, clot retraction, and coagulation factor activation.
2. Platelets are produced by the bone marrow to function in hemostasis.
3. Normal reference interval: 150,000 to 400,000 mm³ (150 to 400 \( \times \) 10⁹/L)
4. Elevated values occur in the following: acute infections, chronic granulocytic leukemia, chronic pancreatitis, cirrhosis, collagen disorders, polycythemia, postsplenectomy; high altitudes and chronic cold weather can increase values.
5. Below normal values occur in the following: acute leukemia, chemotherapy, disseminated intravascular coagulation, hemorrhage, infection, systemic lupus erythematosus, thrombocytopenic purpura.
6. Monitor the venipuncture site for bleeding in clients with known thrombocytopenia.
7. Bleeding precautions should be instituted in clients when the platelet count falls sufficiently below the normal level; the specific value for implementing bleeding precautions usually is determined by agency policy.
Monitor the platelet count closely in clients receiving chemotherapy because of the risk for thrombocytopenia. In addition, any client who will be having an invasive procedure (such as a liver biopsy or thoracentesis) should have coagulation studies and platelet counts done before the procedure.

G. Hemoglobin and hematocrit

1. Hemoglobin is the main component of erythrocytes and serves as the vehicle for transporting oxygen and carbon dioxide.

2. Hematocrit represents red blood cell (RBC) mass and is an important measurement in the presence of anemia or polycythemia (Table 10-2).

3. Fasting is not required for this test.

4. Elevated values occur in the following:
   a. Hemoglobin: chronic obstructive pulmonary disease, high altitudes, polycythemia
   b. Hematocrit: dehydration, high altitudes, polycythemia

5. Below normal values occur in the following:
   a. Hemoglobin: anemia, hemorrhage
   b. Hematocrit: anemia, bone marrow failure, hemorrhage, leukemia, overhydration

H. Lipids

1. Blood lipids consist primarily of cholesterol, triglycerides, and phospholipids.

2. Lipid assessment includes total cholesterol, high-density lipoprotein (HDL), low-density lipoprotein (LDL), and triglycerides.

3. Cholesterol is present in all body tissues and is a major component of LDLs, brain and nerve cells, cell membranes, and some gallbladder stones.

4. Low-density lipoprotein (LDL) transports cholesterol from the liver to the tissues of the body.

5. Triglycerides are synthesized in the liver from fatty acids, protein, and glucose and are obtained from the diet.

6. Increased cholesterol levels, LDL levels, and triglyceride levels place the client at risk for coronary artery disease.

7. HDL helps protect against the risk of coronary artery disease.

8. Instruct the client to abstain from food and fluid, except for water, for 12 to 14 hours and from alcohol for 24 hours before the test.
9. Instruct the client to avoid consuming high-cholesterol foods with the evening meal before the test.
10. Normal reference intervals (Table 10-3).
11. Elevated values occur in the following:
   a. Cholesterol, LDL: biliary obstruction, cirrhosis hyperlipidemia, hypothyroidism, idiopathic hypercholesterolemia, renal disease, uncontrolled diabetes, oral contraceptive use
   b. Triglycerides: diabetes mellitus, hyperlipidemia, hypothyroidism, liver disease
12. Below normal values occur in the following:
   a. Cholesterol, LDL: extensive liver disease, hyperthyroidism, malnutrition, use of corticosteroid therapy
   b. Triglycerides: hyperthyroidism, malabsorption syndrome, malnutrition

I. Fasting blood glucose

1. Glucose is a monosaccharide found in fruits and is formed from the digestion of carbohydrates and the conversion of glycogen by the liver.
2. Glucose is the main source of cellular energy for the body and is essential for brain and erythrocyte function.
3. Fasting blood glucose levels are used to help diagnose diabetes mellitus and hypoglycemia.
4. Instruct the client to fast for 8 to 12 hours before the test.
5. Instruct a client with diabetes mellitus to withhold morning insulin or oral hypoglycemic medication until after the blood is drawn.
6. Normal reference interval: glucose (fasting) 70-99 mg/dL (3.9-5.5 mmol/L).
7. Elevated values occur in the following: acute stress, cerebral lesions, Cushing’s syndrome, diabetes mellitus, hyperthyroidism, pancreatic insufficiency
8. Below normal values occur in the following: Addison’s disease, hepatic disease, hypothyroidism, insulin overdosage, pancreatic tumor, pituitary hypofunction, postdumping syndrome

J. Glycosylated hemoglobin (HgbA1C)

1. HgbA1C is blood glucose bound to hemoglobin.
2. Hemoglobin A$_{1c}$ (glycosylated hemoglobin A; HbA$_{1c}$)
is a reflection of how well blood glucose levels have been controlled for the past 3 to 4 months.

3. Fasting is not required before the test.
5. Elevated values occur in the following: non-diabetic hyperglycemia, poorly controlled diabetes mellitus.
6. Below normal values occur in the following: chronic blood loss, chronic kidney disease, pregnancy, sickle cell anemia.
7. HgbA1C and estimated average glucose (eAG) reference intervals (Table 10-4)

K. Renal function studies

1. Serum creatinine
   a. Creatinine is a specific indicator of renal function.
   b. Increased levels of creatinine indicate a slowing of the glomerular filtration rate.
   c. Instruct the client to avoid excessive exercise for 8 hours and excessive red meat intake for 24 hours before the test.
   d. Normal reference interval: Male: 0.6 to 1.2 mg/dL (53 to 106 mcmol/L); female: 0.5 to 1.1 mg/dL (44 to 97 mcmol/L)
   e. Elevated values occur in severe renal disease.
   f. Below normal values occur in diseases with decreased muscle mass such as muscular dystrophy and myasthenia gravis.

2. Blood urea nitrogen (BUN)
   a. Urea nitrogen is the nitrogen portion of urea, a substance formed in the liver through an enzymatic protein breakdown process.
   b. Urea is normally freely filtered through the renal glomeruli, with a small amount reabsorbed in the tubules and the remainder excreted in the urine.
   c. BUN and creatinine ratios should be analyzed when renal function is evaluated.
   d. Normal reference interval: 10 to
20 mg/dL (3.6 to 7.1 mmol/L)
e. Elevated levels indicate a slowing of the glomerular filtration rate.
f. Elevated values occur in the following:
   burns, dehydration, GI bleeding,
   increase in protein catabolism (fever,
   stress), renal disease, shock, urinary tract infection

g. Below normal values occur in the following:
   fluid overload,
   malnutrition, severe liver damage,
   syndrome of inappropriate antidiuretic hormone

L. White blood cell (WBC) count

1. WBCs function in the immune defense system of the body.
2. The WBC differential provides specific information on WBC types.
3. A “shift to the left” (in the differential) means that an increased number of immature neutrophils is present in the blood.
4. A low total WBC count with a left shift indicates a recovery from bone marrow depression or an infection of such intensity that the demand for neutrophils in the tissue is higher than the capacity of the bone marrow to release them into the circulation.
5. A high total WBC count with a left shift indicates an increased release of neutrophils by the bone marrow in response to an overwhelming infection or inflammation.
6. An increased neutrophil count with a left shift is usually associated with bacterial infection.
7. A “shift to the right” means that cells have more than the usual number of nuclear segments; found in liver disease, Down’s syndrome, and megaloblastic and pernicious anemia.
8. Normal reference interval: 5000 to 10,000 mm$^3$ (5.0 to 10.0 × 10$^9$/L)
9. Elevated values occur in the following: inflammatory and infectious processes, leukemia
10. Below normal values occur in the following: aplastic anemia, autoimmune diseases, overwhelming infection, side effects of chemotherapy and irradiation

Monitor the WBC count and differential closely in clients receiving chemotherapy because of the risk for neutropenia;
neutropenia places the client at risk for infection.

Box 10-1

Body Temperature Conversion

To convert Fahrenheit to Celsius: Degrees Fahrenheit – 32 × 5/9 = Degrees Celsius
Example: 98.2° F – 32 × 5/9 = 36.7° C

To convert Celsius to Fahrenheit: Degrees Celsius × 9/5 + 32 = Degrees Fahrenheit
Example: 38.6° C × 9/5 + 32 = 101.5° F

Box 10-2

Grading Scale for Pulses

4 + = Strong and bounding
3 + = Full pulse, increased
2 + = Normal, easily palpable
1 + = Weak, barely palpable
0 = Absent, not palpable

Box 10-3

Hypertension Categories and Guidelines

Categories

Normal: Less than 120/80 mm Hg
Elevated: Systolic between 120-129 mm Hg and diastolic less than 80 mm Hg
Stage 1: Systolic between 130-139 mm Hg or diastolic between 80-89 mm Hg
Stage 2: Systolic at least 140 mm Hg or diastolic at least 90 mm Hg
Hypertensive crisis: Systolic over 180 mm Hg and/or diastolic over 120 mm Hg, with clients needing prompt changes in medication if there are no other indications of problems, or immediate hospitalization if there are signs of organ damage.

Guidelines

▪ Using proper technique to measure blood pressure.
▪ Use of home blood pressure monitoring using validated devices.
▪ Appropriate training of health care providers to reveal white-coat hypertension.
▪ Only prescribing medication for stage I hypertension if a client has already had a cardiovascular event such as a heart attack or stroke or is at high risk for heart attack or stroke based on age, the presence of diabetes mellitus, chronic kidney
disease, or calculation of atherosclerotic risk (using the same risk calculator used in evaluating high cholesterol).

- Recognizing that many people will need two or more types of medications to control their blood pressure, and that people may take their pills more consistently if multiple medications are combined into a single pill.
- Identifying socioeconomic status and psychosocial stress as risk factors for high blood pressure that should be considered in a client's plan of care.

**Box 10-4**

**Nonverbal Indicators of Pain**

- Moaning
- Crying
- Irritability
- Restlessness
- Grimacing or frowning
- Inability to sleep
- Rigid posture
- Increased blood pressure, heart rate, or respiratory rate
- Nausea
- Diaphoresis
- Use of the FLACC® (face, legs, activity, cry, consolability) scale or FACES® pain scale are appropriate in clients who cannot communicate their pain verbally.

Box 10-5

Complementary and Alternative Therapies

- Acupuncture and acupressure
- Biofeedback
- Chiropractic manipulation
Distraction techniques
Guided imagery and meditation techniques
Herbal therapies
Hypnosis
Laughter and humor
Massage
Relaxation and repositioning techniques
Spiritual measures (e.g., prayer, use of a rosary or prayer beads, reading of scripture)
Therapeutic touch

Box 10-6

Side and Adverse Effects of NSAIDs and Acetylsalicylic Acid

**NSAIDs**

- Gastric irritation
- Hypotension
- Sodium and water retention
- Blood dyscrasias
- Dizziness
- Tinnitus
- Pruritus

**Acetylsalicylic Acid**

- Gastric irritation
- Flushing
- Tinnitus
- Drowsiness
- Headaches
- Vision changes

Pagana KD, Pagana TJ, Pagana TN. Mosby’s *Diagnostic and Laboratory Test Reference*, ed 13, Grafton, IL: Mosby; 450.

**Practice Questions**

64. A client with atrial fibrillation who is receiving maintenance therapy of warfarin sodium has a prothrombin time (PT) of 35 seconds. On the basis of these laboratory values, the nurse anticipates which prescription?

1. Adding a dose of heparin sodium
2. Holding the next dose of warfarin
3. Increasing the next dose of warfarin
4. Administering the next dose of warfarin

65. A staff nurse is precepting a new graduate nurse and the new graduate is assigned to care for a client with chronic pain. Which statement, if made by
the new graduate nurse, indicates the need for further teaching regarding pain management?
1. “I will be sure to ask my client what his pain level is on a scale of 0 to 10.”
2. “I know that I should follow up after giving medication to make sure it is effective.”
3. “I will be sure to cue in to any indicators that the client may be exaggerating their pain.”
4. “I know that pain in the older client might manifest as sleep disturbances or depression.”

66. A client has been admitted to the hospital for gastroenteritis and dehydration. The nurse determines that the client has received adequate volume replacement if the blood urea nitrogen (BUN) level drops to which value?
1. 3 mg/dL (1.08 mmol/L)
2. 15 mg/dL (5.4 mmol/L)
3. 29 mg/dL (10.44 mmol/L)
4. 35 mg/dL (12.6 mmol/L)

67. The nurse is explaining the appropriate methods for measuring an accurate temperature to an assistive personnel (AP). Which method, if noted by the UAP as being an appropriate method, indicates the need for further teaching?
1. Taking a rectal temperature for a client who has undergone nasal surgery
2. Taking an oral temperature for a client with a cough and nasal congestion
3. Taking an axillary temperature for a client who has just consumed hot coffee
4. Taking a temperature on the neck behind the ear using an electronic device for a client who is diaphoretic

68. A client is receiving a continuous intravenous infusion of heparin sodium to treat deep vein thrombosis. The client’s activated partial thromboplastin time (aPTT) is 65 seconds. The nurse anticipates that which action is needed?
1. Discontinuing the heparin infusion
2. Increasing the rate of the heparin infusion
3. Decreasing the rate of the heparin infusion
4. Leaving the rate of the heparin infusion as is

69. A client with a history of heart failure is due for a morning dose of furosemide. Which serum potassium level, if noted in the client’s laboratory report, should be reported before administering the dose of furosemide?
1. 3.2 mEq/L (3.2 mmol/L)
2. 3.8 mEq/L (3.8 mmol/L)
3. 2 mEq/L (4.2 mmol/L)
4. 8 mEq/L (4.8 mmol/L)

70. Several laboratory tests are prescribed for a client, and the nurse reviews the results of the tests. Which laboratory test results should the nurse report?
Select all that apply.
Platelets 35,000 mm$^3$ (35 × 10$^9$/L)
2. Sodium 150 mEq/L (150 mmol/L)
3. Potassium 5.0 mEq/L (5.0 mmol/L)
4. Segmented neutrophils 40% (0.40)
5. Serum creatinine, 1 mg/dL (88.3 mcmol/L)
6. White blood cells, 3000 mm$^3$ (3.0 × 10$^9$/L)

71. The nurse is caring for a client who takes ibuprofen for pain. The nurse is gathering information on the client’s medication history and determines it is necessary to contact the primary health care provider (PHCP) if the client is also taking which medications? Select all that apply.

- 1. Warfarin
- 2. Glimepiride
- 3. Amlodipine
- 4. Simvastatin
- 5. Atorvastatin

72. A client with diabetes mellitus has a glycosylated hemoglobin A$_{1c}$ level of 8%. On the basis of this test result, the nurse plans to teach the client about the need for which measure?

1. Avoiding infection
2. Taking in adequate fluids
3. Preventing and recognizing hypoglycemia
4. Preventing and recognizing hyperglycemia

73. The nurse is caring for a client with a diagnosis of breast cancer who is immunosuppressed. The nurse would consider implementing neutropenic precautions if the client’s white blood cell count was which value?

1. 2000 mm$^3$ (2.0 × 10$^9$/L)
2. 5800 mm$^3$ (5.8 × 10$^9$/L)
3. 8400 mm$^3$ (8.4 × 10$^9$/L)
4. 11,500 mm$^3$ (11.5 × 10$^9$/L)

74. A client brought to the emergency department states that he has accidentally been taking 2 times his prescribed dose of warfarin for the past week. After noting that the client has no evidence of obvious bleeding, the nurse plans to take which action?

1. Prepare to administer an antidote.
2. Draw a sample for type and crossmatch and transfuse the client.
3. Draw a sample for an activated partial thromboplastin time (aPTT) level.
4. Draw a sample for prothrombin time (PT) and international normalized ratio (INR).

75. The nurse is caring for a postoperative client who is receiving demand-dose hydromorphone via a patient-controlled analgesia (PCA) pump for pain.
control. The nurse enters the client’s room and finds the client drowsy and records the following vital signs: temperature 97.2° F (36.2° C) orally, pulse 52 beats per minute, blood pressure 101/58 mm Hg, respiratory rate 11 breaths per minute, and SpO$_2$ of 93% on 3 liters of oxygen via nasal cannula. Which action should the nurse take next?

1. Document the findings.
2. Attempt to arouse the client.
3. Contact the primary health care provider (PHCP) immediately.
4. Check the medication administration history on the PCA pump.

76. An adult female client has a hemoglobin level of 10.8 g/dL (108 mmol/L). The nurse interprets that this result is most likely caused by which condition noted in the client’s history?

1. Dehydration
2. Heart failure
3. Iron deficiency anemia
4. Chronic obstructive pulmonary disease

77. A client with a history of upper gastrointestinal bleeding has a platelet count of 300,000 mm$^3$ (300 × 10$^9$/L). The nurse should take which action after seeing the laboratory results?

1. Report the abnormally low count.
2. Report the abnormally high count.
3. Place the client on bleeding precautions.
4. Place the normal report in the client’s medical record.

**Answers**

64. **Answer:** 2

**Rationale:** The normal PT is 11 to 12.5 seconds (conventional therapy and SI units). A therapeutic PT level is 1.5 to 2 times higher than the normal level. Because the value of 35 seconds is high, the nurse should anticipate that the client would not receive further doses at this time. Therefore, the prescriptions noted in the remaining options are incorrect.

**Test-Taking Strategy:** Focus on the subject, a PT of 35 seconds. Recall the normal range for this value and remember that a PT greater than 25 seconds places the client at risk for bleeding; this will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Foundations of Care: Laboratory Tests

**Health Problem:** Adult Health: Cardiovascular: Dysrhythmias

**Priority Concepts:** Clinical Judgment; Clotting

**Reference:** Lewis et al. (2017), p. 601.

65. **Answer:** 3
**Rationale:** Pain is a highly individual experience, and the new graduate nurse should not assume that the client is exaggerating his pain. Rather, the nurse should frequently assess the pain and intervene accordingly through the use of both nonpharmacological and pharmacological interventions. The nurse should assess pain using a number-based scale or a picture-based scale for clients who cannot verbally describe their pain to rate the degree of pain. The nurse should follow up with the client after giving medication to ensure that the medication is effective in managing the pain. Pain experienced by the older client may be manifested differently than pain experienced by clients in other age groups, and they may have sleep disturbances, changes in gait and mobility, decreased socialization, and depression; the nurse should be aware of this attribute in this population.

**Test-Taking Strategy:** Note the strategic words, need for further teaching. These words indicate a negative event query and the need to select the incorrect statement as the answer. Recall that pain is a highly individual experience, and the nurse should not assume that the client is exaggerating pain.

**Level of Cognitive Ability:** Evaluating
**Client Needs:** Physiological Integrity
**Integrated Process:** Teaching and Learning
**Content Area:** Skills: Vital Signs
**Health Problem:** Adult Health: Neurological: Pain
**Priority Concepts:** Clinical Judgment; Pain
**Reference:** Lewis et al. (2017), pp. 110-111, 123.

66. Answer: 2

**Rationale:** The normal BUN level is 10 to 20 mg/dL (3.6 to 7.1 mmol/L). Values of 29 mg/dL (10.44 mmol/L) and 35 mg/dL (12.6 mmol/L) reflect continued dehydration. A value of 3 mg/dL (1.08 mmol/L) reflects a lower than normal value, which may occur with fluid volume overload, among other conditions.

**Test-Taking Strategy:** Focus on the subject, adequate fluid replacement and the normal BUN level. The correct option is the only option that identifies a normal value.

**Level of Cognitive Ability:** Evaluating
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Evaluation
**Content Area:** Foundations of Care: Laboratory Tests
**Health Problem:** Adult Health: Gastrointestinal: Dehydration
**Priority Concepts:** Fluids and Electrolytes; Leadership
**Reference:** Lewis et al. (2017), p. 1026.

67. Answer: 2

**Rationale:** An oral temperature should be avoided if the client has nasal congestion. One of the other methods of measuring the temperature should be used according to the equipment available. Taking a rectal temperature for a client who has undergone nasal surgery is appropriate. Other, less invasive measures should be used if available; if not available, a rectal temperature is acceptable. Taking an
axillary temperature on a client who just consumed coffee is also acceptable; however, the axillary method of measurement is the least reliable, and other methods should be used if available. If electronic equipment is available and the client is diaphoretic, it is acceptable to measure the temperature on the neck behind the ear, avoiding the forehead.

Test-Taking Strategy: Note the strategic words, need for further teaching. These words indicate a negative event query and the need to select the incorrect action as the answer. Recall that nasal congestion is a reason to avoid taking an oral temperature, as the nasal congestion will cause problems with breathing while the temperature is being taken.

Level of Cognitive Ability: Evaluating
Client Needs: Safe and Effective Care Environment
Integrated Process: Teaching and Learning
Content Area: Skills: Vital Signs
Health Problem: N/A
Priority Concepts: Teaching and Learning; Thermoregulation

68. Answer: 4

Rationale: The normal aPTT varies between 30 and 40 seconds (30 and 40 seconds), depending on the type of activator used in testing. The therapeutic dose of heparin for treatment of deep vein thrombosis is to keep the aPTT between 1.5 (45 to 60) and 2.5 (75 to 100) times normal. This means that the client’s value should not be less than 45 seconds or greater than 100 seconds. Thus, the client’s aPTT is within the therapeutic range and the dose should remain unchanged.

Test-Taking Strategy: Focus on the subject, the expected aPTT for a client receiving a heparin sodium infusion. Remember that the normal range is 30 to 40 seconds and that the aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy. Simple multiplication of 1.5 and 2.5 by 30 and 40 will yield a range of 45 to 100 seconds. This client’s value is 65 seconds.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Analysis
Content Area: Foundations of Care: Laboratory Tests
Health Problem: Adult Health: Cardiovascular: Vascular Disorders
Priority Concepts: Clinical Judgment; Clotting

69. Answer: 1

Rationale: The normal serum potassium level in the adult is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). The correct option is the only value that falls below the therapeutic range. Administering furosemide to a client with a low potassium level and a history of cardiac problems could precipitate ventricular dysrhythmias. The remaining options are within the normal range.

Test-Taking Strategy: Note the subject of the question, the level that should be
reported. This indicates that you are looking for an abnormal level. Remember, the normal serum potassium level in the adult is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). This will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Laboratory Tests

**Health Problem:** Adult Health: Cardiovascular: Heart Failure

**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes

**Reference:** Lewis et al. (2017), p. 280.

70. **Answer:** 1, 2, 4, 6

**Rationale:** The normal values include the following: platelets 150,000 to 400,000 mm$^3$ (150 to 400 × 10$^9$/L); sodium 135 to 145 mEq/L (135 to 145 mmol/L); potassium 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L); segmented neutrophils 62% to 68% (0.62 to 0.68); serum creatinine male: 0.6 to 1.2 mg/dL (53 to 106 mcmol/L); female: 0.5 to 1.1 mg/dL (44 to 97 mcmol/L); and white blood cells 5000 to 10,000 mm$^3$ (5.0 to 10.0 × 10$^9$/L). The platelet level noted is low; the sodium level noted is high; the potassium level noted is normal; the segmented neutrophil level noted is low; the serum creatinine level noted is normal; and the white blood cell level is low.

**Test-Taking Strategy:** Focus on the subject, the abnormal laboratory values that need to be reported. Recalling the normal laboratory values for the blood studies identified in the options will assist in answering this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Laboratory Tests

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Collaboration

**Reference:** Lewis et al. (2017), pp. 599-601, 1026.

71. **Answer:** 1, 2, 3

**Rationale:** Nonsteroidal antiinflammatory drugs (NSAIDs) can amplify the effects of anticoagulants; therefore, these medications should not be taken together. Hypoglycemia may result for the client taking ibuprofen if the client is concurrently taking an oral antidiabetic agent such as glimepiride; these medications should not be combined. A high risk of toxicity exists if the client is taking ibuprofen concurrently with a calcium channel blocker such as amlodipine; therefore, this combination should be avoided. There is no known interaction between ibuprofen and simvastatin or atorvastatin.

**Test-Taking Strategy:** Note the subject of the question, data provided by the client necessitating contacting the PHCP. Determining that ibuprofen is classified as an NSAID will help you determine that it should not be combined with anticoagulants. Also recalling that hypoglycemia can occur as an adverse effect if taken with antidiabetic agents will help you recall that these medications should not be
combined. From the remaining options, it is necessary to remember that toxicity can result if NSAIDs are combined with calcium channel blockers. Also note that options 4 and 5 are comparable or alike and are antilipemic medications. This will assist in eliminating these options.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Skills: Vital Signs  
**Health Problem:** Adult Health: Neurological: Pain  
**Priority Concepts:** Clinical Judgment; Safety  
**Reference:** Lewis et al. (2017), p. 111.

72. **Answer:** 4

**Rationale:** The normal reference range for the glycosylated hemoglobin A\(_{1c}\) is less than 6.0%. This test measures the amount of glucose that has become permanently bound to the red blood cells from circulating glucose. Erythrocytes live for about 120 days, giving feedback about blood glucose for the past 120 days. Elevations in the blood glucose level will cause elevations in the amount of glycosylation. Thus, the test is useful in identifying clients who have periods of hyperglycemia that are undetected in other ways. The estimated average glucose for a glycosylated hemoglobin A\(_{1c}\) of 8% is 205 mg/dL (11.42 mmol/L). Elevations indicate continued need for teaching related to the prevention of hyperglycemic episodes.

**Test-Taking Strategy:** Focus on the subject, a glycosylated hemoglobin A\(_{1c}\) level of 8%. Recalling the normal value and that an elevated value indicates hyperglycemia will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Teaching and Learning  
**Content Area:** Foundations of Care: Laboratory Tests  
**Health Problem:** Adult Health: Endocrine: Diabetes Mellitus  
**Priority Concepts:** Client Education; Glucose Regulation  
**Reference:** Lewis et al. (2017), p. 1118.

73. **Answer:** 1

**Rationale:** The normal WBC count ranges from 5000 to 10,000 mm\(^3\) (5 to 10 \(\times\) \(10^9\)/L). The client who has a decrease in the number of circulating WBCs is immunosuppressed. The nurse implements neutropenic precautions when the client’s values fall sufficiently below the normal level. The specific value for implementing neutropenic precautions usually is determined by agency policy. The remaining options are normal values.

**Test-Taking Strategy:** Focus on the subject, the need to implement neutropenic precautions. Recalling that the normal WBC count is 5000 to 10,000 mm\(^3\) (5 to 10 \(\times\) \(10^9\)/L) will direct you to the correct option.

**Level of Cognitive Ability:** Applying
**Rationale:** The action that the nurse should take is to draw a sample for PT and INR level to determine the client’s anticoagulation status and risk for bleeding. These results will provide information as to how to best treat this client (e.g., if an antidote such as vitamin K or a blood transfusion is needed). The aPTT monitors the effects of heparin therapy.

**Test-Taking Strategy:** Focus on the subject, a client who has taken an excessive dose of warfarin. Eliminate the option with aPTT first because it is unrelated to warfarin therapy and relates to heparin therapy. Next, eliminate the options indicating to administer an antidote and to transfuse the client because these therapies would not be implemented unless the PT and INR levels were known.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Foundations of Care: Laboratory Tests

**Health Problem:** Adult Health: Cancer: Breast

**Priority Concepts:** Clinical Judgment; Infection

74. **Answer:** 4

**Rationale:** The primary concern with opioid analgesics is respiratory depression and hypotension. Based on the assessment findings, the nurse should suspect opioid overdose. The nurse should first attempt to arouse the client and then reassess the vital signs. The vital signs may begin to normalize once the client is aroused, because sleep can also cause decreased heart rate, blood pressure, respiratory rate, and oxygen saturation. The nurse should also check to see how much medication has been taken via the PCA pump and should continue to monitor the client closely to determine whether further action is needed. The nurse should contact the PHCP and document the findings after all data are collected, after the client is stabilized, and if an abnormality still exists after arousing the client.

**Test-Taking Strategy:** First, note the strategic word, next. Focus on the data in the question and determine if an abnormality exists. It is clear that an abnormality exists because the client is drowsy and the vital signs are outside of the normal range. Recall that attempting to arouse the client should come before further assessment of the pump. The client should always be assessed before the equipment, before contacting the PHCP, and before documentation.

**Level of Cognitive Ability:** Synthesizing

**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Skills: Vital Signs  
**Health Problem:** Adult Health: Neurological: Pain  
**Priority Concepts:** Clinical Judgment; Pain  

76. **Answer:** 3

**Rationale:** The normal hemoglobin level for an adult female client is 12 to 16 g/dL (120 to 160 mmol/L). Iron deficiency anemia can result in lower hemoglobin levels. Dehydration may increase the hemoglobin level by hemoconcentration. Heart failure and chronic obstructive pulmonary disease may increase the hemoglobin level as a result of the body’s need for more oxygen-carrying capacity.

**Test-Taking Strategy:** Note the strategic words, most likely. Evaluate each of the conditions in the options in terms of their pathophysiology and whether each is likely to raise or lower the hemoglobin level. Also, note the relationship between hemoglobin level in the question and the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Foundations of Care: Laboratory Tests  
**Health Problem:** Adult Health: Hematological: Anemias  
**Priority Concepts:** Clinical Judgment; Gas Exchange  
**Reference:** Lewis et al. (2017), p. 600.

77. **Answer:** 4

**Rationale:** A normal platelet count ranges from 150,000 to 400,000 mm$^3$ (150 to 400 $\times 10^9$/L). The nurse should place the report containing the normal laboratory value in the client’s medical record. A platelet count of 300,000 mm$^3$ ($300 \times 10^9$/L) is not an elevated count. The count also is not low; therefore, bleeding precautions are not needed.

**Test-Taking Strategy:** Focus on the subject, a platelet count of 300,000 mm$^3$ ($300 \times 10^9$/L). Remember that options that are comparable or alike are not likely to be correct. With this in mind, eliminate options indicating to report the abnormally low count and placing the client on bleeding precautions first. From the remaining options, recalling the normal range for this laboratory test will direct you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Foundations of Care: Laboratory Tests  
**Health Problem:** Adult Health: Gastrointestinal: Upper GI Disorders  
**Priority Concepts:** Clinical Judgment; Clotting  
**Reference:** Lewis et al. (2017), p. 601.
CHAPTER 11

Nutrition

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Health Promotion; Nutrition

I. Nutrients
   A. Carbohydrates
      1. Carbohydrates are the preferred source of energy.
      2. Sugars, starches, and cellulose provide 4 cal/g.
      3. Carbohydrates promote normal fat metabolism, spare protein, and enhance lower gastrointestinal function.
      4. Major food sources of carbohydrates include milk, grains, fruits, and vegetables.
      5. Inadequate carbohydrate intake affects metabolism.
   B. Fats
      1. Fats provide a concentrated source and a stored form of energy.
      2. Fats protect internal organs and maintain body temperature.
      3. Fats enhance absorption of the fat-soluble vitamins.
      4. Fats provide 9 cal/g.
      5. Inadequate intake of essential fatty acids leads to clinical manifestations of sensitivity to cold, skin lesions, increased risk of infection, and amenorrhea in women.
      6. Diets high in fat can lead to obesity and increase the risk of cardiovascular disease and some cancers.
   C. Proteins
      1. Amino acids, which make up proteins, are critical to all aspects of growth and development of body tissues and provide 4 cal/g.
      2. Proteins build and repair body tissues, regulate fluid balance, maintain acid-base balance, produce antibodies, provide energy, and produce enzymes
and hormones.

3. Essential amino acids are required in the diet because the body cannot manufacture them.

4. Complete proteins contain all essential amino acids; incomplete proteins lack some of the essential fatty acids.

5. Inadequate protein can cause protein energy malnutrition and severe wasting of fat and muscle tissue.

Major stages of the lifespan with specific nutritional needs are pregnancy, lactation, infancy, childhood, and adolescence. Adults and older adults may experience physiological aging changes, which influence individual nutritional needs.

D. Vitamins (Box 11-1)

1. Vitamins facilitate metabolism of proteins, fats, and carbohydrates and act as catalysts for metabolic functions.

2. Vitamins promote life and growth processes and maintain and regulate body functions.

3. Fat-soluble vitamins A, D, E, and K can be stored in the body, so an excess can cause toxicity.

4. The B vitamins and vitamin C are water-soluble vitamins, are not stored in the body, and can be excreted in the urine.

E. Minerals and electrolytes (Box 11-2)

1. Minerals are components of hormones, cells, tissues, and bones.

2. Minerals act as catalysts for chemical reactions and enhancers of cell function.

3. Almost all foods contain some form of minerals.

4. A deficiency of minerals can develop in chronically ill or hospitalized clients.

5. Electrolytes play a major role in osmolality and body water regulation, acid-base balance, enzyme reactions, and neuromuscular activity (see Chapter 8 for additional information regarding electrolytes).

F. Water

1. Critical for cell function.

2. Makes 60% to 70% of total body weight.

3. A person cannot survive without water for more than a few days.

II. Malnutrition Laboratory Markers
A. Hematological studies and studies evaluating protein balance
   1. Complete blood cell count with red blood cell indices and peripheral smear to differentiate between anemias and nutritional deficiencies
   2. Long-term protein status can be determined by evaluating serum albumin levels.
   3. Short-term protein status is best determined by evaluating retinol-binding protein, prealbumin, transferrin, creatinine, and blood urea nitrogen (BUN) levels.
   4. Serum electrolytes (see Chapter 8).
   5. Nitrogen balance is evaluated by measuring urea in the urine, which provides information regarding protein loss.

III. MyPlate (Fig. 11-1)
   A. Provides a description of a balanced diet that includes grains, vegetables, fruits, dairy products, and protein foods (see http://www.choosemyplate.gov/).
   B. A nutritionist should be consulted for individualized dietary recommendations (see Box 11-3 for nutrition throughout growth and development).
   C. Guidelines
      1. Avoid eating oversized portions of foods.
      2. Fill half of the plate with fruits and vegetables.
      3. Vary the type of vegetables and fruits eaten.
      4. Select at least half of the grains as whole grains.
      5. Ensure that foods from the dairy group are high in calcium.
      6. Drink milk that is fat-free or low fat (1%).
      7. Eat protein foods that are lean.
      8. Select fresh foods over frozen or canned foods.
      9. Drink water rather than liquids that contain sugar.

IV. 2015-2020 Dietary Guidelines for Americans
   A. Provides average daily consumption guidelines for the five food groups (see https://health.gov/dietaryguidelines/2015/guidelines/).
   B. Guidelines
      2. Increase physical activity and decrease sedentary activities.
3. Limit saturated fats and trans fats, with less than 10% of daily calories from saturated fats.
4. Limit added sugars so that less than 10% of daily calories are from added sugars.
5. Consume less than 2300 milligrams (mg) of sodium per day.
6. Consume low-sodium and potassium-rich foods.
7. Limit alcohol intake to moderate use (one drink daily for women and two drinks daily for men).
8. Use food-safety principles of Clean, Separate, Cook, and Chill.

V. Therapeutic Diets
   A. Clear liquid diet
      1. Indications
         a. Provides fluids and some electrolytes to prevent dehydration.
         b. Used as an initial feeding after complete bowel rest.
         c. Used initially to feed a malnourished person or a person who has not had any oral intake for some time.
         d. Used for bowel preparation for surgery or diagnostic tests, as well as postoperatively and in clients with fever, vomiting, or diarrhea.
         e. Used in gastroenteritis.
         f. Used in gastroenteritis.
      2. Nursing considerations
         a. Clear liquid diet is deficient in energy (calories) and many nutrients.
         b. Clear liquid diet is easily digested and absorbed.
         c. Minimal residue is left in the gastrointestinal tract.
         d. Clients may find a clear liquid diet unappetizing and boring.
         e. As a transition diet, clear liquids are intended for short-term use.
         f. Clear liquids and foods that are relatively transparent to light and are liquid at body temperature are considered “clear liquids,” such as water, bouillon, clear broth, carbonated beverages, gelatin, hard candy, lemonade, ice pops, and regular or decaffeinated coffee or tea.
         g. By limiting caffeine intake, an upset stomach and sleeplessness may be
The client may consume salt and sugar.
i. Dairy products and fruit juices with pulp are not clear liquids.
j. Instruct the client doing bowel preparation to avoid liquids that contain red or purple dye, which can mask the normal color of the lining of the colon.

Monitor the client’s hydration status by assessing intake and output, assessing weight, monitoring for edema, and monitoring for signs of dehydration. Each kilogram (2.2 lb) of weight gained or lost is equal to 1 liter of fluid retained or lost.

B. Full liquid diet
1. Indication: May be used as a transition diet after clear liquids following surgery or for clients who have difficulty chewing, swallowing, or tolerating solid foods.
2. Nursing considerations
   a. A full liquid diet is nutritionally deficient in energy (calories) and many nutrients.
   b. The diet includes clear and opaque liquid foods and those that are liquid at body temperature.
   c. Foods include all clear liquids and items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, soups that are strained, refined cooked cereals, fruit juices, and strained vegetable juices.
   d. Use of a complete nutritional liquid supplement is often necessary to meet nutrient needs for clients on a full liquid diet for more than 3 days.

Provide nutritional supplements such as those high in protein, as prescribed, for the client on a liquid diet.

C. Mechanical soft diet
1. Indications
   a. Provides foods that have been prevented.
mechanically altered in texture to require minimal chewing.
b. Used for clients who have difficulty chewing but can tolerate more variety in texture than a liquid diet offers.
c. Used for clients who have dental problems, surgery of the head or neck, or dysphagia (requires swallowing evaluation and may require thickened liquids if the client has swallowing difficulties).

2. Nursing considerations
   a. Degree of texture modification depends on individual need, including pureed, mashed, ground, or chopped.
   b. Foods include those that are part of a clear and full liquid diet, with the addition of all cream soups, ground or diced meats, flaked fish, cottage cheese, rice, potatoes, pancakes, light breads, cooked vegetables, canned or cooked fruits, bananas, peanut butter, and nonfried eggs.
   c. Foods to be avoided in mechanically altered diets include nuts; dried fruits; raw fruits and vegetables; fried foods; tough, smoked, or salted meats; and foods with coarse textures.

D. Soft diet

1. Indications
   a. Used for clients who have difficulty chewing or swallowing.
   b. Used for clients who have ulcerations of the mouth or gums, oral surgery, broken jaw, plastic surgery of the head or neck, or dysphagia, or for the client who has had a stroke.

2. Nursing considerations
   a. Foods include easily digestible foods such as pastas, casseroles, tender meats, canned fruit, cooked vegetables, cakes, and cookies without nuts or coconut.
   b. Clients with mouth sores should be served foods at cooler temperatures.
   c. Clients who have difficulty chewing
and swallowing because of dry mouth can increase salivary flow by sucking on sour candy.

d. Encourage the client to eat a variety of foods.

e. Provide plenty of fluids with meals to ease chewing and swallowing of foods.

f. Drinking fluids through a straw may be easier than drinking from a cup or glass; a straw may not be allowed for clients with dysphagia (because of the risk of aspiration).

g. All foods and seasonings are permitted; however, liquid, chopped, or pureed foods or regular foods with a soft consistency are tolerated best.

h. Foods that contain nuts or seeds, which easily can become trapped in the mouth and cause discomfort, should be avoided.

i. Raw fruits and vegetables, fried foods, and whole grains should be avoided.

E. Low-fiber (low-residue) diet

1. Indications

   a. Supplies foods that are least likely to form an obstruction when the intestinal tract is narrowed by inflammation or scarring or when gastrointestinal motility is slowed.

   b. Used for inflammatory bowel disease, partial obstructions of the intestinal tract, gastroenteritis, diarrhea, or other gastrointestinal disorders.

2. Nursing considerations

   a. Foods that are low in fiber include white bread, refined cooked cereals, cooked potatoes without skins, white rice, and refined pasta.

   b. Foods to limit or avoid are raw fruits (except bananas), vegetables, nuts and seeds, plant fiber, and whole grains.

Consider the client's disease or illness and how it may affect nutritional status.
c. Dairy products should be limited to 2 servings a day.

F. High-fiber (high-residue) diet
   1. Indication: Used for constipation, irritable bowel syndrome when the primary symptom is alternating constipation and diarrhea, and asymptomatic diverticular disease.
   2. Nursing considerations
      a. High-fiber diet provides 20 to 35 g of dietary fiber daily.
      b. Volume and weight are added to the stool, speeding the movement of undigested materials through the intestine.
      c. High-fiber foods are fruits and vegetables and whole-grain products.
      d. Increase fiber gradually and provide adequate fluids to reduce possible undesirable side effects such as abdominal cramps, bloating, diarrhea, and dehydration.
      e. Gas-forming foods should be limited (Box 11-4).

G. Cardiac diet (Box 11-5)
   1. Indications
      a. Indicated for atherosclerosis, diabetes mellitus, hyperlipidemia, hypertension, myocardial infarction, nephrotic syndrome, and renal failure.
      b. Reduces the risk of heart disease.
      c. Dietary Approaches to Stop Hypertension (DASH) diet: recommended to prevent and control hypertension, hypercholesterolemia, and obesity.
      d. The DASH diet includes fruits, vegetables, whole grains, low-fat dairy foods, meat, fish, poultry, nuts, and beans; it is limited in sugar-sweetened foods and beverages, red meat, and added fats.
   2. Nursing considerations
      a. Restrict total amounts of fat, including saturated, trans, polyunsaturated, and monounsaturated; cholesterol; and
sodium.

b. Teach the client about the DASH diet or other prescribed diet.

H. Fat-restricted diet

1. Indications

a. Used to reduce symptoms of abdominal pain, steatorrhea, flatulence, and diarrhea associated with high intakes of dietary fat and to decrease nutrient losses caused by ingestion of dietary fat in individuals with malabsorption disorders.

b. Used for clients with malabsorption disorders, pancreatitis, gallbladder disease, and gastroesophageal reflux.

2. Nursing considerations

   a. Restrict total amount of fat, including saturated, trans, polyunsaturated, and monounsaturated.

   b. Clients with malabsorption may also have difficulty tolerating fiber and lactose.

   c. Vitamin and mineral deficiencies may occur in clients with diarrhea or steatorrhea.

   d. A fecal fat test may be prescribed and indicates fat malabsorption with excretion of more than 6 to 8 g of fat (or more than 10% of fat consumed) per day during the 3 days of specimen collection.

I. High-calorie, high-protein diet

1. Indication: Used for severe stress, burns, wound healing, cancer, human immunodeficiency virus, acquired immunodeficiency syndrome, chronic obstructive pulmonary disease, respiratory failure, or any other type of debilitating disease.

2. Nursing considerations

   a. Encourage nutrient-dense, high-calorie, high-protein foods such as whole milk and milk products, peanut butter, nuts and seeds, beef, chicken, fish, pork, and eggs.

   b. Encourage snacks between meals, such
as milkshakes, instant breakfasts, and nutritional supplements.

Calorie counts assist in determining the client’s total nutritional intake and can identify a deficit or excess intake.

J. Carbohydrate-consistent diet
1. Indication: Used for clients with diabetes mellitus, hypoglycemia, hyperglycemia, and obesity.
2. Nursing considerations
   a. The Exchange System for Meal Planning, developed by the Academy of Nutrition and Dietetics and the American Diabetes Association, is a food guide that may be recommended.
   b. The Exchange System groups foods according to the amounts of carbohydrates, fats, and proteins they contain; major food groups include the carbohydrate, meat and meat substitute, and fat groups.
   c. A carbohydrate-consistent diet focuses on maintaining a consistent amount of carbohydrate intake each day and with each meal; also known as “carb counting.” For additional information, refer to: http://www.livestrong.com/article/436101-the-consistent-carbohydrate-diet-for-diabetics/
   d. The MyPlate diet may also be recommended.

K. Sodium-restricted diet (see Box 11-5)
1. Indication: Used for hypertension, heart failure, renal disease, cardiac disease, and liver disease.
2. Nursing considerations
   a. Individualized; can include 4 g of sodium daily (no-added-salt diet), 2 to 3 g of sodium daily (moderate restriction), 1 g of sodium daily (strict restriction), or 500 mg of sodium daily (severe restriction and seldom prescribed).
   b. Encourage intake of fresh foods, rather
than processed foods that contain higher amounts of sodium.

c. Canned, frozen, instant, smoked, pickled, and boxed foods usually contain higher amounts of sodium. Lunch meats, soy sauce, salad dressings, fast foods, soups, and snacks such as potato chips and pretzels also contain large amounts of sodium; teach clients to read nutritional facts on product packaging regarding sodium content per serving.

d. Certain medications contain significant amounts of sodium.

e. Salt substitutes may be used to improve palatability; most salt substitutes contain large amounts of potassium and should not be used by clients with renal disease.

L. Protein-restricted diet

1. Indication: Used for renal disease and end-stage liver disease.

2. The nutritional status of critically ill clients with protein-losing renal diseases, malabsorption syndromes, and continuous renal replacement therapy or dialysis should have their protein needs assessed by estimating the protein equivalent of nitrogen appearance (PNA); a nutritionist should be consulted.

3. Nursing considerations

a. Provide enough protein to maintain nutritional status but not an amount that will allow the buildup of waste products from protein metabolism (40 to 60 g of protein daily).

b. The less protein allowed, the more important it becomes that all protein in the diet be of high biological value (contain all essential amino acids in recommended proportions).

c. An adequate total energy intake from foods is critical for clients on protein-restricted diets (protein will be used for energy rather than for protein synthesis).

d. Special low-protein products, such as pastas, bread, cookies, wafers, and gelatin made with wheat starch, can
improve energy intake and add variety to the diet.
e. Carbohydrates in powdered or liquid forms can provide additional energy.
f. Vegetables and fruits contain some protein and, for very-low-protein diets, these foods must be calculated into the diet.
g. Foods are limited from the milk, meat, bread, and starch groups.

M. Gluten-free diet: A treatment for celiac disease and gluten sensitivity for clients needing the protein fraction “gluten” eliminated from their diet. See Chapter 33 for information on this diet.

Fluid restrictions may be prescribed for clients with hyponatremia, severe extracellular volume excess, and renal disorders. Ask specifically about client preferences regarding types of oral fluids and temperature preference of fluids.

N. Renal diet (see Box 11-2)
1. Indication: Used for the client with acute kidney injury or chronic kidney disease and those requiring hemodialysis or peritoneal dialysis
2. Nursing considerations
   a. Controlled amounts of protein, sodium, phosphorus, calcium, potassium, and fluids may be prescribed; may also need modification in fiber, cholesterol, and fat based on individual requirements; clients on peritoneal dialysis usually have diets prescribed that are less restrictive with fluid and protein intake than those on hemodialysis.
   b. Most clients receiving dialysis need to restrict fluids (Box 11-6).
   c. Monitor weight daily as a priority, because weight is an important indicator of fluid status.

O. Potassium-modified diet (see Box 11-2)
1. Indications
   a. Low-potassium diet is indicated for hyperkalemia, which may be caused
by impaired renal function, hypoaldosteronism, Addison’s disease, angiotensin-converting enzyme inhibitor medications, immunosuppressive medications, potassium-retaining diuretics, and chronic hyperkalemia.

b. High-potassium diet is indicated for hypokalemia, which may be caused by renal tubular acidosis, gastrointestinal losses (diarrhea, vomiting), intracellular shifts, potassium-losing diuretics, antibiotics, mineralocorticoid or glucocorticoid excess resulting from primary or secondary aldosteronism, Cushing’s syndrome, or exogenous corticosteroid use.

2. Nursing considerations
   a. Foods that are low in potassium include applesauce, green beans, cabbage, lettuce, peppers, grapes, blueberries, cooked summer squash, cooked turnip greens, pineapple, and raspberries.
   b. Box 11-2 lists foods that are high in potassium.

P. High-calcium diet
   1. Indication: Calcium is needed during bone growth and in adulthood to prevent osteoporosis and to facilitate vascular contraction, vasodilation, muscle contraction, and nerve transmission.
   2. Nursing considerations
      a. Primary dietary sources of calcium are dairy products (see Box 11-2 for food items high in calcium).
      b. Lactose-intolerant clients should incorporate nondairy sources of calcium into their diet regularly.

Q. Low-purine diet
   1. Indication: Used for gout, kidney stones, and elevated uric acid levels
   2. Nursing considerations
      a. Purine is a precursor for uric acid, which forms stones and crystals.
      b. Foods to restrict include
anchovies, herring, mackerel, sardines, scallops, organ meats, gravies, meat extracts, wild game, goose, and sweetbreads.

R. High-iron diet
1. Indication: Used for clients with anemia
2. Nursing considerations
   a. The high-iron diet replaces iron deficit from inadequate intake or loss.
   b. The diet includes organ meats, meat, egg yolks, whole-wheat products, dark green leafy vegetables, dried fruit, and legumes.
   c. Inform the client that concurrent intake of vitamin C with iron foods enhances absorption of iron.

VI. Vegan and Vegetarian Diets
A. Vegan
1. Vegans follow a strict vegetarian diet and consume no animal foods.
2. Eat only foods of plant origin (e.g., whole or enriched grains, legumes, nuts, seeds, fruits, vegetables).
3. The use of soybeans, soy milk, soybean curd (tofu), and processed soy protein products enhance the nutritional value of the diet.

B. Lacto-vegetarian
1. Lacto-vegetarians eat milk, cheese, and dairy foods but avoid meat, fish, poultry, and eggs.
2. A diet of whole or enriched grains, legumes, nuts, seeds, fruits, and vegetables in sufficient quantities to meet energy needs provides a balanced diet.

C. Lacto-ovo-vegetarian
1. Lacto-ovo-vegetarians follow a food pattern that allows for the consumption of dairy products and eggs.
2. Consumption of adequate plant and animal food sources that excludes meat, poultry, pork, and fish poses no nutritional risks.

D. Ovo-vegetarians: The only animal foods that the ovo-vegetarian consumes are eggs, which are an excellent source of complete proteins.

E. Nursing considerations
1. Vegan and vegetarian diets are not usually prescribed but are a diet choice made by a client.
2. Ensure that the client eats a sufficient amount
of varied foods to meet nutrient and energy needs.
3. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
4. Potential deficiencies in vegetarian diets include energy, protein, vitamin B₁₂, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
5. To enhance absorption of iron, vegetarians should consume a good source of iron and vitamin C with each meal.
6. Foods eaten may include tofu, tempeh, soy milk and soy products, meat analogs, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.
7. Soy protein is considered equivalent in quality to animal protein.

Body mass index (BMI) can be calculated by dividing the client’s weight in kilograms by height in meters squared. For example, a client who weighs 75 kg (165 pounds) and is 1.8 m (5 feet, 9 inches) tall has a BMI of 23.15 (75 divided by 1.8² = 23.15). From: Potter et al. (2013), p. 1008.

VII. Enteral Nutrition
A. Description: Provides liquefied foods into the gastrointestinal tract via a tube
B. Indications
1. When the gastrointestinal tract is functional but oral intake is not meeting estimated nutrient needs
2. Used for clients with swallowing problems, burns, major trauma, liver or other organ failure, or severe malnutrition
C. Nursing considerations
1. Clients with lactose intolerance need to be placed on lactose-free formulas.
2. See Chapter 69 for information regarding the administration of gastrointestinal tube feedings and associated complications.

Box 11-1

Food Sources of Vitamins

Water-Soluble Vitamins
Folic acid: Green leafy vegetables; liver, beef, and fish; legumes; grapefruit and oranges
Niacin: Meats, poultry, fish, beans, peanuts, grains
Vitamin B<sub>1</sub> (thiamine): Pork and nuts, whole-grain cereals, and legumes
Vitamin B<sub>2</sub> (riboflavin): Milk, lean meats, fish, grains
Vitamin B<sub>6</sub> (pyridoxine): Yeast, corn, meat, poultry, fish
Vitamin B<sub>12</sub> (cobalamin): Meat, liver
Vitamin C (ascorbic acid): Citrus fruits, tomatoes, broccoli, cabbage

**Fat-Soluble Vitamins**

Vitamin A: Liver, egg yolk, whole milk, green or orange vegetables, fruits
Vitamin D: Fortified milk, fish oils, cereals
Vitamin E: Vegetable oils; green leafy vegetables; cereals; apricots, apples, and peaches
Vitamin K: Green leafy vegetables; cauliflower and cabbage

**Box 11-2**

**Food Sources of Minerals**

**Calcium**

- Cheese
- Collard greens
- Milk and soy milk
- Rhubarb
- Sardines
- Tofu
- Yogurt

**Chloride**

- Salt

**Iron**

- Breads and cereals
- Dark green vegetables
- Dried fruits
- Egg yolk
- Legumes
- Liver
- Meats
Magnesium

- Almonds
- Avocado
- Canned white tuna
- Cauliflower
- Cooked rolled oats
- Green leafy vegetables
- Milk
- Peanut butter
- Peas
- Pork, beef, chicken
- Potatoes
- Raisins
- Soybeans
- Yogurt

Phosphorus

- Dairy products
- Fish
- Nuts
- Pumpkin
- Organ meats
- Pork, beef, chicken
- Squash
- Whole-grain breads and cereals

Potassium

- Avocado
- Bananas
- Cantaloupe
- Carrots
- Fish
- Mushrooms
- Oranges
- Pork, beef, veal
- Potatoes
- Raisins
- Spinach
- Strawberries
- Tomatoes

Sodium
Bacon
Butter
Canned food
Cheese
Cured pork
Hot dogs
Ketchup
Lunch meat
Milk
Mustard
Processed food
Snack food
Soy sauce
Table salt
White and whole-wheat bread

Zinc

Eggs
Leafy vegetables
Meats
Protein-rich foods
Box 11-3

Nutrition Throughout Growth and Development

Infant

The American Academy of Pediatrics recommends breastfeeding for the first 6 months of life and breastfeeding with additional foods from age 6 to 12 months.
Introduce new foods one at a time, 4-7 days apart, to identify allergies.
Infants should not have cow’s milk before the age of 1 year.
Children under 1 year of age should not ingest honey or corn syrup products due to the risk of botulism toxin.

Toddlers and Preschoolers
Milk is a poor source of iron, and children who consume more than 24 ounces of milk per day are at risk for developing milk anemia. Whole milk should be consumed until 2 years of age to ensure adequate fatty acid intake. Limit foods that pose choking hazards, such as hot dogs, candy, nuts, grapes, popcorn, and raw vegetables.

School-Age

Children in this age group have better appetites with a more varied intake. Assess for adequate intake of protein and vitamins A and C. This age group is at risk for high intake of fats, sugar, and salt related to snack foods. Promote healthy choices and encourage physical activity.

Adolescent

Energy needs increase to meet the increased metabolic needs of growth. This age group has increased requirements of daily protein, calcium for bone growth, and iron to replace menstrual losses for girls and promote muscle development for boys. Increased intake of iodine and B-complex vitamins are necessary to support thyroid development and metabolism. Fast-food consumption is common and puts the adolescent at risk for malnutrition and obesity. The onset of eating disorders commonly occurs during adolescence.

Young and Middle Adults

Energy needs decrease as the growth period ends. Lack of physical activity and access to certain foods increases the risk of obesity.

Pregnancy

During pregnancy, protein requirements increase to 60 g per day. Calcium needs increase to promote fetal bone mineralization. Iron supplements support increased blood volume. Folic acid intake is required for DNA synthesis and red blood cell production.

Breastfeeding

For the breastfeeding mother, encourage intake of protein, calcium, and vitamins A, B, and C. Promote adequate fluid intake. Breastfeeding mothers should consume an additional 500 kilocalories per day to support adequate production of breastmilk. Avoid alcohol, caffeine, and drugs, as these are absorbed into breast milk.
Older Adults

Energy needs are decreased due to slowed metabolic rate. Age-related changes that affect nutrition include changes in teeth and saliva production, reduced taste and smell, decreased thirst sensation, and decreased gag reflex. Ensure adequate calcium and vitamin D intake to prevent osteoporosis.

Box 11-4

Gas-Forming Foods

- Apples
- Artichokes
- Barley
- Beans
- Bran
- Broccoli
- Brussels sprouts
- Cabbage
- Celery
- Figs
- Melons
- Milk
- Molasses
- Nuts
- Onions
- Radishes
- Soybeans
- Wheat
- Yeast

Box 11-5

Sodium-Free Spices and Flavorings

- Allspice
- Almond extract
- Bay leaves
- Caraway seeds
- Cinnamon
- Curry powder
- Garlic powder or garlic
- Ginger
Lemon extract
Maple extract
Marjoram
Mustard powder
Nutmeg

Box 11-6
Measures to Relieve Thirst

▪ Chew gum or suck hard candy.
▪ Freeze fluids so they take longer to consume.
▪ Add lemon juice to water to make it more refreshing.
▪ Gargle with refrigerated mouthwash.

Practice Questions

78. The nurse is teaching a client who has iron deficiency anemia about foods she should include in the diet. The nurse determines that the client understands the dietary modifications if which items are selected from the menu?
   1. Nuts and milk
   2. Coffee and tea
   3. Cooked rolled oats and fish
   4. Oranges and dark green leafy vegetables

79. The nurse is planning to teach a client with malabsorption syndrome about the necessity of following a low-fat diet. The nurse develops a list of high-fat foods to avoid and should include which food items on the list? Select all that apply.
   □ 1. Oranges
   □ 2. Broccoli
   □ 3. Margarine
   □ 4. Cream cheese
   □ 5. Luncheon meats
   □ 6. Broiled haddock

80. The nurse instructs a client with chronic kidney disease who is receiving hemodialysis about dietary modifications. The nurse determines that the client understands these dietary modifications if the client selects which items from the dietary menu?
   1. Cream of wheat, blueberries, coffee
   2. Sausage and eggs, banana, orange juice
3. Bacon, cantaloupe melon, tomato juice
4. Cured pork, grits, strawberries, orange juice

81. The nurse is conducting a dietary assessment on a client who is on a vegan diet. The nurse provides dietary teaching and should focus on foods high in which vitamin that may be lacking in a vegan diet?
   1. Vitamin A
   2. Vitamin B₁₂
   3. Vitamin C
   4. Vitamin E

82. A client with hypertension has been told to maintain a diet low in sodium. The nurse who is teaching this client about foods that are allowed should include which food item in a list provided to the client?
   1. Tomato soup
   2. Boiled shrimp
   3. Instant oatmeal
   4. Summer squash

83. A postoperative client has been placed on a clear liquid diet. The nurse should provide the client with which items that are allowed to be consumed on this diet? Select all that apply.
   □ 1. Broth
   □ 2. Coffee
   □ 3. Gelatin
   □ 4. Pudding
   □ 5. Vegetable juice
   □ 6. Pureed vegetables

84. The nurse is instructing a client with hypertension on the importance of choosing foods low in sodium. The nurse should teach the client to limit intake of which food?
   1. Apples
   2. Bananas
   3. Smoked salami
   4. Steamed vegetables

85. A client who is recovering from surgery has been advanced from a clear liquid diet to a full liquid diet. The client is looking forward to the diet change because he has been “bored” with the clear liquid diet. The nurse should offer which full liquid item to the client?
   1. Tea
   2. Gelatin
   3. Custard
   4. Ice pop

86. A client is recovering from abdominal surgery and has a large abdominal wound. The nurse should encourage the client to eat which food item that is naturally high in vitamin C to promote wound healing?
1. Milk
2. Oranges
3. Bananas
4. Chicken

87. The nurse is caring for a client with cirrhosis of the liver. To minimize the effects of the disorder, the nurse teaches the client about foods that are high in thiamine. The nurse determines that the client has the best understanding of the dietary measures to follow if the client states an intention to increase the intake of which food?
   1. Milk
   2. Chicken
   3. Broccoli
   4. Legumes

88. The nurse provides instructions to a client with a low potassium level about the foods that are high in potassium and tells the client to consume which foods? Select all that apply.
   1. Peas
   2. Raisins
   3. Potatoes
   4. Cantaloupe
   5. Cauliflower
   6. Strawberries

89. The nurse is reviewing laboratory results and notes that a client’s serum sodium level is 150 mEq/L (150 mmol/L). The nurse reports the serum sodium level to the primary health care provider (PHCP), and the PHCP prescribes dietary instructions based on the sodium level. Which acceptable food items does the nurse instruct the client to consume? Select all that apply.
   1. Peas
   2. Nuts
   3. Cheese
   4. Cauliflower
   5. Processed oat cereals

Answers

78. Answer: 4
Rationale: Dark green leafy vegetables are a good source of iron, and oranges are a good source of vitamin C, which enhances iron absorption. All other options are not food sources that are high in iron and vitamin C.

Test-Taking Strategy: Focus on the subject, diet choices for a client with anemia. Think about the pathophysiology of anemia and determine that the client needs foods high in iron and recall that vitamin C enhances iron absorption. Use knowledge of foods high in iron and vitamin C. Remember that green leafy vegetables are high in iron and oranges are high in vitamin C.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity

Content Area: Foundations of Care: Therapeutic Diets
Health Problem: Adult Health: Hematological: Anemias
Priority Concepts: Client Education; Nutrition

79. Answer: 3, 4, 5

Rationale: Fruits and vegetables tend to be lower in fat because they do not come from animal sources. Broiled haddock is also naturally lower in fat. Margarine, cream cheese, and luncheon meats are high-fat foods.

Test-Taking Strategy: Focus on the subject of the question, the high-fat foods. Oranges and broccoli (fruit and vegetable) can be eliminated first. Next eliminate haddock because it is a broiled food. Remember that margarine, cheese, and luncheon meats are high in fat content.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Foundations of Care: Therapeutic Diets
Health Problem: Adult Health: Gastrointestinal: Nutrition Problems
Priority Concepts: Client Education; Nutrition

80. Answer: 1

Rationale: The diet for a client with chronic kidney disease who is receiving hemodialysis should include controlled amounts of sodium, phosphorus, calcium, potassium, and fluids, which is indicated in the correct option. The food items in the remaining options are high in sodium, phosphorus, or potassium.

Test-Taking Strategy: Focus on the subject, dietary modification for a client with chronic kidney disease. Think about the pathophysiology of this disorder to recall that sodium needs to be limited. Noting the items sausage, bacon, and cured pork will assist in eliminating these options.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Evaluation
Content Area: Foundations of Care: Therapeutic Diets
Rationale: Vegans do not consume any animal products. Vitamin B\textsubscript{12} is found in animal products and therefore would most likely be lacking in a vegan diet. Vitamins A, C, and E are found in fresh fruits and vegetables, which are consumed in a vegan diet.

Test-Taking Strategy: Focus on the subject, a vegan diet and the vitamin lacking in this diet. Recalling the food items eaten and restricted in this diet will direct you to the correct option. Remember that vegans do not consume any animal products and as a result may be deficient in vitamin B\textsubscript{12}.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Foundations of Care: Therapeutic Diets
Health Problem: N/A
Priority Concepts: Health Promotion; Nutrition

Rationale: Foods that are lower in sodium include fruits and vegetables (summer squash) because they do not contain physiological saline. Highly processed or refined foods (tomato soup, instant oatmeal) are higher in sodium unless their food labels specifically state “low sodium.” Saltwater fish and shellfish are high in sodium.

Test-Taking Strategy: Focus on the subject, foods low in sodium. Begin to answer this question by eliminating boiled shrimp, recalling that saltwater fish and shellfish are high in sodium. Next, eliminate tomato soup and instant oatmeal because they are processed foods.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Foundations of Care: Therapeutic Diets
Health Problem: Adult Health: Cardiovascular: Hypertension
Priority Concepts: Health Promotion; Nutrition

Rationale: A clear liquid diet consists of foods that are relatively transparent to light and are clear and liquid at room and body temperature. These foods include items such as water, bouillon, clear broth, carbonated beverages, gelatin, hard candy, lemonade, ice pops, and regular or decaffeinated coffee or tea. The incorrect food
items are items that are allowed on a full liquid diet.

**Test-Taking Strategy:** Focus on the **subject**, a clear liquid diet. Recalling that a clear liquid diet consists of foods that are relatively transparent to light and are clear will assist in answering the question.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity

**Content Area:** Foundations of Care: Therapeutic Diets  
**Health Problem:** N/A  
**Priority Concepts:** Health Promotion; Nutrition  
**Reference:** Potter et al. (2017), p. 1074.

84. **Answer:** 3

**Rationale:** Smoked foods are high in sodium, which is noted in the correct option. The remaining options are fruits and vegetables, which are low in sodium.

**Test-Taking Strategy:** Note the **subject**, the food item that is high in sodium. Remember that smoked foods are high in sodium. Also eliminate options 1, 2, and 4 because they are comparable or alike and are nonprocessed foods.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Foundations of Care: Therapeutic Diets  
**Health Problem:** Adult Health: Cardiovascular: Hypertension  
**Priority Concepts:** Health Promotion; Nutrition  

85. **Answer:** 3

**Rationale:** Full liquid food items include items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, soups that are strained, refined cooked cereals, and strained vegetable juices. A clear liquid diet consists of foods that are relatively transparent. The food items in the incorrect options are clear liquids.

**Test-Taking Strategy:** Focus on the **subject**, a full liquid item. Remember that a clear liquid diet consists of foods that are relatively transparent. This will assist you in eliminating tea, gelatin, and ice pops; in addition, these are comparable or alike options.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Foundations of Care: Therapeutic Diets  
**Health Problem:** N/A  
**Priority Concepts:** Health Promotion; Nutrition  
**Reference:** Potter et al. (2017), p. 1074.

86. **Answer:** 2
Rationale: Citrus fruits and juices are especially high in vitamin C. Bananas are high in potassium. Meats and dairy products are two food groups that are high in the B vitamins.

Test-Taking Strategy: Note the subject, food items naturally high in vitamin C. It is necessary to recall that citrus fruits and juices are high in vitamin C; this will direct you to the correct option.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Foundations of Care: Therapeutic Diets
Health Problem: Adult Health: Integumentary: Wounds

87. Answer: 4

Rationale: The client with cirrhosis needs to consume foods high in thiamine. Thiamine is present in a variety of foods of plant and animal origin. Legumes are especially rich in this vitamin. Other good food sources include nuts, whole-grain cereals, and pork. Milk contains vitamins A, D, and B₂. Poultry contains niacin. Broccoli contains vitamins C, E, and K and folic acid.

Test-Taking Strategy: Note the strategic word, best. This may indicate that more than one option may be a food that contains thiamine. Remembering that legumes are especially rich in thiamine will direct you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Evaluation
Content Area: Foundations of Care: Therapeutic Diets
Health Problem: Adult Health: Gastrointestinal: GI Accessory Organs
Priority Concepts: Health Promotion; Nutrition

88. Answer: 2, 3, 4, 6

Rationale: The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). Common food sources of potassium include avocado, bananas, cantaloupe, carrots, fish, mushrooms, oranges, potatoes, pork, beef, veal, raisins, spinach, strawberries, and tomatoes. Peas and cauliflower are high in magnesium.

Test-Taking Strategy: Focus on the subject, foods high in potassium. Read each food item and use knowledge about nutrition and components of food. Recall that peas and cauliflower are high in magnesium.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Foundations of Care: Therapeutic Diets
Health Problem: N/A
Priority Concepts: Client Education; Nutrition
89. Answer: 1, 2, 4

Rationale: The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). A serum sodium level of 150 mEq/L (150 mmol/L) indicates hypernatremia. On the basis of this finding, the nurse would instruct the client to avoid foods high in sodium. Peas, nuts, and cauliflower are good food sources of phosphorus and are not high in sodium (unless they are canned or labeled salted). Peas and cauliflower are also a good source of magnesium. Processed foods such as cheese and processed oat cereals are high in sodium content.

Test-Taking Strategy: Focus on the subject, foods acceptable to be consumed by a client with a sodium level of 150 mEq/L (150 mmol/L). First, you must determine that the client has hypernatremia. Select peas and cauliflower first because these are vegetables. From the remaining options, note the word processed in option 5 and recall that cheese is high in sodium. Remember that processed foods tend to be higher in sodium content.

CHAPTER 12

Health and Physical Assessment of the Adult Client

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Clinical Judgment; Health Promotion

I. Environment/Setting
   A. Establish a relationship and explain the procedure to the client.
   B. Ensure privacy and make the client feel comfortable (comfortable room temperature, sufficient lighting, remove distractions such as noise or objects, and avoid interruptions).
   C. Sit down for the interview (avoid barriers such as a desk), maintain an appropriate social distance, and maintain eye level.
   D. Use therapeutic communication techniques and open-ended questions to obtain information about the client’s symptoms and concerns; allow time for the client to ask questions.
   E. Consider religious and cultural characteristics such as language (the need for an interpreter), values and beliefs, health practices, eye contact, and touch.
   F. Keep note-taking to a minimum so the client is the focus of attention.
   G. Types of health and physical assessments (Box 12-1)
   H. SOAP (subjective, objective, assessment, plan) notes are a frequently used format for documenting client data including health history, physical examination, assessment or diagnosis, and plan of care. The nurse should be familiar with SOAP notes, how to interpret the initial history and physical (H&P) SOAP notes, and how to follow subsequent progress SOAP notes so as to maintain abreast of changes in the client’s plan of care. See Table 12-1 for a detailed list of information contained in SOAP notes.

II. Health History (refer to section titled “Subjective” in Table 12-1)
   A. General state of health: Body features and physical characteristics, body movements, body posture, level of consciousness, nutritional status, speech
   B. Chief complaint and history of present illness (document
direct client quotes) that leads the client to seek care
C. Family history: The health status of direct blood relatives as well as the client’s spouse
D. Social history
1. Data about the client’s lifestyle, with a focus on factors that may affect health
2. Information about alcohol, drug, and tobacco use; sexual practices; tattoos; body piercing; travel history; and work setting to identify occupational hazards

E. Domestic violence screening
1. Done to determine whether the client is experiencing any form of domestic violence
2. Conducted during a one-to-one interview with the client while obtaining the health history

III. Mental Status Exam
A. The mental status can be assessed while obtaining subjective data from the client during the health history interview.
B. Appearance
1. Note appearance, including posture, body movements, dress, and hygiene and grooming.
2. An inappropriate appearance and poor hygiene may be indicative of depression, manic disorder, dementia, organic brain disease, or another disorder.

C. Behavior
1. Level of consciousness: Assess alertness and awareness and the client’s ability to interact appropriately with the environment.
2. Facial expression and body language: Check for appropriate eye contact and determine whether facial expression and body language are appropriate to the situation; this assessment also provides information regarding the client’s mood and affect.

D. Cognitive level of functioning (Box 12-2)

IV. Physical Exam (refer to section titled “Objective” in Table 12-1)
A. Overview
1. Gather equipment needed for the examination.
2. Use the senses of sight, smell, touch, and hearing to collect data.
3. Assessment includes inspection, palpation, percussion, and auscultation; these skills are performed one at a time, in this order (except the
B. Assessment techniques

1. Inspection
   a. The first assessment technique, which uses vision and smell senses while observing the client.
   b. Requires good lighting, adequate body exposure with draping, and possibly the use of certain instruments such as an otoscope or ophthalmoscope.

2. Palpation
   a. Uses the sense of touch; warm the hands before touching the client.
   b. Identify tender areas and palpate them last.
   c. Start with light palpation to detect surface characteristics, and then perform deeper palpation.
   d. Light palpation is done with 1 hand by pressing the skin gently with the tips of 2 or 3 fingers held close together; deep palpation is done by placing 1 hand on top of the other and pressing down with the fingertips of both hands.
   e. Assess texture, temperature, and moisture of the skin, as well as organ location and size and symmetry if appropriate.
   f. Assess for swelling, vibration or pulsation, rigidity or spasticity, and crepitation.
   g. Assess for the presence of lumps or masses, as well as the presence of tenderness or pain.

3. Percussion
   a. Involves tapping the client’s skin to assess underlying structures and to determine the presence of vibrations and sounds and, if present, their intensity, duration, pitch, quality, and location.
   b. Provides information related to the presence of air, fluid, or solid masses as well as organ size, shape, and position.
   c. Descriptions of findings include
resonance, hyperresonance, tympany, dullness, or flatness.

4. Auscultation: Involves listening with a stethoscope to sounds produced by the body for presence and quality, such as heart, lung, or bowel sounds

C. Vital signs

1. Includes temperature, radial pulse (apical pulse may be measured during the cardiovascular assessment), respirations, blood pressure, pulse oximetry, and presence of pain (refer to Chapter 10 for information on vital signs, pulse oximetry, and pain)

2. Height, weight, and nutritional status are also assessed.

V. Body Systems Assessment

A. Integumentary system: Involves inspection and palpation of skin, hair, and nails.

1. Subjective data: Self-care behaviors, history of skin disease, medications being taken, environmental or occupational hazards and exposure to toxic substances, changes in skin color or pigmentation, change in a mole or a sore that does not heal

2. Objective data: Color, temperature (hypothermia or hyperthermia); excessive dryness or moisture; skin turgor; texture (smoothness, firmness); excessive bruising, itching, rash; hair loss (alopecia) or nail abnormalities such as pitting; lesions (may be inspected with a magnifier and light or with the use of a Wood’s light [ultraviolet light used in a darkened room]); scars or birthmarks; edema; capillary filling time (Boxes 12-3 and 12-4; Table 12-2)

3. Dark-skinned client
   a. Cyanosis: Check lips and tongue for a gray color; nailbeds, palms, and soles for a blue color; and conjunctivae for pallor.
   b. Jaundice: Check oral mucous membranes for a yellow color; check the sclera nearest to the iris for a yellow color.
   c. Bleeding: Look for skin swelling and darkening and compare the affected side with the unaffected side.
   d. Inflammation: Check for warmth or a shiny or taut and pitting skin area, and compare with the unaffected side.
4. Refer to Chapter 42 for diagnostic tests related to the integumentary system

To test skin turgor, pinch a large fold of skin and assess the ability of the skin to return to its place when released. Poor turgor occurs in severe dehydration or extreme weight loss.

5. Client teaching

a. Provide information about factors that can be harmful to the skin, such as sun exposure.

b. Encourage performing self-examination of the skin for lesions monthly using the ABCDE (asymmetry, border irregularity, color variance, diameter greater than 6 mm, evolving size, shape, and color) mnemonic.

B. Head, neck, and lymph nodes: Involves inspection, palpation, and auscultation of the head, neck, and lymph nodes

1. Ask the client about headaches; episodes of dizziness (lightheadedness) or vertigo (spinning sensation); history of head injury; loss of consciousness; seizures; episodes of neck pain; limitations of range of motion; numbness or tingling in the shoulders, arms, or hands; lumps or swelling in the neck; difficulty swallowing; medications being taken; and history of surgery in the head and neck region.

2. Head

a. Inspect and palpate: Size, shape, masses or tenderness, and symmetry of the skull

b. Palpate temporal arteries, located above the cheekbone between the eye and the top of the ear.

c. Palpate frontal and maxillary sinuses for tenderness.

d. Temporomandibular joint: Ask the client to open his or her mouth and move it from side to side; note any crepitation, tenderness, or limited range of motion. This tests cranial nerve V, the trigeminal nerve.

e. Face: Inspect facial structures for shape, symmetry, involuntary movements, or swelling, such as periorbital edema (swelling around the eyes).
3. Neck
   a. Inspect for symmetry of accessory neck muscles.
   b. Assess range of motion.
   c. Test cranial nerve XI (spinal accessory nerve) to assess muscle strength: Ask the client to push against resistance applied to the side of the chin (tests sternocleidomastoid muscle); also ask the client to shrug the shoulders against resistance (tests trapezius muscle).
   d. Palpate the trachea: It should be midline, without any deviations.
   e. Thyroid gland: Inspect the neck as the client takes a sip of water and swallows (thyroid tissue moves up with a swallow); palpate using an anterior-posterior approach (usually the normal adult thyroid cannot be palpated); if it is enlarged, auscultate for a bruit.

4. Lymph nodes
   a. Palpate using a gentle pressure and a circular motion of the finger pads.
   b. Begin with the preauricular lymph nodes (in front of the ear); move to the posterior auricular lymph nodes and then downward toward the supraclavicular lymph nodes. Lymph nodes in the head and neck area to be palpated include preauricular, postauricular, tonsillar, submandibular, submental, anterior cervical chain (superficial and deep), posterior cervical chain, supraclavicular, and infraclavicular.
   c. Palpate with both hands, comparing the 2 sides for symmetry.
   d. If nodes are palpated, note their size, shape, location, mobility, consistency, and tenderness.

5. Client teaching: Instruct the client to notify the primary health care provider (PHCP) if persistent headache, dizziness, or neck pain occurs; if swelling
or lumps are noted in the head and neck region; or if a neck or head injury occurs.

**Neck movements are never performed if the client has sustained a neck injury or if a neck injury is suspected.**

C. Eyes: Includes inspection, palpation, vision-testing procedures, and the use of an ophthalmoscope

1. **Subjective data:** Difficulty with vision (e.g., decreased acuity, double vision, blurring, blind spots); pain, redness, swelling, watery or other discharge from the eye; use of glasses or contact lenses; medications being taken; history of eye problems

2. **Objective data**
   a. Inspect the external eye structures, including eyebrows, for symmetry; eyelashes for even distribution; eyelids for ptosis (drooping); eyeballs for exophthalmos (protrusion) or enophthalmos (recession into the orbit; sunken eye).
   b. Inspect the conjunctiva (should be clear), sclera (should be white), and lacrimal apparatus (check for excessive tearing, redness, tenderness, or swelling); cornea and lens (should be smooth and clear); iris (should be flat, with a round regular shape and even coloration); eyelids; and pupils.

3. **Snellen eye chart**
   a. The Snellen eye chart is a simple tool used to measure distance vision.
   b. Position the client in a well-lit spot 20 feet (6 meters) from the chart, with the chart at eye level, and ask the client to read the smallest line that he or she can discern.
   c. Instruct the client to leave on glasses or leave in contact lenses; if the glasses are for reading only, they are removed because they blur distance vision.
   d. Test 1 eye at a time, cover the eye not
being tested.
e. Record the result using the fraction at
the end of the last line successfully
read on the chart.
f. Normal visual acuity is 20/20 (distance
in feet at which the client is standing
from the chart/distance in feet at which
a normal eye could have read that
particular line).
g. This assessment tests cranial nerve II,
the optic nerve.

4. Near vision
   a. Use a handheld vision screener (held
      about 14 inches [35.5 cm] from the eye)
      that contains various sizes of print or
      ask the client to read from a magazine.
b. Test each eye separately with the
   client’s glasses on or contact lenses in.
   Cover the eye not being tested.
c. Normal result is 14/14 (distance in
   inches at which the subject holds the
   card from the eye/distance in inches at
   which a normal eye could have read
   that particular line).
d. This assessment tests cranial nerve II,
   the optic nerve.

5. Confrontation test
   a. A crude but rapid test used to measure
      peripheral vision and compare the
      client’s peripheral vision with the
      nurse’s (assuming that the nurse’s
      peripheral vision is normal)
b. The client covers 1 eye and looks
   straight ahead; the nurse, positioned 2
   feet away (60 cm), covers his or her eye
   opposite the client’s covered eye.
c. The nurse advances a finger or other
   small object from the periphery from
   several directions; the client should see
   the object at the same time the nurse
   does.
d. Documented as the client’s peripheral
   vision is equal to that of the
   examiner’s.
e. This assessment tests cranial nerve II,
   the optic nerve.

6. Corneal light reflex
   a. Used to assess for parallel alignment of
the axes of the eyes
b. Client is asked to gaze straight ahead as the nurse holds a light about 12 inches (30 cm) from the client.
c. The nurse looks for reflection of the light on the corneas in exactly the same spot in each eye.

7. Cover/uncover test
   a. Used to check for slight degrees of deviated alignment
   b. Each eye is tested separately.
   c. The nurse asks the client to gaze straight ahead and cover 1 eye.
   d. The nurse examines the uncovered eye, expecting to note a steady, fixed gaze.

8. Diagnostic positions test (6 cardinal positions of gaze) (Fig. 12-1)
   a. The 6 muscles that attach the eyeball to its orbit and serve to direct the eye to points of interest are tested.
   b. Client holds head still and is asked to move his or her eyes and follow a small object.
   c. The examiner notes any parallel movements of the eye or nystagmus, an involuntary, rhythmic, rapid twitching of the eyeballs.
   d. This assessment tests cranial nerves III, IV, and VI, oculomotor, trochlear, and abducens, respectively.

9. Color vision
   a. Tests for color vision involve the client picking numbers or letters out of a complex and colorful picture using what is known as the Ishihara chart.
   b. The test is sensitive for the diagnosis of red-green blindness but cannot detect discrimination of blue.

| The first slide on the Ishihara chart is one that everyone can discriminate; failure to identify numbers on this slide suggests a problem with performing the test, not a problem with color vision. |

10. Pupils (Box 12-5)
    a. The pupils are round and of equal size.
    b. Increasing light causes pupillary
constriction.
c. Decreasing light causes pupillary dilation.
d. Constriction of both pupils is a normal response to direct light. Constriction of the pupil in which the light is being shone is considered reaction to direct light, and constriction of the pupil in which the light is not being shone is considered reaction to consensual light.

11. Sclera and cornea
   a. Normal sclera color is white.
   b. A yellow color to the sclera may indicate jaundice or systemic problems.
   c. In a dark-skinned person, the sclera may normally appear yellow; pigmented dots may be present.
   d. The cornea is transparent, smooth, shiny, and bright.
   e. Cloudy areas or specks on the cornea may be the result of an accident or eye injury.

12. Ophthalmoscopy or fundoscopy
   a. The ophthalmoscope, or funduscope, is an instrument used to examine the external structures and the interior of the eye.
   b. The room is darkened so that the pupil will dilate.
   c. The instrument is held with the right hand when examining the right eye and with the left hand when examining the left eye.
   d. The client is asked to look straight ahead at an object on the wall.
   e. The examiner should approach the client’s eye from about 12 to 15 inches (30.5 to 38 cm) away and 15 degrees lateral to the client’s line of vision.
   f. As the instrument is directed at the pupil, a red glare (red reflex) is seen in the pupil.
   g. The red reflex is the reflection of light on the vascular retina.
   h. Absence of the red reflex may indicate opacity of the lens.
i. The optic disc, retinal vessels, general background, and macula can be examined.

j. The optic disc should be creamy yellow-orange to pink, round or oval shape with distinct margins. Retinal vessels should be visible without nicking and engorgement. General background varies from light red to dark brown red, corresponding with the person’s color.

13. Refer to Chapter 56 for diagnostic tests related to the eye.

14. Client teaching
   a. Instruct the client to notify the PHCP if alterations in vision occur or any redness, swelling, or drainage from the eye is noted.
   b. Inform the client of the importance of regular eye examinations.

D. Ears: Includes inspection, palpation, hearing tests, vestibular assessment, and the use of an otoscope

1. Subjective data: Difficulty hearing, earaches, drainage from the ears, dizziness, ringing in the ears, exposure to environmental noise, use of a hearing aid, medications being taken, history of ear problems or infections

2. Objective data
   a. Inspect and palpate the external ear, noting size, shape, symmetry, skin color, and the presence of pain.
   b. Inspect the external auditory meatus for size, swelling, redness, discharge, and foreign bodies; some cerumen (earwax) may be present.

3. Auditory assessment
   a. Sound is transmitted by air conduction and bone conduction.
   b. Air conduction takes 2 or 3 times longer than bone conduction.
   c. Hearing loss is categorized as conductive, sensorineural, or mixed conductive and sensorineural.
   d. Conductive hearing loss is caused by
any physical obstruction to the transmission of sound waves.
e. Sensorineural hearing loss is caused by a defect in the cochlea, eighth cranial nerve, or the brain itself.
f. A mixed hearing loss is a combination of a conductive and sensorineural hearing loss; it results from problems in both the inner ear and the outer ear or middle ear.

4. Voice (Whisper) test
   a. Used to determine whether hearing loss has occurred
   b. One ear is tested at a time (the ear not being tested is occluded by the client).
   c. The nurse stands 1 to 2 feet (30 to 60 cm) from the client, covers his or her mouth so that the client cannot read the lips, exhales fully, and softly whispers 2-syllable words in the direction of the unoccluded ear; the client points a finger up during the test when the nurse’s voice is heard (a ticking watch may also be used to test hearing acuity).
   d. Failure to hear the sounds could indicate possible fluid collection and/or consolidation, requiring further assessment.

5. Watch test
   a. A ticking watch is used to test for high-frequency sounds.
   b. The examiner holds a ticking watch about 5 inches (12.5 cm) from each ear and asks the client if the ticking is heard.

6. Tuning fork tests
   a. Used to measure hearing on the basis of air conduction or bone conduction; includes the Weber’s and Rinne’s tests. These tests are not commonly used because of their limited sensitivity to detect hearing loss.

7. Vestibular assessment (Box 12-6)

8. Otoscopic exam
Before performing an otoscopic exam and inserting the speculum, check the auditory canal for foreign bodies. Instruct the client not to move the head during the examination to avoid damage to the canal and tympanic membrane.

a. The client’s head is tilted slightly away and the otoscope is held upside down as if it were a large pen; this permits the examiner’s hand to lay against the client’s head for support.
b. In an adult, pull the pinna up and back to straighten the external canal.
c. Visualize the external canal while slowly inserting the speculum.
d. The normal external canal is pink and intact, without lesions and with varying amounts of cerumen and fine little hairs.
e. Assess the tympanic membrane for intactness; the normal tympanic membrane is intact, without perforations, and should be free from lesions.
f. The tympanic membrane is transparent, opaque, pearly gray, and slightly concave. The cone of light reflex is noted at 5 o’clock on the right and 7 o’clock on the left, and there is positive mobility when the client swallows.
g. A fluid line or the presence of air bubbles is not normally visible.
h. If the tympanic membrane is bulging or retracting, the edges of the light reflex will be fuzzy (diffuse) and may spread over the tympanic membrane.

The otoscope is never introduced blindly into the external canal because of the risk of perforating the tympanic membrane.

9. Refer to Chapter 56 for diagnostic tests related to the ear.
10. Client teaching

a. Instruct the client to notify the PHCP if an alteration in hearing or ear pain or ringing in the ears occurs, or if redness, swelling, or drainage from the ear is noted.
b. Instruct the client in the proper method of cleaning the ear canal.

c. The client should cleanse the ear canal with the corner of a moistened washcloth and should never insert sharp objects or cotton-tipped applicators into the ear canal.

E. Nose, mouth, and throat: Includes inspection and palpation

1. Subjective data

   a. Nose: Ask about discharge or nosebleed (epistaxis), facial or sinus pain, history of frequent colds, altered sense of smell, allergies, medications being taken, history of nose trauma, or surgery.

   b. Mouth and throat: Ask about the presence of sores or lesions; bleeding from the gums or elsewhere; altered sense of taste; toothaches; use of dentures or other appliances; tooth and mouth care hygiene habits; at-risk behaviors (e.g., smoking, alcohol consumption); and history of infection, trauma, or surgery.

2. Objective data

   a. External nose should be midline and in proportion to other facial features.

   b. Patency of the nostrils can be tested by pushing each nasal cavity closed and asking the client to sniff inward through the other nostril.

   c. A nasal speculum and penlight or a short, wide-tipped speculum attached to an otoscope head is used to inspect for redness, swelling, discharge, bleeding, or foreign bodies; the nasal septum is assessed for deviation.

   d. The nurse presses the frontal sinuses (located below the eyebrows) and over the maxillary sinuses (located below the cheekbones); the client should feel firm pressure but no pain.

   e. The external and inner surfaces of the lips are assessed for color, moisture, cracking, or lesions.
f. The teeth are inspected for condition and number (should be white, spaced evenly, straight, and clean, free of debris and decay).

g. The alignment of the upper and lower jaws is assessed by having the client bite down.

h. The gums are inspected for swelling, bleeding, discoloration, and retraction of gingival margins (gums normally appear pink).

i. The tongue is inspected for color, surface characteristics, moisture, white patches, nodules, and ulcerations (dorsal surface is normally rough; ventral surface is smooth and glistening, with visible veins).

j. The nurse retracts the cheek with a tongue depressor to check the buccal mucosa for color and the presence of nodules or lesions; normal mucosa is glistening, pink, soft, moist, and smooth.

k. Using a penlight and tongue depressor, the nurse inspects the hard and soft palates for color, shape, texture, and defects; the hard palate (roof of the mouth), which is located anteriorly, should be white and dome-shaped, and the soft palate, which extends posteriorly, should be light pink and smooth.

l. The uvula is inspected for midline location; the nurse asks the client to say “ahhh” and watches for the soft palate and uvula to rise in the midline (this tests 1 function of cranial nerve X, the vagus nerve).

m. Using a penlight and tongue depressor, the nurse inspects the throat for color, presence of tonsils, and the presence of exudate or lesions; tonsils should be graded (0 is surgically removed; 1 + is tonsils hidden within pillars; 2 + is tonsils extending to the pillars, 3 + is tonsils extending beyond the pillars, 4 + is tonsils extending to the midline). One technique to test
cranial nerve XII (the hypoglossal nerve) is asking the client to stick out the tongue (should protrude in the midline).

n. To test the gag reflex, touch the posterior pharynx with the end of a tongue blade; the client should gag momentarily (this tests the function of cranial nerve IX, the glossopharyngeal nerve).

3. Client teaching
   a. Emphasize the importance of hygiene and tooth care, as well as regular dental examinations and the use of fluoridated water or fluoride supplements.
   b. Encourage the client to avoid at-risk behaviors (e.g., smoking, alcohol consumption).
   c. Stress the importance of reporting pain or abnormal occurrence (e.g., nodules, lesions, signs of infection).

F. Lungs

1. Subjective data: Cough; expectoration of sputum; shortness of breath or dyspnea; chest pain on breathing; smoking history; environmental exposure to pollution or chemicals; medications being taken; history of respiratory disease or infection; last tuberculosis test, chest radiograph, pneumonia, and any influenza immunizations. Record the smoking history in pack-years (the number of packs per day times the number of years smoked). For example, a client who has smoked one-half pack a day for 20 years has a 10-pack/year smoking history.

2. Objective data: Includes inspection, palpation, percussion, and auscultation

3. Inspection of the anterior and posterior chest: Note skin color and condition and the rate and quality of respirations, look for lumps or lesions, note the shape and configuration of the chest wall, and note the position the client takes to breathe.

4. Palpation: Palpate the entire chest wall, noting skin temperature and moisture and looking for areas of tenderness and lumps, lesions, or masses; assess chest excursion and tactile or vocal fremitus (Box 12-7).
5. Percussion
   a. Starting at the apices, percuss across the top of the shoulders, moving to the interspaces, making a side-to-side comparison all the way down the lung area (Fig. 12-2).
   b. Determine the predominant note; resonance is noted in healthy lung tissue.
   c. Hyperresonance is noted when excessive air is present and a dull note indicates lung density.

6. Auscultation
   a. Using the flat diaphragm endpiece of the stethoscope, hold it firmly against the chest wall and listen to at least 1 full respiration in each location (anterior, posterior, and lateral).
   b. Posterior: Start at the apices and move side to side for comparison (see Fig. 12-2).
   c. Anterior: Auscultate the lung fields from the apices in the supraclavicular area down to the 6th rib; avoid percussion and auscultation over female breast tissue (displace this tissue), because a dull sound will be produced (see Fig. 12-2).
   d. Compare findings on each side.

7. Normal breath sounds: Three types of breath sounds are considered normal in certain parts of the thorax, including vesicular, bronchovesicular, and bronchial; breath sounds should be clear to auscultation (Fig. 12-3).

8. Abnormal breath sounds: Also known as adventitious sounds (Table 12-3)

9. Voice sounds (Box 12-8)
   a. Performed when a pathological lung condition is suspected
   b. Auscultate over the chest wall; the client is asked to vocalize words or a phrase while the nurse listens to the chest.
   c. Normal voice transmission is soft and muffled; the nurse can hear the sound but is unable to distinguish exactly what is being said.
10. Refer to Chapter 50 for diagnostic tests related to the respiratory system.

11. **Client teaching**
   a. Encourage the client to avoid exposure to environmental hazards, including smoking (discuss smoking cessation programs as appropriate).
   b. Client should undergo periodic examinations as prescribed (e.g., chest x-ray study, tuberculosis skin testing; refer to Chapter 50).
   c. Encourage the client to obtain pneumonia and influenza immunizations.
   d. PHCP should be notified if client experiences persistent cough, shortness of breath, or other respiratory symptoms.

**G. Heart**

1. **Subjective data:** Chest pain, dyspnea, cough, fatigue, edema, nocturia, leg pain or cramps (claudication), changes in skin color, obesity, medications being taken, cardiovascular risk factors, family history of cardiac or vascular problems, personal history of cardiac or vascular problems
2. **Objective data:** May include inspection, palpation, percussion, and auscultation
3. **Inspection:** Inspect the anterior chest for pulsations (apical impulse) created as the left ventricle rotates against the chest wall during systole; not always visible.
4. **Palpation**
   a. Palpate the apical impulse at the fourth or fifth interspace, or medial to the midclavicular line (not palpable in obese clients or clients with thick chest walls).
   b. Palpate the apex, left sternal border, and base for pulsations; normally none are present.
5. **Percussion:** May be performed to outline the heart’s
borders and to check for cardiac enlargement (denoted by resonance over the lung and dull notes over the heart).

6. Auscultation

   a. Areas of the heart (Fig. 12-4)
   b. Auscultate heart rate and rhythm; check for a pulse deficit (auscultate the apical heartbeat while palpating an artery) if an irregularity is noted.
   c. Assess S1 (“lub”) and S2 (“dub”) sounds, and listen for extra heart sounds, as well as the presence of murmurs (blowing or swooshing noise that can be faint or loud with a high, medium, or low pitch).
   d. Grading a murmur: See Box 12-9.

7. Peripheral vascular system

   a. Assess adequacy of blood flow to the extremities by palpating arterial pulses for equality and symmetry and checking the condition of the skin and nails.
   b. Check for pretibial edema and measure calf circumference (see Table 12-2).
   c. Measure blood pressure.
   d. Palpate superficial inguinal nodes (using firm but gentle pressure), beginning in the inguinal area and moving down toward the inner thigh.
   e. An ultrasonic stethoscope may be needed to amplify the sounds of a pulse wave if the pulse cannot be palpated.
   f. Carotid artery: Located in the groove between the trachea and sternocleidomastoid muscle, medial to and alongside the muscle.
   g. Palpate 1 carotid artery at a time to avoid compromising blood flow to the brain.
   h. Auscultate each carotid artery for the presence of a bruit (a blowing, swishing, or buzzing, humming sound), which indicates blood flow turbulence; normally a bruit is not present.
   i. Palpate the arteries in the extremities
8. Refer to Chapter 52 for diagnostic tests related to the cardiovascular system.

9. **Client teaching**
   a. Advise client to modify lifestyle for risk factors associated with heart and vascular disease.
   b. Encourage the client to seek regular physical examinations.
   c. Client should seek medical assistance for signs of heart or vascular disease.

H. **Breasts**

1. **Subjective data:** Pain or tenderness, lumps or thickening, swollen axillary lymph nodes, nipple discharge, rash or swelling, medications being taken, personal or family history of breast disease, trauma or injury to the breasts, previous surgery on the breasts, breast self-examination (BSE) compliance, mammograms as prescribed

2. **Objective data:** Inspection and palpation

3. **Inspection**
   a. Performed with the client’s arms raised above the head, the hands pressed against the hips, and the arms extended straight ahead while the client sits and leans forward
   b. Assess size and symmetry (1 breast is often larger than the other); masses, flattening, retraction, or dimpling; color and venous pattern; size, color, shape, and discharge in the nipple and areola; and the direction in which nipples point.

4. **Palpation**
   a. Client lies supine, with the arm on the side being examined behind the head and a small pillow under the shoulder.
   b. The nurse uses the pads of the first 3 fingers to compress the breast tissue gently against the chest wall, noting tissue consistency.
   c. Palpation is performed systematically, ensuring that the entire breast and tail are palpated.
d. The nurse notes the consistency of the breast tissue, which normally feels dense, firm, and elastic.
e. The nurse gently palpates the nipple and areola and compresses the nipple, noting any discharge.
f. It is important to document lump or mass characteristics, which includes size, shape, consistency, movability, distinctness, nipple characteristics, skin findings over the lump, tenderness, and lymphadenopathy.

5. Axillary lymph nodes
a. The nurse faces the client and stands on the side being examined, supporting the client’s arm in a slightly flexed position, and abducts the arm away from the chest wall.
b. The nurse places the free hand against the client’s chest wall and high in the axillary hollow, then, with the fingertips, gently presses down, rolling soft tissue over the surface of the ribs and muscles.
c. Lymph nodes are normally not palpable.

6. Client teaching
a. Encourage and teach the client to perform BSE (refer to Chapter 44 for information on performing BSE).
b. Client should report lumps or masses to the PHCP immediately.
c. Regular physical examinations and mammograms should be obtained as prescribed.

I. Abdomen
1. Subjective data: Changes in appetite or weight, difficulty swallowing, dietary intake, intolerance to certain foods, nausea or vomiting, pain, bowel habits, medications currently being taken, history of abdominal problems or abdominal surgery

2. Objective data
a. Ask the client to empty the bladder.
b. Be sure to warm the hands and the
When performing an abdominal assessment, the specific order for assessment techniques is inspection, auscultation, percussion, and palpation.

3. Inspection
   a. Contour: Look down at the abdomen and then across the abdomen from the rib margin to the pubic bone; describe as flat, rounded, concave, or protuberant.
   b. Symmetry: Note any bulging or masses.
   c. Umbilicus: Should be midline and inverted
   d. Skin surface: Should be smooth and even
   e. Pulsations from the aorta may be noted in the epigastric area, and peristaltic waves may be noted across the abdomen.

4. Auscultation
   a. Performed before percussion and palpation, which can increase peristalsis.
   b. Hold the stethoscope lightly against the skin and listen for bowel sounds in all 4 quadrants; begin in the right lower quadrant (bowel sounds are normally heard here).
   c. Note the character and frequency of normal bowel sounds: high-pitched gurgling sounds occurring irregularly from 5 to 30 times a minute.
   d. Identify as normal, hypoactive, or hyperactive (borborygmus).
   e. Absent sounds: Auscultate for 5 minutes before determining that sounds are absent.
   f. Auscultate over the aorta, renal arteries, iliac arteries, and femoral arteries for vascular sounds or bruits with the bell of the stethoscope.

5. Percussion
   a. All 4 quadrants are percussed lightly.
   b. Borders of the liver and spleen are
percussed and measured.
c. Tympany should predominate over the abdomen, with dullness over the liver and spleen.
d. Percussion over the kidney at the 12th rib (costovertebral angle) should produce no pain. This is also known as costovertebral tenderness.

6. Palpation
   a. Begin with light palpation of all 4 quadrants, using the fingers to depress the skin about 1 cm; next perform deep palpation, depressing 5 to 8 cm.
   b. Palpate the liver and spleen (spleen may not be palpable).
   c. Palpate the aortic pulsation in the upper abdomen slightly to the left of midline; normally it pulsates in a forward direction (pulsation expands laterally if an aneurysm is present).

7. Refer to Chapter 48 for diagnostic tests related to the gastrointestinal system.

8. Client teaching
   a. Encourage the client to consume a balanced diet; obesity needs to be prevented.
   b. Substances that can cause gastric irritation should be avoided.
   c. The regular use of laxatives is discouraged.
   d. Lifestyle behaviors that can cause gastric irritation (e.g., spicy foods) should be modified.
   e. Regular physical examinations are important.
   f. The client should report gastrointestinal problems to the PHCP.

J. Musculoskeletal system

1. Subjective data: Joint pain or stiffness; redness, swelling, or warm joints; limited motion of joints; muscle pain, cramps, or weakness; bone pain; limitations in activities of daily living; exercise patterns; exposure to occupational hazards (e.g., heavy lifting, prolonged standing or sitting); medications being taken; history of joint, muscle, or bone injuries; history of surgery of the joints, muscles, or bones
2. Objective data: Inspection and palpation
3. Inspection: Inspect gait and posture, and for cervical, thoracic, and lumbar curves (Box 12-11).
4. Palpation: Palpate all bones, joints, and surrounding muscles.
5. Range of motion
   a. Perform active and passive range-of-motion exercises of each major joint.
   b. Check for pain, limited mobility, spastic movement, joint instability, stiffness, and contractures.
   c. Normally joints are nontender, without swelling, and move freely.
6. Muscle tone and strength
   a. Assess during measurement of range of motion.
   b. Ask client to flex the muscle to be examined and then to resist while applying opposing force against the flexion.
   c. Assess for increased tone (hypertonicity) or little tone (hypotonicity).
7. Grading muscle strength (Table 12-4)
8. Refer to Chapter 60 for diagnostic tests related to the musculoskeletal system.
9. Client teaching
   a. The client should consume a balanced diet, including foods containing calcium and vitamin D.
   b. Activities that cause muscle strain or stress to the joints should be avoided.
   c. Encourage the client to maintain a normal weight.
   d. Participation in a regular exercise program is beneficial.
   e. The client should contact the PHCP if joint or muscle pain or problems occur or if limitations in range of motion or muscle strength develop.

K. Neurological system
1. Subjective data: Headaches, dizziness or vertigo, tremors, weakness, incoordination, numbness or tingling in any area of the body, difficulty speaking or swallowing, medications being taken, history of
seizures, history of head injury or surgery, exposure to environmental or occupational hazards (e.g., chemicals, alcohol, drugs)

2. Objective data: Assessment of cranial nerves, level of consciousness, pupils, motor function, cerebellar function, coordination, sensory function, and reflexes

3. Note mental and emotional status, behavior and appearance, language ability, and intellectual functioning, including memory, knowledge, abstract thinking, association, and judgment.

4. Vital signs: Check temperature, pulse, respirations, and blood pressure; monitor for blood pressure or pulse changes, which may indicate increased intracranial pressure (see Chapter 50 for abnormal respiratory patterns).

5. Cranial nerves (Table 12-5)

6. Level of consciousness
   a. Assess the client’s behavior to determine level of consciousness (e.g., alertness, confusion, delirium, unconsciousness, stupor, coma); assessment becomes increasingly invasive as the client is less responsive. Use the Glasgow Coma Scale as appropriate (eye opening, motor response, verbal response, graded on a scale). See Chapter 58 for a description of this scale.
   b. Speak to client.
   c. Assess appropriateness of behavior and conversation.
   d. Lightly touch the client (as culturally appropriate).

7. Pupils
   a. Assess size, equality, and reaction to light (brisk, slow, or fixed) and note any unusual eye movements (check direct light and consensual light reflex); refer to Chapter 58 for abnormal pupillary findings.
   b. This component of the neurological examination may be performed during assessment of the eye.

8. Motor function
a. Assess muscle tone, including strength and equality.

b. Assess for voluntary and involuntary movements and purposeful and nonpurposeful movements.

c. This component of the neurological examination may be performed during assessment of the musculoskeletal system.

9. Cerebellar function

a. Monitor gait as the client walks in a straight line, heel to toe (tandem walking).

b. Romberg’s test: Client is asked to stand with the feet together and the arms at the sides and to close the eyes and hold the position; normally the client can maintain posture and balance.

c. If appropriate, ask the client to perform a shallow knee bend or to hop in place on 1 leg and then the other.

10. Coordination

a. Assess by asking the client to perform rapid alternating movements of the hands (e.g., turning the hands over and patting the knees continuously).

b. The nurse asks the client to touch the nurse’s finger, then his or her own nose; the client keeps the eyes open and the nurse moves the finger to different spots to ensure that the client’s movements are smooth and accurate.

c. Heel-to-shin test: Assist the client into a supine position, then ask the client to place the heel on the opposite knee and run it down the shin; normally the client moves the heel down the shin in a straight line.

11. Sensory function

a. Pain: Assess by applying an object with a sharp point and one with a dull point to the client’s body in random order; ask the client to identify the sharp and dull feelings.

b. Light touch: Brush a piece of cotton over the client’s skin at various locations in a random order and ask
the client to say when the touch is felt.
c. Position sense (kinesthesia): Move the client’s finger or toe up or down and ask the client which way it has been moved; this tests the client’s ability to perceive passive movement.
d. Stereognosis: Tests the client’s ability to recognize objects placed in his or her hand
e. Graphesthesia: Tests the client’s ability to identify a number traced on the client’s hand
f. Two-point discrimination: Tests the client’s ability to discriminate 2 simultaneous pinpricks on the skin

12. Deep tendon reflexes
   a. Includes testing the following reflexes: biceps, triceps, brachioradialis, patella, Achilles
   b. Limb should be relaxed.
   c. The tendon is tapped quickly with a reflex hammer, which should cause contraction of muscle.
   d. Scoring deep tendon reflex activity (Box 12-12)

13. Plantar reflex
   a. A cutaneous (superficial) reflex is tested with a pointed but not sharp object.
   b. The sole of the client’s foot is stroked from the heel, up the lateral side, and then across the ball of the foot to the medial side.
   c. The normal response is plantar flexion of all toes.

   ! Dorsiflexion of the great toe and fanning of the other toes (Babinski’s sign) after firmly stroking the sole of the foot, is abnormal in anyone older than 2 years and indicates the presence of central nervous system disease.

14. Testing for meningeal irritation
   a. A positive Brudzinski’s sign or Kernig’s sign indicates meningeal irritation.
   b. Brudzinski’s sign is tested with the client in the supine position. The nurse flexes the client’s head (gently moves the head to the chest) and there should
be no reports of pain or resistance to the neck flexion; a positive Brudzinski’s sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.

c. Kernig’s sign is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended.

15. Refer to Chapter 58 for additional neurological assessments and diagnostic tests.

16. **Client teaching**

a. Client should avoid exposure to environmental hazards (e.g., insecticides, lead).

b. High-risk behaviors that can result in head and spinal cord injuries should be avoided.

c. Protective devices (e.g., a helmet, body pads) should be worn when participating in high-risk behaviors.

d. Seat belts should always be worn.

L. Female genitalia and reproductive tract

1. **Subjective data:** Urinary difficulties or symptoms such as frequency, urgency, or burning; vaginal discharge; pain; menstrual and obstetrical histories; onset of menopause; medications being taken; sexual activity and the use of barrier and other contraceptives; history of sexually transmitted infections

2. **Objective data**

a. Use a calm and relaxing approach; the examination is embarrassing for many clients and may be a difficult experience for an adolescent.

b. Consider the client’s cultural background and their beliefs regarding examination of the genitalia.

c. Consider sexual orientation in these types of exams, such as a transgendered individual and the sensitivity required in caring for this
special population.
d. A complete examination will include the external genitalia and a pelvic (speculum and bi-manual) examination.
e. The nurse’s role is to prepare the client for the examination and to assist the PHCP or other practitioner.
f. The client is asked to empty her bladder before the examination.
g. The client is placed in the lithotomy position, and a drape is placed across the client.

3. External genitalia
   a. Quantity and distribution of hair
   b. Characteristics of labia majora and minora (make note of any inflammation, edema, lesions, or lacerations)
c. Urethral orifice is observed for color and position.
d. Vaginal orifice (introitus) is inspected for inflammation, edema, discoloration, discharge, and lesions.
e. The examiner may check Skene’s and Bartholin’s glands for tenderness or discharge (if discharge is present, color, odor, and consistency are noted and a culture of the discharge is obtained).
f. The client is assessed for the presence of a cystocele (in which a portion of the vaginal wall and bladder prolapse, or fall, into the orifice anteriorly) or a rectocele (bulging of the posterior wall of the vagina caused by prolapse of the rectum).

4. Speculum examination of the internal genitalia
   a. Performed by the PHCP or other practitioner
   b. Permits visualization of the cervix and vagina
   c. Papanicolaou (Pap) smear (test): A painless screening test for cervical cancer is done; the specimen is obtained during the speculum examination, and the nurse helps prepare the specimen for laboratory
analysis. This test may or may not include screening for human papilloma virus (HPV).

5. Bimanual examination
   a. Performed by PHCP or other practitioner
   b. Internal examination of the structures of the female reproductive tract
   c. May reveal masses, nodules, growths, or tenderness
   d. The uterus is palpated for position, size, shape, contour, and mobility.
   e. The adnexa and ovaries are palpated for masses or tenderness.
   f. A rectovaginal examination may be done for further examination of the pelvic structures.

6. Client teaching
   a. Stress the importance of personal hygiene.
   b. Explain the purpose and recommended frequency of Pap tests.
   c. Explain the signs of sexually transmitted infections.
   d. Educate the client on measures to prevent a sexually transmitted infection.
   e. Inform the client with a sexually transmitted infection that she must inform her sexual partner(s) of the need for an examination.

M. Male genitalia

1. Subjective data: Urinary difficulty (e.g., frequency, urgency, hesitancy or straining, dysuria, nocturia); pain, lesions, or discharge on or from the penis; pain or lesions in the scrotum; medications being taken; sexual activity and the use of contraceptives; history of sexually transmitted infections

2. Objective data
   a. Includes assessment (inspection and palpation) of the external genitalia and inguinal ring and canal
   b. Client may stand or lie down for this
examination.
c. Genitalia are manipulated gently to avoid causing erection or discomfort.
d. Sexual maturity is assessed by noting the size and shape of the penis and testes, the color and texture of the scrotal skin, and the character and distribution of pubic hair.
e. The penis is checked for the presence of lesions or discharge; a culture is obtained if a discharge is present.
f. The scrotum is inspected for size, shape, and symmetry (normally the left testicle hangs lower than the right) and is palpated for the presence of lumps.
g. Inguinal ring and canal: inspection (asking the client to cough or bear down) and palpation are performed to assess for the presence of a hernia.

3. Client teaching
   a. Stress the importance of personal hygiene.
   b. Teach the client how to perform testicular self-examination (TSE); a day of the month is selected and the exam is performed on the same day each month after a shower or bath when the hands are warm and soapy and the scrotum is warm. (Refer to Chapter 44 for information on performing TSE.)
c. Explain the signs of sexually transmitted infections.
d. Educate the client on measures to prevent sexually transmitted infections.
e. Inform the client with a sexually transmitted infection that he must inform his sexual partner(s) of the need for an examination.

N. Rectum and anus
   1. Subjective data: Usual bowel pattern; any change in bowel habits; rectal pain, bleeding from the rectum, or black or tarry stools; dietary habits; problems with urination; previous screening for colorectal cancer; previous screening for prostate
cancer; medications being taken; history of rectal or colon problems; family history of rectal or colon problems

2. Objective data
   a. Examination can detect colorectal cancer in its early stages; in men, the rectal examination can also detect prostate tumors.
   b. Women may be examined in the lithotomy position after examination of the genitalia.
   c. A man is best examined by having the client bend forward with his hips flexed and upper body resting over the examination table.
   d. A nonambulatory client may be examined in the left lateral (Sims’) position.
   e. The external anus is inspected for lumps or lesions, rashes, inflammation or excoriation, scars, or hemorrhoids.
   f. Digital examination will most likely be performed by the PHCP or other practitioner.
   g. Digital examination is performed to assess sphincter tone; to check for tenderness, irregularities, polyps, masses, or nodules in the rectal wall; and to assess the prostate gland.
   h. The prostate gland is normally firm, without bogginess, tenderness, or nodules (hardness or nodules may indicate the presence of a cancerous lesion; bogginess or tenderness may indicate infection).

3. Client teaching
   a. Diet should include high-fiber and low-fat foods and plenty of liquids.
   b. The client should obtain regular digital examinations.
   c. The client should be able to identify the symptoms of colorectal cancer or prostatic cancer (men).
   d. The client should follow the American Cancer Society’s guidelines for
screening for colorectal cancer and prostate cancer.

VI. Documenting Health and Physical Assessment Findings

A. Documentation of findings may be either written or recorded electronically (depending on agency protocol).
B. Whether written or electronic, the documentation is a legal document and a permanent record of the client’s health status.
C. Principles of documentation need to be followed and data need to be recorded accurately, concisely, completely, legibly, and objectively without bias or opinions; always follow agency protocol for documentation.
D. Documentation findings serve as a source of client information for other health care providers; procedures for maintaining confidentiality are always followed.
E. Record findings about the client’s health history and physical examination as soon as possible after completion of the health assessment.
F. Refer to Chapter 6 for additional information about documentation guidelines.

Box 12-1

Types of Health and Physical Assessments

Complete Assessment: Includes a complete health history and physical examination and forms a baseline database.
Focused Assessment: Focuses on a limited or short-term problem, such as the client’s complaint.
Episodic/Follow-up Assessment: Focuses on evaluating a client’s progress.
Emergency Assessment: Involves the rapid collection of data, often during the provision of lifesaving measures.

<td><strong>None</strong> Appearance, patency, discharge, polyps, turbinate, septum, sinus tenderness, odors</td>
</tr>
<tr>
<td><strong>Personal and social history</strong> Varies based on health influences Cultural background and practices, home environment, general life satisfaction, safety/abuse, stressors, religious preferences, occupation, exposure to heat/cold or toxins, exposure to contagious diseases, health habits such as diet, exercise, smoking, salt intake, obesity, alcohol intake, recreational drug use, caffeine use, sexual activity, concerns about cost of care. Review of systems (may include some objective data) General or constitutional symptoms: fever, chills, malaise, night sweats, fatigue, unintentional weight loss or gain, overall behavior Skin: hair, nails: rash, itching, pigmentation change, sweating, abnormal hair or nail growth Head and neck: headache, dizziness, syncope, concussion, loss of consciousness, eyes: visual acuity, double vision, blurring, light sensitivity, glaucoma, use of glasses or contacts, use of eyeglasses Ears: hearing loss, ear pain, tinnitus, vertigo Nose: smell, colds, nosebleeds, postnasal discharge, sinus pain Throat and mouth: hoarseness, change in voice, sore throat, gum bleeding or swelling, taste changes Lymphatics: enlargement, tenderness Chest and lungs: respiratory pain, dyspnea, wheezing, cyanosis, cough, sputum, hemoptysis, last chest x-ray Breasts: development, pain, tenderness, lumps, discharge, last mammogram Heart and circulation: chest pain, edema, history of hypertension, myocardial infarction, exercise tolerance, previous cardiac tests, claudication, brusing, thrombophlebitis Hematologic: anemia, blood cell disorder, bleeding Gastrointestinal: appetite, food intolerance, dysphagia, heartburn, nausea, vomiting, diarrhea, constipation, change in stool, dark urine previous studies such as colonoscopy, diet recall Endocrine: thyroid enlargement, heat or cold intolerance, polyphagia, polydipsia, polyuria, changes in facial or body hair, striae Genitourinary: for males, puberty onset, testicular pain, libido, infertility; for females, menses onset, regularity, duration, dysmenorrhea, last period, itching, date of last Pap smear, human papilloma virus (HPV) test, age at menopause, libido, sexual difficulties, pregnancy (GTPAL refer to Chapter 21); for both, dysuria, flank pain, urgency, frequency, nocturia, dribbling, hematuria, incontinence Musculoskeletal: joint pain, stiffness, redness, swelling, restricted motion, deformities Neurological: syncope, seizures, weakness, paralysis, incoordination, tremors, cognition Mental health: mood changes, depression, anxiety, difficulty concentrating, suicidal thoughts, irritability, sleep disturbances</td>
<td></td>
</tr>
</tbody>
</table>
Box 12-2

The Mental Status Examination: Cognitive Level of Functioning

Orientation: Assess client’s orientation to person, place, and time.
Attention Span: Assess client’s ability to concentrate.
Recent Memory: Assessed by asking the client to recall a recent occurrence (e.g., the means of transportation used to get to the health care agency for the physical assessment).
Remote Memory: Assessed by asking the client about a verifiable past event (e.g., a vacation).
New Learning: Used to assess the client’s ability to recall unrelated words identified by the nurse; the nurse selects four words and asks the client to recall the words 5, 10, and 30 minutes later.
Judgment: Determine whether the client’s actions or decisions regarding
discussions during the interview are realistic.

**Thought Processes and Perceptions:** The way the client thinks and what the client says should be logical, coherent, and relevant; the client should be consistently aware of reality.

---

**Box 12-3**

**Characteristics of Skin Color**

* Cyanosis: Mottled bluish coloration
* Erythema: Redness
* Pallor: Pale, whitish coloration
* Jaundice: Yellow coloration

---

**Box 12-4**

**Assessing Capillary Filling Time**

1. Depress the nailbed to produce blanching.
2. Release and observe for the return of color.
3. Color will return within 3 seconds if arterial capillary perfusion is normal.

---

**Table 12-2**

**Pitting Edema Scale**

<table>
<thead>
<tr>
<th>Scale</th>
<th>Description</th>
<th>“Measurement”*</th>
</tr>
</thead>
<tbody>
<tr>
<td>1+</td>
<td>A barely perceptible pit</td>
<td>2 mm (3/32 in)</td>
</tr>
<tr>
<td>2+</td>
<td>A deeper pit, rebounds in a few seconds</td>
<td>4 mm (6/32 in)</td>
</tr>
<tr>
<td>3+</td>
<td>A deep pit, rebounds in 10-20 sec</td>
<td>6 mm (14 in)</td>
</tr>
<tr>
<td>4+</td>
<td>A deeper pit, rebounds in &gt; 30 sec</td>
<td>8 mm (5/32 in)</td>
</tr>
</tbody>
</table>

* “Measurement” is in quotation marks because depth of edema is rarely actually measured but is included as a frame of reference.

FIG. 12-1 Checking extraocular muscles in the 6 cardinal positions. This indicates the functioning of cranial nerves III, IV, and VI.

Box 12-5
Assessing and Documenting Pupillary Responses

Pupillary Light Reflex

1. Darken the room (to dilate the client’s pupils) and ask the client to look forward.
2. Test each eye.
3. Advance a light in from the side to note constriction of the same-side pupil (direct light reflex) and simultaneous constriction of the other pupil (consensual light reflex).

Accommodation

1. Ask the client to focus on a distant object (dilates the pupil).
2. Ask the client to shift gaze to a near object held about 3 inches (7.5 cm) from the nose.
3. Normal response includes pupillary constriction and convergence of the axes of the eyes.

Documenting Normal Findings: PERRLA

P = pupils
E = equal
R = round
RL = reactive to light (direct and consensual)
A = reactive to accommodation

Box 12-6
Vestibular Assessment
Test for Falling

1. The examiner asks the client to stand with the feet together, arms hanging loosely at the sides, and eyes closed.
2. The client normally remains erect, with only slight swaying.
3. A significant sway is a positive Romberg’s sign.

Test for Past Pointing

1. The client sits in front of the examiner.
2. The client closes the eyes and extends the arms in front, pointing both index fingers at the examiner.
3. The examiner holds and touches his or her own extended index fingers under the client’s extended index fingers to give the client a point of reference.
4. The client is instructed to raise both arms and then lower them, attempting to return to the examiner’s extended index fingers.
5. The normal test response is that the client can easily return to the point of reference.
6. The client with a vestibular function problem lacks a normal sense of position and cannot return the extended fingers to the point of reference; instead, the fingers deviate to the right or left of the reference point.

Gaze Nystagmus Evaluation

1. The client’s eyes are examined as the client looks straight ahead, 30 degrees to each side, upward and downward.
2. Any spontaneous nystagmus—an involuntary, rhythmic, rapid twitching of the eyeballs—represents a problem with the vestibular system.

Dix-Hallpike Maneuver

1. The client starts in a sitting position; the examiner lowers the client to the exam table and rather quickly turns the client’s head to the 45-degree position.
2. If after about 30 seconds there is no nystagmus, the client is returned to a sitting position and the test is repeated on the other side.

Box 12-7

Palpation of the Chest

Chest Excursion

*Posterior:* The nurse places the thumbs along the spinal processes at the 10th rib, with the palms in light contact with the posterolateral surfaces. The nurse’s thumbs should be about 2 inches (5 cm) apart, pointing toward the
spine, with the fingers pointing laterally.

*Anterior:* The nurse places the hands on the anterolateral wall with the thumbs along the costal margins, pointing toward the xiphoid process. The nurse instructs the client to take a deep breath after exhaling. The nurse should note movement of the thumbs, and chest excursion should be symmetrical, separating the thumbs approximately 2 inches (5 cm).

**Tactile or Vocal Fremitus**

The nurse places the ball or lower palm of the hand over the chest, starting at the lung apices and palpating from side to side. The nurse asks the client to repeat the words “ninety-nine.” Symmetrical palpable vibration should be felt by the nurse.

### Characteristics of Adventitious Sounds

<table>
<thead>
<tr>
<th>Adventitious Sound</th>
<th>Characteristics</th>
<th>Clinical Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fine crackles</td>
<td>High-pitched crackling and popping noises (discontinuous sounds) heard during the end of inspiration. Not cleared by cough.</td>
<td>May be heard in pneumonia, heart failure, asthma, and restrictive pulmonary diseases</td>
</tr>
<tr>
<td>Medium crackles</td>
<td>Medium-pitched, moist sound heard about halfway through inspiration. Not cleared by cough.</td>
<td>Same as above, but condition is worse</td>
</tr>
<tr>
<td>Coarse crackles</td>
<td>Low-pitched, bubbling or gurgling sounds that start early in inspiration and extend into the first part of expiration. Not cleared by cough.</td>
<td>Same as above, but condition is worse or may be heard in terminally ill clients with diminished gag reflex. Also heard in pulmonary edema and pulmonary fibrosis.</td>
</tr>
<tr>
<td>Wheeze (also called sibilant wheeze)</td>
<td>High-pitched, musical sound similar to a squeak. Heard more commonly during expiration, but may also be heard during inspiration. Occurs in small airways.</td>
<td>Heard in narrowed airway diseases such as asthma</td>
</tr>
<tr>
<td>Rhonchi (also called sonorous wheeze)</td>
<td>Low-pitched, coarse, loud, low snoring or moaning tone. Actually sounds like snoring. Heard primarily during expiration, but may also be heard during inspiration. Coughing may clear.</td>
<td>Heard in disorders causing obstruction of the trachea or bronchus, such as chronic bronchitis</td>
</tr>
<tr>
<td>Pleural friction rub</td>
<td>A superficial, low-pitched, coarse rubbing or grating sound. Sounds like 2 surfaces rubbing together. Heard throughout inspiration and expiration. Loudest over the lower anterolateral surface. Not cleared by cough.</td>
<td>Heard in individuals with pleurisy (inflammation of the pleural surfaces)</td>
</tr>
</tbody>
</table>

Data from Wilson AF, Giddens JF: *Health assessment for nursing practice*, ed 5, St. Louis, 2013, Mosby.

### Box 12-8

#### Voice Sounds

**Bronchophony**

1. Ask the client to repeat the words “ninety-nine.”
2. Normal voice transmission is soft, muffled, and indistinct.

**Egophony**

1. Ask the client to repeat a long “ee-ee-ee” sound.
2. Normally the nurse would hear the “ee-ee-ee” sound.

**Whispered Pectoriloquy**

1. Ask the client to whisper the words “one, two, three.”
2. Normal voice transmission is faint, muffled, and almost inaudible.
Box 12-9

Grading a Murmur

Grade I: Barely audible
Grade II: Quiet but clearly audible
Grade III: Moderately loud
Grade IV: Loud, associated with a thrill
Grade V: Very loud, easily palpable thrill
Grade VI: Very loud, audible without using a stethoscope, thrill easily palpable and visible

Box 12-10

Arterial Pulse Points and Grading the Force of Pulses

Arteries in the Arms and Hands
Radial Pulse: Located at the radial side of the forearm at the wrist
Ulnar Pulse: Located on the opposite side of the location of the radial pulse at the wrist
Brachial Pulse: Located above the elbow at the antecubital fossa, between the biceps and triceps muscles

Arteries in the Legs

Femoral Pulse: Located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine
Popliteal Pulse: Located behind the knee
Dorsalis Pedis Pulse: Located at the top of the foot, in line with the groove between the extensor tendons of the great and first toes
Posterior Tibial Pulse: Located on the inside of the ankle, behind and below the medial malleolus (ankle bone)

Grading the Force

4 + = Strong and bounding
3 + = Full pulse, increased
2 + = Normal, easily palpable
1 + = Weak, barely palpable

Box 12-11
Common Postural Abnormalities

Lordosis (Swayback): Increased lumbar curvature
Kyphosis (Hunchback): Exaggeration of the posterior curvature of the thoracic spine
Scoliosis: Lateral spinal curvature

Table 12-5

Assessment of the Cranial Nerves
<table>
<thead>
<tr>
<th>Cranial Nerve</th>
<th>Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cranial Nerve I: Olfactory</td>
<td>■ Sensory&lt;br&gt;■ Controls the sense of smell&lt;br&gt;&amp; Have the client close the eyes and occlude 1 nostril with a finger&lt;br&gt;&amp; Ask the client to identify nonirritating and familiar odors (e.g., coffee, tea, cloves, soap, chewing gum, peppermint)&lt;br&gt;&amp; Repeat the test on the other nostril</td>
</tr>
<tr>
<td>Cranial Nerve II: Optic</td>
<td>■ Sensory&lt;br&gt;■ Controls vision&lt;br&gt;&amp; Assess visual acuity with a Snellen chart and perform an ophthalmoscopic exam&lt;br&gt;&amp; Check peripheral vision by confrontation&lt;br&gt;&amp; Check color vision</td>
</tr>
<tr>
<td>Cranial Nerves III, IV, and VI</td>
<td>■ Motor&lt;br&gt;■ Controls pupillary constriction, upper-eyelid elevation, and most eye movement&lt;br&gt;&amp; The motor functions of cranial nerves III, IV, and VI overlap; therefore, they should be tested together&lt;br&gt;&amp; Inspect the eyelids for ptosis (drooping); then assess ocular movements and note any eye deviation&lt;br&gt;&amp; Test accommodation and direct and consensal light reflexes</td>
</tr>
<tr>
<td>Cranial Nerve III: Oculomotor</td>
<td>■ Motor&lt;br&gt;■ Controls downward and inward eye movement</td>
</tr>
<tr>
<td>Cranial Nerve IV: Trochlear</td>
<td>■ Motor&lt;br&gt;■ Controls lateral eye movement</td>
</tr>
<tr>
<td>Cranial Nerve V: Trigeminal</td>
<td>■ Sensory and motor&lt;br&gt;■ Controls sensation in the cornea, nasal and oral mucosa, and facial skin, as well as mastication&lt;br&gt;&amp; To test motor function, ask the client to clench the teeth and assess the muscles of mastication; then try to open the client’s jaws after asking the client to keep them tightly closed&lt;br&gt;&amp; The corneal reflex may be tested by the primary health care provider; this is done by lightly touching the client’s cornea with a cotton wisp (this test may be omitted if the client is alert and blinking normally)&lt;br&gt;&amp; Check sensory function by asking the client to close the eyes; lightly touch forehead, cheeks, and chin, noting whether the touch is felt equally on the 2 sides</td>
</tr>
<tr>
<td>Cranial Nerve VII: Facial</td>
<td>■ Sensory and motor&lt;br&gt;■ Controls movement of the face and taste sensation&lt;br&gt;&amp; Test taste sensation on the anterior two-thirds of the tongue; the client should be able to taste salty and sweet tastes&lt;br&gt;&amp; Have the client smile, frown, and show the teeth&lt;br&gt;&amp; Ask the client to puff out the cheeks&lt;br&gt;&amp; Attempt to close the client’s eyes against resistance</td>
</tr>
<tr>
<td>Cranial Nerve VII: Acoustic or Vestibulocochlear</td>
<td>■ Sensory&lt;br&gt;■ Controls hearing and vestibular function&lt;br&gt;&amp; Assessing the client’s ability to hear tests the cochlear portion&lt;br&gt;&amp; Assessing the client’s sense of equilibrium tests the vestibular portion&lt;br&gt;&amp; Check the client’s hearing, using acuity tests&lt;br&gt;&amp; Observe the client’s balance and watch for swaying when he or she is walking or standing&lt;br&gt;&amp; Assessment of sensorineural hearing loss may be done with the Weber’s or Rinne’s tests</td>
</tr>
<tr>
<td>Cranial Nerves IX and X</td>
<td>■ Sensory and motor&lt;br&gt;■ Controls swallowing ability, sensation in the pharyngeal soft palate and tonsillar mucosa, taste perception on the posterior third of the tongue, and salivation&lt;br&gt;&amp; Usually cranial nerves IX and X are tested together&lt;br&gt;&amp; Test taste perception on the posterior one-third of the tongue or pharynx; the client should be able to taste bitter and sour tastes&lt;br&gt;&amp; Inspect the soft palate and watch for symmetrical elevation when the client says “aaaah”&lt;br&gt;&amp; Touch the posterior pharyngeal wall with a tongue depressor to elicit the gag reflex</td>
</tr>
<tr>
<td>Cranial Nerve X: Vagus</td>
<td>■ Sensory and motor&lt;br&gt;■ Controls swallowing and phonation, sensation in the exterior ear’s posterior wall, and sensation behind the ear&lt;br&gt;■ Controls sensation in the thoracic and abdominal viscera</td>
</tr>
<tr>
<td>Cranial Nerve XI: Spinal Accessory</td>
<td></td>
</tr>
</tbody>
</table>
Scoring Deep Tendon Reflex Activity

0 = No response
1 + = Sluggish or diminished
2 + = Active or expected response
3 + = Slightly hyperactive, more brisk than normal; not necessarily pathological
4 + = Brisk, hyperactive with intermittent clonus associated with disease

Data from Wilson AF, Giddens JF: Health assessment for nursing practice, ed 5, St. Louis, 2013, Mosby.

Practice Questions

90. A Spanish-speaking client arrives at the triage desk in the emergency department and states to the nurse that an interpreter is needed. Which is the best action for the nurse to take?
   1. Have one of the client’s family members interpret.
   2. Have the Spanish-speaking triage receptionist interpret.
   3. Page an interpreter from the hospital’s interpreter services.
   4. Obtain a Spanish-English dictionary and attempt to triage the client.

91. The nurse is performing a neurological assessment on a client and notes a positive Romberg’s test. The nurse makes this determination based on which observation?
   1. An involuntary rhythmic, rapid, twitching of the eyeballs
   2. A dorsiflexion of the great toe with fanning of the other toes
   3. A significant sway when the client stands erect with feet together, arms at the side, and the eyes closed
   4. A lack of normal sense of position when the client is unable to return extended fingers to a point of reference

92. The nurse notes documentation that a client is exhibiting Cheyne-Stokes respirations. On assessment of the client, the nurse should expect to note which finding?
1. Rhythmic respirations with periods of apnea
2. Regular rapid and deep, sustained respirations
3. Totally irregular respiration in rhythm and depth
4. Irregular respirations with pauses at the end of inspiration and expiration

93. A client diagnosed with conductive hearing loss asks the nurse to explain the cause of the hearing problem. The nurse plans to explain to the client that this condition is caused by which problem?
   1. A defect in the cochlea
   2. A defect in cranial nerve VIII
   3. A physical obstruction to the transmission of sound waves
   4. A defect in the sensory fibers that lead to the cerebral cortex

94. While performing a cardiac assessment on a client with an incompetent heart valve, the nurse auscultates a murmur. The nurse documents the finding and describes the sound as which?
   1. Lub-dub sounds
   2. Scratchy, leathery heart noise
   3. A blowing or swooshing noise
   4. Abrupt, high-pitched snapping noise

95. The nurse is testing the extraocular movements in a client to assess for muscle weakness in the eyes. The nurse should implement which assessment technique to assess for muscle weakness in the eye?
   1. Test the corneal reflexes.
   2. Test the 6 cardinal positions of gaze.
   3. Test visual acuity, using a Snellen eye chart.
   4. Test sensory function by asking the client to close the eyes and then lightly touching the forehead, cheeks, and chin.

96. The nurse is instructing a client how to perform a testicular self-examination (TSE). The nurse should explain that which is the best time to perform this exam?
   1. After a shower or bath
   2. While standing to void
   3. After having a bowel movement
   4. While lying in bed before arising

97. The nurse is assessing a client suspected of having meningitis for meningeal irritation and elicits a positive Brudzinski’s sign. Which finding did the nurse observe?
   1. The client rigidly extends the arms with pronated forearms and plantar flexion of the feet.
   2. The client flexes a leg at the hip and knee and reports pain in the vertebral column when the leg is extended.
   3. The client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.
   4. The client’s upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated.

98. A client with a diagnosis of asthma is admitted to the hospital with respiratory distress. Which type of adventitious lung sounds should the nurse expect to hear when performing a respiratory assessment on this
client?
1. Stridor
2. Crackles
3. Wheezes
4. Diminished

99. The clinic nurse prepares to perform a focused assessment on a client who is complaining of symptoms of a cold, a cough, and lung congestion. Which should the nurse include for this type of assessment? **Select all that apply.**

- [ ] 1. Auscultating lung sounds
- [ ] 2. Obtaining the client’s temperature
- [ ] 3. Assessing the strength of peripheral pulses
- [ ] 4. Obtaining information about the client’s respirations
- [ ] 5. Performing a musculoskeletal and neurological examination
- [ ] 6. Asking the client about a family history of any illness or disease

**Answers**

90. **Answer:** 3

**Rationale:** The best action is to have a professional hospital-based interpreter translate for the client. English-speaking family members may not appropriately understand what is asked of them and may paraphrase what the client is actually saying. Also, client confidentiality as well as accurate information may be compromised when a family member or a non–health care provider acts as interpreter.

**Test-Taking Strategy:** Note the **strategic word**, best. Initially focus on what the client needs. In this case the client needs and asks for an interpreter. Next keep in mind the issue of confidentiality and making sure that information is obtained in the most efficient and accurate way. This will assist in eliminating options 1, 2, and 4.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Foundations of Care: Communication

**Health Problem:** N/A

**Priority Concepts:** Communication; Culture

91. **Answer:** 3

**Rationale:** In Romberg’s test, the client is asked to stand with the feet together and the arms at the sides, and to close the eyes and hold the position; normally the client can maintain posture and balance. A positive Romberg’s sign is a vestibular...
neurological sign that is found when a client exhibits a loss of balance when closing the eyes. This may occur with cerebellar ataxia, loss of proprioception, and loss of vestibular function. A lack of normal sense of position coupled with an inability to return extended fingers to a point of reference is a finding that indicates a problem with coordination. A positive gaze nystagmus evaluation results in an involuntary rhythmic, rapid twitching of the eyeballs. A positive Babinski’s test results in dorsiflexion of the great toe with fanning of the other toes; if this occurs in anyone older than 2 years it indicates the presence of central nervous system disease.

**Test-Taking Strategy:** Note the subject, Romberg’s sign. You can easily answer this question if you can recall that the client’s balance is tested in this test.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Health Assessment/Physical Exam: Neurological

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Mobility

92. **Answer:** 1

**Rationale:** Cheyne-Stokes respirations are rhythmic respirations with periods of apnea and can indicate a metabolic dysfunction in the cerebral hemisphere or basal ganglia. Neurogenic hyperventilation is a regular, rapid and deep, sustained respiration that can indicate a dysfunction in the low midbrain and middle pons. Ataxic respirations are totally irregular in rhythm and depth and indicate a dysfunction in the medulla. Apneustic respirations are irregular respirations with pauses at the end of inspiration and expiration and can indicate a dysfunction in the middle or caudal pons.

**Test-Taking Strategy:** Focus on the subject, the characteristics of Cheyne-Stokes respirations. Recalling that periods of apnea occur with this type of respiration will help direct you to the correct answer.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Health Assessment/Physical Exam: Thorax and Lungs

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Gas Exchange

**Reference:** Lewis et al. (2017), p. 1324.

93. **Answer:** 3

**Rationale:** A conductive hearing loss occurs as a result of a physical obstruction to the transmission of sound waves. A sensorineural hearing loss occurs as a result of a pathological process in the inner ear, a defect in cranial nerve VIII, or a defect of the sensory fibers that lead to the cerebral cortex.

**Test-Taking Strategy:** Focus on the subject, a conductive hearing loss. Noting the relationship of the word *conductive* in the question and *transmission* in the correct
94. **Answer:** 3

**Rationale:** A heart murmur is an abnormal heart sound and is described as a faint or loud blowing, swooshing sound with a high, medium, or low pitch. Lub-dub sounds are normal and represent the S1 (first) heart sound and S2 (second) heart sound, respectively. A pericardial friction rub is described as a scratchy, leathery heart sound. A click is described as an abrupt, high-pitched snapping sound.

**Test-Taking Strategy:** Focus on the subject, characteristics of a murmur. Eliminate option 1 because it describes normal heart sounds. Next recall that a murmur occurs as a result of the manner in which the blood is flowing through the cardiac chambers and valves. This will direct you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Communication and Documentation  
**Content Area:** Health Assessment/Physical Exam: Heart and Peripheral Vascular  
**Health Problem:** Adult Health: Cardiovascular: Inflammatory and Structural Heart Disorders  
**Priority Concepts:** Clinical Judgment; Perfusion  

95. **Answer:** 2

**Rationale:** Testing the 6 cardinal positions of gaze (diagnostic positions test) is done to assess for muscle weakness in the eyes. The client is asked to hold the head steady, and then to follow movement of an object through the positions of gaze. The client should follow the object in a parallel manner with the 2 eyes. A Snellen eye chart assesses visual acuity and cranial nerve II (optic). Testing sensory function by having the client close his or her eyes and then lightly touching areas of the face and testing the corneal reflexes assess cranial nerve V (trigeminal).

**Test-Taking Strategy:** Focus on the subject, assessing for muscle weakness in the eyes. Note the relationship between the words *extraocular movements* in the question and *positions of gaze* in the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Health Assessment/Physical Exam: Ear, Nose, and Throat  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Sensory Perception
Rationale: The nurse needs to teach the client how to perform a TSE. The nurse should instruct the client to perform the exam on the same day each month. The nurse should also instruct the client that the best time to perform a TSE is after a shower or bath when the hands are warm and soapy and the scrotum is warm. Palpation is easier and the client will be better able to identify any abnormalities. The client would stand to perform the exam, but it would be difficult to perform the exam while voiding. Having a bowel movement is unrelated to performing a TSE.

Test-Taking Strategy: Note the strategic word, best. Think about the purpose of this test and visualize this assessment technique to answer correctly.

Level of Cognitive Ability: Applying
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Health Assessment/Physical Exam: Testicles
Health Problem: N/A
Priority Concepts: Client Education; Sexuality

97. Answer: 3

Rationale: Brudzinski’s sign is tested with the client in the supine position. The nurse flexes the client’s head (gently moves the head to the chest), and there should be no reports of pain or resistance to the neck flexion. A positive Brudzinski’s sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column. Kernig’s sign also tests for meningeal irritation and is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended. Decorticate posturing is abnormal flexion and is noted when the client’s upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated. Decerebrate posturing is abnormal extension and occurs when the arms are fully extended, forearms pronated, wrists and fingers flexed, jaws clenched, neck extended, and feet plantar-flexed.

Test-Taking Strategy: Focus on the subject, a positive Brudzinski’s sign. Recalling that a positive sign is elicited if the client reports pain will assist in eliminating options 1 and 4. Next it is necessary to know that a positive Brudzinski’s sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Health Assessment/Physical Exam: Neurological
Health Problem: Adult Health: Neurological: Inflammation/Infections
Priority Concepts: Clinical Judgment; Intracranial Regulation
Rationale: Asthma is a respiratory disorder characterized by recurring episodes of dyspnea, constriction of the bronchi, and wheezing. Wheezes are described as high-pitched musical sounds heard when air passes through an obstructed or narrowed lumen of a respiratory passageway. Stridor is a harsh sound noted with an upper airway obstruction and often signals a life-threatening emergency. Crackles are produced by air passing over retained airway secretions or fluid, or the sudden opening of collapsed airways. Diminished lung sounds are heard over lung tissue where poor oxygen exchange is occurring.

Test-Taking Strategy: Note the subject, assessment of abnormal lung sounds. Note the client’s diagnosis and think about the pathophysiology that occurs in this disorder. Recalling that bronchial constriction occurs will assist in directing you to the correct option. Also, thinking about the definition of each adventitious lung sound identified in the options will direct you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Health Assessment/Physical Exam: Thorax and Lungs
Health Problem: Adult Health: Respiratory: Asthma
Priority Concepts: Clinical Judgment; Gas Exchange

Rationale: A focused assessment focuses on a limited or short-term problem, such as the client’s complaint. Because the client is complaining of symptoms of a cold, a cough, and lung congestion, the nurse would focus on the respiratory system and the presence of an infection. A complete assessment includes a complete health history and physical examination and forms a baseline database. Assessing the strength of peripheral pulses relates to a vascular assessment, which is not related to this client’s complaints. A musculoskeletal and neurological examination also is not related to this client’s complaints. However, strength of peripheral pulses and a musculoskeletal and neurological examination would be included in a complete assessment. Likewise, asking the client about a family history of any illness or disease would be included in a complete assessment.

Test-Taking Strategy: Focus on the subject and note the words focused assessment. Noting that the client’s symptoms relate to the respiratory system and the presence of an infection will direct you to the correct options.

Level of Cognitive Ability: Analyzing
Client Needs: Health Promotion and Maintenance
Integrated Process: Nursing Process—Assessment
Content Area: Health Assessment/Physical Exam: Health History
Health Problem: N/A
Priority Concepts: Clinical Judgment; Gas Exchange

CHAPTER 13

Provision of a Safe Environment

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Infection, Safety

I. Environmental Safety

A. Fire safety (see Priority Nursing Actions)

1. Keep open spaces free of clutter.
2. Clearly mark fire exits.
3. Know the locations of all fire alarms, exits, and extinguishers (Table 13-1; also see Priority Nursing Actions).

Priority Nursing Actions

Event of a Fire

Race

1. Rescue clients who are in immediate danger.
2. Activate the fire alarm.
3. Confine the fire.
4. Extinguish the fire.

Pass

5. Obtain the fire extinguisher.
6. Pull the pin on the fire extinguisher.
7. Aim at the base of the fire.
8. Squeeze the extinguisher handle.
9. Sweep the extinguisher from side to side to coat the area of the fire evenly.

Reference

4. Know the telephone number for reporting fires.
5. Know the fire drill and evacuation plan of the agency.
6. Never use the elevator in the event of a fire.
7. Turn off oxygen and appliances in the vicinity of the fire.
8. In the event of a fire, if a client is on life support,
maintain respiratory status manually with an Ambu bag (resuscitation bag) until the client is moved away from the threat of the fire and can be placed back on life support.

9. In the event of a fire, ambulatory clients can be directed to walk by themselves to a safe area and, in some cases, may be able to assist in moving clients in wheelchairs.

10. Bedridden clients generally are moved from the scene of a fire by stretcher, their bed, or wheelchair.

11. If a client must be carried from the area of a fire, appropriate transfer techniques need to be used.

12. If fire department personnel are at the scene of the fire, they will help evacuate clients.

Remember the mnemonic RACE (Rescue clients, Activate the fire alarm, Confine the fire, Extinguish the fire) to set priorities in the event of a fire and the mnemonic PASS (Pull the pin, Aim at the base of the fire, Squeeze the handle, Sweep from side to side) to use a fire extinguisher.

B. Electrical safety

Any electrical equipment that the client brings into the health care facility must be inspected for safety before use.

1. Electrical equipment must be maintained in good working order and should be grounded; otherwise, it presents a physical hazard; remove equipment that is not in proper working order and notify appropriate staff.

2. Use a 3-pronged electrical cord.

3. In a 3-pronged electrical cord, the third, longer prong of the cord is the ground; the other 2 prongs carry the power to the piece of electrical equipment.

4. Check electrical cords and outlets for exposed, frayed, or damaged wires.

5. Avoid overloading any circuit.

6. Read warning labels on all equipment; never operate unfamiliar equipment.

7. Use safety extension cords only when absolutely necessary, and tape them to the floor with electrical tape.

9. Never pull a plug by using the cord; always grasp the plug itself.
10. Never use electrical appliances near sinks, bathtubs, or other water sources.

11. Always disconnect a plug from the outlet before cleaning equipment or appliances.

12. If a client receives an electrical shock, turn off the electricity before touching the client.

C. Radiation safety (Refer to Chapter 44 for additional radiation safety measures)

1. Know the protocols and guidelines of the health care agency.

2. Label potentially radioactive material.

3. To reduce exposure to radiation, do the following.
   
   a. Limit the time spent near the source.
   
   b. Make the distance from the source as great as possible.
   
   c. Use a shielding device such as a lead apron.

5. Place the client who has a radiation implant in a private room.

7. Keep all linens in the client’s room until the implant is removed.

D. Disposal of infectious wastes

1. Handle all infectious materials as a hazard.

2. Dispose of waste in designated areas only, using proper containers for disposal.

3. Ensure that infectious material is labeled properly.

4. Dispose of all sharps immediately after use in closed, puncture-resistant disposal containers that are leak-proof and labeled or color-coded.

E. Physiological changes in the older client that increase the risk of accidents (Box 13-1)

F. Risk for falls assessment

1. Should be client-centered and include the use of a fall
risk scale per agency procedures
2. Include the client’s own perceptions of their risk factors for falls and their method to adapt to these factors. Areas of concern may include gait stability, muscle strength and coordination, balance, and vision.
3. Assess for any previous accidents.
4. Assess with the client any concerns about their immediate environment, including stairs, use of throw rugs, grab bars, a raised toilet seat, or environmental lighting.
5. Review/analyze the medications, both prescription and nonprescription, that the client is taking that could have side/adverse effects that could place the client at risk for a fall.
6. Determine any scheduled procedures that pose risks to the client.

G. Measures to prevent falls (Box 13-2)

H. Measures to promote safety in ambulation for the client
1. Gait belt may be used to keep the center of gravity midline.
   a. Place the belt on the client prior to ambulation.
   b. Encircle the client’s waist with the belt.
   c. Hold on to the side or back of the belt so that the client does not lean to one side.
   d. Return the client to bed or a nearby chair if the client develops dizziness or becomes unsteady.
   e. When finished safely ambulating the client, remove belt and replace it in its appropriate storage area.

I. The Joint Commission: National Patient Safety Goals 2018
1. See Box 13-3 for a list of the National Patient Safety Goals
2. Refer to the following website for detailed information on these goals
   https://www.jointcommission.org/assets/1/6/NPSG_Cf

J. Steps to prevent injury to the health care worker (Box 13-4)

K. Restraints (safety devices)
1. Restraints (safety devices) are protective devices used to limit the physical activity of a client or to immobilize a client or an extremity.
   a. The agency policy should be checked
and followed when using side rails.
b. The use of side rails is not considered a restraint when they are used to prevent a sedated client from falling out of bed.
c. The client must be able to exit the bed easily in case of an emergency when using side rails. Only the top two side rails should be used.
d. The bed must be kept in the lowest position.

2. Physical restraints restrict client movement through the application of a device.

3. Chemical restraints are medications given to inhibit a specific behavior or movement.

4. Interventions

a. Use alternative devices, such as pressure-sensitive beds or chair pads with alarms or other types of bed or chair alarms, whenever possible.
b. If restraints are necessary, the primary health care provider’s (PHCP’s) prescriptions should state the type of restraint, identify specific client behaviors for which restraints are to be used, and identify a limited time frame for use.
c. The PHCP’s prescriptions for restraints should be renewed within a specific time frame according to agency policy.
d. Restraints are not to be prescribed PRN (as needed).
e. The reason for the safety device should be given to the client and the family, and their permission should be sought and documented.
f. Restraints should not interfere with any treatments or affect the client’s health problem.
g. Use a half-bow, a safety knot (quick release tie), or a restraint with a quick release buckle to secure the device to the bed frame or chair, not to a movable part of bed (including the side rails).
h. Ensure that there is enough slack on the straps to allow some movement of the body part.
i. Assess skin integrity and neurovascular and circulatory status every 30 minutes and remove the safety device at least every 2 hours to permit muscle exercise and to promote circulation (follow agency policies).

j. Continually assess and document the need for safety devices (Box 13-5).

k. Offer fluids if clinically indicated at least every 2 hours.

l. Offer bedpan or toileting every 2 hours.

An PHCP’s prescription for use of a safety device (restraint) is needed. Alternative measures for safety devices should always be used first.

5. Alternatives to safety devices for a client with confusion

a. Orient the client and family to the surroundings with every interaction and identify the client by their name.

b. Explain all procedures and treatments to the client and family.

c. Encourage family and friends to stay with the client, and use sitters for clients who need supervision.

d. Assign confused and disoriented clients to rooms near the nurses’ station.

e. Provide appropriate visual and auditory stimuli, such as a night light, clocks, calendars, television, and a radio, to the client; leave the client’s room door open.

f. Place familiar items, such as family pictures, near the client’s bedside.

g. Maintain toileting routines.

h. Eliminate bothersome treatments, such as nasogastric tube feedings, as soon as possible.

i. Evaluate all medications that the client is receiving.

j. Use relaxation techniques with the client.

k. Institute exercise and ambulation schedules as the client’s condition allows.

l. Collaborate with the PHCP to evaluate oxygenation status, vital signs,
electrolyte/laboratory values, and other pertinent assessment findings that may provide information about the cause of the client’s confusion.

L. Poisons

1. A poison is any substance that impairs health or destroys life when ingested, inhaled, or otherwise absorbed by the body.
2. Specific antidotes or treatments are available only for some types of poisons.
3. The capacity of body tissue to recover from a poison determines the reversibility of the effect.
4. Poison can impair the respiratory, circulatory, central nervous, hepatic, gastrointestinal, and renal systems of the body.
5. The infant, toddler, the preschooler, and the young school-age child must be protected from accidental poisoning.
6. In older adults, diminished eyesight and impaired memory may result in accidental ingestion of poisonous substances or an overdose of prescribed medications.
7. A Poison Control Center phone number should be visible on the telephone in homes with small children; in all cases of suspected poisoning, the number should be called immediately.
8. Interventions
   a. Remove any obvious materials from the mouth, eyes, or body area immediately.
   b. Identify the type and amount of substance ingested.
   c. Call the Poison Control Center before attempting an intervention.
   d. If the victim vomits or vomiting is induced, save the vomitus if requested to do so, and deliver it to the Poison Control Center.
   e. If instructed by the Poison Control Center to take the person to the emergency department, call an ambulance.
   f. Never induce vomiting following
ingestion of lye, household cleaners, grease, or petroleum products.
g. Never induce vomiting in an unconscious victim.

II. Health Care–Associated (Nosocomial) Infections

A. Health care–associated (nosocomial) infections also are referred to as hospital-acquired infections.

B. These infections are acquired in a hospital or other health care facility and were not present or incubating at the time of a client’s admission.

C. *Clostridium difficile* is spread mainly by hand-to-hand contact in a health care setting. Clients taking multiple antibiotics for a prolonged period are most at risk.

D. Common drug-resistant infections: Vancomycin-resistant enterococci (VRE), methicillin-resistant *Staphylococcus aureus* (MRSA), multidrug-resistant tuberculosis, carbapenem-resistant Enterobacteriaceae (CRE)

E. Illness and some medications such as immunosuppressants impair the normal defense mechanisms.

F. The hospital environment provides exposure to a variety of virulent organisms that the client has not been exposed to in the past; therefore, the client has not developed resistance to these organisms.

G. Infections can be transmitted by health care personnel who fail to practice proper standard precautions (i.e., hand-washing procedures or failing to change gloves between client contacts).

H. At many health care agencies, dispensers containing an alcohol-based solution for hand sanitization are mounted at the entrance to each client’s room; it is important to note that alcohol-based sanitizers are not effective against some infectious agents such as *Clostridium difficile* spores; therefore, handwashing is necessary.

III. Standard Precautions

A. Description

1. Nurses must practice standard precautions with all clients in any setting, regardless of the diagnosis or presumed infectiveness.

2. Standard precautions include hand washing and the use of gloves, as well as washing hands after gloves are removed. Additionally, standard precautions include the use of masks, eye protection, and gowns, when appropriate, for client contact.

3. These precautions apply to blood, all body fluids
(whether or not they contain blood), secretions and excretions, nonintact skin, and mucous membranes.

B. Interventions

1. Wash hands between client contacts; after contact with blood, body fluids, secretions or excretions, nonintact skin, or mucous membranes; after contact with equipment or contaminated articles; and immediately after removing gloves.

2. Wear gloves when touching blood, body fluids, secretions, excretions, nonintact skin, mucous membranes, or contaminated items; remove gloves and wash hands between client care contacts.

3. For routine decontamination of hands, use alcohol-based hand rubs when hands are not visibly soiled. For more information on hand hygiene from the Centers for Disease Control and Prevention (CDC), see www.cdc.gov/handhygiene/

4. Wear masks and eye protection, or face shields, if client care activities may generate splashes or sprays of blood or body fluid.

5. Wear gowns if soiling of clothing is likely from blood or body fluid; wash hands after removing a gown.

6. Steps for donning and removing personal protective equipment (PPE) (Table 13-2)

7. Clean and reprocess client care equipment properly and discard single-use items.

8. Place contaminated linens in leak-proof bags and limit handling to prevent skin and mucous membrane exposure. Dispose according to agency policy.

9. Use needleless devices or special needle safety devices whenever possible to reduce the risk of needle sticks and sharps injuries to health care workers.

10. Discard all sharp instruments and needles in a puncture-resistant container; dispose of needles uncapped or engage the safety mechanism on the needle if available.

11. Clean spills of blood or body fluids with a solution of bleach and water (diluted 1:10) or agency-approved disinfectant.

IV. Transmission-Based Precautions

A. Transmission-based precautions include airborne, droplet, and contact precautions.
B. Airborne precautions

1. Diseases
   a. Measles
   b. Chickenpox (varicella)
   c. Disseminated varicella zoster
   d. Pulmonary or laryngeal tuberculosis

2. Barrier protection
   a. Used for clients known or suspected to be infected with pathogens transmitted by the airborne route.
   b. Single room is maintained under negative pressure; door remains closed except upon entering and exiting.
   c. Negative airflow pressure is used in the room, with a minimum of 6 to 12 air exchanges per hour via high-efficiency particulate air (HEPA) filtration mask or according to agency protocol.
   d. Ultraviolet germicide irradiation or HEPA filter is used in the room.
   e. Health care workers wear a respiratory mask (N95 or higher level). A surgical mask is placed on the client when the client needs to leave the room; the client leaves the room only if necessary.

C. Droplet precautions

1. Diseases
   a. Adenovirus
   b. Diphtheria (pharyngeal)
   c. Epiglottitis
   d. Influenza (flu)
   e. Meningitis
   f. Mumps
   g. Mycoplasmal pneumonia or meningococcal pneumonia
   h. Parvovirus B19
   i. Pertussis
   j. Pneumonia
   k. Rubella
   l. Scarlet fever
   m. Sepsis
   n. Streptococcal pharyngitis

2. Barrier protection
   a. Used for clients with known or
suspected infection with pathogens transmitted by respiratory droplets, generated when coughing, sneezing, or talking.

b. Private room or cohort client (a client whose body cultures contain the same organism)

c. Wear a surgical mask when within 3 feet of a client; place a mask on the client when the client needs to leave the room.

D. Contact precautions

1. Diseases

a. Colonization or infection with a multidrug-resistant organism
b. Enteric infections, such as Clostridium difficile
c. Respiratory infections, such as respiratory syncytial virus
d. Influenza: Infection can occur by touching something with flu viruses on it and then touching the mouth or nose.
e. Wound infections
f. Skin infections, such as cutaneous diphtheria, herpes simplex, impetigo, pediculosis, scabies, staphylococci, and varicella zoster
g. Eye infections, such as conjunctivitis
h. Indirect contact transmission may occur when contaminated object or instrument, or hands, are encountered.

2. Barrier protection

a. Private room or cohort client
b. Use gloves and a gown whenever entering the client’s room.

V. Emergency Response Plan and Disasters

A. Know the emergency response plan of the agency.
B. Internal disasters are those that occur within the health care facility.
C. External disasters occur in the community, and victims are brought to the health care facility for care.

D. When the health care facility is notified of a disaster, the nurse should follow the guidelines specified in the emergency response plan of the facility.

E. See Chapter 7 for additional information on disaster planning.
VI. Biological Warfare Agents

A. A warfare agent is a biological or chemical substance that can cause mass destruction or fatality.

B. Anthrax (Fig. 13-1)

1. The disease is caused by Bacillus anthracis and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.

2. Anthrax is transmitted by direct contact with bacteria and spores; spores are dormant encapsulated bacteria that become active when they enter a living host (no person-to-person spread) (Box 13-6).

3. The infection is carried to the lymph nodes and then spreads to the rest of the body by way of the blood and lymph systems; high levels of toxins lead to shock and death.

4. In the lungs, anthrax can cause buildup of fluid, tissue decay, and death (fatal if untreated).

5. A blood test is available to detect anthrax (detects and amplifies Bacillus anthracis DNA if present in the blood sample).

6. Anthrax is usually treated with antibiotics such as ciprofloxacin, doxycycline, or penicillin.

7. The vaccine for anthrax has limited availability.

C. Smallpox (Fig. 13-2)

1. Smallpox is transmitted in air droplets and by handling contaminated materials and is highly contagious.

2. Symptoms begin 7 to 17 days after exposure and include fever, back pain, vomiting, malaise, and headache.

3. Papules develop 2 days after symptoms develop and progress to pustular vesicles that are abundant on the face and extremities initially.

4. A vaccine is available to those at risk for exposure to smallpox.

D. Botulism
1. Botulism is a serious paralytic illness caused by a nerve toxin produced by the bacterium *Clostridium botulinum* (death can occur within 24 hours).

2. Its spores are found in the soil and can spread through the air or food (improperly canned food) or via a contaminated wound.

3. Botulism cannot be spread from person to person.

4. Symptoms include abdominal cramps, diarrhea, nausea and vomiting, double vision, blurred vision, drooping eyelids, difficulty swallowing or speaking, dry mouth, and muscle weakness.

5. Neurological symptoms begin 12 to 36 hours after ingestion of food-borne botulism and 24 to 72 hours after inhalation and can progress to paralysis of the arms, legs, trunk, or respiratory muscles (mechanical ventilation is necessary).

6. If diagnosed early, food-borne and wound botulism can be treated with an antitoxin that blocks the action of toxin circulating in the blood.

7. For wound botulism, surgical removal of the source of the toxin-producing bacteria may be done; antibiotics may be prescribed.

8. No vaccine is available.

E. Plague

1. Plague is caused by *Yersinia pestis*, a bacteria found in rodents and fleas.

2. Plague is contracted by being bitten by a rodent or flea that is carrying the plague bacterium, by the ingestion of contaminated meat, or by handling an animal infected with the bacteria.

3. Transmission is by direct person-to-person spread.

4. Forms include bubonic (most common), pneumonic, and septicemic (most deadly).

5. Symptoms usually begin within 1 to 3 days and include fever, chest pain, lymph node swelling, and a productive cough (hemoptysis).

6. The disease rapidly progresses to dyspnea, stridor, and cyanosis; death occurs from respiratory failure, shock, and bleeding.

7. Antibiotics are effective only if administered immediately; the usual medications of choice include
streptomycin or gentamicin.
8. A vaccine is available.

F. Tularemia
1. Tularemia (also called deer fly fever or rabbit fever) is an infectious disease of animals caused by the bacillus Francisella tularensis.
2. The disease is transmitted by ticks, deer flies, or contact with an infected animal.
3. Symptoms include fever, headache, and an ulcerated skin lesion with localized lymph node enlargement, eye infections, gastrointestinal ulcerations, or pneumonia.
4. Treatment is with antibiotics such as streptomycin, gentamicin, doxycycline, and ciprofloxacin.
5. Recovery produces lifelong immunity (a vaccine is available).

G. Hemorrhagic fever
1. Hemorrhagic fever is caused by several viruses, including Marburg, Lassa, Junin, and Ebola.
2. The virus is carried by rodents and mosquitoes.
3. The disease can be transmitted directly by person-to-person spread via body fluids.
4. Manifestations include fever, headache, malaise, conjunctivitis, nausea, vomiting, hypotension, hemorrhage of tissues and organs, and organ failure.
5. No known specific treatment is available; treatment is symptomatic.

H. Ebola Virus Disease (EVD)
1. Previously known as Ebola hemorrhagic fever
2. Caused by infection with a virus of the family Filoviridae, genus Ebola virus
3. First discovered in 1976 in the Democratic Republic of the Congo. Outbreaks have appeared in Africa and in several other countries in the world.
4. The natural reservoir host of Ebola virus remains unknown. It is believed that the virus is animal-borne and that bats are the most likely reservoir.
5. Spread of the virus is through contact with objects (such as clothes, bedding, needles, syringes/sharps, or medical equipment) that have been contaminated with the virus.
6. Symptoms similar to hemorrhagic fever may appear from 2 to 21 days after exposure.
7. Assessment: Ask the client if he or she traveled to an area with EVD such as Guinea, Nigeria, or Sierra Leone within the last 21 days or if he or she has had contact with someone with EVD and had any of the following symptoms:
   a. Fever at home or a current temperature of 38° C (100.4° F) or greater
   b. Severe headache
   c. Muscle pain
   d. Weakness
   e. Fatigue
   f. Diarrhea
   g. Vomiting
   h. Abdominal pain
   i. Unexplained bleeding or bruising

8. Interventions
   a. If the assessment indicates possible infection with EVD, the client needs to be isolated in a private room with a private bathroom or a covered bedside commode with the door closed.
   b. Health care workers need to wear the proper personal protective equipment (PPE) and follow updated procedures designated by the Centers for Disease Control and Prevention for donning (putting on) and removing PPE. Refer to the following Web site for updated information:
   c. The number of health care workers entering the room should be limited, and a log of everyone who enters and leaves the room should be kept.
   d. Only necessary tests and procedures should be performed, and aerosol-generating procedures should be avoided.
   e. Refer to the CDC guidelines for cleaning, disinfecting, and managing waste (www.cdc.gov/vhf/ebola/healthcare-us/cleaning/hospitals.html).
   f. The agency’s infection control program should be notified, as well as state and local public health authorities.
A. Sarin
1. Sarin is a highly toxic nerve gas that can cause death within minutes of exposure.
2. It enters the body through the eyes and skin and acts by paralyzing the respiratory muscles.

B. Phosgene is a colorless gas normally used in chemical manufacturing that if inhaled at high concentrations for a long enough period will lead to severe respiratory distress, pulmonary edema, and death.

C. Mustard gas is yellow to brown and has a garlic-like odor that irritates the eyes and causes skin burns and blisters.

D. Nuclear warfare
1. Acute radiation exposure develops after a substantial exposure to radiation and is referred to as nuclear warfare.
2. Exposure can occur from external radiation or internal absorption.
3. Symptoms depend on the amount of exposure to the radiation and range from nausea and vomiting, diarrhea, fever, electrolyte imbalances, and neurological and cardiovascular impairment to leukopenia, purpura, hemorrhage, and death.

VIII. Nurse’s Role in Exposure to Warfare Agents
A. Be aware that, initially, a bioterrorism attack may resemble a naturally occurring outbreak of an infectious disease.
B. Nurses and other health care workers must be prepared to assess and determine what type of event occurred, the number of clients who may be affected, and how and when clients will be expected to arrive at the health care agency.
C. It is essential to be aware that changes in the microorganism can occur that may increase its virulence or make it resistant to conventional antibiotics or vaccines.
D. See Chapter 7 for additional information on disasters and emergency response planning.

Box 13-1

Physiological Changes in Older Clients That Increase the Risk of Accidents

Musculoskeletal Changes

Strength and function of muscles decrease.
Joints become less mobile and bones become brittle.
Postural changes and limited range of motion occur.

Nervous System Changes

Voluntary and autonomic reflexes become slower.
Decreased ability to respond to multiple stimuli occurs.
Decreased sensitivity to touch occurs.

Sensory Changes

Decreased vision and lens accommodation and cataracts develop.
Delayed transmission of hot and cold impulses occurs.
Impaired hearing develops, with high-frequency tones less perceptible.

Genitourinary Changes

Increased nocturia and occurrences of incontinence may occur.

Box 13-2

Measures to Prevent Falls

- Assess the client’s risk for falling; use agency fall risk assessment scale.
- Assign the client at risk for falling to a room near the nurses’ station.
- Alert all personnel to the client’s risk for falling; use agency fall risk alert procedures and methods as necessary.
- Assess the client frequently.
- Orient the client to physical surroundings.
- Instruct the client to seek assistance when getting up.
- Explain the use of the nurse call system.
• Use safety devices such as floor pads, and bed or chair alarms that alert health care personnel of the person getting out of bed or a chair.
• Keep the bed in the low position with side rails adjusted to a safe position (follow agency policy).
• Lock all beds, wheelchairs, and stretchers.
• Keep clients’ personal items within their reach.
• Eliminate clutter and obstacles in the client’s room.
• Provide adequate lighting.
• Reduce bathroom hazards.
• Maintain the client’s toileting schedule throughout the day.

**Box 13-3**

**The Joint Commission: 2018 National Patient Safety Goals**

• Improve the accuracy of client identification.
• Improve the effectiveness of communication among caregivers
• Improve the safety of using medications
• Focus on the risk points related to medication reconciliation
• Reduce the harm associated with clinical alarm systems
• Reduce the risk of health care–associated infections
• Identify client safety risks
• Prevent mistakes in surgery

https://www.jointcommission.org/assets/1/6/NPSG_Chapter_HAP_Jan2018.pdf

**Box 13-4**

**Steps to Prevent Injury to the Health Care Worker When Moving a Client**

• Use available safety equipment.
• Keep the weight to be lifted as close to the body as possible.
• Bend at the knees.
• Tighten abdominal muscles and tuck the pelvis.
• Maintain the trunk erect and knees bent so that multiple muscle groups work together in a coordinated manner.

Box 13-5

Documentation Points With Use of a Safety Device (Restraint)

- Reason for safety device
- Method of use for safety device
- Date and time of application of safety device
- Duration of use of safety device and client’s response
- Release from safety device with periodic exercise and circulatory, neurovascular, and skin assessment
- Assessment of continued need for safety device
- Evaluation of client’s response

<tr>
<td>Select appropriate size and extend to cover wrists of gown.</td>
<td>Grasp bottom ties then top ties to remove.</td>
</tr>
</tbody>
</table>

* Note: All equipment is considered contaminated on the outside.
Box 13-6

Anthrax: Transmission and Symptoms

Skin

Spores enter the skin through cuts and abrasions and are contracted by handling contaminated animal skin products. Infection starts with an itchy bump like a mosquito bite that progresses to a small liquid-filled sac. The sac becomes a painless ulcer with an area of black, dead tissue in the middle. Toxins destroy surrounding tissue.

Gastrointestinal

Infection occurs following the ingestion of contaminated undercooked meat. Symptoms begin with nausea, loss of appetite, and vomiting. The disease progresses to severe abdominal pain, vomiting of blood, and severe diarrhea.

Inhalation

Infection is caused by the inhalation of bacterial spores, which multiply in the alveoli.
The disease begins with the same symptoms as the flu, including fever, muscle aches, and fatigue. Symptoms suddenly become more severe with the development of breathing problems and shock. Toxins cause hemorrhage and destruction of lung tissue.

Practice Questions

100. The nurse is preparing to initiate an intravenous (IV) line containing a high dose of potassium chloride using an IV infusion pump. While preparing to plug the pump cord into the wall, the nurse finds that no receptacle is available in the wall socket. The nurse should take which action?
   1. Initiate the IV line without the use of a pump.
   2. Contact the electrical maintenance department for assistance.
   3. Plug in the pump cord in the available plug above the room sink.
   4. Use an extension cord from the nurses’ lounge for the pump plug.

101. The nurse obtains a prescription from a primary health care provider to restrain a client and instructs an assistive personnel (AP) to apply the safety device to the client. Which observation of unsafe application of the safety device would indicate that further instruction is required for the AP?
   1. Placing a safety knot in the safety device straps
   2. Safely securing the safety device straps to the side rails
   3. Applying safety device straps that do not tighten when force is applied against them
   4. Securing so that 2 fingers can slide easily between the safety device and the client’s skin

102. The community health nurse is providing a teaching session about anthrax to
members of the community and asks the participants about the methods of transmission. Which answers by the participants would indicate that teaching was effective? Select all that apply.

1. Bites from ticks or deer flies
2. Inhalation of bacterial spores
3. Through a cut or abrasion in the skin
4. Direct contact with an infected individual
5. Sexual contact with an infected individual
6. Ingestion of contaminated undercooked meat

103. The nurse is giving report to an assistive personnel (AP) who will be caring for a client in hand restraints (safety devices). How frequently should the nurse instruct the AP to check the tightness of the restrained hands?
   1. Every 2 hours
   2. Every 3 hours
   3. Every 4 hours
   4. Every 30 minutes

104. The nurse is reviewing a plan of care for a client with an internal radiation implant. Which intervention, if noted in the plan, indicates the need for revision of the plan?
   1. Wearing gloves when emptying the client’s bedpan
   2. Keeping all linens in the room until the implant is removed
   3. Wearing a lead apron when providing direct care to the client
   4. Placing the client in a semiprivate room at the end of the hallway

105. Contact precautions are initiated for a client with a health care–associated (nosocomial) infection caused by methicillin-resistant Staphylococcus aureus (MRSA). The nurse prepares to provide colostomy care and should obtain which protective items to perform this procedure?
   1. Gloves and gown
   2. Gloves and goggles
   3. Gloves, gown, and shoe protectors
   4. Gloves, gown, goggles, and a mask or face shield

106. The nurse enters a client’s room and finds that the wastebasket is on fire. The nurse immediately assists the client out of the room. What is the next nursing action?
   1. Call for help.
   2. Extinguish the fire.
   3. Activate the fire alarm.
   4. Confine the fire by closing the room door.

107. A mother calls a neighbor who is a nurse and tells the nurse that her 3-year-old child has just ingested liquid furniture polish. The nurse would direct the mother to take which immediate action?
   1. Induce vomiting.
   2. Call an ambulance.
   3. Call the Poison Control Center.
4. Bring the child to the emergency department.

108. The emergency department (ED) nurse receives a telephone call and is informed that a tornado has hit a local residential area and that numerous casualties have occurred. The victims will be brought to the ED. The nurse should take which initial action?
   1. Prepare the triage rooms.
   2. Activate the emergency response plan specific to the facility.
   3. Obtain additional supplies from the central supply department.
   4. Obtain additional nursing staff to assist in treating the casualties.

109. The nurse is caring for a client with meningitis and implements which transmission-based precaution for this client?
   1. Private room or cohort client
   2. Personal respiratory protection device
   3. Private room with negative airflow pressure
   4. Mask worn by staff when the client needs to leave the room

110. The nurse working in the emergency department (ED) is assessing a client who recently returned from Nigeria and presented complaining of a fever at home, fatigue, muscle pain, and abdominal pain. Which action should the nurse take next?
   1. Check the client’s temperature.
   2. Isolate the client in a private room.
   3. Check a complete set of vital signs.
   4. Contact the primary health care provider.

Answers

100. Answer: 2

   **Rationale:** Electrical equipment must be maintained in good working order and should be grounded; otherwise, it presents a physical hazard. An IV line that contains a dose of potassium chloride should be administered by an infusion pump. The nurse needs to use hospital resources for assistance. A regular extension cord should not be used because it poses a risk for fire. Use of electrical appliances near a sink also presents a hazard.

   **Test-Taking Strategy:** Note the subject, electrical safety. Recalling safety issues will direct you to the correct option. Contacting the maintenance department is the only correct option, since the other options are not considered safe practice when implementing electrical actions. In addition, since potassium chloride is in the IV solution, a pump must be used.

   **Level of Cognitive Ability:** Applying
   **Client Needs:** Safe and Effective Care Environment
   **Integrated Process:** Nursing Process—Implementation
   **Content Area:** Foundations of Care: Safety
   **Health Problem:** N/A
   **Priority Concepts:** Clinical Judgment; Safety
   **Reference:** Potter et al. (2017), pp. 389, 393.
101. **Answer:** 2

**Rationale:** The safety device straps are secured to the bed frame and never to the side rails to avoid accidental injury in the event that the side rails are released. A half-bow or safety knot or device with a quick release buckle should be used to apply a safety device because it does not tighten when force is applied against it and it allows quick and easy removal of the safety device in case of an emergency. The safety device should be secure, and 1 or 2 fingers should slide easily between the safety device and the client's skin.

**Test-Taking Strategy:** Focus on the **subject**, the unsafe intervention. Also note the **strategic words**, *further instruction is required*. These words indicate a **negative event query** and the need to select the incorrect option. Read each option carefully. The words *securing the safety device straps to the side rails* in option 2 should direct your attention to this as an incorrect and unsafe action.

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Foundations of Care: Safety

**Health Problem:** N/A

**Priority Concepts:** Health Care Quality; Safety

**Reference:** Potter et al. (2017), pp. 400-401.

102. **Answer:** 2, 3, 6

**Rationale:** Anthrax is caused by *Bacillus anthracis* and can be contracted through the digestive system or abrasions in the skin, or inhaled through the lungs. It cannot be spread from person to person, and it is not contracted via bites from ticks or deer flies.

**Test-Taking Strategy:** Focus on the **subject**, routes of transmission of anthrax, and note the **strategic word**, *effective*. Knowledge regarding the methods of contracting anthrax is needed to answer this question. Remember that it is not spread by person-to-person contact or contracted via tick or deer fly bites.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Foundations of Care: Infection Control

**Health Problem:** Adult Health: Immune: Infections

**Priority Concepts:** Client Teaching; Infection

103. **Answer:** 4

**Rationale:** The nurse should instruct the AP to check safety devices for tightness every 30 minutes. The neurovascular and circulatory status of the extremity should also be checked by the registered nurse every 30 minutes. In addition, the safety device should be removed at least every 2 hours to permit muscle exercise and to promote circulation. Agency guidelines regarding the use of safety devices should
always be followed.

**Test-Taking Strategy:** Focus on the **subject**, checking the tightness of a safety devices. In this situation, selecting the option that identifies the most frequent time frame is best.

**Level of Cognitive Ability:** Applying
**Client Needs:** Safe and Effective Care Environment
**Integrated Process:** Teaching and Learning
**Content Area:** Leadership/Management: Delegating
**Health Problem:** N/A
**Priority Concepts:** Health Care Quality; Safety

104. **Answer:** 4

**Rationale:** A private room with a private bath is essential if a client has an internal radiation implant. This is necessary to prevent accidental exposure of other clients to radiation. The remaining options identify accurate interventions for a client with an internal radiation implant and protect the nurse from exposure.

**Test-Taking Strategy:** Note the **strategic words**, indicates the need for revision. These words indicate a **negative event query** and the need to select the incorrect nursing intervention. Remember that the client with an internal radiation implant needs to be placed in a private room.

**Level of Cognitive Ability:** Applying
**Client Needs:** Safe and Effective Care Environment
**Integrated Process:** Nursing Process—Planning
**Content Area:** Foundations of Care: Safety
**Health Problem:** N/A
**Priority Concepts:** Health Care Quality; Safety

105. **Answer:** 4

**Rationale:** Splashes of body secretions can occur when providing colostomy care. Goggles and a mask or face shield are worn to protect the face and mucous membranes of the eyes during interventions that may produce splashes of blood, body fluids, secretions, or excretions. In addition, contact precautions require the use of gloves, and a gown should be worn if direct client contact is anticipated. Shoe protectors are not necessary.

**Test-Taking Strategy:** Focus on the **subject**, protective items needed to perform colostomy care. Also, note the words **contact precautions**. Visualize care for this client to determine the necessary items required for self-protection. This will direct you to the correct option.

**Level of Cognitive Ability:** Applying
**Client Needs:** Safe and Effective Care Environment
**Integrated Process:** Nursing Process—Implementation
**Content Area:** Foundations of Care: Infection Control
**Health Problem:** Adult Health: Immune: Infections

438
106. **Answer:** 3

**Rationale:** The order of priority in the event of a fire is to rescue the clients who are in immediate danger. The next step is to activate the fire alarm. The fire then is confined by closing all doors and, finally, the fire is extinguished.

**Test-Taking Strategy:** Note the **strategic word**, *next*. Remember the mnemonic RACE to prioritize in the event of a fire. *R* is rescue clients in immediate danger, *A* is alarm (sound the alarm), *C* is confine the fire by closing all doors, and *E* is extinguish or evacuate.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Safety

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 392-393.

107. **Answer:** 3

**Rationale:** If a poisoning occurs, the Poison Control Center should be contacted immediately. Vomiting should not be induced if the victim is unconscious or if the substance ingested is a strong corrosive or petroleum product. Bringing the child to the emergency department or calling an ambulance would not be the initial action because this would delay treatment. The Poison Control Center may advise the mother to bring the child to the emergency department; if this is the case, the mother should call an ambulance.

**Test-Taking Strategy:** Note the **strategic word**, *immediate*. Calling the Poison Control Center is the first action, since it will direct the mother on the next step to take based on the type of poisoning. The other options are unsafe or could cause a delay in treatment.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Safety

**Health Problem:** Pediatric-Specific: Poisoning

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), p. 375.

108. **Answer:** 2

**Rationale:** In an external disaster (a disaster that occurs outside of the institution or agency), many victims may be brought to the ED for treatment. The initial nursing action must be to activate the emergency response plan specific to the facility. Once the emergency response plan is activated, the actions in the other options will occur.
**Test-Taking Strategy:** Note the strategic word, *initial*, and determine the priority action. Note that the correct option is the umbrella option. The emergency response plan includes all of the other options.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Safety

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

109. **Answer:** 1

**Rationale:** Meningitis is transmitted by droplet infection. Precautions for this disease include a private room or cohort client and use of a standard precaution mask. Private negative airflow pressure rooms and personal respiratory protection devices are required for clients with airborne disease such as tuberculosis. When appropriate, a mask must be worn by the client and not the staff when the client leaves the room.

**Test-Taking Strategy:** Focus on the subject, the correct precaution needs for a client with meningitis. Recalling that meningitis is transmitted by droplets will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Infection Control

**Health Problem:** Adult Health: Neurological: Inflammation/Infections

**Priority Concepts:** Infection; Safety

110. **Answer:** 2

**Rationale:** The nurse should suspect the potential for Ebola virus disease (EVD) because of the client’s recent travel to Nigeria. The nurse needs to consider the symptoms that the client is reporting, and clients who meet the exposure criteria should be isolated in a private room before other treatment measures are taken. Exposure criteria include a fever reported at home or in the ED of 38.0° C (100.4° F) or headache, fatigue, weakness, muscle pain, vomiting, diarrhea, abdominal pain, or signs of bleeding. This client is reporting a fever and is showing other signs of EVD, and therefore should be isolated. After isolating the client, it would be acceptable to then collect further data and notify the primary health care provider and other state and local authorities of the client’s signs and symptoms.

**Test-Taking Strategy:** Note the strategic word, *next*. This indicates that some or all of the other options may be partially or totally correct, but the nurse needs to prioritize. Eliminate options 1 and 3 first because they are comparable or alike. Next note that the client recently traveled to Nigeria. Recall that isolation to prevent transmission of an infection is the immediate priority in the care of a client with
suspected EVD.

Level of Cognitive Ability: Analyzing
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Foundations of Care: Infection Control
Health Problem: Adult Health: Immune: Infections
Priority Concepts: Clinical Judgment; Safety
I. Medication Administration (Box 14-1)
In most clinical settings, an electronic infusion device is used to administer intravenous (IV) solutions and IV medications. However, the NCLEX-RN® examination is going to require that you correctly calculate an intravenous infusion rate via drops per minute, so be sure that you master this skill.

II. Medication Measurement Systems
A. Metric system (Box 14-2)
1. The basic units of metric measures are the meter, liter, and gram.
2. Meter measures length; liter measures volume; gram measures mass.

B. Apothecary and household systems
1. The apothecary and household systems are the oldest of the medication measurement systems.
2. Apothecary measures such as grain, dram, and minim are not commonly used in the clinical setting.
3. Commonly used household measures include drop, teaspoon, tablespoon, ounce, pint, and cup.

C. Additional common medication measures
1. Milliequivalent
   a. Milliequivalent is abbreviated mEq.
   b. The milliequivalent is an expression of the number of grams of a medication contained in 1 mL of a solution.
   c. For example, the measure of serum...
potassium is given in milliequivalents.

2. Unit
   a. Unit measures a medication in terms of its action, not its physical weight.
   b. For example, penicillin, heparin sodium, and insulin are measured in units.

III. Conversions
   A. Conversion between metric units (Box 14-3)
      1. The metric system is a decimal system; therefore, conversions between the units in this system can be done by dividing or multiplying by 1000 or by moving the decimal point 3 places to the right or 3 places to the left.
      2. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal point 3 places to the right.
      3. In the metric system, to convert smaller to larger, divide by 1000 or move the decimal point 3 places to the left.
   B. Conversion between household and metric systems
      1. Household and metric measures are equivalent and not equal measures.
      2. Conversion to equivalent measures between systems is necessary when a medication prescription is written in one system but the medication label is stated in another.
      3. Medications are not always prescribed and prepared in the same system of measurement; therefore, conversion of units from one system to another is necessary. However, the metric system is the most commonly used system in the clinical setting.
      4. Calculating equivalents between 2 systems may be done by using the method of ratio and proportion (Boxes 14-4 and 14-5).

IV. Medication Labels
   A. A medication label always contains the generic name and may contain the trade name of the medication.
   B. Always check expiration dates on medication labels.
The NCLEX tests you on generic names of medications. Trade names will not be presented on the exam for most medications, so be sure to learn medications by their generic names. However, you will likely still encounter the trade names in the clinical setting.

V. Medication Prescriptions (Box 14-6)
A. In a medication prescription, the name of the medication is written first, followed by the dosage, route, and frequency (depending on the frequency of the prescription, times of administration are usually established by the health care agency and written in an agency policy).

B. Medication prescriptions need to be written using accepted abbreviations, acronyms, and symbols approved by The Joint Commission; also follow agency guidelines.

If the nurse has any questions about or sees inconsistencies in the written prescription, the nurse must contact the person who wrote the prescription immediately and must verify the prescription.

VI. Oral Medications
A. Scored tablets contain an indented mark to be used for possible breakage into partial doses; when necessary, scored tablets (those marked for division) can be divided into halves or quarters according to agency policy.

B. Enteric-coated tablets and sustained-released capsules delay absorption until the medication reaches the small intestine; these medications should not be crushed.

C. Capsules contain a powdered or oily medication in a gelatin cover.

D. Orally administered liquids are supplied in solution form and contain a specific amount of medication in a given amount of solution, as stated on the label.

E. The medicine cup
   1. The medicine cup has a capacity of 30 mL or 1 ounce (oz) and is used for orally administered liquids.
   2. The medicine cup is calibrated to measure teaspoons, tablespoons, and ounces.
   3. To pour accurately, place the medication cup on a level surface at eye level and then pour the liquid while reading the measuring markings

F. Volumes of less than 5 mL are measured using a syringe with the needle removed.

A calibrated syringe is used for giving medicine to children.
VII. Parenteral Medications

A. Parenteral means an injection route, and parenteral medications are administered by intravenous (IV), intramuscular, subcutaneous, or intradermal injection (see Fig. 14-1 for angles of injection).

B. Parenteral medications are packaged in single-use ampules, in single- and multiple-use rubber-stoppered vials, and in premeasured syringes and cartridges.

C. The standard 3-mL syringe is used to measure most injectable medications and is calibrated in tenths (0.1) of a milliliter.

D. The syringe is filled by drawing in solution until the top ring on the plunger (i.e., the ring closest to the needle), not the middle section or the bottom ring of the plunger, is aligned with the desired calibration (Fig. 14-2).

E. The nurse should not administer more than 3 mL per intramuscular injection site (2 mL for the deltoid) or 0.5 to 1.5 mL for an adult per subcutaneous injection site; larger volumes are difficult for an injection site to absorb and, if prescribed, need to be verified. Variations for pediatric clients are discussed in the pediatric sections of this text.

F. In an adult that is of normal size, a 25-gauge 5⁄8-inch needle at a 45-degree angle or a 1⁄2-inch needle at a 90-degree angle is used for subcutaneous injections.

G. For an intramuscular injection in an adult client, the client’s weight, site for injection, and the amount of adipose tissue influences needle size. An obese person may require a needle 2 to 3 inches long, whereas a thin person requires only a 1⁄2- to 1-inch needle; the gauge of the needle will depend on the viscosity of the solution being injected, with a larger gauge needed for more viscous solutions. If a Z-track method is used, a larger, deeper muscle such as the ventrogluteal muscle should be chosen as the site.

H. For an intradermal injection, a tuberculin or small syringe is used. The angle of insertion for an intradermal injection is 5 to 15 degrees.

Always question and verify excessively large or small volumes of medication.

I. Prefilled medication cartridge

1. The medication cartridge slips into the cartridge holder, which provides a plunger for injection of the medication.

2. The cartridge is designed to provide sufficient space to allow for the addition of a second medication when combined dosages are prescribed.

3. The prefilled medication cartridge is to be used once
and discarded; if the nurse is to give less than the full single dose provided, the nurse needs to discard the extra amount before giving the client the injection, in accordance with agency policies and procedures.

J. In general, standard medication doses for adults are to be rounded to the nearest tenth (0.1 mL) of a milliliter and measured on the milliliter scale; for example, 1.28 mL is rounded to 1.3 mL (follow agency policy for rounding medication doses).

K. When volumes larger than 3 mL are required, the nurse may use a 5-mL syringe; these syringes are calibrated in fifths (0.2 mL) (Fig. 14-3).

L. Other syringe sizes may be available (10, 20, and 50 mL) and may be used for medication administration requiring dilution.

M. Tuberculin syringe (Fig. 14-4)
   1. The tuberculin syringe holds 1 mL and is used to measure small or critical amounts of medication, such as allergen extract, vaccine, or a child’s medication.
   2. The syringe is calibrated in hundredths (0.01) of a milliliter, with each one-tenth (0.1) marked on the metric scale.

N. Insulin syringe (Fig. 14-5)
   1. The standard 100-unit insulin syringe is calibrated for 100 units of insulin (100 units = 1 mL); low-dose insulin syringes, such as a 30-unit insulin syringe or a 50-unit insulin syringe, are available for a more precise insulin draw for clients with low-dose insulin prescriptions.
   2. Insulin should not be measured in any other type of syringe.

O. Safety needles contain shielding devices that are attached to the needle and slipped over the needle to reduce the incidence of needlestick injuries.
VIII. Injectable Medications in Powder Form
   A. Some medications become unstable when stored in solution form and are therefore packaged in powder form.
   B. Powders must be dissolved with a sterile diluent before use; usually, sterile water or normal saline is used. The dissolving procedure is called reconstitution (Box 14-7).

IX. Calculating the Correct Dosage (see Box 14-8 for the standard formula)
   A. When calculating dosages of oral medications, check the calculation and question the prescription if the calculation calls for more than 3 tablets.
   B. When calculating dosages of parenteral medications, check the calculation and question the prescription if the amount to be given is too large a dose.
   C. Be sure that all measures are in the same system and that all units are in the same size, converting when necessary; carefully consider what the reasonable amount of the medication that should be administered is.
   D. Round standard injection doses to tenths and measure in a 3-mL syringe (follow agency policy).
   E. Per agency policy, it may be acceptable to round down (avoid rounding up) small, critical amounts or children’s doses to hundredths and measure in a 1-mL tuberculin syringe (example: 1.752 mL can be rounded to 1.75 mL).
   F. In addition to using the standard formula (see Box 14-8), calculations can be done using dimensional analysis, a method that uses conversion factors to move from one unit of measurement to another; the required elements of the equation include the desired answer units, conversion formula that includes the desired answer units and the units that need to be converted, and the original factors to convert, including quantity and units.

Regardless of the source or cause of a medication error, if the nurse gives an incorrect dose, the nurse is legally responsible for the action.

X. Percentage and Ratio Solutions
   A. Percentage solutions
      1. Express the number of grams (g) of the medication per 100 mL of solution.
      2. For example, calcium gluconate 10% is 10 g of pure medication per 100 mL of solution.
   B. Ratio solutions
      1. Express the number of grams of the medication per total milliliters of solution.
2. For example, epinephrine 1:1000 is 1 g of pure medication per 1000 mL of solution.

XI. Intravenous Flow Rates (Box 14-9)

A. Monitor IV flow rate frequently even if the IV solution is being administered through an electronic infusion device (follow agency policy regarding frequency).

B. If an IV is running behind schedule, collaborate with the primary health care provider to determine the client’s ability to tolerate an increased flow rate, particularly for older clients and those with cardiac, pulmonary, renal, or neurological conditions.

The nurse should never increase the rate of (i.e., speed up) an IV infusion to catch up if the infusion is running behind schedule. The nurse should include any IV fluid administered in the intake portion of the client’s assessment.

C. Whenever a prescribed IV rate is increased, the nurse should assess the client for increased heart rate, increased respirations, and increased lung congestion, which could indicate fluid overload.

D. Intravenously administered fluids are prescribed most frequently based on milliliters per hour.

E. The volume per hour prescribed is administered by setting the flow rate, which is counted in drops per minute.

F. Most flow rate calculations involve changing milliliters per hour to drops per minute.

G. Intravenous tubing

1. IV tubing sets are calibrated in drops per milliliter; this calibration is needed for calculating flow rates.

2. A standard or macrodrip set is used for routine adult IV administrations; depending on the manufacturer and type of tubing, the set will require 10 to 20 drops (gtt) to equal 1 mL.

3. A minidrip or microdrip set is used when more exact measurements are needed, such as in intensive care units and pediatric units.

4. In a minidrip or microdrip set, 60 gtt is usually equal to 1 mL.

5. The calibration, in drops per milliliter, is written on the IV tubing package.

XII. Calculation of Infusions Prescribed by Unit Dosage per Hour

A. The most common medications that will be prescribed by unit dosage per hour and run by continuous infusion are heparin sodium and regular insulin.

B. Calculation of these infusions can be done using a 2-step process (Box 14-10).
**Box 14-1**

**Medication Administration**

- Assess the medication prescription.
- Compare the client’s medication prescription with all medications that the client was previously taking (medication reconciliation).
- Ask the client about a history of allergies or use of herbal substances.
- Assess the client’s current condition and the purpose for the medication or intravenous (IV) solution.
- Determine the client’s understanding of the purpose of the prescribed medication or need for IV solution.
- Teach the client about the medication and about self-administration at home.
- Identify and address concerns (social, cultural, religious, spiritual) that the client may have about taking the medication.
- Assess the need for conversion when preparing a dose of medication for administration to the client.
- Assess the rights of medication administration such as: right prescription, right medication, right dose, right client, right route, right frequency/time, right reason, right education (medication name, purpose, action, and possible undesirable side or adverse effects), right assessment (performed by a qualified health care provider), right to refuse medication regardless of the consequences, right approach/technique, right evaluation/response, and right documentation.
- Inform the client of additional medication rights, which include not receiving unnecessary medication; being advised of the experimental nature of medication therapy and to give written consent for its use; being informed if prescribed medications are a part of a research study; and receiving appropriate supportive therapy in relation to medication therapy.
- Assess the vital signs, check significant laboratory results, and identify any potential interactions (food or medication interactions) before administering medication, when appropriate.
- Document the administration of the prescribed therapy and the client’s response to the therapy.

**Box 14-2**

**Metric System**

**Abbreviations**

- meter: m
- liter: L
- milliliter: mL
kilogram: kg
gram: g
milligram: mg
microgram: mcg
milliequivalents: mEq

Equivalents

1 mcg = 0.000001 g
1 mg = 1000 mcg or 0.001 g
1 g = 1000 mg
1 kg = 1000 g
1 kg = 2.2 lb
1 mL = 0.001 L

Box 14-3
Conversion Between Metric Units

Problem 1
Convert 2 g to milligrams.

Solution
Change a larger unit to a smaller unit:
2 g = 2000 mg (multiply by 1000 or move decimal point 3 places to the right)

Problem 2
Convert 250 mL to liters.

Solution
Change a smaller unit to a larger unit:
250 mL = 0.25 L (divide by 1000 or move decimal point 3 places to the left)

Box 14-4
Ratio and Proportion

Ratio: The relationship between 2 numbers, separated by a colon; for example, 1:2 (1 to 2).
Proportion: The relationship between 2 ratios, separated by a double colon (::) or an equal sign (=).

Formula:
To solve a ratio and proportion problem: The middle numbers (means) are multiplied and the end numbers (extremes) are multiplied.

Sample Problem

\[ \frac{H}{V} : \frac{V}{X} = \frac{(1)}{(2)} \times \frac{(3)}{(X)} \]

Set up the formula: \( 1 : 2 :: 3 : X \)

Solve: Multiply means and extremes:

\[ 1 \times 6 = 6 \]

\[ X = 6 \]

Box 14-5

Calculating Equivalents Between Two Systems

Calculating equivalents between 2 systems may be done by using the method of ratio and proportion.

Problem

The primary health care provider prescribes nitroglycerin grain (gr).

The medication label reads 0.4 milligrams (mg) per tablet. The nurse prepares to administer how many tablets to the client?

If you knew that \( \frac{1}{150} \) gr was equal to 0.4 mg, you would know that you need to administer 1 tablet. Otherwise, use the ratio and proportion formula.

Note that grain is a measure in the apothecary system but nitroglycerin is one medication that you may find prescribed in this unit of measure.

Ratio and Proportion Formula

\[ \frac{H}{V} : \frac{V}{X} = \frac{(1)}{(2)} \times \frac{(3)}{(X)} \]

\[ \frac{1}{150} \text{gr} : 60 \text{mg} :: \frac{1}{150} \text{gr} : X \text{mg} \]
Box 14-6

Medication Prescriptions

- Name of client
- Date and time when prescription is written
- Name of medication to be given
- Dosage of medication
- Medication route
- Time and frequency of administration
- Signature of person writing the prescription

\[ 60 \times \frac{1}{150} = X \]

\[ X = 0.4 \text{ mg (1 tablet)} \]
FIG. 14-1 Angles of injection.

FIG. 14-2 Parts of a syringe.
Box 14-7

Reconstitution

- In reconstituting a medication, locate the instructions on the label or in the vial package insert and read and follow the directions carefully.
- Instructions will state the volume of diluent to be used and the resulting volume of the reconstituted medication.
- Often, the powdered medication adds volume to the solution in addition to the amount of diluent added.
- The total volume of the prepared solution will exceed the volume of the diluent added.
- When reconstituting a multiple-dose vial, label the medication vial with the date and time of preparation, your initials, and the date of expiration.
- Indicating the strength per volume on the medication label also is important.
**Box 14-8**

**Standard Formula for Calculating a Medication Dosage**

\[ \frac{D}{A} \times Q = X \]

D (desired) is the dosage that the primary health care provider prescribed. A (available) is the dosage strength as stated on the medication label. Q (quantity) is the volume or form in which the dosage strength is available, such as tablets, capsules, or milliliters.

**Box 14-9**

**Formulas for Intravenous Calculations**

**Flow Rates**

\[ \frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute} \]

**Infusion Time**

\[ \frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} = \text{Infusion time} \]

**Number of Milliliters per Hour**
Box 14-10

Infusions Prescribed by Unit Dosage per Hour

Calculation of these problems can be done using a 2-step process.

1. Determine the amount of medication per milliliter (mL).
2. Determine the infusion rate or milliliters per hour.

Problem 1

Prescription: Continuous heparin sodium by IV at 1000 units per hour
Available: IV bag of 500 mL D\textsubscript{5}W with 20,000 units of heparin sodium
How many milliliters per hour are required to administer the correct dose?

Solution

Step 1: Calculate the amount of medication (units) per 1 mL.

\[
\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \frac{20,000 \text{ units}}{500 \text{ mL}} = 40 \text{ units/mL}
\]

Step 2: Calculate milliliters per hour.
Problem 2

*Prescription:* Continuous regular insulin by IV at 10 units per hour  
*Available:* IV bag of 100 mL NS with 50 units regular insulin  
How many milliliters per hour are required to administer the correct dose?

**Solution**

*Step 1:* Calculate the amount of medication (units) per 1 mL.

\[
\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \frac{50 \text{ units}}{100 \text{ mL}} = 0.5 \text{ units/mL}
\]

\[
\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hour}
\]

\[
\frac{1000 \text{ units}}{40 \text{ units}} = 25 \text{ mL/hour}
\]
Practice Questions

111. A prescription reads 1000 mL of normal saline (NS) to infuse over 12 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse prepares to set the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.

   Answer: _______ drops per minute

112. A prescription reads to administer an intravenous (IV) dose of 400,000 units of penicillin G benzathine. The label on the 10-milliliters (mL) ampule sent from the pharmacy reads penicillin G benzathine, 300,000 units/mL. The nurse prepares how much medication to administer the correct dose? Fill in the blank. Record your answer using 1 decimal place.

   Answer: _______ mL

113. A prescription reads potassium chloride 30 mEq to be added to 1000 mL normal saline (NS) and to be administered over a 10-hour period. The label on the medication bottle reads 40 mEq/20 mL. The nurse prepares how many milliliters (mL) of potassium chloride to administer the correct dose of medication? Fill in the blank.

   Answer: _______ mL

114. A prescription reads clindamycin phosphate 0.3 g in 50 mL normal saline (NS) to be administered intravenously over 30 minutes. The medication label reads clindamycin phosphate 900 mg in 6 mL. The nurse prepares how many milliliters (mL) of the medication to administer the correct dose? Fill in the blank.

   Answer: _______ mL

115. A prescription reads phenytoin 0.2 g orally twice daily. The medication label states that each capsule is 100 mg. The nurse prepares how many capsule(s) to administer 1 dose? Fill in the blank.

   Answer: _______ capsule(s)

116. A prescription reads 1000 mL of normal saline 0.9% to infuse over 8 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.

   Answer: _______ drops per minute

117. A prescription reads heparin sodium, 1300 units/hr by continuous intravenous (IV) infusion. The pharmacy prepares the medication and delivers an IV bag labeled heparin sodium 20,000 units/250 mL D₃W. An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters (mL) per hour to deliver 1300 units/hour? Fill in the blank. Record your answer to the nearest whole number.
Answer: ______ mL/hr

118. A prescription reads 3000 mL of D$_5$W to be administered over a 24-hour period. The nurse determines that how many milliliters (mL) per hour will be administered to the client? Fill in the blank.

Answer: ______ mL/hr

119. Gentamicin sulfate, 80 mg in 100 mL normal saline (NS), is to be administered over 30 minutes. The drop factor is 10 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.

Answer: ______ drops per minute

120. A prescription reads levothyroxine, 150 mcg orally daily. The medication label reads levothyroxine, 0.1 mg/tablet. The nurse administers how many tablet(s) to the client? Fill in the blank.

Answer: ______ tablet(s)

121. Cefuroxime sodium, 1 g in 50 mL normal saline (NS), is to be administered over 30 minutes. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank.

Answer: ______ drops per minute

122. A prescription reads 1000 mL D$_5$W to infuse at a rate of 125 mL/hr. The nurse determines that it will take how many hours for 1 L to infuse? Fill in the blank.

Answer: ______ hour(s)

123. A prescription reads to infuse 1 unit of packed red blood cells over 4 hours. The unit of blood contains 250 mL. The drop factor is 10 drops (gtt)/1 mL. The nurse prepares to set the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.

Answer: ______ drops per minute

124. A prescription reads morphine sulfate, 8 mg stat. The medication ampule reads morphine sulfate, 10 mg/mL. The nurse prepares how many milliliters (mL) to administer the correct dose? Fill in the blank.

Answer: ______ mL

125. A prescription reads regular insulin, 8 units/hr by continuous intravenous (IV) infusion. The pharmacy prepares the medication and then delivers an IV bag labeled 100 units of regular insulin in 100 mL normal saline (NS). An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters (mL) per hour to deliver 8 units/hr? Fill in the blank.

Answer: ______ mL/hr

---

**Answers**

111. *Answer: 21*

*Rationale:* Use the intravenous (IV) flow rate formula.

*Formula:*
Test-Taking Strategy: Focus on the subject, calculating an IV flow rate. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Skills: Dosage Calculations
Health Problem: N/A
Priority Concepts: Clinical Judgment; Safety

112. Answer: 1.3

Rationale: Use the medication dose formula.
Formula:

\[
\frac{\text{Total Volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}
\]

\[
\frac{1000 \text{ mL} \times 15 \text{ gtt}}{720 \text{ minutes}} = \frac{15,000}{720} = 20.8, \text{ or } 21 \text{ gtt/min}
\]

\[
\frac{\text{400,000 units} \times 1 \text{ mL}}{300,000 \text{ units}} = \text{Milliliters per dose}
\]
\frac{400,000}{300,000} = 1.33 = 1.3 \text{mL}

**Test-Taking Strategy:** Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record your answer using 1 decimal place.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Skills: Dosage Calculations  
**Health Problem:** Adult Health: Immune: Infections  
**Priority Concepts:** Clinical Judgment; Safety  

113. **Answer:** 15

**Rationale:** In most facilities, potassium chloride is premixed in the intravenous solution and the nurse will need to verify the correct dose before administration. In some cases the nurse will need to add the potassium chloride and will use the medication calculation formula to determine the mL to be added.

**Formula:**

\[
\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}
\]

\[
\frac{30 \text{mEq} \times 20 \text{mL}}{40 \text{mEq}} = 15 \text{mL}
\]

**Test-Taking Strategy:** Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Skills: Dosage Calculations  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Safety

114. Answer: 2

Rationale: You must convert 0.3 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal 3 places to the right. Therefore, 0.3 g = 300 mg. After conversion from grams to milligrams, use the formula to calculate the correct dose.

Formula:

\[
\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}
\]

\[
\frac{300\text{mg} \times 6\text{mL}}{900\text{mg}} = \frac{1800}{900} = 2\text{mL}
\]

Test-Taking Strategy: Focus on the subject, a dosage calculation. In this medication calculation problem, first you must convert grams to milligrams. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation

Health Problem: Adult Health: Immune: Infections
Priority Concepts: Clinical Judgment; Safety

115. Answer: 2

Rationale: You must convert 0.2 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal point 3 places to the right. Therefore, 0.2 g equals 200 mg. After conversion from grams to milligrams, use the formula to calculate the correct dose.

Formula:
Test-Taking Strategy: Focus on the subject, a dosage calculation. In this medication calculation problem, first you must convert grams to milligrams. Once you have done the conversion and reread the medication calculation problem, you will know that 2 capsules is the correct answer. Recheck your work using a calculator and make sure that the answer makes sense.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Skills: Dosage Calculations
Health Problem: Adult Health: Neurological: Seizure disorder/epilepsy
Priority Concepts: Clinical Judgment; Safety

116. Answer: 31

Rationale: Use the intravenous (IV) flow rate formula.
Formula:

\[
\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in Minutes}} = \text{Drop per minute}
\]

\[
\frac{1000 \text{ mL} \times 15 \text{ gtt}}{480 \text{ minutes}} = \frac{15,000}{480} = 31.2, \text{ or } 31 \text{ gtt/min}
\]

Test-Taking Strategy: Focus on the subject, an IV flow rate. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.
Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Skills: Dosage Calculations
Health Problem: N/A
Priority Concepts: Clinical Judgment; Safety

117. Answer: 16

Rationale: Calculation of this problem can be done using a 2-step process. First, you need to determine the amount of heparin sodium in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

Formula:

\[
\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \frac{\text{Amount of medication per milliliter}}{}
\]

\[
\frac{20,000 \text{ units}}{250 \text{ mL}} = 80 \text{ units/mL}
\]

Step 2:

\[
\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \frac{\text{Infusion rate, or mL/hr}}{}
\]

\[
\frac{1300 \text{ units}}{80 \text{ units/mL}} = 16.25, \text{ or } 16 \text{ mL/hr}
\]
**Test-Taking Strategy:** Focus on the subject, an IV flow rate. Read the question carefully, noting that 2 steps can be used to solve this medication problem. Follow the formula, verify your answer using a calculator, and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Content Area:** Skills: Dosage Calculations

**Health Problem:** Adult Health: Hematological: Bleeding/Clotting Disorders

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 958, 978-979.

118. **Answer:** 125

**Rationale:** Use the intravenous (IV) formula to determine milliliters per hour.

**Formula:**

\[
\frac{\text{Total volume in milliliters}}{\text{Number of hours}} = \text{Milliliters per hour}
\]

\[
\frac{3000 \text{ mL}}{24 \text{ hours}} = 125 \text{ mL/hr}
\]

**Test-Taking Strategy:** Focus on the subject, an IV infusion calculation of mL per hour. Read the question carefully, noting that the question is asking about milliliters per hour to be administered to the client. Use the formula for calculating milliliters per hour. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Skills: Dosage Calculations

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 978-979.

119. **Answer:** 33
Rationale: Use the intravenous (IV) flow rate formula.

**Formula:**

\[
\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}
\]

\[
\frac{100 \text{ mL} \times 10 \text{gtt}}{30 \text{ minutes}} = \frac{1000}{30} = 33.3, \text{ or } 33 \text{ gtt/min}
\]

**Test-Taking Strategy:** Focus on the subject, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Skills: Dosage Calculations

**Health Problem:** Adult Health: Immune: Infections

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 978-979.

120. **Answer:** 1.5

Rationale: You must convert 150 mcg to milligrams. In the metric system, to convert smaller to larger, divide by 1000 or move the decimal 3 places to the left. Therefore, 150 mcg equals 0.15 mg. Next, use the formula to calculate the correct dose.

**Formula:**

\[
\frac{\text{Desired}}{\text{Available}} \times \text{Tablet} = \text{Tablets per dose}
\]
\[
\frac{0.15 \text{mg}}{0.1 \text{mg}} \times 1 \text{tablet} = 1.5 \text{ tablets}
\]

*Test-Taking Strategy:* Focus on the **subject**, a dosage calculation. In this medication calculation problem, first you must convert micrograms to milligrams. Next, follow the formula for the calculation of the correct dose, verify your answer using a calculator, and make sure that the answer makes sense.

*Level of Cognitive Ability:* Applying

*Client Needs:* Physiological Integrity

*Integrated Process:* Nursing Process—Implementation

*Content Area:* Skills: Dosage Calculations

*Health Problem:* Adult Health: Endocrine: Thyroid Disorders

*Priority Concepts:* Clinical Judgment; Safety

121. *Answer:* 25

*Rationale:* Use the intravenous (IV) flow rate formula.

*Formula:*

\[
\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}
\]

\[
\frac{50 \text{mL} \times 15 \text{gtt}}{30 \text{minutes}} = \frac{750}{30} = 25 \text{gtt/min}
\]

*Test-Taking Strategy:* Focus on the **subject**, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

*Level of Cognitive Ability:* Applying

*Client Needs:* Physiological Integrity

*Integrated Process:* Nursing Process—Implementation

*Content Area:* Skills: Dosage Calculations

*Health Problem:* Adult Health: Immune: Infections

*Priority Concepts:* Clinical Judgment; Safety

122. *Answer:* 8
**Rationale:** You must determine that 1 L equals 1000 mL. Next, use the formula for determining infusion time in hours.

**Formula:**

\[
\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} = \text{Infusion time}
\]

\[
\frac{1000\text{mL}}{125\text{mL per hour}} = 8\text{ hours}
\]

**Test-Taking Strategy:** Focus on the **subject**, an IV infusion time calculation. Read the question carefully, noting that the question is asking about infusion time in hours. First, convert 1 L to milliliters. Next, use the formula for determining infusion time in hours. Verify your answer using a calculator and make sure that the answer makes sense.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Skills: Dosage Calculations

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

123. **Answer:** 10

**Rationale:** Use the intravenous (IV) flow rate formula.

**Formula:**

\[
\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minute}} = \text{Drops per minute}
\]
**Test-Taking Strategy:** Focus on the subject, an IV infusion rate. Although an infusion pump would be used, use the formula to calculate drops per minute to answer the question. The formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Skills: Dosage Calculations

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 978-979.

124. **Answer:** 0.8

**Rationale:** Use the formula to calculate the correct dose.

**Formula:**

\[
\frac{250 \text{ mL} \times 10 \text{ gtt}}{240 \text{ minutes}} = \frac{2500}{240} = 10.4, \text{or} 10 \text{ gtt/min}
\]

**Test-Taking Strategy:** Focus on the subject, a dosage calculation. Follow the formula for the calculation of the correct dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Skills: Dosage Calculations

**Health Problem:** Adult Health: Neurological: Pain

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 618-620.
125. Answer: 8

**Rationale:** Calculation of this problem can be done using a 2-step process. First, you need to determine the amount of regular insulin in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

**Formula:**

**Step 1:**

\[
\text{Known amount of medication in solution} \div \text{Total volume of diluent} = \text{Amount of medication per milliliter}
\]

\[
\frac{100 \text{ units}}{100 \text{ mL}} = 1 \text{ unit/mL}
\]

**Step 2:**

\[
\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or milliliters per hour}
\]

\[
\frac{8 \text{ units}}{1 \text{ unit/mL}} = 8 \text{ mL/hour}
\]

**Test-Taking Strategy:** Focus on the subject, an IV flow rate. Read the question carefully, noting that 2 steps can be used to solve this medication problem. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. These steps can be used for similar medication problems related to the administration of heparin sodium or regular insulin by IV infusion.

CHAPTER 15

Perioperative Nursing Care

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Infection; Safety

I. Preoperative Care

A client may return home shortly after having a surgical procedure because many surgical procedures are done through ambulatory care or 1-day stay surgical units. Perioperative care procedures apply even when the client returns home on the same day of the surgical procedure.

A. Obtaining informed consent

1. The surgeon is responsible for explaining the surgical procedure to the client and answering the client’s questions. Often, the nurse is responsible for obtaining the client’s signature on the consent form for surgery, which indicates the client’s agreement to the procedure based on the surgeon’s explanation.

2. The nurse may witness the client’s signing of the consent form, but the nurse must be sure that the client has understood the surgeon’s explanation of the surgery.

3. The nurse needs to document the witnessing of the signing of the consent form after the client acknowledges understanding the procedure.

4. Minors (clients younger than 18 years) may need a parent or legal guardian to sign the consent form.

5. Clients who are not alert or oriented may need power of attorney or legal guardian to sign the consent form.

6. Psychiatric clients have a right to refuse treatment until a court has legally determined that they are unable to make decisions for themselves.

7. No sedation should be administered to the client before the client signs the consent form.

8. Obtaining telephone consent from a legal guardian or power of attorney for health care is an acceptable practice if clients are unable to give consent.
themselves. The nurse must engage another nurse as a witness to the consent given over the telephone.

B. Nutrition

1. Review the surgeon’s prescriptions regarding the NPO (nothing by mouth) status before surgery.
2. Withhold solid foods and liquids as prescribed to avoid aspiration, usually for 6 to 8 hours before general anesthesia and for approximately 3 hours before surgery with local anesthesia (as prescribed).
3. Insert an intravenous (IV) line and administer IV fluids, if prescribed; per agency policy, the IV catheter size should be large enough to administer blood products if they are required.

C. Elimination

1. If the client is to have intestinal or abdominal surgery, per surgeon’s preference, an enema, laxative, or both may be prescribed for the day or night before surgery.
2. The client should void immediately before surgery.
3. Insert an indwelling urinary catheter, if prescribed; urinary catheter collection bags should be emptied immediately before surgery, and the nurse should document the amount and characteristics of the urine.

D. Surgical site

1. Clean the surgical site with a mild antiseptic or antibacterial soap on the night before surgery, as prescribed.
2. Shave the operative site, as prescribed; shaving may be done in the operative area.

E. Preoperative client teaching

1. Inform the client about what to expect postoperatively.
2. Inform the client to notify the nurse if the client experiences any pain postoperatively and that pain medication will be prescribed and given as the client requests. The client should be informed that some degree of pain should be expected and is normal.
3. Inform the client that requesting an opioid after surgery will not make the client a drug addict.
4. Demonstrate the use of a patient-controlled analgesia (PCA) pump if prescribed and explain that the client is the sole person who should push the button to

Hair on the head or face (including the eyebrows) should be shaved only if prescribed.
administer medication.
5. Instruct the client how to use noninvasive pain relief techniques such as relaxation, distraction techniques, and guided imagery before the pain occurs and as soon as the pain is noticed.
6. The nurse should instruct the client not to smoke (for at least 24 hours before surgery); discuss smoking cessation treatments and programs.
7. Instruct the client in deep-breathing and coughing techniques, use of incentive spirometry, and the importance of performing the techniques postoperatively to prevent the development of pneumonia and atelectasis (Box 15-1).
8. Instruct the client in leg and foot exercises and the purpose of sequential compression devices to prevent venous stasis of blood and to facilitate venous blood return (Fig. 15-1; see Box 15-1; see Fig. 15-3).
9. Instruct the client in how to splint an incision, turn, and reposition (Fig. 15-2; see Box 15-1).
10. Inform the client of any invasive devices that may be needed after surgery, such as a nasogastric tube, drain, urinary catheter, epidural catheter, or IV or subclavian lines.
11. Instruct the client not to pull on any of the invasive devices; they will be removed as soon as possible.

F. Psychosocial preparation

1. Be alert to the client’s level of anxiety.
2. Answer any questions or concerns that the client may have regarding surgery.
3. Allow time for privacy for the client to prepare psychologically for surgery.
4. Provide support and assistance as needed.
5. Take cultural and spiritual aspects into consideration when providing care (Box 15-2).

G. Preoperative checklist

1. Ensure that the client is wearing an identification bracelet.
2. Assess for allergies, including an allergy to latex (see Chapter 62 for information on latex allergy).
3. Review the preoperative checklist to be sure that each item is addressed before the client is transported to surgery.
4. Follow agency policies regarding preoperative
procedures, including informed consents, preoperative checklists, prescribed laboratory or radiological tests, and any other preoperative procedure.

5. Ensure that informed consent forms have been signed for the operative procedure, any blood transfusions, disposal of a limb, or surgical sterilization procedures.

6. Ensure that a history and physical examination have been completed and documented in the client’s record (Box 15-3).

7. Ensure that consultation requests have been completed and documented in the client’s record.

8. Ensure that prescribed laboratory results are documented in the client’s record.

9. Ensure that electrocardiogram and chest radiography reports are documented in the client’s record.

10. Ensure that a blood type, screen, and crossmatch are performed and documented in the client’s record within the established time frame per agency policy.

11. Remove jewelry, makeup, dentures, hairpins, nail polish (depending on agency procedures), glasses, and prostheses.

12. Document that valuables have been given to the client’s family members or locked in the hospital safe.

13. Document the last time that the client ate or drank.

14. Document that the client voided before surgery.

15. Document that the prescribed preoperative medications were given (Box 15-4).

16. Monitor and document the client’s vital signs.

H. Preoperative medications

1. Prepare to administer preoperative medications as prescribed before surgery.

2. Instruct the client about the desired effects of the preoperative medication.

After administering the preoperative medications, keep the client in bed with the side rails up (per agency policy). Place the call bell next to the client; instruct the client not to get out of bed and to call for assistance if needed.

I. Arrival in the operating room

1. Guidelines to prevent wrong site and wrong procedure surgery

a. The surgeon meets with the client in the preoperative area and uses a surgical marking pen to mark the operative site.
b. In the operating room, the nurse and surgeon ensure and reconfirm that the operative site has been appropriately marked.

c. Just before starting the surgical procedure, a time-out is conducted with all members of the operative team present to identify the correct client and appropriate surgical site again.

2. When the client arrives in the operating room, the operating room nurse will verify the identification bracelet with the client’s verbal response and will review the client’s chart.

3. The client’s record will be checked for completeness and reviewed for informed consent forms, history and physical examination, and allergic reaction information.

4. The surgeon’s prescriptions will be verified and implemented.

5. The IV line may be initiated at this time (or in the preoperative area), if prescribed.

6. The anesthesia team will administer the prescribed anesthesia.

II. Postoperative Care

A. Description

1. Postoperative care is the management of a client after surgery and includes care given during the immediate postoperative period as well as during the days after surgery.

2. The goal of postoperative care is to prevent complications, to promote healing of the surgical incision, and to return the client to a healthy state.

B. Respiratory system

1. Monitor vital signs per agency policy.

2. Monitor airway patency and ensure adequate ventilation (prolonged mechanical ventilation during anesthesia may affect postoperative lung function).

3. Remember that extubated clients who are lethargic
may not be able to maintain an airway.

4. Monitor for secretions; if the client is unable to clear the airway by coughing, suction the secretions from the client’s airway.

5. Observe chest movement for symmetry and the use of accessory muscles.

6. Monitor oxygen administration if prescribed.

7. Monitor pulse oximetry and end tidal carbon dioxide (CO₂) as prescribed.

8. Encourage deep-breathing and coughing exercises as soon as possible after surgery.

9. Note the rate, depth, and quality of respirations; the respiratory rate should be greater than 10 and less than 30 breaths per minute.

10. Monitor for signs of respiratory distress, atelectasis, or other respiratory complications.

C. Cardiovascular system

1. Monitor circulatory status, such as skin color, peripheral pulses, and capillary refill, and for the absence of edema, numbness, and tingling.

2. Monitor for bleeding.

3. Assess the pulse for rate and rhythm (a bounding pulse may indicate hypertension, fluid overload, or client anxiety).

4. Monitor for signs of hypertension and hypotension.

5. Monitor for cardiac dysrhythmias.

6. Monitor for signs of thrombophlebitis, particularly in clients who were in the lithotomy position during surgery.

7. Encourage the use of antiembolism stockings or sequential compression devices (Fig. 15-3), if prescribed, to promote venous return, strengthen muscle tone, and prevent pooling of blood in the extremities.

D. Musculoskeletal system

1. Assess the client for movement of the extremities.

2. Review the surgeon’s prescriptions regarding client positioning or restrictions.

3. Encourage ambulation if prescribed; before ambulation, instruct the client to sit at the edge of the
bed with his or her feet supported to assume balance.

4. Unless contraindicated, place the client in a low-Fowler’s position after surgery to increase the size of the thorax for lung expansion.

5. Avoid positioning the postoperative client in a supine position until pharyngeal reflexes have returned; if the client is comatose or semicomatose, position on the side (in addition, an oral airway may be needed).

6. If the client is unable to get out of bed, turn the client every 1 to 2 hours unless contraindicated.

E. Neurological system

1. Assess level of consciousness.

2. Make frequent periodic attempts to awaken the client until the client fully awakens.

3. Orient the client to the environment.

4. Speak in a soft tone; filter out extraneous noises in the environment.

5. Maintain the client’s body temperature and prevent heat loss by providing the client with warm blankets and raising the room temperature as necessary.

F. Temperature control

1. Monitor temperature.

2. Monitor for signs of hypothermia that may result from anesthesia, a cool operating room, or exposure of the skin and internal organs during surgery.

3. Apply warm blankets, continue oxygen, and administer medication as prescribed if the client experiences postoperative shivering.

G. Integumentary system

1. Assess the surgical site, drains, and wound dressings (serous drainage may occur from an incision, but notify the surgeon if excessive bleeding occurs from the site). Mark time and date for any drainage on surgical dressings and monitor for excessive drainage per agency policy.

2. Assess the skin for redness, abrasions, or breakdown that may have resulted from surgical positioning.

3. Monitor body temperature and wound for signs of infection.

4. Maintain a dry, intact dressing.

5. Change dressings as prescribed, noting the amount of bleeding or drainage, odor, and intactness of sutures or staples; commonly used dressings include 4 × 4...
inch gauze, nonadherent pads, abdominal pads, gauze rolls, and split gauze that are commonly referred to as drain sponges.

6. Wound drains should be patent; prepare to assist with the removal of drains (as prescribed by the surgeon) when the drainage amount becomes insignificant. Empty drains as needed and document the output and drainage characteristics.

7. An abdominal binder may be prescribed for obese and debilitated individuals to prevent dehiscence of the incision.

H. Fluid and electrolyte balance
   1. Monitor IV fluid administration as prescribed.
   2. Record intake and output.
   3. Monitor for signs of fluid or electrolyte imbalances.

I. Gastrointestinal system
   1. Monitor intake and output and for nausea and vomiting.
   2. Maintain patency of the nasogastric tube if present and monitor placement and drainage per agency procedure.
   5. Administer frequent oral care, at least every 2 hours.
   6. Maintain the NPO status until the gag reflex and peristalsis return.
   7. When oral fluids are permitted, start with ice chips and water.
   8. Ensure that the client advances to clear liquids and then to a regular diet, as prescribed and as the client can tolerate.

To prevent aspiration, turn the client to a side-lying position if vomiting occurs; have suctioning equipment available and ready to use.

J. Renal system
   1. Assess the bladder for distention.
   2. Monitor urine output (urinary output should be at least 30 mL/hr).
3. If the client does not have a urinary catheter, the client is expected to void within 6 to 8 hours postoperatively depending on the type of anesthesia administered; ensure that the amount is at least 200 mL.

K. Pain management

1. Assess the type of anesthetic used and preoperative medication that the client received, and note whether the client received any pain medications in the postanesthesia period.

2. Assess for pain and inquire about the type and location of pain; ask the client to rate the degree of pain on a scale of 1 to 10, with 10 being the most severe.

3. If the client is unable to rate the pain using a numerical pain scale, use a descriptor scale that lists words that describe different levels of pain intensity, such as no pain, mild pain, moderate pain, and severe pain, or other available pain rating scales.

4. Monitor for objective data related to pain, such as facial expressions, body gestures, increased pulse rate, increased blood pressure, and increased respirations.

5. Inquire about the effectiveness of the last pain medication.

6. Assess respiratory rate, blood pressure, heart rate, oxygen saturation, and level of consciousness (LOC), and note if or when last medication was given prior to administering pain medication. Administer pain medication as prescribed.

7. Ensure that the client with a PCA pump understands how to use it.

8. If an opioid has been prescribed, after administration, assess the client every 30 minutes for respiratory rate and pain relief.

9. Use noninvasive measures to relieve postoperative pain, including provision of distraction, relaxation techniques, guided imagery, comfort measures, positioning, backrubs, heat or cold therapy, and a quiet and restful environment.

Consider cultural and spiritual practices and beliefs when planning pain management.

III. Pneumonia and Atelectasis

A. Description ([Box 15-5 and Fig. 15-4])

1. Pneumonia: An inflammation of the alveoli caused by an infectious process that may develop 3 to 5 days postoperatively as a result of infection, aspiration, or immobility.

2. Atelectasis: A collapsed or airless state of the lung that may be the result of airway obstruction caused by accumulated secretions or failure of the client to deep breathe or ambulate after surgery; a postoperative complication that usually occurs 1 to 2 days after surgery.

B. Assessment

1. Dyspnea and increased respiratory rate
2. Crackles over involved lung area
3. Elevated temperature
4. Productive cough and chest pain

C. Interventions

1. Assess lung sounds.
2. Reposition the client every 1 to 2 hours.
3. Encourage the client to deep breathe, cough, and use the incentive spirometer as prescribed.
4. Provide chest physiotherapy and postural drainage, as prescribed.
5. Encourage fluid intake and early ambulation.
6. Use suction to clear secretions if the client is unable to cough.

IV. Hypoxemia

A. Description: An inadequate concentration of oxygen in arterial blood; in the postoperative client, hypoxemia can be due to shallow breathing from the effects of anesthesia or medications.

B. Assessment

1. Restlessness
2. Dyspnea
3. Diaphoresis
4. Tachycardia
5. Hypertension
6. Cyanosis
7. Low pulse oximetry readings

C. Interventions

1. Monitor for signs of hypoxemia.
2. Notify the surgeon.
3. Monitor lung sounds and pulse oximetry.
4. Administer oxygen as prescribed.
5. Encourage deep breathing and coughing and use of the incentive spirometer.
6. Turn and reposition the client frequently; encourage ambulation.

V. Pulmonary Embolism
   A. Description: An embolus blocking the pulmonary artery and disrupting blood flow to 1 or more lobes of the lung
   B. Assessment
      1. Sudden dyspnea
      2. Sudden sharp chest or upper abdominal pain
      3. Cyanosis
      4. Tachycardia
      5. A drop in blood pressure
   C. Interventions
      1. Notify the surgeon immediately, because pulmonary embolism may be life-threatening and requires emergency action.
      2. Monitor vital signs.
      3. Administer oxygen, medications, and treatments as prescribed.

VI. Hemorrhage
   A. Description: The loss of a large amount of blood externally or internally in a short time period
   B. Assessment
      1. Restlessness
      2. Weak and rapid pulse
      3. Hypotension
      4. Tachypnea
      5. Cool, clammy skin
      6. Reduced urine output
   C. Interventions
      1. Provide pressure to the site of bleeding.
      2. Notify the surgeon.
      3. Administer oxygen, as prescribed.
      4. Administer IV fluids and blood, as prescribed.
      5. Prepare the client for a surgical procedure, if necessary.

VII. Shock
A. Description: Loss of circulatory fluid volume, which usually is caused by hemorrhage
B. Assessment: Similar to assessment findings in hemorrhage
C. Interventions
   1. If shock develops, elevate the legs.
   2. Notify the surgeon.
   3. Determine and treat the cause of shock.
   4. Administer oxygen, as prescribed.
   5. Monitor level of consciousness.
   6. Monitor vital signs for increased pulse or decreased blood pressure.
   7. Monitor intake and output.
   8. Assess color, temperature, turgor, and moisture of the skin and mucous membranes.
   9. Administer IV fluids, blood, and colloid solutions, as prescribed.

If the client had spinal anesthesia, do not elevate the legs any higher than placing them on the pillow; otherwise, the diaphragm muscles needed for effective breathing could be impaired.

VIII. Thrombophlebitis
A. Description
   1. Thrombophlebitis is an inflammation of a vein, often accompanied by clot formation.
   2. Veins in the legs are affected most commonly.
B. Assessment
   1. Vein inflammation
   2. Aching or cramping pain
   3. Vein feels hard and cord-like and is tender to touch.
   4. Elevated temperature
C. Interventions
   1. Monitor legs for swelling, inflammation, pain, tenderness, venous distention, and cyanosis; notify the surgeon if any of these signs are present.
   2. Elevate the extremity 30 degrees without allowing any pressure on the popliteal area.
   3. Encourage the use of antiembolism stockings as prescribed; remove stockings twice a day to wash and inspect the legs.
   4. Use a sequential compression device as prescribed (see Fig. 15-3).
   5. Perform passive range-of-motion exercises every 2 hours if the client is confined to bed rest.
6. Encourage early ambulation, as prescribed.
7. Do not allow the client to dangle the legs.
8. Instruct the client not to sit in 1 position for an extended period of time.
9. Administer anticoagulants such as heparin sodium or enoxaparin, as prescribed.

IX. Urinary Retention
A. Description
1. Urinary retention is an involuntary accumulation of urine in the bladder as a result of loss of muscle tone.
2. It is caused by the effects of anesthetics or opioid analgesics and appears 6 to 8 hours after surgery.

B. Assessment
1. Inability to void
2. Restlessness and diaphoresis
3. Lower abdominal pain
4. Distended bladder
5. Hypertension
6. On percussion, the bladder sounds like a drum.

C. Interventions
1. Monitor for voiding.
2. Assess for a distended bladder by palpation and bladder scanning if indicated.
3. Encourage ambulation when prescribed.
4. Encourage fluid intake unless contraindicated.
5. Assist the client to void by helping the client stand.
6. Provide privacy.
7. Pour warm water over the perineum or allow the client to hear running water to promote voiding.
8. Contact the surgeon and catheterize the client as prescribed after all noninvasive techniques have been attempted.

X. Constipation
A. Description
1. Constipation is an abnormal infrequent passage of stool.
2. When the client resumes a solid diet postoperatively, failure to pass stool within 48 hours may indicate constipation.

B. Assessment
1. Absence of bowel movements
2. Abdominal distention
3. Anorexia, headache, and nausea

C. Interventions
1. Assess bowel sounds.
2. Encourage fluid intake up to 3000 mL/day unless contraindicated.
3. Encourage early ambulation.
4. Encourage consumption of fiber foods unless contraindicated.
5. Provide privacy and adequate time for bowel elimination.
6. Administer stool softeners and laxatives, as prescribed.

XI. Paralytic Ileus
A. Description
1. Paralytic ileus is failure of appropriate forward movement of bowel contents.
2. The condition may occur as a result of anesthetic medications or of manipulation of the bowel during the surgical procedure.

B. Assessment
1. Vomiting postoperatively
2. Abdominal distention
3. Absence of bowel sounds, bowel movement, or flatus

C. Interventions
1. Monitor intake and output.
2. Maintain NPO status until bowel sounds return.
3. Maintain patency of a nasogastric tube if in place; assess patency and drainage per agency procedure.
4. Encourage ambulation.
5. Administer IV fluids or parenteral nutrition, as prescribed.
6. Administer medications as prescribed to increase gastrointestinal motility and secretions.
7. If ileus occurs, it is treated first nonsurgically with bowel decompression by insertion of a nasogastric tube attached to intermittent or constant suction.

Vomiting postoperatively, abdominal distention, and absence of bowel sounds may be signs of paralytic ileus.

XII. Wound Infection
A. Description
1. Wound infection may be caused by poor aseptic
technique or a contaminated wound before surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk.

2. Infection usually occurs 3 to 6 days after surgery.  
3. Purulent material may exit from the drains or separated wound edges.

B. Assessment

1. Fever and chills  
2. Warm, tender, painful, and inflamed incision site  
3. Edematous skin at the incision and tight skin sutures  
4. Elevated white blood cell count

C. Interventions

1. Monitor temperature.  
2. Monitor incision site for approximation of suture line, edema, or bleeding and signs of infection (REEDA: redness, erythema, ecchymosis, drainage, approximation of the wound edges); notify the surgeon if signs of wound infection are present.  
3. Maintain patency of drains, and assess drainage amount, color, and consistency.  
4. Maintain asepsis, change the dressing, and perform wound irrigation, if prescribed (Box 15-6).  
5. Anticipate prescriptions for wound culture and blood culture if infection is suspected.  
6. Administer antibiotics, as prescribed.

XIII. Wound Dehiscence and Evisceration (Fig. 15-5)

A. Description

1. Wound dehiscence is separation of the wound edges at the suture line; it usually occurs 6 to 8 days after surgery.  
2. Wound evisceration is protrusion of the internal organs through an incision; it usually occurs 6 to 8 days after surgery.  
3. Dehiscence and evisceration is most common among obese clients, clients who have had abdominal surgery, or those who have poor wound-healing ability.  
4. Wound evisceration is an emergency.

B. Assessment: Dehiscence

1. Increased drainage  
2. Opened wound edges  
3. Appearance of underlying tissues through the wound
C. Assessment: Evisceration
   1. Discharge of serosanguineous fluid from a previously dry wound
   2. The appearance of loops of bowel or other abdominal contents through the wound
   3. Client reports feeling a popping sensation after coughing or turning.

D. Interventions (see Priority Nursing Actions)

Priority Nursing Actions

<table>
<thead>
<tr>
<th>Evisceration in a Wound</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Call for help; ask that the surgeon be notified and that needed supplies be brought to the client’s room.</td>
</tr>
<tr>
<td>2. Stay with the client.</td>
</tr>
<tr>
<td>3. While waiting for supplies to arrive, place the client in a low-Fowler’s position with the knees bent.</td>
</tr>
<tr>
<td>4. Cover the wound with a sterile normal saline dressing and keep the dressing moist.</td>
</tr>
<tr>
<td>5. Take vital signs and monitor the client closely for signs of shock.</td>

XIV. Ambulatory Care or 1-Day Stay Surgical Units

A. General criteria for client discharge
   1. Is alert and oriented.
   2. Vital signs at baseline.
   3. Laboratory values (if prescribed) within normal limits.
   4. Has voided.
   5. Has no respiratory distress.
   6. Is able to ambulate, swallow, and cough.
   7. Has minimal pain.
   8. Is not vomiting.
   9. Has minimal, if any, bleeding from the incision site with absence of purulent drainage.
   10. Has a responsible adult available to drive the client home.
   11. Discharge is appropriate and safe for client (i.e., to home or facility).
   12. The surgeon has signed a release form.

B. Discharge teaching (Box 15-7)
   1. Discharge teaching should be performed before the date of the scheduled procedure.
2. Provide written instructions to the client and family regarding the specifics of care.
3. Instruct the client and family about postoperative complications that can occur.
4. Provide appropriate resources for home care support.
5. Instruct the client not to drive, make important decisions, or sign any legal documents for 24 hours after receiving general anesthesia.
6. Instruct the client to call the surgeon, ambulatory center, or emergency department if postoperative problems occur.
7. Instruct the client to keep follow-up appointments with the surgeon.

**Box 15-1**

**Client Teaching**

**Deep-Breathing and Coughing Exercises**

Instruct the client that a sitting position gives the best lung expansion for coughing and deep-breathing exercises.
Instruct the client to breathe deeply 3 times, inhaling through the nostrils and exhaling slowly through pursed lips.
Instruct the client that the third breath should be held for 3 seconds; then the client should cough deeply 3 times.
The client should perform this exercise every 1 to 2 hours.

**Incentive Spirometry**

Instruct the client to assume a sitting or upright position.
Instruct the client to place the mouth tightly around the mouthpiece.
Instruct the client to inhale slowly to raise and maintain the flow rate indicator, on the device as prescribed.
Instruct the client to hold the breath for 5 seconds and then to exhale through pursed lips.
Instruct the client to repeat this process 10 times every hour.

**Leg and Foot Exercises**

Gastrocnemius (calf) pumping: Instruct the client to move both ankles by pointing the toes up and then down.
Quadriceps (thigh) setting: Instruct the client to press the back of the knees against the bed and then to relax the knees; this contracts and relaxes the thigh and calf muscles to prevent thrombus formation.
Foot circles: Instruct the client to rotate each foot in a circle.
Hip and knee movements: Instruct the client to flex the knee and thigh and to straighten the leg, holding the position for 5 seconds before lowering (not performed if the client is having abdominal surgery or if the client has a back problem).

**Splinting the Incision**

If the surgical incision is abdominal or thoracic, instruct the client to place a pillow, or 1 hand with the other hand on top, over the incisional area. During deep breathing and coughing, the client presses gently against the incisional area to splint or support it.
Essential

Gastrocnemius (calf) pumping

Quadriiceps (thigh) setting

Desirable

Foot circles

Hip and knee movements
Box 15-2

Cultural Aspects of Perioperative Nursing Care

- Primary language spoken
- Feelings related to surgery and pain
- Pain management
- Expectations
- Support systems
- Feelings toward self
- Cultural practices and beliefs
- Allow a family member to be present if appropriate.
- Secure the help of a professional interpreter to communicate with non-English-
speaking clients.

- Use pictures or phrase cards to communicate and assess the non–English-speaking client’s perception of pain or other feelings.
- Provide preoperative and postoperative educational materials in the appropriate language.

Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby

**Box 15-3**

**Medical Problems That Increase Risk During Surgery**

- Bleeding disorders such as thrombocytopenia or hemophilia
- Diabetes mellitus
- Chronic pain
- Heart disease, such as a recent myocardial infarction, dysrhythmia, heart failure, or peripheral vascular disease
- Obstructive sleep apnea
- Upper respiratory infection
- Liver disease
- Fever
- Chronic respiratory disease, such as emphysema, bronchitis, or asthma
- Immunological disorders, such as leukemia, infection with human immunodeficiency virus, acquired immunodeficiency syndrome, bone marrow depression, or use of chemotherapy or immunosuppressive agents
- Abuse of street drugs

**Box 15-4**

**Substances That Can Affect the Client in Surgery**

**Antibiotics**

Antibiotics potentiate the action of anesthetic agents.

**Anticholinergics**

Medications with anticholinergic effects increase the potential for confusion, tachycardia, and intestinal hypotonicity and hypomotility.
Anticoagulants, Antiplatelets, and Thrombolytics
These medications alter normal clotting factors and increase the risk of hemorrhaging.
- Acetylsalicylic acid (aspirin), clopidogrel, and nonsteroidal antiinflammatory drugs are commonly used medications that can alter platelet aggregation.
- These medications should be discontinued at least 48 hours before surgery or as specified by the surgeon; clopidogrel usually has to be discontinued 5 days before surgery.

Anticonvulsants
Long-term use of certain anticonvulsants can alter the metabolism of anesthetic agents.

Antidepressants
Antidepressants may lower the blood pressure during anesthesia.

Antidyssrhythmics
Antidyssrhythmic medications reduce cardiac contractility and impair cardiac conduction during anesthesia.

Antihypertensives
Antihypertensive medications can interact with anesthetic agents and cause bradycardia, hypotension, and impaired circulation.

Corticosteroids
Corticosteroids cause adrenal atrophy and reduce the ability of the body to withstand stress.
- Before and during surgery, dosages may be increased temporarily.

Diuretics
Diuretics potentiate electrolyte imbalances after surgery.

Herbal Substances
Herbal substances can interact with anesthesia and cause a variety of adverse effects. These substances may need to be stopped at a specific time before surgery. During the preoperative period, the client needs to be asked if he or she is taking an herbal substance.

Insulin
The need for insulin after surgery in a diabetic may be reduced because the client’s nutritional intake is decreased, or the need for insulin may be increased because of the stress response and intravenous administration of glucose solutions.

Box 15-5

Postoperative Complications

- Pneumonia and atelectasis
- Hypoxemia
- Pulmonary embolism
- Hemorrhage
- Shock
- Thrombophlebitis
- Urinary retention
- Constipation
- Paralytic ileus
- Wound infection
- Wound dehiscence
- Wound evisceration

Box 15-6
Procedure for Sterile Dressing Change and Wound Irrigation*

- Verify the prescription for the procedure in the medical record.
- Anticipate supplies that will be needed and gather supplies, including personal protective equipment (PPE) and additional equipment needed for protection (i.e., gown, face shield, clean and sterile gloves), a sterile dressing change kit if available, and any anticipated additional supplies such as gauze pads, drain sponges, cotton-tipped applicators, tape, an abdominal pad, a measuring tool, syringe for irrigation, irrigation basin, extra pair of sterile gloves, and underpad.
- Introduce self to client, identify the client with 2 accepted identifiers and compare against the medical record, provide privacy, and explain the
procedure.

- Assess the client’s pain level using an appropriate pain scale and medicate as necessary.
- Assess the client for allergies, particularly to tape or latex.
- Perform hand hygiene and don PPE.
- Position the client appropriately, apply clean gloves, and place the underpad underneath the client.
- Remove the soiled dressing, assess and characterize drainage noted on the dressing, and discard the removed dressing in the biohazard waste; note: if a moist-to-dry dressing adheres to the wound, gently free the dressing and warn the client of the discomfort; if a dry dressing adheres to the wound that is not to be debrided, moisten the dressing with normal saline and remove.
- Assess the wound and periwound for size (length, width, depth; measure using measuring tool), appearance, color, drainage, edema, approximation, granulation tissue, presence and condition of drains, and odor; and palpate edges for tenderness or pain.
- Cover the wound with sterile gauze by opening a sterile gauze pack and lightly placing the gauze on the wound without touching the dressing material; remove gloves and perform hand hygiene.
- Set up the sterile field: prepare sterile equipment using sterile technique on an overbed table. If irrigation is prescribed, pour any prescribed irrigation solution into a sterile basin and draw solution into the irrigating syringe. Gently irrigate the wound with the prescribed solution from the least contaminated area to the most contaminated area. Use an approved irrigation basin to collect solution from the irrigating procedure.
- Cleanse the wound with sterile gauze from the least contaminated area to the most contaminated area, using single-stroke motions. Discard the gauze from each stroke and use a new one for the next stroke. If drains are present, use cotton-tipped applicators to hold drains up and clean around drain sites using circular strokes, starting near the drain and moving outward from the insertion site using cotton-tipped applicators or sterile gauze. Dry sites in the same manner using sterile gauze.
- Apply any prescribed wound antiseptic with a cotton-tipped applicator or sterile gauze, using the same technique as when cleansing the wound.
- Dress the wound with the prescribed dressings using sterile technique and secure in place.
- Date/time/initial the dressing and discard supplies as indicated per agency procedures, and remove gloves.
- Assist the client to a comfortable position and ensure safety; assess pain level.
- Document the procedure, any related assessments, client response, and any additional procedural responses.

Adapted from Perry A, Potter P, Ostendorf W: Clinical nursing skills and techniques, ed 8, St. Louis, 2014, Mosby.
*Note: Adapt procedure if irrigation is not prescribed or if the client does not have drains or tubes in place. Always follow agency procedures for dressing changes and wound irrigations.

Box 15-7

Postoperative Discharge Teaching

- Assess the client’s readiness to learn, educational level, and desire to change or modify lifestyle.
- Assess the need for resources needed for home care.
- Demonstrate care of the incision and how to change the dressing.
- Instruct the client to cover the incision with plastic if showering is allowed.
- Ensure that the client is provided with a 48-hour supply of dressings per agency procedure, for home use.
- Instruct the client on the importance of returning to the surgeon’s office for follow-up.

FIG. 15-5 Complications of wound healing.
• Instruct the client that sutures usually are removed in the surgeon’s office 7 to 10 days after surgery.
• Inform the client that staples are removed 7 to 14 days after surgery and that the skin may become slightly reddened when staples are ready to be removed.
• Sterile adhesive strips (e.g., Steri-Strips®) may be applied to provide extra support after the sutures are removed.
• Instruct the client on the use of medications, their purpose, dosages, administration, and side effects or adverse effects.
• Instruct the client on diet and to drink 6 to 8 glasses of liquid a day unless contraindicated.
• Instruct the client about activity levels and to resume normal activities gradually.
• Instruct the client to avoid lifting for 6 weeks if a major surgical procedure was performed.
• Instruct the client with an abdominal incision not to lift anything weighing 10 pounds or more and not to engage in any activities that involve pushing or pulling.
• The client usually can return to work in 6 to 8 weeks depending on the procedure and as prescribed by the surgeon.
• Instruct the client about the signs and symptoms of complications and when to call the surgeon.

Practice Questions

126. The nurse has just reassessed the condition of a postoperative client who was admitted 1 hour ago to the surgical unit. The nurse plans to monitor which parameter most carefully during the next hour?
   1. Urinary output of 20 mL/hr
   2. Temperature of 37.6°C (99.6°F)
   3. Blood pressure of 100/70 mm Hg
   4. Serous drainage on the surgical dressing

127. The nurse is teaching a client about coughing and deep-breathing techniques to prevent postoperative complications. Which statement is most appropriate for the nurse to make to the client at this time as it relates to these techniques?
   1. “Use of an incentive spirometer will help prevent pneumonia.”
   2. “Close monitoring of your oxygen saturation will detect hypoxemia.”
   3. “Administration of intravenous fluids will prevent or treat fluid imbalance.”
   4. “Early ambulation and administration of blood thinners will prevent pulmonary embolism.”

128. The nurse is creating a plan of care for a client scheduled for surgery. The nurse should include which activity in the nursing care plan for the client on the day of surgery?
1. Avoid oral hygiene and rinsing with mouthwash.
2. Verify that the client has not eaten for the last 24 hours.
3. Have the client void immediately before going into surgery.
4. Report immediately any slight increase in blood pressure or pulse.

129. A client with a gastric ulcer is scheduled for surgery. The client cannot sign the operative consent form because of sedation from opioid analgesics that have been administered. The nurse should take which **most appropriate** action in the care of this client?

1. Obtain a court order for the surgery.
2. Have the charge nurse sign the informed consent immediately.
3. Send the client to surgery without the consent form being signed.
4. Obtain a telephone consent from a family member, following agency policy.

130. A preoperative client expresses anxiety to the nurse about upcoming surgery. Which response by the nurse is **most likely** to stimulate further discussion between the client and the nurse?

1. “If it’s any help, everyone is nervous before surgery.”
2. “I will be happy to explain the entire surgical procedure to you.”
3. “Can you share with me what you’ve been told about your surgery?”
4. “Let me tell you about the care you’ll receive after surgery and the amount of pain you can anticipate.”

131. The nurse is conducting preoperative teaching with a client about the use of an incentive spirometer. The nurse should include which piece of information in discussions with the client?

1. Inhale as rapidly as possible.
2. Keep a loose seal between the lips and the mouthpiece.
3. After maximum inspiration, hold the breath for 15 seconds and exhale.
4. The best results are achieved when sitting up or with the head of the bed elevated 45 to 90 degrees.

132. The nurse has conducted preoperative teaching for a client scheduled for surgery in 1 week. The client has a history of arthritis and has been taking acetylsalicylic acid. The nurse determines that the client **needs additional teaching** if the client makes which statement?

1. “Aspirin can cause bleeding after surgery.”
2. “Aspirin can cause my ability to clot blood to be abnormal.”
3. “I need to continue to take the aspirin until the day of surgery.”
4. “I need to check with my doctor about the need to stop the aspirin before the scheduled surgery.”

133. The nurse assesses a client’s surgical incision for signs of infection. Which finding by the nurse would be interpreted as a normal finding at the surgical site?

1. Red, hard skin
2. Serous drainage
3. Purulent drainage
4. Warm, tender skin

134. The nurse is monitoring the status of a postoperative client in the immediate
postoperative period. The nurse would become most concerned with which sign that could indicate an evolving complication?

1. Increasing restlessness
2. A pulse of 86 beats per minute
3. Blood pressure of 110/70 mm Hg
4. Hypoactive bowel sounds in all 4 quadrants

135. A client who has had abdominal surgery complains of feeling as though “something gave way” in the incisional site. The nurse removes the dressing and notes the presence of a loop of bowel protruding through the incision. Which interventions should the nurse take? Select all that apply.

- [ ] 1. Contact the surgeon.
- [ ] 2. Instruct the client to remain quiet.
- [ ] 3. Prepare the client for wound closure.
- [ ] 4. Document the findings and actions taken.
- [ ] 5. Place a sterile saline dressing and ice packs over the wound.
- [ ] 6. Place the client in a supine position without a pillow under the head.

136. A client who has undergone preadmission testing has had blood drawn for serum laboratory studies, including a complete blood count, coagulation studies, and electrolytes and creatinine levels. Which laboratory result should be reported to the surgeon’s office by the nurse, knowing that it could cause surgery to be postponed?

1. Hemoglobin, 8.0 g/dL (80 mmol/L)
2. Sodium, 145 mEq/L (145 mmol/L)
3. Serum creatinine, 0.8 mg/dL (70.6 mcmol/L)
4. Platelets, 210,000 cells/mm$^3$ (210 × 10$^9$/L)

137. The nurse receives a telephone call from the postanesthesia care unit stating that a client is being transferred to the surgical unit. The nurse plans to take which action first on arrival of the client?

1. Assess the patency of the airway.
2. Check tubes or drains for patency.
3. Check the dressing to assess for bleeding.
4. Assess the vital signs to compare with preoperative measurements.

138. The nurse is reviewing a surgeon’s prescription sheet for a preoperative client that states that the client must be nothing by mouth (NPO) after midnight. The nurse should call the surgeon to clarify that which medication should be given to the client and not withheld?

1. Prednisone
2. Ferrous sulfate
3. Cyclobenzaprine
4. Conjugated estrogen
Answers

126. Answer: 1

**Rationale:** Urine output should be maintained at a minimum of 30 mL/hr for an adult. An output of less than 30 mL for 2 consecutive hours should be reported to the surgeon. A temperature higher than 37.7°C (100°F) or lower than 36.1°C (97°F) and a falling systolic blood pressure, lower than 90 mm Hg, are usually considered reportable immediately. The client’s preoperative or baseline blood pressure is used to make informed postoperative comparisons. Moderate or light serous drainage from the surgical site is considered normal.

**Test-Taking Strategy:** Note the strategic word, *most*. Focus on the subject, expected postoperative assessment findings. To answer this question correctly, you must know the normal ranges for temperature, blood pressure, urinary output, and wound drainage. Note that the urinary output is the only observation that is not within the normal range.

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Foundations of Care: Perioperative Care

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Perfusion

127. Answer: 1

**Rationale:** Postoperative respiratory problems are atelectasis, pneumonia, and pulmonary emboli. Pneumonia is the inflammation of lung tissue that causes productive cough, dyspnea, and lung crackles and can be caused by retained pulmonary secretions. Use of an incentive spirometer helps prevent pneumonia and atelectasis. Hypoxemia is an inadequate concentration of oxygen in arterial blood. While close monitoring of the oxygen saturation will help detect hypoxemia, monitoring is not directly related to coughing and deep-breathing techniques. Fluid imbalance can be a deficit or excess related to fluid loss or overload, and surgical clients are often given intravenous fluids to prevent a deficit; however, this is not related to coughing and deep breathing. Pulmonary embolus occurs as a result of a blockage of the pulmonary artery that disrupts blood flow to 1 or more lobes of the lung; this is usually due to clot formation. Early ambulation and administration of blood thinners helps prevent this complication; however, it is not related to coughing and deep-breathing techniques.

**Test-Taking Strategy:** Note the strategic words, *most appropriate*. Focus on the subject, client instructions related to coughing and deep-breathing techniques. Also, focus on the data in the question and note the relationship between the words *coughing* and *deep-breathing* in the question and *pneumonia* in the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning
**Rationale:** The nurse would assist the client to void immediately before surgery so that the bladder will be empty. Oral hygiene is allowed, but the client should not swallow any water. The client usually has a restriction of food and fluids for 6 to 8 hours (or longer as prescribed) before surgery instead of 24 hours. A slight increase in blood pressure and pulse is common during the preoperative period and is usually the result of anxiety.

**Test-Taking Strategy:** Focus on the subject, preoperative care measures. Think about the measures that may be helpful and promote comfort. Oral hygiene should be administered, since it may make the client feel more comfortable. A client should be nothing by mouth (NPO) for 6 to 8 hours before surgery rather than 24 hours. A slight increase in blood pressure or pulse is insignificant in this situation.

**Level of Cognitive Ability:** Creating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Foundations of Care: Perioperative Care

**Health Problem:** N/A

**Reference:** Ignatavicius, Workman, Rebar (2018), pp. 244, 281.

128. **Answer:** 3

Every effort should be made to obtain permission from a responsible family member to perform surgery if the client is unable to sign the consent form. A telephone consent must be witnessed by 2 persons who hear the family member’s oral consent. The 2 witnesses then sign the consent with the name of the family member, noting that an oral consent was obtained. Consent is not informed if it is obtained from a client who is confused, unconscious, mentally incompetent, or under the influence of sedatives. In an emergency, a client may be unable to sign and family members may not be available. In this situation, a surgeon is permitted legally to perform surgery without consent, but the data in the question do not indicate an emergency. Options 1, 2, and 3 are not appropriate in this situation. Also, agency policies regarding informed consent should always be followed.

**Test-Taking Strategy:** Note the strategic words, most appropriate. Focus on the data in the question. Eliminate options 1 and 3 first. Option 1 will delay necessary surgery, and option 3 is inappropriate. Option 2 is not an acceptable and legal role of a charge nurse. Select option 4, since it is the only legally acceptable option: to obtain a telephone permission from a family member if it is witnessed by 2 persons.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation
130. **Answer:** 3

**Rationale:** Explanations should begin with the information that the client knows. By providing the client with individualized explanations of care and procedures, the nurse can assist the client in handling anxiety and fear for a smooth preoperative experience. Clients who are calm and emotionally prepared for surgery withstand anesthesia better and experience fewer postoperative complications. Option 1 does not focus on the client’s anxiety. Explaining the entire surgical procedure may increase the client’s anxiety. Option 4 avoids the client’s anxiety and is focused on postoperative care.

**Test-Taking Strategy:** Note that the client expresses anxiety. Use therapeutic communication techniques. Note that the question contains strategic words, most likely, and also note the words stimulate further discussion. Also use the steps of the nursing process. The correct option addresses assessment and is the only therapeutic response.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Communication and Documentation

**Content Area:** Foundations of Care: Perioperative Care

**Health Problem:** Mental Health: Therapeutic Communication

**Priority Concepts:** Anxiety; Communication

131. **Answer:** 4

**Rationale:** For optimal lung expansion with the incentive spirometer, the client should assume the semi-Fowler’s or high-Fowler’s position. The mouthpiece should be covered completely and tightly while the client inhales slowly, with a constant flow through the unit. The breath should be held for 5 seconds before exhaling slowly.

**Test-Taking Strategy:** Focus on the subject, correct use of an incentive spirometer, and visualize the procedure. Note the words rapidly, loose, and 15 seconds in the incorrect options. Options 1, 2, and 3 are incorrect steps regarding incentive spirometer use.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Skills: Perioperative Care

**Health Problem:** N/A

**Priority Concepts:** Client Education; Gas Exchange

**Reference:** Ignatavicius, Workman, Rebar (2018), pp. 243-244.
132. **Answer: 3**

**Rationale:** Antiplatelets alter normal clotting factors and increase the risk of bleeding after surgery. Aspirin has properties that can alter platelet aggregation and should be discontinued at least 48 hours before surgery. However, the client should always check with his or her surgeon regarding when to stop taking the aspirin when a surgical procedure is scheduled. Options 1, 2, and 4 are accurate client statements.

**Test-Taking Strategy:** Note the strategic words, *needs additional teaching*. These words indicate a negative event query and that you need to select the incorrect client statement. Eliminate options 1 and 2 first because they are comparable or alike. From the remaining options, recalling that aspirin has properties that can alter platelet aggregation will direct you to the correct option.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Foundations of Care: Perioperative Care

**Health Problem:** Adult Health: Musculoskeletal: Rheumatoid Arthritis and Osteoarthritis

**Priority Concepts:** Client Education; Clotting

133. **Answer: 2**

**Rationale:** Serous drainage is an expected finding at a surgical site. The other options indicate signs of wound infection. Signs and symptoms of infection include warm, red, and tender skin around the incision. Wound infection usually appears 3 to 6 days after surgery. The client also may have a fever and chills. Purulent material may exit from drains or from separated wound edges. Infection may be caused by poor aseptic technique or a contaminated wound before surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk.

**Test-Taking Strategy:** Focus on the subject, normal findings in the postoperative period. Eliminate options 1, 3, and 4 because they are comparable or alike and are manifestations of infection.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Foundations of Care: Perioperative Care

**Health Problem:** Adult Health: Integumentary: Wounds

**Priority Concepts:** Infection; Tissue Integrity

134. **Answer: 1**

**Rationale:** Increasing restlessness is a sign that requires continuous and close monitoring because it could indicate a potential complication such as hemorrhage,
shock, or pulmonary embolism. A blood pressure of 110/70 mm Hg with a pulse of 86 beats per minute is within normal limits. Hypoactive bowel sounds heard in all 4 quadrants are a normal occurrence in the immediate postoperative period.

**Test-Taking Strategy:** Note the **strategic word**, most. Focus on the **subject**, a manifestation of an evolving complication in the immediate postoperative period. Eliminate each of the incorrect options because they are **comparable or alike** and are normal expected findings, especially given the time frame noted in the question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Foundations of Care: Perioperative Care

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Lewis et al. (2017), p. 331.

135. **Answer:** 1, 2, 3, 4

**Rationale:** Wound dehiscence is the separation of the wound edges. Wound evisceration is protrusion of the internal organs through an incision. If wound dehiscence or evisceration occurs, the nurse should call for help, stay with the client, and ask another nurse to contact the surgeon and obtain needed supplies to care for the client. The nurse places the client in a low-Fowler’s position, and the client is kept quiet and instructed not to cough. Protruding organs are covered with a sterile saline dressing. Ice is not applied because of its vasoconstrictive effect. The treatment for evisceration is usually immediate wound closure under local or general anesthesia. The nurse also documents the findings and actions taken.

**Test-Taking Strategy:** Focus on the **subject**, that the client is experiencing wound evisceration. Visualizing this occurrence will assist you in determining that the client would not be placed supine and that ice packs would not be placed on the incision.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Skills: Perioperative Care

**Health Problem:** Adult Health: Integumentary: Wounds

**Priority Concepts:** Clinical Judgment; Tissue Integrity

136. **Answer:** 1

**Rationale:** Routine screening tests include a complete blood count, serum electrolyte analysis, coagulation studies, and a serum creatinine test. The complete blood count includes the hemoglobin analysis. All of these values are within normal range except for hemoglobin. If a client has a low hemoglobin level, the surgery likely could be postponed by the surgeon.

**Test-Taking Strategy:** Focus on the **subject**, an abnormal laboratory result that needs to be reported. Use knowledge of the normal reference intervals to assist in answering correctly. The hemoglobin value is the only abnormal laboratory finding.
Rationale: The first action of the nurse is to assess the patency of the airway and respiratory function. If the airway is not patent, the nurse must take immediate measures for the survival of the client. The nurse then takes vital signs followed by checking the dressing and the tubes or drains. The other nursing actions should be performed after a patent airway has been established.

Test-Taking Strategy: Note the strategic word, first. Use the principles of prioritization to answer this question. Use the ABCs—airway, breathing, and circulation. Ensuring airway patency is the first action to be taken, directing you to the correct option.

Rationale: Prednisone is a corticosteroid. With prolonged use, corticosteroids cause adrenal atrophy, which reduces the ability of the body to withstand stress. When stress is severe, corticosteroids are essential to life. Before and during surgery, dosages may be increased temporarily and may be given parenterally rather than orally. Ferrous sulfate is an oral iron preparation used to treat iron deficiency anemia. Cyclobenzaprine is a skeletal muscle relaxant. Conjugated estrogen is an estrogen used for hormone replacement therapy in postmenopausal women. These last 3 medications may be withheld before surgery without undue effects on the client.

Test-Taking Strategy: Focus on the subject, the medication that should be administered in the preoperative period. Use knowledge about medications that may have special implications for the surgical client. Prednisone is a corticosteroid. Recall that when stress is severe, such as with surgery, corticosteroids are essential to life.
Health Problem: N/A  
Priority Concepts: Clinical Judgment; Collaboration  
I. Guidelines for Positioning
   A. Client safety and comfort
      1. Position client in a safe and appropriate manner to provide safety and comfort.
      2. Select a position that will prevent the development of complications related to an existing condition, prescribed treatment, or medical or surgical procedure.

   B. Ergonomic principles related to body mechanics (Box 16-1)

II. Positions to Ensure Safety and Comfort
   A. Integumentary system
      1. Autograft: After surgery, the site is immobilized usually for 3 to 7 days, or as prescribed, to provide the time needed for the graft to adhere and attach to the wound bed.
      2. Burns of the face and head: Elevate the head of the bed to prevent or reduce facial, head, and tracheal edema.
      3. Circumferential burns of the extremities: Elevate the extremities above the level of the heart to prevent or reduce dependent edema.
4. Skin graft: Elevate and immobilize the graft site to prevent movement and shearing of the graft and disruption of tissue; avoid weight-bearing.

B. Reproductive system
   1. Mastectomy
      a. Position the client with the head of the bed elevated at least 30 degrees (semi-Fowler’s position), with the affected arm elevated on a pillow to promote lymphatic fluid return after the removal of axillary lymph nodes.
      b. Turn the client only to the back and unaffected side.

   2. Perineal and vaginal procedures: Place the client in the lithotomy position.

C. Endocrine system
   1. Hypophysectomy: Elevate the head of the bed to prevent increased intracranial pressure.
   2. Thyroidectomy
      a. Place the client in the semi-Fowler’s to Fowler’s position to reduce swelling and edema in the neck area.
      b. Sandbags or pillows or other stabilization devices may be used to support the client’s head or neck.
      c. Avoid neck extension to decrease tension on the suture line.

D. Gastrointestinal system
   1. Hemorrhoidectomy: Assist the client to a lateral (side-lying) position to prevent pain and bleeding.
   2. Gastroesophageal reflux disease: Reverse Trendelenburg’s position may be prescribed to promote gastric emptying and prevent esophageal reflux.
   3. Liver biopsy (see Priority Nursing Actions)

Priority nursing actions

Liver Biopsy
1. Explain the procedure to the client.
2. Ensure that informed consent has been obtained.
3. Position the client supine, with the right side of the upper abdomen exposed; the client’s right arm is raised and extended behind the head and over the left shoulder.
4. Remain with the client during the procedure.
5. After the procedure, assist the client into a right lateral (side-lying) position and place a small pillow or folded towel under the puncture site.
6. Monitor vital signs closely after the procedure and monitor for signs of bleeding.
7. Document appropriate information about the procedure, client’s tolerance, and postprocedure assessment findings.

Reference
Lewis et al. (2017), p. 850.

4. Paracentesis: Client is usually positioned in a semi-Fowler’s position in bed, or sitting upright on the side of the bed or in a chair with the feet supported; client is assisted to a position of comfort after the procedure.

5. Nasogastric tube
   a. Insertion: Position the client in a **high-Fowler’s position** with the head titled forward; this position will help close the trachea and open the esophagus.
   b. Irrigation and tube feedings: Elevate the head of the bed (semi-Fowler’s to Fowler’s position) to prevent aspiration; head elevation is maintained for 30 minutes to 1 hour (per agency procedure) after an intermittent feeding and should remain elevated for continuous feedings.

   ![If the client receiving a continuous tube feeding needs to be placed in a supine position when providing care, such as when giving a bed bath or changing linens, shut off the feeding to prevent aspiration. Remember to turn the feeding back on and check the rate of flow when the client is placed back into the semi-Fowler’s or Fowler’s position.]

6. Rectal enema and irrigations: Place the client in the left **Sims’ position** to allow the solution to flow by gravity in the natural direction of the colon.

7. Sengstaken-Blakemore and Minnesota tubes
   a. Not commonly used because they are uncomfortable for the client and can cause complications, but their use may be necessary when other interventions are not feasible.
   b. If prescribed, maintain elevation of the
head of the bed to enhance lung expansion and reduce portal blood flow, permitting effective esophagogastric balloon tamponade.

E. Respiratory system

1. Chronic obstructive pulmonary disease: In advanced disease, place the client in a sitting position, leaning forward, with the client’s arms over several pillows or an overbed table; this position will assist the client to breathe easier.

2. Laryngectomy (radical neck dissection): Place the client in a semi-Fowler’s or Fowler’s position to maintain a patent airway and minimize edema.

3. Bronchoscopy postprocedure: Place the client in a semi-Fowler’s position to prevent choking or vaspiration resulting from an impaired ability to swallow.

4. Postural drainage: The lung segment to be drained should be in the uppermost position; **Trendelenburg’s position** may be used.

5. Thoracentesis
   a. During the procedure, to facilitate removal of fluid from the pleural space, position the client sitting on the edge of the bed or examining table and leaning over a bedside table with the feet supported on a stool, or lying on the unaffected side with the client in Fowler’s position.
   b. After the procedure, assist the client to a position of comfort.

   **Always check the PHCP’s prescription regarding positioning for the client who had a thoracotomy, lung wedge resection, lobectomy of the lung, or pneumonectomy.**

F. Cardiovascular system

1. Abdominal aneurysm resection
   a. After surgery, limit elevation of the head of the bed to 45 degrees to avoid flexion of the graft.
   b. The client may be turned from side to side.

2. Amputation of the lower extremity
a. During the first 24 hours after amputation, elevate the foot of the bed (the residual limb is supported with pillows but not elevated because of the risk of flexion contractures) to reduce edema.

b. Consult with the PHCP and, if prescribed, position the client in a prone position twice a day for a 20- to 30-minute period to stretch muscles and prevent flexion contractures of the hip.

3. Arterial vascular grafting of an extremity
a. To promote graft patency after the procedure, bed rest usually is maintained for approximately 24 hours, and the affected extremity is kept straight.

b. Limit movement and avoid flexion of the hip and knee.

4. Cardiac catheterization
a. If the femoral vessel was accessed for the procedure, the client is maintained on bed rest for 4 to 6 hours (time for bed rest may vary depending on PHCP preference and if a vascular closure device was used); the client may turn from side to side.

b. The affected extremity is kept straight and the head is elevated no more than 30 degrees (some PHCPs prefer a lower head position or the flat position) until hemostasis is adequately achieved.

5. Heart failure and pulmonary edema: Position the client upright, preferably with the legs dangling over the side of the bed, to decrease venous return and lung congestion.

Most often, clients with respiratory and cardiac disorders should be positioned with the head of the bed elevated.

6. Peripheral arterial disease
a. Obtain the PHCP’s prescription for positioning.
b. Because swelling can prevent arterial blood flow, clients may be advised to elevate their feet at rest, but they should not raise their legs above the level of the heart, because extreme elevation slows arterial blood flow; some clients may be advised to maintain a slightly dependent position to promote perfusion.

7. Deep vein thrombosis

a. If the extremity is red, edematous, and painful, traditional heparin sodium therapy may be initiated. Bed rest with leg elevation may also be prescribed for the client.
b. Clients receiving low-molecular-weight heparin usually can be out of bed after 24 hours if pain level permits.

8. Varicose veins: Leg elevation above heart level usually is prescribed; the client also is advised to minimize prolonged sitting or standing during daily activities.

9. Venous insufficiency and leg ulcers: Leg elevation usually is prescribed.

G. Sensory system

1. Cataract surgery: Postoperatively, elevate the head of the bed (semi-Fowler’s to Fowler’s position) and position the client on the back or the nonoperative side to prevent the development of edema at the operative site.

2. Retinal detachment

a. If the detachment is large, bed rest and bilateral eye patching may be prescribed to minimize eye movement and prevent extension of the detachment.
b. Restrictions in activity and positioning after repair of the detachment depends on the PHCP’s preference and the surgical procedure performed.

H. Neurological system

1. Autonomic dysreflexia: Elevate the head of the
bed to a high-Fowler’s position to assist with adequate ventilation and assist in the prevention of hypertensive stroke.

If autonomic dysreflexia occurs, immediately place the client in a high-Fowler’s position.

2. Cerebral aneurysm: Bed rest is maintained with the head of the bed elevated 30 to 45 degrees to prevent pressure on the aneurysm site.

3. Cerebral angiography
   a. Maintain bed rest for the length of time as prescribed.
   b. The extremity into which the contrast medium was injected is kept straight and immobilized for about 6 to 8 hours.

4. Stroke (brain attack)
   a. In clients with hemorrhagic strokes, the head of the bed is usually elevated to 30 degrees to reduce intracranial pressure and to facilitate venous drainage.
   b. For clients with ischemic strokes, the head of the bed is usually kept flat.
   c. Maintain the head in a midline, neutral position to facilitate venous drainage from the head.
   d. Avoid extreme hip and neck flexion; extreme hip flexion may increase intrathoracic pressure, whereas extreme neck flexion prohibits venous drainage from the brain.

5. Craniotomy
   a. The client should not be positioned on the site that was operated on, especially if the bone flap has been removed, because the brain has no bony covering on the affected site.
   b. Elevate the head of the bed 30 to 45 degrees and maintain the head in a midline, neutral position to facilitate venous drainage from the head.
c. Avoid extreme hip and neck flexion.

6. Laminectomy and other vertebral surgery
   a. Clients are often out of bed postoperatively with a back brace if prescribed.
   b. When the client is out of bed, the client’s back is kept straight (the client is placed in a straight-backed chair) with the feet resting comfortably on the floor.

7. Increased intracranial pressure
   a. Elevate the head of the bed 30 to 45 degrees and maintain the head in a midline, neutral position to facilitate venous drainage from the head.
   b. Avoid extreme hip and neck flexion.

   Do not place a client with a head injury in a flat or Trendelenburg’s position because of the risk of increased intracranial pressure.

8. Lumbar puncture
   a. During the procedure, assist the client to the lateral (side-lying) position, with the back bowed at the edge of the examining table, the knees flexed up to the abdomen, and the neck flexed so that the chin is resting on the chest.
   b. After the procedure, place the client in the supine position for 4 to 12 hours, as prescribed.

9. Spinal cord injury
   a. Immobilize the client on a spinal backboard, with the head in a neutral position, to prevent incomplete injury from becoming complete.
   b. Prevent head flexion, rotation, or extension; the head is immobilized with a firm, padded cervical collar.
   c. Logroll the client; no part of the body should be twisted or turned, nor should the client be allowed to assume a sitting position.

I. Musculoskeletal system
   1. Total hip replacement
a. Positioning depends on the surgical techniques used (anterior or posterior approach), the method of implantation, the prosthesis, and surgeon’s preference.
b. Avoid extreme internal and external rotation.
c. Avoid adduction; in most cases side-lying is permitted as long as an abduction pillow is in place; some surgeons allow turning to only 1 side.
d. Maintain abduction when the client is in a supine position or positioned on the nonoperative side.
e. Place a wedge (abduction) pillow between the client’s legs to maintain abduction; instruct the client not to cross the legs
f. Check the PHCP’s prescriptions regarding elevation of the head of the bed and hip flexion.

2. Devices used to promote proper positioning (Box 16-2)
FIG. 16-1 Bed positions.

- Flat
- Trendelenburg’s
- Fowler’s
- Reverse Trendelenburg’s
- Semi-Fowler’s

FIG. 16-2 Lithotomy position for examination.
When planning to move a client, arrange for adequate help, including the use of
mechanical aids. Use mechanical aids if help is unavailable.

- Encourage the client to assist as much as possible.
- Keep the back, neck and pelvis, and feet aligned. Avoid twisting.
- Flex knees and keep feet wide apart.
- Raise the client’s bed so that the client’s weight is at the level of the nurse’s center of gravity.
- Position self close to the client (or object being lifted).
- Use arms and legs (not back).
- Slide client toward yourself, using a pull sheet. When transferring a client onto a stretcher, a slide board is more appropriate.
- Set (tighten) abdominal and gluteal muscles in preparation for the move.
- The person with the heaviest load coordinates efforts of the team involved by counting to 3.

---

**Box 16-2**

**Devices Used for Proper Positioning**

**Bed Boards**
These plywood boards are placed under the entire surface area of the mattress and are useful for increasing back support and body alignment. Many of the beds used in health care facilities have the capability of being adjusted to a softness or hardness desired for the mattress to meet the client’s needs.

**Foot Boots**
Foot boots are made of rigid plastic or heavy foam and keep the foot flexed at the proper angle. They should be removed 2 or 3 times a day to assess skin integrity and joint mobility by providing range of motion.

**Hand Rolls**
Hand rolls maintain the fingers in a slightly flexed and functional position and keep the thumb slightly adducted in opposition to the fingers.

**Hand-Wrist Splints**
These splints are individually molded for the client to maintain proper alignment of the thumb in slight adduction and the wrist in slight dorsiflexion.

**Pillows**
Pillows provide support, elevate body parts, splint incisional areas, and reduce postoperative pain during activity, coughing, or deep breathing. They should be of the appropriate size for the body part to be positioned.

**Sandbags**
Sandbags are soft devices filled with a substance that can be shaped to body contours to provide support. They immobilize extremities and maintain specific body alignment.

**Side Rails**
These bars, positioned along the sides of the length of the bed, ensure client safety and are useful for increasing mobility. They also provide assistance in rolling from side to side or sitting up in bed. Laws regarding the use of side rails vary state to state, and these laws must be followed; some states view side rails as a form of restraint, and therefore, laws and agency policies must be followed.

**Trapeze Bar**
This bar descends from a securely fastened overhead bar attached to the bed frame. It allows the client to use the upper extremities to raise the trunk off the bed, assists in transfer from the bed to a wheelchair, and helps the client to perform upper arm–strengthening exercises.

**Trochanter Rolls**
These rolls prevent external rotation of the legs when the client is in the supine position. To form a roll, use a cotton bath blanket or a sheet folded lengthwise to a width extending from the greater trochanter of the femur to the lower border of the popliteal space.

**Wedge Pillow**
This triangular pillow is made of heavy foam and is used to maintain the legs in abduction after total hip replacement surgery.

**Practice Questions**

139. A client is being prepared for a thoracentesis. The nurse should assist the client to which position for the procedure?
   1. Lying in bed on the affected side
   2. Lying in bed on the unaffected side
   3. Sims’ position with the head of the bed flat
   4. Prone with the head turned to the side and supported by a pillow

140. The nurse is caring for a client following a craniotomy, in which a large cancerous tumor was removed from the left side. In which position can the nurse safely place the client? **Refer to the figures in options 1 to 4.**

![Diagram of a bed with positioning options]
141. The nurse creates a plan of care for a client with deep vein thrombosis. Which client position or activity in the plan should be included?
   1. Out-of-bed activities as desired
   2. Bed rest with the affected extremity kept flat
   3. Bed rest with elevation of the affected extremity
   4. Bed rest with the affected extremity in a dependent position

142. The nurse is caring for a client who is 1 day postoperative for a total hip replacement. Which is the best position in which the nurse should place the client?
   1. Head elevated lying on the operative side
   2. On the nonoperative side with the legs abducted
   3. Side-lying with the affected leg internally rotated
   4. Side-lying with the affected leg externally rotated

143. The nurse is providing instructions to a client and the family regarding home care after right eye cataract removal. Which statement by the client would indicate an understanding of the instructions?
   1. “I should sleep on my left side.”
   2. “I should sleep on my right side.”
   3. “I should sleep with my head flat.”
   4. “I should not wear my glasses at any time.”

144. The nurse is administering a cleansing enema to a client with a fecal impaction. Before administering the enema, the nurse should place the client in which position?
   1. Left Sims’ position
   2. Right Sims’ position
   3. On the left side of the body, with the head of the bed elevated 45 degrees
   4. On the right side of the body, with the head of the bed elevated 45 degrees

145. A client has just returned to a nursing unit after an above-knee amputation of the right leg. The nurse should place the client in which position?
1. Prone
2. Reverse Trendelenburg’s
3. Supine, with the residual limb flat on the bed
4. Supine, with the residual limb supported with pillows

146. The nurse is caring for a client with a severe burn who is scheduled for an autograft to be placed on the lower extremity. The nurse creates a postoperative plan of care for the client and should include which intervention in the plan?
   1. Maintain the client in a prone position.
   2. Elevate and immobilize the grafted extremity.
   3. Maintain the grafted extremity in a flat position.
   4. Keep the grafted extremity covered with a blanket.

147. The nurse is preparing to care for a client who has returned to the nursing unit after cardiac catheterization performed through the femoral vessel. The nurse checks the primary health care provider’s (PHCP’s) prescription and plans to allow which client position or activity after the procedure?
   1. Bed rest in high-Fowler’s position
   2. Bed rest with bathroom privileges only
   3. Bed rest with head elevation at 60 degrees
   4. Bed rest with head elevation no greater than 30 degrees

148. The nurse is preparing to insert a nasogastric tube into a client. The nurse should place the client in which position for insertion?
   1. Right side
   2. Low-Fowler’s
   3. High-Fowler’s
   4. Supine with the head flat

**Answers**

139. **Answer:** 2

**Rationale:** To facilitate removal of fluid from the chest, the client is positioned sitting at the edge of the bed leaning over the bedside table, with the feet supported on a stool; or lying in bed on the unaffected side with the head of the bed elevated 30 to 45 degrees. The prone and Sims’ positions are inappropriate positions for this procedure.

**Test-Taking Strategy:** Focus on the subject, positioning for thoracentesis. To perform a thoracentesis safely, the site must be visible to the primary health care provider (PHCP) performing the procedure. The client should be placed in a position where he or she is as comfortable as possible with access to the affected side. A prone position would not give the PHCP access to the chest. Lying on the affected side would prevent access to the site.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Diagnostic Tests

**Health Problem:** N/A
**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Lewis et al. (2017), p. 471.

140. **Answer:** 1

**Rationale:** Clients who have undergone craniotomy should have the head of the bed elevated 30 to 45 degrees to promote venous drainage from the head. The client is positioned to avoid extreme hip or neck flexion and the head is maintained in a midline neutral position. The client should not be positioned on the site that was operated on, especially if the bone flap was removed, because the brain has no bony covering on the affected site. A flat position or Trendelenburg’s position would increase intracranial pressure. A reverse Trendelenburg’s position would not be helpful and may be uncomfortable for the client.

**Test-Taking Strategy:** Focus on the subject, positioning after craniotomy. Remember that a primary concern is the risk for increased intracranial pressure. Therefore, use concepts related to gravity and preventing edema and increased intracranial pressure to answer this question.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Safety

**Health Problem:** Adult Health: Cancer: Brain Tumors

**Priority Concepts:** Intracranial Regulation; Safety

141. **Answer:** 3

**Rationale:** For the client with deep vein thrombosis, elevation of the affected leg facilitates blood flow by the force of gravity and also decreases venous pressure, which in turn relieves edema and pain. A flat or dependent position of the leg would not achieve this goal. Bed rest is indicated to prevent emboli and to prevent pressure fluctuations in the venous system that occur with walking.

**Test-Taking Strategy:** Focus on the subject, the safe position or activity for the client with deep vein thrombosis. Think about the pathophysiology associated with this disorder and the principles related to gravity flow and edema to answer the question.

**Level of Cognitive Ability:** Creating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Foundations of Care: Safety

**Health Problem:** Adult Health: Cardiovascular: Vascular Disorders

**Priority Concepts:** Perfusion; Safety

**Reference:** Lewis et al. (2017), p. 823.

142. **Answer:** 2

**Rationale:** Positioning after a total hip replacement depends on the surgical...
techniques used, the method of implantation, the prosthesis, and the primary health care provider’s (PHCP’s) preference. Abduction is maintained when the client is in a supine position or positioned on the nonoperative side. Internal and external rotation, adduction, or lying on the operative side (unless specifically prescribed by the PHCP) is avoided to prevent displacement of the prosthesis.

**Test-Taking Strategy:** Focus on the **strategic word**, *best*. Use knowledge regarding care of clients after total hip replacement to answer this question. After a total hip replacement, the client should never have the extremity internally or externally rotated. Lying on the surgical side can cause damage to the surgical replacement site.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Implementation

**Content Area:** Foundations of Care: Safety

**Health Problem:** Adult Health: Musculoskeletal: Skeletal Injury

**Priority Concepts:** Mobility; Safety

**Reference:** Lewis et al. (2017), p. 1483.

143. **Answer:** 1

**Rationale:** After cataract surgery, the client should not sleep on the side of the body that was operated on to prevent edema formation and intraocular pressure. The client also should be placed in a semi-Fowler’s position to assist in minimizing edema and intraocular pressure. During the day, the client may wear glasses or a protective shield; at night, the protective shield alone is sufficient.

**Test-Taking Strategy:** Focus on the **subject**, right cataract surgery. Use of the principles of gravity and edema formation will assist in answering this question. Remember to instruct the client to remain off the operative side and to rest with the head elevated to minimize edema formation. This will assist you when answering questions related to cataract surgery.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Evaluation

**Content Area:** Foundations of Care: Safety

**Health Problem:** Adult Health: Eye: Cataracts

**Priority Concepts:** Client Teaching; Sensory Perception

**Reference:** Lewis et al. (2017), pp. 375-376.

144. **Answer:** 1

**Rationale:** For administering an enema, the client is placed in a left Sims’ position so that the enema solution can flow by gravity in the natural direction of the colon. The head of the bed is not elevated in the Sims’ position.

**Test-Taking Strategy:** Focus on the **subject**, positioning for enema administration. Use knowledge regarding the anatomy of the bowel to answer the question. The descending colon is located on the lower left side of the body. The head of the bed should be flat during enema administration.

**Level of Cognitive Ability:** Applying
Client Needs: Physiological Integrity  
Integrated Process: Nursing Process—Implementation  
Content Area: Skills: Elimination  
Health Problem: Adult Health: Gastrointestinal: Lower GI Disorders  
Priority Concepts: Elimination; Safety  

145. Answer: 4

Rationale: The residual limb is usually supported on pillows for the first 24 hours after surgery to promote venous return and decrease edema. After the first 24 hours, the residual limb usually is placed flat on the bed to reduce hip contracture. Edema also is controlled by limb-wrapping techniques. In addition, it is important to check the primary health care provider’s or surgeon’s prescriptions regarding positioning after amputation, because there are often differences in preference in terms of positioning after the procedure related to risks associated with hip and knee contracture.

Test-Taking Strategy: Focus on the subject, positioning after amputation, and note that the client has just returned from surgery. Using basic principles related to immediate postoperative care and preventing edema will assist in directing you to the correct option.

Level of Cognitive Ability: Applying  
Client Needs: Physiological Integrity  
Integrated Process: Nursing Process—Implementation  
Content Area: Foundations of Care: Perioperative Care  
Health Problem: Adult Health: Musculoskeletal: Amputation  
Priority Concepts: Perfusion; Tissue Integrity  

146. Answer: 2

Rationale: Autografts placed over joints or on lower extremities are elevated and immobilized after surgery for 3 to 7 days, depending on the surgeon’s preference. This period of immobilization allows the autograft time to adhere and attach to the wound bed, and the elevation minimizes edema. Keeping the client in a prone position and covering the extremity with a blanket can disrupt the graft site.

Test-Taking Strategy: Focus on the subject, positioning after autograft. Use general postoperative principles; elevating the graft site will decrease edema to the graft. The client should not be placed in a prone position or have it covered after surgery, because this can disrupt a graft easily.

Level of Cognitive Ability: Creating  
Client Needs: Physiological Integrity  
Integrated Process: Nursing Process—Planning  
Content Area: Foundations of Care: Perioperative Care  
Health Problem: Adult Health: Integumentary: Burns  
Priority Concepts: Perfusion; Tissue Integrity  
147. **Answer:** 4

**Rationale:** After cardiac catheterization, the extremity into which the catheter was inserted is kept straight for 4 to 6 hours. The client is maintained on bed rest for 4 to 6 hours (time for bed rest may vary depending on the primary health care provider’s (PHCPs) preference and on whether a vascular closure device was used), and the client may turn from side to side. The head is elevated no more than 30 degrees (although some PHCPs prefer a lower position or the flat position) until hemostasis is adequately achieved.

**Test-Taking Strategy:** Focus on the **subject**, positioning after cardiac catheterization. Think about this diagnostic procedure and what it entails. Understanding that the head of the bed is never elevated more than 30 degrees and bathroom privileges are restricted in the immediate postcatheterization period will assist in answering this question.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Foundations of Care: Diagnostic Tests  
**Health Problem:** N/A  
**Priority Concepts:** Perfusion; Safety  

148. **Answer:** 3

**Rationale:** During insertion of a nasogastric tube, the client is placed in a sitting or high-Fowler’s position to facilitate insertion of the tube and reduce the risk of pulmonary aspiration if the client should vomit. The right side and low-Fowler’s and supine positions place the client at risk for aspiration; in addition, these positions do not facilitate insertion of the tube.

**Test-Taking Strategy:** Focus on the **subject**, insertion of a nasogastric tube. Visualize each position and think about how it may facilitate insertion of the tube. Also, recall that a concern with insertion of a nasogastric tube is pulmonary aspiration. Placing the client in a high-Fowler’s position with his or her chin to the chest will decrease the risk of aspiration.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Skills: Tube Care  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Safety

UNIT IV
Growth and Development Across the Life Span
Introduction

Pyramid to Success

Normal growth and development proceed in an orderly, systematic, and predictable pattern, which provides a basis for identifying and assessing an individual’s abilities. Understanding the normal path of growth and development across the life span assists the nurse in identifying appropriate and expected human behavior. The Pyramid to Success focuses on Sigmund Freud’s theory of psychosexual development, Jean Piaget’s theory of cognitive development, Erik Erikson’s psychosocial theory, and Lawrence Kohlberg’s theory of moral development. Growth and development concepts also focus on the aging process and on physical characteristics, nutritional behaviors, skills, play, and specific safety measures relevant to a particular age group that will ensure a safe and hazard-free environment. When a question is presented on the NCLEX-RN® examination, if an age is identified in the question, note the age and think about the associated growth and developmental concepts to answer the question correctly.

Client Needs: Learning Objectives

Safe and Effective Care Environment

Acting as a client advocate
Communicating with the interprofessional health care team
Ensuring home safety and security plans
Ensuring that informed consent has been obtained for invasive treatments or procedures
Establishing priorities of care
Maintaining confidentiality
Preventing accidents and errors considering risks related to age
Providing care in accordance with ethical and legal standards
Providing care using a nonjudgmental approach
Respecting client and family needs, based on their preferences
Upholding the client’s rights

Health Promotion and Maintenance

Discussing high-risk behaviors and lifestyle choices
Identifying changes that occur as a result of the aging process
Identifying developmental stages and transitions
Maintaining health and wellness and self-care measures
Monitoring growth and development
Performing the necessary health and physical assessment techniques based on age
Providing client and family education
Respecting health care beliefs and preferences

**Psychosocial Integrity**

Assessing for abuse and neglect
Considering grief and loss issues and end-of-life care
Identifying coping mechanisms
Identifying cultural, religious, and spiritual practices and beliefs of the client and appropriate support systems
Identifying loss of quantity and quality of relationships with the older client
Monitoring for adjustment to potential deterioration in physical and mental health and well-being in the older client
Monitoring for changes and adjustment in role function in the older client (threat to independent functioning)
Monitoring for sensory and perceptual alterations
Providing resources for the client and family

**Physiological Integrity**

Administering medication safely and teaching the client about prescribed medications
Identifying practices or restrictions related to procedures and treatments
Monitoring for alterations in body systems and the related risks associated with the client’s age
Providing basic care and comfort needs
Providing interventions compatible with the client’s age; cultural, spiritual, religious, and health care beliefs; education level; and language
CHAPTER 17

Theories of Growth and Development

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Development, Health Promotion

I. Psychosocial Development: Erik Erikson
   A. The theory
      1. Erikson’s theory of psychosocial development describes the human life cycle as a series of 8 developmental stages from birth to death.
      2. Each stage presents a psychosocial crisis in which the goal is to integrate physical, maturation, and societal demands.
      3. The result of 1 stage may not be permanent, but can be changed by experience(s) later in life.
      4. The theory focuses on psychosocial tasks that should be accomplished throughout the life cycle.
   B. Psychosocial development: Occurs through a lifelong series of crises affected by social and cultural factors

II. Cognitive Development: Jean Piaget
   A. The theory
      1. Piaget’s theory of cognitive development defines cognitive acts as ways in which the mind organizes and adapts to its environment (i.e., “mental mapping”).
      2. Schema refers to an individual’s cognitive structure or

According to Erikson’s theory of psychosocial development, each psychosocial crisis must be resolved for the child or adult to progress emotionally. Unsuccessful resolution can leave the person emotionally disabled.

C. Stages of psychosocial development (Table 17-1)

D. Interventions to assist the client in achieving Erikson’s stages of development (Box 17-1)
framework of thought.

3. Schemata
   a. Schemata are categories that an individual forms in his or her mind to organize and understand the world.
   b. A young child has only a few schemata with which to understand the world, and gradually these are increased in number.
   c. Adults use a wide variety of schemata to understand the world.

4. Assimilation
   a. Assimilation is the ability to incorporate new ideas, objects, and experiences into the framework of one’s thoughts.
   b. The growing child will perceive and give meaning to new information according to what is already known and understood.

5. Accommodation
   a. Accommodation is the ability to change a schema to introduce new ideas, objects, or experiences.
   b. Accommodation changes the mental structure so that new experiences can be added.

B. Stages of cognitive development

1. Sensorimotor stage
   a. Birth to 2 years
   b. Development proceeds from reflex activity to imagining and solving problems through the senses and movement.
   c. The infant or toddler learns about reality and how it works.
   d. The infant or toddler does not recognize that objects continue to be in existence if they are out of the visual field.

2. Preoperational stage
   a. 2 to 7 years
   b. The child learns to think in terms of past, present, and future.
   c. The child moves from knowing the world through sensation and movement to prelogical thinking and finding solutions to problems.
d. The child is egocentric.
e. The child is unable to conceptualize and requires concrete examples.

3. Concrete operational
   a. 7 to 11 years
   b. The child is able to classify, order, and sort facts.
   c. The child moves from prelogical thought to solving concrete problems through logic.
   d. The child begins to develop abstract thinking.
   e. The child is less egocentric and thinks about how others may view a situation.

4. Formal operational
   a. 11 years to adulthood
   b. The person is able to think abstractly and logically.
   c. Logical thinking is expanded to include solving abstract and concrete problems.

III. Moral Development: Lawrence Kohlberg
   A. Moral development
      1. Moral development is a complicated process involving the acceptance of the values and rules of society in a way that shapes behavior.
      2. Moral development is classified in a series of levels and behaviors.
      3. Moral development is sequential.
      4. Stages or levels of moral development cannot be skipped.

   B. Levels of moral development (Box 17-2)

IV. Psychosexual Development: Sigmund Freud
   A. Components of the theory (Box 17-3)
   B. Levels of awareness
      1. Unconscious level of awareness
         a. The unconscious is not logical and is governed by the Pleasure Principle, which refers to seeking immediate tension reduction.
         b. Memories, feelings, thoughts, or wishes are repressed and are not available to the conscious mind.
         c. These repressed memories, thoughts, or feelings, if made prematurely conscious, can cause anxiety.
2. Preconscious level of awareness
   a. The preconscious is called the subconscious.
   b. The preconscious includes experiences, thoughts, feelings, or desires that might not be in immediate awareness but can be recalled to consciousness.
   c. The subconscious can help repress unpleasant thoughts or feelings and can examine and censor certain wishes and thinking.

3. Conscious level of awareness
   a. The conscious mind is logical and is regulated by the Reality Principle.
   b. Consciousness includes all experiences that are within an individual’s awareness and that the individual is able to control and includes all information that is remembered easily and is immediately available to an individual.

C. Agencies of the mind: id, ego, and superego

The id, ego, and superego are the 3 systems of personality. These psychological processes follow different operating principles. In a mature and well-adjusted personality, they work together as a team under the leadership of the ego.

1. The id
   a. Source of all drives, present at birth; operates according to the Pleasure Principle
   b. Does not tolerate uncomfortable states and seeks to discharge the tension and return to a more comfortable, constant level of energy
   c. Acts immediately in an impulsive, irrational way and pays no attention to the consequences of its actions; therefore, often behaves in ways harmful to self and others
   d. The primary process is a psychological activity in which the id attempts to reduce tension
   e. The primary process by itself is not capable of reducing tension; therefore, a secondary psychological process
must develop if the individual is to survive. When this occurs, the structure of the second system of the personality, the ego, begins to take form.

2. The ego
   a. Functions include reality testing and problem solving; follows the Reality Principle
   b. Begins its development during the fourth or fifth month of life
   c. Emerges out of the id and acts as an intermediary between the id and the external world
   d. Emerges because the needs, wishes, and demands of the id require appropriate exchanges with reality
   e. The ego distinguishes between things in the mind and things in the external world.

3. The superego
   a. Necessary part of socialization that develops during the phallic stage at 3 to 6 years of age
   b. Develops from interactions with the child’s parents during the extended period of childhood dependency
   c. Includes internalization of the values, ideals, and moral standards of parents and society
   d. Superego consists of the conscience and the ego ideal.
   e. Conscience refers to capacity for self-evaluation and criticism; when moral codes are violated, the conscience punishes the individual by instilling guilt.

D. Anxiety and defense mechanisms
   1. The ego develops defenses or defense mechanisms to fight off anxiety.
   2. Defense mechanisms operate on an unconscious level, except for suppression, so the individual is not aware of their operation.
   3. Defense mechanisms deny, falsify, or distort reality to make it less threatening.
4. An individual cannot survive without defense mechanisms; however, if the individual becomes too extreme in distorting reality, interference with healthy adjustment and personal growth may occur.

E. Psychosexual stages of development (Box 17-4)

1. Human development proceeds through a series of stages from infancy to adulthood.
2. Each stage is characterized by the inborn tendency of all individuals to reduce tension and seek pleasure.
3. Each stage is associated with a particular conflict that must be resolved before the child can move successfully to the next stage.
4. Experiences during the early stages determine an individual’s adjustment patterns and the personality traits that the individual has as an adult.

**Box 17-1**

535
Interventions to Assist the Client in Achieving Erikson’s Stages of Development

Infancy

- Hold the infant often.
- Offer comfort after painful procedures.
- Meet the infant’s needs for food and hygiene.
- Encourage parents to play an active role while the infant is hospitalized.

Early Childhood

- Allow self-feeding opportunities.
- Encourage child to remove and put on own clothes.
- Allow for choice.

Late Childhood

- Offer medical equipment for play.
- Respect the child’s choices and expressions of feelings.

School Age

- Encourage the child to continue schoolwork while hospitalized.
- Encourage the child to bring favorite pastimes to the hospital.

Adolescence

- Take the health history and perform examinations without parents present.
- Allow adolescent a choice in the plan of care.

Early Adulthood

- Include support from client’s partner or significant other.
- Assist with rehabilitation and contacting support services as needed before return to work.

Middle Adulthood

- Assist in choosing creative ways to foster social development.
- Encourage volunteer activities.

Later Adulthood
Listen attentively to reminiscent stories about his or her life’s accomplishments. Assist with making changes to living arrangements.

**Box 17-2**

**Moral Development: Lawrence Kohlberg**

**Level One: Preconventional Morality**

**Stage 0 (Birth to 2 Years): Egocentric Judgment**

The infant has no awareness of right or wrong.

**Stage 1 (2 to 4 Years): Punishment-Obedience Orientation**

At this stage, children cannot reason as mature members of society. Children view the world in a selfish way, with no real understanding of right or wrong. The child obeys rules and demonstrates acceptable behavior to avoid punishment and to avoid displeasing those who are in power, and because the child fears punishment from a superior force, such as a parent. A toddler typically is at the first substage of the preconventional stage, involving punishment and obedience orientation, in which the toddler makes judgments based on avoiding punishment or obtaining a reward. Physical punishment and withholding privileges tend to give the toddler a negative view of morals. Withdrawing love and affection as punishment leads to feelings of guilt in the toddler. Appropriate discipline includes providing simple explanations of why certain behaviors are unacceptable, praising appropriate behavior, and using distractions when the toddler is headed for an unsafe action.

**Stage 2 (4 to 7 Years): Instrumental Relativist Orientation**

The child conforms to rules to obtain rewards or have favors returned. The child’s moral standards are those of others, and the child observes them either to avoid punishment or obtain rewards. A preschooler is in the preconventional stage of moral development. In this stage, conscience emerges and the emphasis is on external control.

**Level Two: Conventional Morality**

The child conforms to rules to please others. The child has increased awareness of others’ feelings. A concern for social order begins to emerge. A child views good behavior as that which those in authority will approve.
If the behavior is not acceptable, the child feels guilty.

**Stage 3 (7 to 10 Years): Good Boy or Nice Girl Orientation**

Conformity occurs to avoid disapproval or dislike by others. This stage involves living up to what is expected by individuals close to the child or what individuals generally expect of others in their roles such as daughter, son, brother, sister, and friend.
Being good is important and is interpreted as having good motives and showing concern about others.
Being good also means maintaining mutual relationships, such as trust, loyalty, respect, and gratitude.

**Stage 4 (10 to 12 Years): Law and Order Orientation**

The child considers society as a whole when making judgments.
Emphasis is on obeying laws to maintain social order.
Moral reasoning develops as the child shifts the focus of living to society.
The school-age child is at the conventional level of the conformity stage and has an increased desire to please others.
The child observes and to some extent internalizes the standards of others.
The child wants to be considered “good” by those individuals whose opinions matter to her or him.

**Level Three: Postconventional Morality**

The individual focuses on individual rights and principles of conscience.
The focus is on concerns regarding what is best for all.

**Stage 5: Social Contract and Legalistic Orientation**

The person is aware that others hold a variety of values and opinions and that most values and rules are relative to the group.
The adolescent in this stage gives and takes and does not expect to get something without paying for it.
At this stage, the person may disobey rules if they feel they are inconsistent with their personal values.

**Stage 6: Universal Ethical Principles Orientation**

Conformity is based on universal principles of justice and occurs to avoid self-condemnation.
This stage involves following self-chosen ethical principles.
The development of the postconventional level of morality occurs in the adolescent at about age 13 years, marked by the development of an individual conscience and a defined set of moral values.
The adolescent can now acknowledge a conflict between 2 socially accepted standards and try to decide between them. Control of conduct is now internal in standards observed and in reasoning about right and wrong.

**Box 17-3**

**Components of Sigmund Freud’s Psychosexual Development Theory**

- Levels of awareness
- Agencies of the mind (id, ego, superego)
- Concept of anxiety and defense mechanisms
- Psychosexual stages of development

**Box 17-4**

**Freud’s Psychosexual Stages of Development**

**Oral Stage (Birth to 1 Year)**

During this stage, the infant is concerned with self-gratification. The infant is all id, operating on the Pleasure Principle and striving for immediate gratification of needs. When the infant experiences gratification of basic needs, a sense of trust and security begins. The ego begins to emerge as the infant begins to see self as separate from the caregiver; this marks the beginning of the development of a sense of self.

**Anal Stage (1 to 3 Years)**

Toilet training occurs during this period, and the child gains pleasure from learning to control his or her bodily needs. It provides a sense of accomplishment and independence. The conflict of this stage is between those demands from society and the parents and the sensations of pleasure associated with the anus. The child begins to gain a sense of control over instinctive drives and learns to delay immediate gratification to gain a future goal.

**Phallic Stage (3 to 6 Years)**

The child experiences pleasurable and conflicting feelings associated with the genital organs.
The pleasures of masturbation and the fantasy life of children set the stage for the Oedipus complex. The child’s unconscious sexual attraction to and wish to possess the parent of the opposite sex, the hostility and desire to remove the parent of the same sex, and the subsequent guilt about these wishes constitute the conflict the child faces. The conflict is resolved when the child begins to identify with the parent of the same sex. The emergence of the superego is the solution to and the result of these intense impulses.

**Latency Stage (6 to 12 Years)**

The latency stage is a tapering off of conscious biological and sexual urges. The sexual impulses are channeled and elevated into a more culturally accepted level of activity such as intellectual pursuits and social communication. Growth of ego functions and the ability to care about and relate to others outside the home is the task of this stage of development.

**Genital Stage (12 Years and Beyond)**

The genital stage emerges at adolescence with the onset of puberty, when the genital organs mature. The individual gains gratification from his or her own body. During this stage, the individual develops satisfying sexual and emotional relationships with members of the opposite sex. The individual plans life goals and gains a strong sense of personal identity.

**Practice Questions**

149. The clinic nurse is preparing to explain the concepts of Kohlberg’s theory of moral development with a parent. The nurse should tell the parent that which factor motivates good and bad actions for the child at the preconventional level?
   1. Peer pressure
   2. Social pressure
   3. Parents’ behavior
   4. Punishment and reward

150. The maternity nurse is providing instructions to a new mother regarding the psychosocial development of the newborn infant. Using Erikson’s psychosocial development theory, the nurse instructs the mother to take which measure?
   1. Allow the newborn infant to signal a need.
   2. Anticipate all needs of the newborn infant.
   3. Attend to the newborn infant immediately when crying.
   4. Avoid the newborn infant during the first 10 minutes of crying.
151. The nurse notes that a 6-year-old child does not recognize that objects exist when the objects are outside of the visual field. Based on this observation, which action should the nurse take?
   1. Report the observation to the pediatrician
   2. Move the objects in the child’s direct field of vision.
   3. Teach the child how to visually scan the environment.
   4. Provide additional lighting for the child during play activities.

152. A nursing student is presenting a clinical conference to peers regarding Freud’s psychosexual stages of development, specifically the anal stage. The student explains to the group that which characteristic relates to the anal stage?
   1. This stage is associated with toilet training.
   2. This stage is characterized by the gratification of self.
   3. This stage is characterized by a tapering off of conscious biological and sexual urges.
   4. This stage is associated with pleasurable and conflicting feelings about the genital organs.

153. The nurse is describing Piaget’s cognitive developmental theory to pediatric nursing staff. The nurse should tell that staff that which child behavior is characteristic of the formal operations stage?
   1. The child has the ability to think abstractly.
   2. The child begins to understand the environment.
   3. The child is able to classify, order, and sort facts.
   4. The child learns to think in terms of past, present, and future.

154. The mother of an 8-year-old child tells the clinic nurse that she is concerned about the child because the child seems to be more attentive to friends than anything else. Using Erikson’s psychosocial development theory, the nurse should make which response?
   1. “You need to be concerned.”
   2. “You need to monitor the child’s behavior closely.”
   3. “At this age, the child is developing his own personality.”
   4. “You need to provide more praise to the child to stop this behavior.”

155. The nurse educator is preparing to conduct a teaching session for the nursing staff regarding the theories of growth and development and plans to discuss Kohlberg’s theory of moral development. What information should the nurse include in the session? **Select all that apply.**
   1. Individuals move through all 6 stages in a sequential fashion.
   3. A person’s ability to make moral judgments develops over a period of time.
   4. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior.
   5. In stage 1 (punishment-obedience orientation), children are
expected to reason as mature members of society.

6. In stage 2 (instrumental-relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

156. A parent of a 3-year-old tells a clinic nurse that the child is rebelling constantly and having temper tantrums. Using Erikson’s psychosocial development theory, which instructions should the nurse provide to the parent? Select all that apply.

☐ 1. Set limits on the child’s behavior.
☐ 2. Ignore the child when this behavior occurs.
☐ 3. Allow the behavior, because this is normal at this age period.
☐ 4. Provide a simple explanation of why the behavior is unacceptable.
☐ 5. Punish the child every time the child says “no” to change the behavior.

Answers

149. Answer: 4

Rationale: In the preconventional stage, morals are thought to be motivated by punishment and reward. If the child is obedient and is not punished, then the child is being moral. The child sees actions as good or bad. If the child’s actions are good, the child is praised. If the child’s actions are bad, the child is punished. Options 1, 2, and 3 are not associated factors for this stage of moral development.

Test-Taking Strategy: Eliminate options 1 and 2; they are comparable or alike because peer pressure is the same as social pressure. To select from the remaining options, recalling that the preconventional stage occurs between birth and 7 years will assist in directing you to the correct option.

Level of Cognitive Ability: Applying
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Developmental Stages: Toddler
Health Problem: N/A
Priority Concepts: Client Education; Development

150. Answer: 1

Rationale: According to Erikson, the caregiver should not try to anticipate the newborn infant’s needs at all times but must allow the newborn infant to signal needs. If a newborn infant is not allowed to signal a need, the newborn will not learn how to control the environment. Erikson believed that a delayed or prolonged response to a newborn infant’s signal would inhibit the development of trust and
lead to mistrust of others.

**Test-Taking Strategy:** Eliminate options 2, 3, and 4 because of the **closed-ended words** “all,” “immediately,” and “avoid,” in these options.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Developmental Stages: Infant

**Priority Concepts:** Client Education; Development

151. **Answer:** 1

**Rationale:** According to Jean Piaget’s theory of cognitive development, it is normal for the infant or toddler not to recognize that objects continue to be in existence if out of the visual field; however, this is abnormal for the 6-year-old. If a 6-year-old child does not recognize that objects still exist even when outside the visual field, the child is not progressing normally through the developmental stages. The nurse should report this finding to the pediatrician. Options 2, 3, and 4 delay necessary follow-up and treatment.

**Test-Taking Strategy:** Focus on the **data in the question.** Also, note the age of the child and think about developmental concepts related to this age. Noting that the child is not able to recognize that objects continue to be in existence, even if out of the visual field, will direct you to the correct option. Also, note that options 2, 3, and 4 are **comparable or alike** and are interventions that will delay follow-up for an abnormal observation.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Developmental Stages: Preschool and School Age

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Development

152. **Answer:** 1

**Rationale:** In general, toilet training occurs during the anal stage. According to Freud, the child gains pleasure from the elimination of feces and from their retention. Option 2 relates to the oral stage. Option 3 relates to the latency period. Option 4 relates to the phallic stage.

**Test-Taking Strategy:** Focus on the **subject,** the anal stage. Note the relationship between the words **anal** in the question and **toilet training** in the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Developmental Stages: Toddler

**Health Problem:** N/A

**Priority Concepts:** Development; Health Promotion

543

153. **Answer:** 1

**Rationale:** In the formal operations stage, the child has the ability to think abstractly and logically. Option 2 identifies the sensorimotor stage. Option 3 identifies the concrete operational stage. Option 4 identifies the preoperational stage.  

**Test-Taking Strategy:** Focus on the subject, the formal operational stage of Piaget’s cognitive developmental theory, and note the relationship between the subject and the description in the correct option. Remember that in the formal operations stage, the child has the ability to think abstractly and logically.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Teaching and Learning  
**Content Area:** Developmental Stages: Preschool and School Age  
**Health Problem:** N/A  
**Priority Concepts:** Client Education; Development  

154. **Answer:** 3

**Rationale:** According to Erikson, during school-age years (6 to 12 years of age), the child begins to move toward peers and friends and away from the parents for support. The child also begins to develop special interests that reflect his or her own developing personality instead of the parents’. Therefore, options 1, 2, and 4 are incorrect responses.

**Test-Taking Strategy:** Use knowledge of Erikson’s psychosocial development theory related to middle childhood. Options 1 and 2 can be eliminated first because they are comparable or alike and indicate that the mother should be concerned about the child. Eliminate option 4 next because although praising the child for accomplishments is important at this age, the behavior that the child is exhibiting is normal.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Developmental Stages: Preschool and School Age  
**Health Problem:** N/A  
**Priority Concepts:** Development; Health Promotion  

155. **Answer:** 2, 3, 4, 6

**Rationale:** Kohlberg’s theory states that individuals move through stages of development in a sequential fashion but that not everyone reaches stages 5 and 6 in his or her development of personal morality. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior. It states that moral development progresses in relationship to cognitive development.
and that a person’s ability to make moral judgments develops over a period of time. In stage 1, ages 2 to 3 years (punishment-obedience orientation), children cannot reason as mature members of society. In stage 2, ages 4 to 7 years (instrumental-relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

Test-Taking Strategy: Read each option carefully. Recalling that the theory provides a framework for understanding how individuals determine a moral code to guide their behavior and recalling the ages associated with each stage will assist in answering the question. Also noting the closed-ended word “all” in option 1 and the word mature in option 5 will assist in eliminating these options.

Level of Cognitive Ability: Applying
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Developmental Stages: Infant
Health Problem: N/A
Priority Concepts: Client Education; Development

156. Answer: 1, 4

Rationale: According to Erikson, the child focuses on gaining some basic control over self and the environment and independence between ages 1 and 3 years. Gaining independence often means that the child has to rebel against the parents’ wishes. Saying things like “no” or “mine” and having temper tantrums are common during this period of development. Being consistent and setting limits on the child’s behavior are necessary elements. Providing a simple explanation of why certain behaviors are unacceptable is an appropriate action. Options 2 and 3 do not address the child’s behavior. Option 5 is likely to produce a negative response during this normal developmental pattern.

Test-Taking Strategy: Options 2 and 3 can be eliminated first because they are comparable or alike, indicating that the mother should not address the child’s behavior. Next, eliminate option 5, because this action is likely to produce a negative response during this normal developmental pattern. Also, note the closed-ended word “every” in option 5.

Level of Cognitive Ability: Applying
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Developmental Stages: Toddler
Priority Concepts: Client Education; Development
Chapter 18

Growth, Development, and Stages of Life

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Development, Family Dynamics

I. The Hospitalized Infant and Toddler

A. Separation anxiety

1. Protest
   a. Crying, screaming, searching for a parent; avoidance and rejection of contact with strangers
   b. Verbal attacks on others
   c. Physical fighting: Kicking, biting, hitting, pinching

2. Despair
   a. Withdrawn, depressed, uninterested in the environment
   b. Loss of newly learned skills

3. Detachment
   a. Detachment is uncommon and occurs only after lengthy separations from the parent.
   b. Superficially, the toddler appears to have adjusted to the loss.
   c. During the detachment phase, the toddler again becomes more interested in the environment, plays with others, and seems to form new relationships; this behavior is a form of resignation and is not a sign of contentment.
   d. The toddler detaches from the parent in an effort to escape the emotional pain of desiring the parent’s presence.
   e. During the detachment phase, the toddler copes by forming shallow relationships with others, becoming
increasingly self-centered, and attaching primary importance to material objects.

f. Detachment is the most serious phase because reversal of the potential adverse effects is less likely to occur once detachment is established.

g. In most situations, the temporary separation imposed by hospitalization does not cause such prolonged parental absence that the toddler enters into detachment.

B. Fear of injury and pain: Affected by previous experiences, separation from parents, and preparation for the experience

C. Loss of control

1. Hospitalization, with its own set of rituals and routines, can severely disrupt the life of a toddler.
2. The lack of control often is exhibited in behaviors related to feeding, toileting, playing, and bedtime.
3. The toddler may demonstrate regression.

D. Interventions

1. Provide cuddling and touch and talk softly to the infant.
2. Provide opportunities for sucking and oral stimulation for the infant, using a pacifier if the infant is NPO (nothing by mouth).
3. Provide stimulation, if appropriate, for the infant, using objects of contrasting colors and textures.
4. Provide choices as much as possible to the toddler to enable him or her to have some control.
5. Approach the toddler with a positive attitude.
6. Allow the toddler to express feelings of protest.
7. Encourage the toddler to talk about parents or others in their lives.
8. Accept regressive behavior without ridiculing the toddler.
9. Provide the toddler with favorite and comforting objects.
10. Utilize play therapy for the toddler.
11. Allow the toddler as much mobility as possible.
12. Anticipate temper tantrums from the toddler and maintain a safe environment for physical acting out.
13. Employ pain reduction techniques, as appropriate.

For the hospitalized toddler, provide routines and rituals as
II. The Hospitalized Preschooler

A. Separation anxiety

1. Separation anxiety is generally less obvious and less serious than in the toddler.
2. As stress increases, the preschooler’s ability to separate from the parents decreases.
3. Protest
   a. Protest is less direct and aggressive than in the toddler.
   b. The preschooler may displace feelings onto others.

4. Despair
   a. The preschooler reacts in a manner similar to that of the toddler.
   b. The preschooler is quietly withdrawn, depressed, and uninterested in the environment.
   c. The child exhibits loss of newly learned skills.
   d. The preschooler becomes generally uncooperative, refusing to eat or take medication.
   e. The preschooler repeatedly asks when the parents will be visiting.

5. Detachment: Similar to the toddler

B. Fear of injury and pain

1. The preschooler has a general lack of understanding of body integrity.
2. The child fears invasive procedures and mutilation.
3. The child imagines things to be much worse than they are.
4. Preschoolers believe that they are ill because of something they did or thought.

C. Loss of control

1. The preschooler likes familiar routines and rituals and may show regression if not allowed to maintain some control.
2. Preschoolers’ egocentric and magical thinking limits their ability to understand events, because they view all experiences from their own self-referenced (egocentric) perspective.
3. The child has attained a good deal of independence and self-care at home and may expect that to continue in the hospital.

D. Interventions
1. Provide a safe and secure environment.
2. Take time for communication.
3. Allow the preschooler to express anger.
4. Acknowledge fears and anxieties.
5. Accept regressive behavior; assist the preschooler in moving from regressive to appropriate behaviors according to age.
6. Encourage rooming-in or leaving a favorite toy.
7. Allow mobility and provide play and diversional activities.
8. Place the preschooler with other children of the same age if possible.
9. Encourage the preschooler to be independent.
10. Explain procedures simply, on the preschooler’s level.
11. Avoid intrusive procedures when possible.
12. Allow the wearing of underpants.

III. The Hospitalized School-Age Child

A. Separation anxiety
   1. The school-age child is accustomed to periods of separation from the parents, but as stressors are added, the separation becomes more difficult.
   2. The child is more concerned with missing school and the fear that friends will forget her or him.
   3. Usually, the stages of behavior of protest, despair, and detachment do not occur with school-age children.

B. Fear of injury and pain
   1. The school-age child fears bodily injury and pain.
   2. The child fears illness itself, disability, death, and intrusive procedures in genital areas.
   3. The child is uncomfortable with any type of sexual examination.
   4. The child groans or whines, holds rigidly still, and communicates about pain.

C. Loss of control
   1. The child is usually highly social, independent, and involved with activities.
   2. The child seeks information and asks relevant questions about tests and procedures and the illness.
   3. The child associates his or her actions with the cause of the illness.
   4. The child may feel helpless and dependent if physical limitations occur.

D. Interventions
   1. Encourage rooming-in.
   2. Focus on the school-age child’s abilities and needs.
3. Encourage the school-age child to become involved with his or her own care.
4. Accept regression but encourage independence.
5. Provide choices to the school-age child.
6. Allow expression of feelings verbally and nonverbally.
7. Acknowledge fears and concerns and allow for discussion.
8. Explain all procedures, using body diagrams or outlines.
10. Avoid intrusive procedures if possible.
11. Allow the school-age child to wear underpants.
12. Involve the school-age child in activities appropriate to the developmental level and illness.
13. Encourage the school-age child to contact friends.
14. Provide for educational needs.
15. Use appropriate interventions to relieve pain.

IV. The Hospitalized Adolescent

A. Separation anxiety

1. Adolescents are not sure whether they want their parents with them when they are hospitalized.
2. Adolescents become upset if friends go on with their lives, excluding them.

For the hospitalized adolescent, separation from friends is a source of anxiety.

B. Fear of injury and pain

1. Adolescents fear being different from others and their peers.
2. Adolescents may give the impression that they are not afraid, even though they are terrified.
3. Adolescents become guarded when any areas related to sexual development are examined.

C. Loss of control

1. Behaviors exhibited include anger, withdrawal, and uncooperativeness.
2. Adolescents seek help and then reject it.

D. Interventions

1. Encourage questions about appearance and effects of the illness on the future.
2. Explore feelings about the hospital and the significance that the illness might have for relationships.
3. Encourage adolescents to wear their own clothes and
carry out normal grooming activities.
4. Allow favorite foods to be brought into the hospital if possible.
5. Provide privacy.
6. Use body diagrams to prepare for procedures.
7. Introduce them to other adolescents in the nursing unit if appropriate and possible.
8. Encourage maintaining contact with peer groups.
9. Provide for educational needs.
10. Identify formation of future plans.
11. Help develop positive coping mechanisms.

V. Communication Approaches

A. General guidelines (Box 18-1)

B. Infant

1. Infants respond to nonverbal communication behaviors of adults, such as holding, rocking, patting, cuddling, and touching.
2. Use a slow approach and allow the infant to get to know the nurse.
3. Use a calm, soft, soothing voice.
4. Be responsive to cries.
5. Talk and read to infants.
6. Allow security objects such as blankets and pacifiers if the infant has them.

C. Toddler

1. Approach the toddler cautiously.
2. Remember that toddlers accept the verbal communications of others literally.
3. Learn the toddler’s words for common items and use them in conversations.
4. Use short, concrete terms.
5. Prepare the toddler for procedures immediately before the event.
6. Repeat explanations and descriptions.
7. Use play for demonstrations.
8. Use visual aids such as picture books, puppets, and dolls.
9. Allow the toddler to handle the equipment or instruments; explain what the equipment or instrument does and how it feels.
10. Encourage the use of comfort objects.

D. Preschooler

1. Seek opportunities to offer choices.
2. Speak in simple sentences.
3. Be concise and limit the length of explanations.
4. Allow asking questions.
5. Describe procedures as they are about to be performed.
6. Use play to explain procedures and activities.
7. Allow handling of equipment or instruments, which will ease fear and help to answer questions.

E. School-age child
1. Establish limits.
2. Provide reassurance to help in alleviating fears and anxieties.
3. Engage in conversations that encourage thinking.
4. Use medical play techniques.
5. Use photographs, books, dolls, and videos to explain procedures.
6. Explain in clear terms.
7. Allow time for composure and privacy.

F. Adolescent
1. Remember that the adolescent may be preoccupied with body image.
2. Encourage and support independence.
3. Provide privacy.
4. Use photographs, books, and videos to explain procedures.
5. Engage in conversations about the adolescent’s interests.
6. Avoid becoming too abstract, too detailed, and too technical.
7. Avoid responding by prying, confronting, condescending, or expressing judgmental attitudes.

VI. Car Safety Seats and Guidelines

A. The safest place for all children to ride, regardless of age, is in the back seat of the car.
B. Lock the car doors; 4-door cars should be equipped with child safety locks on the back doors.
C. There are different types of car safety seats, and the manufacturer’s guidelines need to be followed.
D. For specific information regarding car safety, refer to Car seats: information for families (copyright © 2018 American Academy of Pediatrics), found at https://www.healthychildren.org/English/safety-prevention/on-the-go/Pages/Car-Safety-Seats-Information-for-Families.aspx

VII. Preventive Pediatric Health Care

A. The American Academy of Pediatrics (AAP) and Bright Futures have developed guidelines regarding the recommended ages children should receive certain assessments and screenings. See Box 18-2 for more information regarding the recommended types of assessments and screenings and see Box 18-3 for the suggested
timeline for preventive services, also known as well-child checks. For detailed information on these screenings and the timeline, access the following links:

B. Well-checks are important in promoting health early in childhood and preventing diseases later in life. Childhood obesity, type 2 diabetes mellitus, and hyperlipidemia are noted to have an increased incidence in recent years. See Chapters 32 and 36 for more information on these problems.

https://brightfutures.aap.org/Pages/default.aspx

VIII. Immunizations

A. Guidelines (see Priority Nursing Actions)

Priority Nursing Actions

Administering a Parenteral Vaccine

1. Verify the prescription for the vaccine.
2. Obtain an immunization history from the parents and assess for allergies.
3. Provide information to the parents about the vaccine.
4. Obtain parental consent.
5. Check the lot number and expiration date and prepare the injection.
6. Select the appropriate site for administration.
7. Administer the vaccine.
8. Document the administration and site of administration and lot number and expiration date of the vaccine.
9. Provide a vaccination record to the parents.

Reference

1. Immunizations are an important aspect of health promotion during childhood.
2. In the United States, the recommended age for beginning primary immunizations of infants is at birth.
3. Children who began primary immunizations at the recommended age but failed to receive all required doses do not need to begin the series again; they need to receive only the missed doses.
4. If there is suspicion that the parent will not bring the child to the pediatrician or health care clinic for follow-up immunizations according to the optimal immunization schedule, any of the recommended vaccines can be administered simultaneously.

B. General contraindications and precautions

1. A vaccine is contraindicated if the child experienced
an anaphylactic reaction to a previously administered vaccine or a component in the vaccine.
2. Live virus vaccines generally are not administered to individuals with severely deficient immune systems, individuals with a severe sensitivity to gelatin, or pregnant women.
3. A vaccine is administered with caution to an individual with a moderate or severe acute illness, with or without fever.
4. See Section IX, Recommended Childhood and Adolescent Immunizations, for specific information for each type of vaccine.

C. Guidelines for administration (Box 18-4)

Children born preterm should receive the full dose of each vaccine at the appropriate chronological age.

IX. Recommended Childhood and Adolescent Immunizations (Box 18-5)

A. For the most up-to-date information, refer to Centers for Disease Control and Prevention (CDC) Web site:

B. Hepatitis B vaccine (HepB)

1. Administered by the intramuscular route
2. Contraindications: Severe allergic reaction to previous dose or vaccine component (components include aluminum hydroxide, yeast protein)
3. Precautions: An infant weighing less than 2000 g or an infant with moderate or severe acute illness with or without fever
4. HBsAg (hepatitis B surface antigen)-positive mothers
   a. Infant should receive HepB vaccine and hepatitis B immunoglobulin (HBIG) within 12 hours of birth.
   b. Infant should be tested for HBsAg and antibody to HBsAg after completion of HepB series (9 to 18 months of age).
5. Mother whose HBsAg status is unknown
   a. Infant should receive the first dose of hepatitis vaccine series within 12 hours of birth.
   b. Maternal blood should be drawn as soon as possible to determine the mother’s HBsAg status.
   c. If the mother’s HBsAg test result is positive, the infant should receive HBIG as soon as possible (no later than 1 week of age).
C. Rotavirus vaccine (RV)
1. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months of age; children younger than 3 months have some protection because of maternally acquired antibodies.
2. Vaccines are available and are administered by the oral route because the vaccine must replicate in the infant’s gut.
3. Vaccine may be withheld if an infant is experiencing severe vomiting and diarrhea; it is administered as soon as the infant recovers.

D. Diphtheria, tetanus, acellular pertussis (DTaP); tetanus toxoid; reduced diphtheria toxoid and acellular pertussis vaccine (Tdap adolescent preparation)
1. Administered by intramuscular route
2. The Tdap (adolescent preparation) is recommended at 11 to 12 years of age for children who have completed the recommended childhood DTaP series but have not received a tetanus and diphtheria toxoid (Td) booster dose; children 13 to 18 years old who have not received Tdap should receive a dose.
3. Td does not provide protection against pertussis; Td is used as a booster every 10 years after Tdap is administered at 11 to 18 years of age.
4. Encephalopathy is a complication.
5. Contraindications: Encephalopathy within 7 days of a previous dose or a severe allergic reaction to a previous dose or to a vaccine component

E. Haemophilus influenzae type b (Hib) conjugate vaccine (Hib)
1. Protects against numerous serious infections caused by H. influenzae type b, such as bacterial meningitis, epiglottitis, bacterial pneumonia, septic arthritis, and sepsis
2. Administered by the intramuscular route
3. Contraindications: Severe allergic reaction to a previous dose or vaccine component

F. Influenza vaccine: Vaccine is recommended annually for children beginning at age 6 months.

G. Inactivated poliovirus vaccine (IPV)
1. IPV is administered by the subcutaneous route (it may also be given by the intramuscular route).
2. Contraindications: Severe allergic reaction to a previous dose or vaccine component; components may include formalin, neomycin, streptomycin, or polymyxin B

H. Measles, mumps, rubella (MMR) vaccine
1. Vaccine is administered by the subcutaneous route.
2. Contraindications: Severe allergic reaction to a previous dose or vaccine component (gelatin, neomycin, eggs), pregnancy, known immunodeficiency
3. If the child received immunoglobulin, the MMR vaccine should be postponed for at least 3 to 6 months (immunoglobulin can inhibit the immune response to the MMR vaccine).

I. Varicella vaccine
1. It is administered by the subcutaneous route.
2. Children receiving the vaccine should avoid aspirin or aspirin-containing products because of the risk of Reye’s syndrome.
3. Contraindications: Severe allergic reaction to a previous dose or vaccine component (gelatin, bovine albumin, neomycin), significant suppression of cellular immunity, pregnancy

J. Pneumococcal conjugate vaccine (PCV)
1. PCV prevents infection with Streptococcus pneumoniae, which may cause meningitis, pneumonia, septicemia, sinusitis, and otitis media.
2. It is administered by the intramuscular route.
3. Contraindications: Severe allergic reaction to a previous dose or vaccine component

K. Hepatitis A vaccine (HepA)
1. It is administered by the intramuscular route.
2. Contraindications: Severe allergic reaction to a previous dose or vaccine component

L. Meningococcal vaccine (MCV)
1. Vaccine protects against Neisseria meningitidis.
2. MCV4 is the preferred type of vaccine and is given intramuscularly.
3. MCV4 should be administered to all children at age 11 to 12 years and to unvaccinated adolescents at high school entry (age 15 years); all college freshmen living in dormitories should be vaccinated.
4. Revaccination is recommended for children who remain at increased risk after 3 years (if the first dose was administered at age 2 to 6 years) or after 5 years (if the first dose was administered at age 7 years or older).
5. It is contraindicated in children with a history of Guillain-Barré syndrome.

M. Human papillomavirus vaccine (HPV)
1. Depending on the type of vaccine used (HPV2 or HPV4), the HPV vaccine guards against diseases that are caused by HPV types 6, 11, 16, and 18, such as cervical cancer, cervical abnormalities that can lead to
cervical cancer, and genital warts.

2. The vaccine is most effective for boys and girls if administered before exposure to human papillomavirus through sexual contact.

3. The vaccine is administered as 3 injections over 6 months—first dose to girls at age 11 to 12 years, the second dose 2 months after the first dose, and the third dose 6 months after the first dose.

4. A 3-dose series may be administered to boys 9 to 18 years old to reduce their likelihood of acquiring genital warts.

5. The vaccine can cause pain, swelling, itching, and redness at the injection site; fever; nausea; and dizziness.

6. The vaccine is contraindicated in individuals with a reaction to a previous injection and in pregnant women.

X. Reactions to a Vaccine

A. Local reactions

1. Tenderness, erythema, swelling at injection site
2. Low-grade fever
3. Behavioral changes such as drowsiness, unusual crying, decreased appetite

B. Minimizing local reactions

1. Select a needle of adequate length to deposit vaccine deep into the muscle or subcutaneous mass.
2. Inject into the appropriate recommended site.

A. Anaphylactic reactions

1. Goals of treatment are to secure and protect the airway, restore adequate circulation, and prevent further exposure to the antigen.
2. For a mild reaction with no evidence of respiratory distress or cardiovascular compromise, a subcutaneous injection of an antihistamine, such as diphenhydramine, and epinephrine may be administered.
3. For moderate or severe distress, establish an airway; provide cardiopulmonary resuscitation if the child is not breathing; elevate the head; administer epinephrine, fluids, and vasopressors as prescribed; monitor vital signs; and monitor urine output.

B. Refer to Chapter 62 for additional information on allergic responses and anaphylactic reactions

XI. Developmental Characteristics

A. Infant
1. Physical

a. Height increases by 1 inch per month in the first 6 months, and by 1 year the length has increased by 50%.
b. Weight is doubled at 5 to 6 months and tripled at 12 months.
c. At birth, head circumference is 33 to 35 cm (13.2 to 14 inches), approximately 2 to 3 cm more than chest circumference.
d. By 1 to 2 years of age, head circumference and chest circumference are equal.
e. Anterior fontanel (soft and flat in a normal infant) closes by 18 months of age.
f. Posterior fontanel (soft and flat in a normal infant) closes by 4 months of age.
g. The first primary teeth to erupt are the lower central incisors at approximately 6 to 10 months of age. Children at risk for development of dental caries should see a dentist 6 months after the first tooth erupts or by 1 year of age.
h. Sleep patterns vary among infants; in general, by 3 to 4 months of age, most infants have developed a nocturnal pattern of sleep that lasts 9 to 11 hours.

2. Vital signs (Box 18-6)

3. Nutrition

a. The infant may breast-feed or bottle-feed (with iron-fortified formula), depending on the mother’s choice; however, breast milk is the preferred form of nutrition for all infants, especially during the first 6 months.
b. Exclusively breast-fed infants and infants ingesting less than 1000 mL of vitamin D–fortified formula or milk per day should receive daily vitamin D supplementation (400 IU) starting in the first few days of life to prevent rickets and vitamin D deficiency.
c. Iron stores from birth are depleted by 4 months of age; if the infant is being breast-fed only, iron supplementation, usually with a liquid iron supplement, is needed. Premature babies are at higher risk for iron deficiency due to smaller iron stores and often need additional supplementation. Infants should be screened at 12 months of age for iron deficiency.

d. Whole milk, low-fat milk, skim milk, other animal milk, or imitation milk should not be given to infants as a primary source of nutrition, because these food sources lack the necessary components needed for growth and have limited digestibility. If introduced, cow’s milk should not be given to infants until 12 months of age.

e. Fluoride supplementation may be needed at about 6 months of age, depending on the infant’s intake of fluoridated tap water.

f. Solid foods (strained, pureed, or finely mashed) are introduced at about 5 to 6 months of age; introduce solid foods one at a time, usually at intervals of 4 to 5 days, to identify food allergens.

g. Sequence of the introduction of solid foods varies depending on the pediatrician’s preference and usually is as follows: iron-fortified rice cereal, fruits, vegetables, then meats.

h. At 12 months of age, eggs can be given (introduce egg whites in small quantities to detect an allergy); cheese may be used as a substitute for meat.

i. Avoid solid foods that place the infant at risk for choking, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.

j. Avoid microwaving baby bottles and baby food because of the potential for uneven heating.

k. Never mix food or medications with formula.

l. Infants under 12 months should not be fed honey. Avoid adding honey to
formula, water, or other fluid to prevent botulism.
m. Offer fruit juice from a cup (12 to 13 months or at a prescribed age) rather than a bottle to prevent nursing (bottle-mouth) caries; fruit juice is limited because of its high sugar content.

4. Skills (Box 18-7)

5. Play

- a. Solitary
- b. Birth to 3 months: Verbal, visual, and tactile stimuli
- c. 4 to 6 months: Initiation of actions and recognition of new experiences
- d. 6 to 12 months: Awareness of self, imitation, repetition of pleasurable actions
- e. Enjoyment of soft stuffed animals, crib mobiles with contrasting colors, squeeze toys, rattles, musical toys, water toys during the bath, large picture books, and push toys after the infant begins to walk

6. Safety

- a. Parents must baby-proof the home.
- b. Guard the infant when on a bed or changing table.
- c. Use gates to protect the infant from stairs.
- d. Be sure that bath water is not hot; do not leave the infant unattended in the bath.
- e. Do not hold the infant while drinking or working near hot liquids or items such as a stove.
- f. Cool vaporizers instead of steam should be used if needed, to prevent burn injuries.
- g. Avoid offering food that is round and similar to the size of the airway to prevent choking.
- h. Be sure that toys have no small pieces.
- i. Toys or mobiles hanging over the crib should be well out of reach, to prevent
strangulation.
j. Avoid placing large toys in the crib, because an older infant may use them as steps to climb.
k. Cribs should be positioned away from curtains and blind cords.
l. Cover electrical outlets.
m. Remove hazardous objects from low, reachable places.
n. Remove chemicals such as cleaning or other household products, medications, poisons, and plants from the infant’s reach.
o. Keep the Poison Control Center number available.

Never shake an infant because of the risk of causing a closed head injury known as shaken baby syndrome, which is a life-threatening injury.

B. Toddler

1. Physical

a. Height and weight increase in phases, reflecting growth spurts and lags.
b. Head circumference increases about 1 inch (25.5 mm) between ages 1 and 2 years; thereafter head circumference increases about ½ inch (12.5 mm) per year until age 5 years.
c. Anterior fontanel closes between ages 12 and 18 months.
d. Weight gain is slower than in infancy; by age 2 years, the average weight is 22 to 27 pounds (10 to 12 kg).
e. Normal height changes include a growth of about 3 inches (7.5 cm) per year; the average height of the toddler is 34 inches (86 cm) at age 2 years.
f. Lordosis (pot belly) is noted.
g. Regular dental care is essential, and the toddler will require assistance with brushing and flossing of teeth (fluoride supplements may be necessary if the water is not fluoridated).
h. A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries.

i. Typically, the toddler sleeps through the night and has 1 daytime nap; the daytime nap is normally discontinued at about age 3 years.

j. A consistent bedtime ritual helps prepare the toddler for sleep.

k. Security objects at bedtime may assist in sleep.

2. Vital signs (Box 18-8)

3. Nutrition

a. The MyPlate food guide (see Fig. 11-1) provides dietary guidelines and applies to children as young as 2 years of age (see www.choosemyplate.gov).

b. The toddler should average an intake of 2 to 3 servings of milk daily (24 to 30 oz [700 to 800 mL]) to ensure an adequate amount of calcium and phosphorus (low-fat milk may be given after 2 years of age).

c. Trans-fatty acids and saturated fats need to be restricted; otherwise fat restriction is not appropriate for a toddler (mothers should be taught about the types of food that contain fat that should be selected).

d. Iron-fortified cereal and a high-iron diet, adequate amounts of calcium and vitamin D, and vitamin C (4 to 6 oz [120 to 180 mL] of juice daily) are essential components for the toddler’s diet.

e. Most toddlers prefer to feed themselves.

f. The toddler generally does best by eating several small nutritious meals each day rather than 3 large meals.

g. Offer a limited number of foods at any one time.

h. Offer finger foods and avoid
concentrated sweets and empty calories.

i. The toddler is at risk for aspiration of small foods that are not chewed easily, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.

j. Physiological anorexia may occur and is normal because of the alternating stages of fast and slow growth.

k. Sit the toddler in a high chair at the family table for meals.

l. Allow sufficient time to eat, but remove food when the toddler begins to play with it.

m. The toddler drinks well from a cup held with both hands.

n. Avoid using food as a reward or punishment.

4. Skills

a. The toddler begins to walk with 1 hand held by age 12 to 13 months.

b. The toddler runs by age 2 years and walks backward and hops on 1 foot by age 3 years.

c. The toddler usually cannot alternate feet when climbing stairs.

d. The toddler begins to master fine motor skills for building, undressing, and drawing lines.

e. The young toddler often uses “no” even when he or she means “yes” to assert independence.

f. The toddler begins to use short sentences and has a vocabulary of about 300 words by age 2 years.

5. Bowel and bladder control

a. Certain signs indicate that a toddler is ready for toilet training (Box 18-9).

b. Bowel control develops before bladder control.

c. By age 3 years, the toddler achieves fairly good bowel and bladder control.
d. The toddler may stay dry during the day but may need a diaper at night until about age 4 years.

6. Play

a. The major socializing mechanism is parallel play, and therapeutic play can begin at this age.

b. The toddler has a short attention span, causing the toddler to change toys often.

c. The toddler explores body parts of self and others.

d. Typical toys include push-pull toys, blocks, sand, finger paints and bubbles, large balls, crayons, trucks and dolls, containers, Play-Doh, toy telephones, cloth books, and wooden puzzles.

7. Safety

Toddlers are eager to explore the world around them; they need to be supervised at play to ensure safety.

a. Use back burners on the stove to prepare a meal; turn pot handles inward and toward the middle of the stove.

b. Keep dangling cords from small appliances or other items away from the toddler.

c. Place inaccessible locks on windows and doors, and keep furniture away from windows.

d. Secure screens on all windows.

e. Place safety gates at stairways.

f. Do not allow the toddler to sleep or play in an upper bunk bed.

g. Never leave the toddler alone near a bathtub, pail of water, swimming pool, or any other body of water.

h. Keep toilet lids closed.

i. Keep all medicines, poisons, household plants, and toxic products in high areas and locked out of reach.

j. Keep the Poison Control Center number
C. Preschooler
   1. Physical
      a. The preschooler grows 2.5 to 3 inches (6.5 to 7.5 cm) per year.
      b. Average height is 37 inches (94 cm) at age 3 years, 40.5 inches (103 cm) at age 4 years, and 43 inches (110 cm) at age 5 years.
      c. The preschooler gains approximately 5 pounds (2.25 kg) per year; average weight is 40 pounds (18 kg) at age 5 years.
      d. The preschooler requires about 12 hours of sleep each day.
      e. A security object and a nightlight help with sleeping.
      f. At the beginning of the preschool period, the eruption of the deciduous (primary) teeth is complete.
      g. Regular dental care is essential, and the preschooler may require assistance with brushing and flossing of teeth; fluoride supplements may be necessary if the water is not fluoridated.

2. Vital signs (Box 18-10)
3. Nutrition
   a. Nutritional needs are similar to those required for the toddler, although the daily amounts of minerals, vitamins, and protein may increase with age.
   b. The MyPlate food guide is appropriate for preschoolers (see www.choosemyplate.gov).
   c. The preschooler exhibits food fads and certain taste preferences and may exhibit finicky eating.
   d. By 5 years old, the child tends to focus on social aspects of eating, table conversations, manners, and willingness to try new foods.

4. Skills
   a. The preschooler has good posture.
   b. The child develops fine motor coordination.
   c. The child can hop, skip, and run more
smoothly.
d. Athletic abilities begin to develop.
e. The preschooler demonstrates increased 
skills in balancing.
f. The child alternates feet when climbing 
stairs.
g. The child can tie shoelaces by age 6 
years.
h. The child may talk continuously and 
ask many “why” questions.
i. Vocabulary increases to about 900 
words by age 3 years and to 2100 
words by age 5 years.
j. By age 3 years, the preschooler usually 
talks in 3- or 4-word sentences and 
speaks in short phrases.
k. By age 4 years, the preschooler speaks 
5- or 6-word sentences, and by age 5 
years, speaks in longer sentences that 
contain all parts of speech.
l. The child can be understood readily by 
others and can understand clearly 
what others are saying.

5. Bowel and bladder control

a. By age 4 years, the preschooler has 
daytime control of bowel and bladder 
but may experience bed-wetting 
accidents at night.
b. By age 5 years, the preschooler achieves 
bowel and bladder control, although 
accidents may occur in stressful 
situations.

6. Play

a. The preschooler is cooperative.
b. The preschooler has imaginary 
playmates.
c. The child likes to build and create 
things, and play is simple and 
imaginative.
d. The child understands sharing and is 
able to interact with peers.
e. The child requires regular socialization 
with mates of similar age.
f. Play activities include a large space for 
running and jumping.
g. The preschooler likes dress-up clothes, 
paints, paper, and crayons for creative
expression.
h. Swimming and sports aid in growth development.
i. Puzzles and toys aid with fine motor development.

7. Safety

a. Preschoolers are active and inquisitive.
b. Because of their magical thinking, they may believe that daring feats seen in cartoons are possible and may attempt them.
c. The preschooler can learn simple safety practices because they can follow simple verbal directions and their attention span is longer.
d. Teach the preschooler basic safety rules to ensure safety when playing in a playground such as near swings and ladders.
e. Teach the preschooler never to play with matches or lighters.
f. The preschooler should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the preschooler.
g. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
h. Teach the preschooler his or her full name, address, parents’ names, and telephone number.
i. Teach the preschooler how to dial 911 in an emergency situation.
j. Keep the Poison Control Center number available.

D. School-age child

1. Physical

a. Girls usually grow faster than boys.
b. Growth is about 2 inches (5 cm) per year between ages 6 and 12 years.
c. Height ranges from 45 inches (115 cm) at age 6 years to 59 inches (150 cm) at age 12 years.

d. School-age children gain weight at a rate of about 4.5 to 6.5 pounds (2 to 3 kg) per year.

e. Average weight is 46 pounds (21 kg) at age 6 years and 88 pounds (40 kg) at age 12 years.

f. The first permanent (secondary) teeth erupt around age 6 years, and deciduous teeth are lost gradually.

 Regular dentist visits are necessary, and the school-age child needs to be supervised with brushing and flossing teeth; fluoride supplements may be necessary if the water is not fluoridated.

i. For school-age children with primary and permanent dentition, the best toothbrush is one with soft nylon bristles and an overall length of about 6 inches (15 cm).

j. Sleep requirements range from 10 to 12 hours a night.

2. Vital signs (Box 18-11)

3. Nutrition

 a. School-age children will have increased growth needs as they approach adolescence.

 b. Children require a balanced diet from foods in the MyPlate food guide; healthy snacks should continue to be emphasized to prevent childhood obesity (see www.choosemyplate.gov).

 c. Children still may be picky eaters but are usually willing to try new foods.

4. Skills

 a. School-age children exhibit refinement of fine motor skills.

 b. Development of gross motor skills continues.

 c. Strength and endurance increase.

5. Play

 a. Play is more competitive.

 b. Rules and rituals are important aspects of play and games.

 c. The school-age child enjoys drawing, collecting items, dolls, pets, guessing games, board games, listening to the radio, TV, reading, watching videos or DVDs, and computer games.

 d. The child participates in team sports.

 e. The child may participate in secret clubs, group peer activities, and scout organizations.

6. Safety
a. The school-age child experiences less fear in play activities and frequently imitates real life by using tools and household items.
b. Major causes of injuries include bicycles, skateboards, and team sports as the child increases in motor abilities and independence.
c. Children should always wear a helmet when riding a bike or using in-line skates or skateboards.
d. Teach the child water safety rules.
e. Instruct the child to avoid teasing or playing roughly with animals.
f. Teach the child never to play with matches or lighters.
g. The child should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the child.
h. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
i. Teach the child traffic safety rules.
j. Teach the child how to dial 911 in an emergency situation.
k. Keep the Poison Control Center number available.

Teach the preschooler and school-age child that if another person touches his or her body in an inappropriate way, an adult should be told. Also teach the child to avoid speaking to strangers and never to accept a ride, toys, or gifts from a stranger.

E. Adolescent
1. Physical
   a. Puberty is the maturational, hormonal, and growth process that occurs when the reproductive organs begin to function and the secondary sex characteristics develop.
   b. Body mass increases to adult size.
   c. Sebaceous and sweat glands become active and fully functional.
   d. Body hair distribution occurs.
   e. Increases in height, weight, breast development, and pelvic girth occur in girls.
   f. Menstrual periods occur about 2.5 years after the onset of puberty.
   g. In boys, increases in height, weight,
muscle mass, and penis and testicle size occur.
h. The voice deepens in boys.
i. Normal weight gain during puberty:
   Girls gain 15 to 55 pounds (7 to 25 kg);
   boys gain 15 to 65 pounds (7 to 30 kg).
j. Careful brushing and care of the teeth are important, and many adolescents need to wear braces.
k. Sleep patterns include a tendency to stay up late; therefore, in an attempt to catch up on missed sleep, adolescents sleep late whenever possible; an overall average of 8 hours per night is recommended.

2. Vital signs (Box 18-12)

3. Nutrition

   a. Teaching about the MyPlate food guide is important (see www.choosemyplate.gov).
   b. Adolescents typically eat whenever they have a break in activities.
   c. Calcium, zinc, iron, folic acid, and protein are especially important nutritional needs.
   d. Adolescents tend to snack on empty calories, and the importance of adequate and healthy nutrition needs to be stressed.
   e. Body image is important.

4. Skills

   a. Gross and fine motor skills are well developed.
   b. Strength and endurance increase.

5. Play

   a. Games and athletic activities are the most common forms of play.
   b. Competition and strict rules are important.
   c. Adolescents enjoy activities such as sports, videos, movies, reading, parties, dancing, hobbies, computer games, music, communicating via the
Internet, and experimenting, such as with makeup and hairstyles.
d. Friends are important, and adolescents like to gather in small groups.

6. Safety

a. Adolescents are risk takers.
b. Adolescents have a natural urge to experiment and to be independent.
c. Reinforce instructions about the dangers related to cigarette smoking, caffeine ingestion, alcohol, and drugs.
d. Help adolescents to recognize that they have choices when difficult or potentially dangerous situations arise.
e. Ensure that the adolescent uses a seat belt.
f. Instruct adolescents in the consequences of injuries that motor vehicle accidents can cause.
g. Instruct adolescents in water safety and emphasize that they should enter the water feet first as opposed to diving, especially when the depth of the water is unknown.
h. Instruct adolescents about the dangers associated with guns, violence, and gangs.
i. Instruct adolescents about the complications associated with body piercing, tattooing, and sun tanning.

F. Early adulthood
1. Description: Period between the late teens and mid to late 30s
2. Physical changes
a. Person has completed physical growth
by the age of 20 years.
b. Person is active.
c. Severe illnesses are less common than in older age groups.
d. Person tends to ignore physical symptoms and postpone seeking health care.
e. Lifestyle habits such as smoking, stress, lack of exercise, poor personal hygiene, and family history of disease increase the risk of future illness.

3. Cognitive changes
   a. Person has rational thinking habits.
   b. Conceptual, problem-solving, and motor skills increase.
   c. Person identifies preferred occupational areas.

4. Psychosocial changes
   a. Person separates from family of origin.
   b. Person gives much attention to occupational and social pursuits to improve socioeconomic status.
   c. Person makes decisions regarding career, marriage, and parenthood.
   d. Person is able to adapt to new situations.

5. Sexuality
   a. Person has the emotional maturity to develop mature sexual relationships.
   b. Person is at risk for sexually transmitted infections.

G. Middle adulthood
   1. Description: Period between the mid- to late 30s and mid-60s
   2. Physical changes
      a. Physical changes occur between 40 and 65 years of age.
      b. Individual becomes aware that changes in reproductive and physical abilities signify the beginning of another stage in life.
      c. Menopause occurs in women and climacteric occurs in men.
d. Physiological changes often have an impact on self-concept and body image.
e. Physiological concerns include stress, level of wellness, and the formation of positive health habits.

3. Cognitive changes
   a. Person may be interested in learning new skills.
   b. Person may become involved in educational or vocational programs for entering the job market or for changing careers.

4. Psychosocial changes
   a. Changes may include expected events, such as children moving away from home (postparental family stage), or unexpected events, such as the death of a close friend.
   b. Time and financial demands decrease as children move away from home, and couples face redefining their relationship.
   c. Adults may become grandparents.
   d. Adults are achieving generativity.

5. Sexuality
   a. Many couples renew their relationships and find increased marital and sexual satisfaction.
   b. The onset of menopause and climacteric may affect sexual health.
   c. Stress, health, and medications can affect sexuality.

H. Later adulthood (period between 65 years and death): Refer to Chapter 19.

XII. Gender Dysphoria Across the Life Span
   A. The following section was adapted from Keltner, Steele (2015), pp. 371-372, DSM-5 Criteria
   B. Children
      1. Description: An incongruence between one’s experienced and expressed gender and assigned gender of a duration of at least 6 months and at least two of the following assessment findings; results in clinically significant distress in social, school, or other important areas of functioning.
2. Assessment 
   a. A strong desire or insistence that one is the other gender.
   b. A strong preference for cross-dressing in female attire for boys; a strong preference for wearing masculine attire for girls.
   c. A strong preference for cross-gender roles in make-believe play.
   d. A strong preference for toys, games, or activities used stereotypically by the other gender.
   e. A strong preference for playmates of the other gender.
   f. Avoidance of rough play and masculine toys for boys, and avoidance of feminine toys for girls.

C. Adolescents and Adults 
   1. Description: An incongruence between one’s experienced and expressed gender and assigned gender of a duration of at least 6 months and at least two of the following assessment findings. Results in clinically significant distress in social, occupational, or other important areas of functioning.
   2. Assessment 
      a. Incongruence between expressed gender and sex characteristics.
      b. A strong desire to be rid of one’s sex characteristics because of incongruence with expressed gender.
      c. A strong desire for sex characteristics of the other gender.
      d. A strong desire to be of the other gender.
      e. A strong desire to be treated as the other gender.
      f. A strong conviction that one has the typical feelings and reactions of the other gender.

D. Posttransition 
   1. The individual has transitioned to full-time living in the desired gender.
   2. The individual has undergone or is preparing to undergo at least one cross-sex medical procedure or treatment regimen.

XIII. End-of-Life Care 
   A. Description: End-of-life care relates to death and dying.
B. Legal and ethical issues

1. Outcomes related to care during illness and the dying experience should be based on the client’s wishes.
2. Issues for consideration may include organ and tissue donations, advance directives or other legal documents, withholding or withdrawing treatment, and cardiopulmonary resuscitation.

C. Cultural and religious considerations (Box 18-13)

D. Palliative and hospice care

1. Focuses on caring interventions and symptom management rather than cure for diseases or conditions that no longer respond to treatment and can be required at any age depending on the condition and prognosis.
2. Pain and symptoms are controlled; the dying client should be as pain-free and as comfortable as possible.
3. Provides support and care for clients of any age in the last phases of incurable diseases so that they might live as fully and as comfortably as possible; client and family needs are the focus of any intervention.

E. Near-death physiological manifestations

1. As death approaches, metabolism is reduced, and the body gradually slows down until all functions end.
2. Sensory: The client experiences blurred vision, decreased sense of taste and smell, decreased pain and touch perception, and loss of blink reflex and appears to stare (hearing is believed to be the last sense lost).
3. Respirations
   a. Respirations may be rapid or slow, shallow, and irregular.
   b. Respirations may be noisy and wet sounding (“death rattle”).
   c. Cheyne-Stokes respiration is alternating periods of apnea and deep, rapid breathing.
4. Circulation
   a. Heart rate slows, and blood pressure falls progressively.
   b. Skin is cool to the touch, and the extremities become pale, mottled, and cyanotic.
   c. Skin is wax-like very near death.
5. Urinary output decreases; incontinence may occur.
6. Gastrointestinal motility and peristalsis diminish,
leading to constipation, gas accumulation, and distention; incontinence may occur.

7. Musculoskeletal system: The client gradually loses ability to move, has difficulty speaking and swallowing, and loses the gag reflex.

F. Death

1. Death occurs when all vital organs and body systems cease to function.
2. In general, respirations cease first, and then the heartbeat stops a few minutes thereafter.
3. Brain death occurs when the cerebral cortex stops functioning or is irreversibly damaged.

G. Nursing care

1. Frequency of assessment depends on the client’s stability (at least every 4 hours); as changes occur, assessment needs to be done more frequently.
2. Physical care (Box 18-14)
3. Psychosocial care
   a. Monitor for anxiety and depression.
   b. Monitor for fear (Box 18-15).
   c. Encourage the client and family to express feelings.
   d. Provide support and advocacy for the client and family.
   e. Provide privacy for the client and family.
   f. Provide a private room for the client.
4. See Chapter 67 for information on grief and loss.
5. Postmortem care (Box 18-16)
   a. Maintain respect and dignity for the client.
   b. Determine whether the client is an organ donor; if so, follow appropriate procedures related to the donation.
   c. Consider cultural and religious rituals, state laws, and agency procedures when performing postmortem care.
   d. Prepare the body for immediate viewing by the family.
   e. Provide privacy and time for the family to be with the deceased person.
   f. Medical examiner jurisdiction guidelines are determined by each state and usually include nonnatural, traumatic, or question of criminal involvement deaths; any forensic evidence is preserved and the body is
Box 18-1

General Guidelines for Communication

Allow the child to feel comfortable with the nurse.
Communicate through the use of objects.
Allow the child to express fears and concerns.
Speak clearly and in a quiet, unhurried voice.
Offer choices when possible.
Be honest with the child.
Set limits with the child as appropriate.

**Preventive Services and Screenings: Well-Check Schedule**

• Prenatal visit
• Newborn visit
• First week visit (3 to 5 days)
• 1 month visit
• 2 month visit
• 3 month visit
• 4 month visit
• 6 month visit
• 9 month visit
• 12 month visit
• 15 month visit
• 18 month visit
• 2 year visit
• 2½ year visit
• 3 year visit

• Annual visits from 4 years of age to 18 years of age; thereafter, the child should begin to visit a general practitioner

---

**Box 18-4**

**Guidelines for Administration of Vaccines**

• Follow manufacturer’s recommendations for route of administration, storage, and reconstitution of the vaccine.

• If refrigeration is necessary, store on a central shelf and not on the door; frequent temperature changes from opening the refrigerator door can alter the vaccine’s potency.
A vaccine information statement needs to be given to the parents or individual, and informed consent for administration needs to be obtained.

Check the expiration date on the vaccine bottle.

Parenteral vaccines are given in separate syringes in different injection sites.

Vaccines administered intramuscularly are given in the vastus lateralis muscle (best site) or ventrogluteal muscle (the deltoid can be used for children 36 months of age and older).

Vaccines administered subcutaneously are given in the fatty areas in the lateral upper arms and anterior thighs.

Adequate needle length and gauge are as follows: intramuscular, 1 inch, 23-25 gauge; subcutaneous, {⅝} inch, 25 gauge (needle length may vary depending on the child’s size).

Mild side effects include fever, soreness, swelling, or redness at injection site.

A topical anesthetic may be applied to injection site before the injection.

For painful or red injection sites, advise the parent to apply cool compresses for the first 24 hours, and then use warm or cold compresses as long as needed.

An age-appropriate dose of acetaminophen or ibuprofen, per health care provider’s preference, may be administered every 4 to 6 hours for vaccine-associated discomfort.

Maintain an immunization record—document day, month, year of administration; manufacturer and lot number of vaccine; name, address, and title of person administering the vaccine; and site and route of administration.

A vaccine adverse event report needs to be filed and the health department needs to be notified if an adverse reaction to an immunization occurs.

---

**Box 18-5**

**Recommended Childhood and Adolescent Immunizations: 2018**

**Birth:** Hepatitis B vaccine (HepB)

**1 month:** HepB

**2 months:** Inactivated poliovirus vaccine (IPV); diphtheria, tetanus, acellular pertussis (DTaP) vaccine; *Haemophilus influenzae* type b conjugate vaccine (Hib); pneumococcal conjugate vaccine (PCV), rotavirus (RV)

**4 months:** DTaP, Hib, IPV, PCV, RV

**6 months:** DTaP, Hib, HepB, IPV, PCV, RV (dose may be needed depending on type of vaccine used for first and second doses)

**12-15 months:** Hib; PCV; measles, mumps, rubella (MMR) vaccine; hepatitis A, first dose (second dose is given 6-18 months after the first dose); varicella vaccine

**15-18 months:** DTaP

**18-33 months:** Hepatitis A (second dose given 6-18 months after the first dose)

**4-6 years:** DTaP, IPV, MMR, varicella vaccine
11-12 years: MMR (if not administered at 4-6 years); diphtheria, tetanus, acellular pertussis adolescent preparation (Tdap); meningococcal vaccine (MCV4) with a booster at age 16 years; human papillomavirus (HPV) (first dose to girls at age 11 to 12 years, second dose 2 months after first dose, and third dose 6 months after first dose)

Note: Influenza vaccine is recommended annually for children beginning at age 6 months.

From Centers for Disease Control and Prevention (CDC): Immunization schedules, Atlanta, 2018, CDC. Available at http://www.cdc.gov/vaccines/schedules/index.html.

---

**Box 18-6**

**Vital Signs: Newborn and 1-Year-Old Infant**

Newborn

*Temperature:* Axillary, 96.8° F to 99.0° F (36° C to 37.2° C)
*Apical Heart Rate:* 120-160 beats per minute
*Respirations:* 30-60 (average 40) breaths per minute
*Blood Pressure:* 80-90/40-50 mm Hg

1-Year-Old Infant

*Temperature:* Axillary, 97° F to 99° F (36.1° C to 37.2° C)
*Apical Heart Rate:* 90-130 beats per minute
*Respirations:* 20-40 breaths per minute
*Blood Pressure:* 90/56 mm Hg

---

**Box 18-7**

**Infant Skills**

**2 to 3 Months**

▪ Smiles
▪ Turns head side to side
▪ Follows objects
▪ Holds head in midline

**4 to 5 Months**
- Grasps objects
- Switches objects from hands
- Rolls over for the first time
- Enjoys social interaction
- Begins to show memory
- Aware of unfamiliar surroundings

6 to 7 Months

- Creeps
- Sits with support
- Imitates
- Exhibits fear of strangers
- Holds arms out
- Frequent mood swings
- Waves “bye-bye”

8 to 9 Months

- Sits steadily unsupported
- Crawls
- May stand while holding on
- Begins to stand without help

10 to 11 Months

- Can change from prone to sitting position
- Walks while holding on to furniture
- Stands securely
- Entertains self for periods of time

12 to 13 Months

- Walks with 1 hand held
- Can take a few steps without falling
- Can drink from a cup

14 to 15 Months

- Walks alone
- Can crawl up stairs
- Shows emotions such as anger and affection
Will explore away from mother in familiar surroundings

Box 18-8

The Toddler’s Vital Signs

Temperature: Axillary, 97.5° F to 98.6° F (36.4° C to 37° C)
Apical Heart Rate: 80-120 beats per minute
Respirations: 20-30 breaths per minute
Blood Pressure: Average, 92/55 mm Hg

Box 18-9

Signs of Readiness for Toilet Training

Child is able to stay dry for 2 hours.
Child is waking up dry from a nap.
Child is able to sit, squat, and walk.
Child is able to remove clothing.
Child recognizes the urge to defecate or urinate.
Child expresses willingness to please a parent.
Child is able to sit on the toilet for 5 to 10 minutes without fussing or getting off.

Data from Hockenberry M, Wilson D: Nursing care of infants and children, ed 9, St. Louis, 2011, Mosby.

Box 18-10

The Preschooler’s Vital Signs

Temperature: Axillary, 97.5° F to 98.6° F (36.4° C to 37° C)
Apical Heart Rate: 70-110 beats per minute
Respirations: 16-22 breaths per minute
Blood Pressure: Average, 95/57 mm Hg

Box 18-11

The School-Age Child’s Vital Signs

Temperature: Oral, 97.5° F to 98.6° F (36.4° C to 37° C)
**Apical Heart Rate:** 60-100 beats per minute
**Respirations:** 18-20 breaths per minute
**Blood Pressure:** Average, 107/64 mm Hg

---

**Box 18-12**

**The Adolescent’s Vital Signs**

**Temperature:** Oral, 97.5° F to 98.6° F (36.4° C to 37° C)
**Apical Heart Rate:** 55-90 beats per minute
**Respirations:** 12-20 breaths per minute
**Blood Pressure:** Average, 121/70 mm Hg

---

**Box 18-13**

**Religious and Cultural Beliefs Related to End-of-Life Care**

**Amish**

Funerals are conducted in the home without a eulogy, flower decorations, or any other display; caskets are plain and simple, without adornment. At death, a woman is usually buried in her bridal dress. One is believed to live on after death, with either eternal reward in heaven or punishment in hell. The Amish permit organ donation with the exception of heart transplants (the heart is the soul of the body).

**Catholic and Orthodox**

A priest anoints the sick. Other sacraments before death include reconciliation and Holy Communion.

**Church of Jesus Christ of Latter-day Saints (Mormons)**

A sacrament may be administered if the client requests it.

**Protestant**

No last rites are provided (anointing of the sick is accepted by some groups). Prayers are given to offer comfort and support.

**Jehovah’s Witnesses**
Members are not allowed to receive a blood transfusion. Members believe that the soul cannot live after the body has died.

Islam

Second-degree male relatives such as cousins or uncles should be the contact people and determine whether the client or family should be given information about the client. The client may choose to face Mecca (west or southwest in the United States). The head should be elevated above the body. Discussions about death usually are not welcomed. Stopping medical treatment is against the will of Allah (Arabic word for God). Grief may be expressed through slapping or hitting the body. If possible, only a same-sex Muslim should handle the body after death; if not possible, non-Muslims should wear gloves so as not to touch the body. Some Muslims permit organ transplant for the purpose of saving human life.

Judaism

A client placed on life support should remain so until death. A dying person should not be left alone (a rabbi’s presence is desired). Autopsy and cremation are usually not allowed. Some generally oppose prolonging life after irreversible brain damage.

Hinduism

Rituals include tying a thread around the neck or wrist of the dying person, sprinkling the person with special water, and placing a leaf of basil on the person’s tongue. After death, the sacred threads are not removed, and the body is not washed. Some prefer cremation and desire to cast the ashes in a holy river.

Buddhism

A shrine to Buddha may be placed in the client’s room. Time for meditation at the shrine is important and should be respected. Clients may refuse medications that may alter their awareness (e.g., opioids). After death, a monk may recite prayers for 1 hour (need not be done in the presence of the body). Buddhists in the United States encourage organ donation and consider it an act of mercy.

African Americans

Members discuss issues with the spouse or older family member (elders are
held in high respect). Family is highly valued and is central to the care of terminally ill members. Open displays of emotion are common and accepted. Many prefer to die at home.

**Asian Americans**

Family members usually make decisions about care and often do not tell the client the diagnosis or prognosis. Dying at home may be considered bad luck with some ethnic groups. Organ donation may not be allowed in some ethnic groups.

**Hispanic and Latino groups**

The family generally makes decisions and may request to withhold the diagnosis or prognosis from the client. Extended-family members often are involved in end-of-life care (pregnant women may be prohibited from caring for dying clients or attending funerals). Several family members may be at the dying client’s bedside. Vocal expression of grief and mourning is acceptable and expected. Members may refuse procedures that alter the body, such as autopsy. Dying at home may be considered bad luck with some ethnic groups.

**Native Americans**

Family meetings may be held to make decisions about end-of-life care and the type of treatments that should be pursued. Some groups avoid contact with the dying (may prefer to die in the hospital).

Noted are general cultural and religious considerations in planning care for a client and family. Not all members of a particular cultural or religious group adhere to specified practices. Therefore, it is most important for the nurse to obtain an individualized assessment to provide individualized end-of-life care to the client and family.

---

**Box 18-14**

**Physical Care of the Dying Client**

**Pain**

Administer pain medication. Do not delay or deny pain medication.
Dyspnea

Elevate the head of the bed or position the client on his or her side. 
Administer supplemental oxygen for comfort. 
Suction fluids from the airway as needed. 
Administer medications as prescribed.

Skin

Assess color and temperature. 
Assess for breakdown. 
Implement measures to prevent breakdown.

Dehydration

Maintain regular oral care. 
Encourage taking ice chips and sips of fluid. 
Do not force the client to eat or drink. 
Use moist cloths to provide moisture to the mouth. 
Apply lubricant to the lips and oral mucous membranes.

Anorexia, Nausea, and Vomiting

Provide antiemetics before meals. 
Have family members provide the client’s favorite foods. 
Provide frequent small portions of favorite foods.

Elimination

Monitor urinary and bowel elimination. 
Place absorbent pads under the client and check frequently.

Weakness and Fatigue

Provide rest periods. 
Assess tolerance for activities. 
Provide assistance and support as needed for maintaining bed or chair positions.

Restlessness

Maintain a calm, soothing environment. 
Do not restrain. 
Limit the number of visitors at the client’s bedside (consider cultural practices). 
Allow a family member to stay with the client.
Fear Associated With Dying

Fear of Pain

Fear of pain may occur, based on anxieties related to dying. Do not delay or deny pain relief measures to a terminally ill client.

Fear of Loneliness and Abandonment

Allow family members to stay with the client. Holding hands, touching (if culturally acceptable), and listening to the client are important.

Fear of Being Meaningless

Client may feel hopeless and powerless. Encourage life reviews and focus on the positive aspects of the client’s life.

General Postmortem Procedures

Close the client’s eyes. Replace dentures. Wash the body and change bed linens if needed. Place pads under the perineum. Remove tubes and dressings. Straighten the body and place a pillow under the head in preparation for family viewing.

Practice Questions

157. A 4-year-old child diagnosed with leukemia is hospitalized for chemotherapy. The child is fearful of the hospitalization. Which nursing intervention should be implemented to alleviate the child’s fears?
   1. Encourage the child’s parents to stay with the child.
   2. Encourage play with other children of the same age.
3. Advise the family to visit only during the scheduled visiting hours.
4. Provide a private room, allowing the child to bring favorite toys from home.

158. A 16-year-old client is admitted to the hospital for acute appendicitis and an appendectomy is performed. Which nursing intervention is **most appropriate** to facilitate normal growth and development postoperatively?
   1. Encourage the client to rest and read.
   2. Encourage the parents to room in with the client.
   3. Allow the family to bring in the client’s favorite computer games.
   4. Allow the client to interact with others in his or her same age group.

159. Which car safety device should be used for a child who is 8 years old and 4 feet tall?
   1. Seat belt
   2. Booster seat
   3. Rear-facing convertible seat
   4. Front-facing convertible seat

160. The nurse assesses the vital signs of a 12-month-old infant with a respiratory infection and notes that the respiratory rate is 35 breaths per minute. On the basis of this finding, which action is **most appropriate**?
   1. Administer oxygen.
   2. Document the findings.
   3. Notify the pediatrician.
   4. Reassess the respiratory rate in 15 minutes.

161. The nurse is monitoring a 3-month-old infant for signs of increased intracranial pressure. On palpation of the fontanels, the nurse notes that the anterior fontanel is soft and flat. On the basis of this finding, which nursing action is **most appropriate**?
   1. Increase oral fluids.
   2. Document the finding.
   3. Notify the pediatrician.
   4. Elevate the head of the bed to 90 degrees.

162. The nurse is evaluating the developmental level of a 2-year-old. Which does the nurse expect to observe in this child?
   1. Uses a fork to eat
   2. Uses a cup to drink
   3. Pours own milk into a cup
   4. Uses a knife for cutting food

163. A 2-year-old child is treated in the emergency department for a burn to the chest and abdomen. The child sustained the burn by grabbing a cup of hot coffee that was left on the kitchen counter. The nurse reviews safety principles with the parents before discharge. Which statement by the parents indicates an understanding of measures to provide safety in the home?
   1. “We will be sure not to leave hot liquids unattended.”
   2. “I guess our children need to understand what the word hot means.”
   3. “We will be sure that the children stay in their rooms when we
work in the kitchen.”
4. “We will install a safety gate as soon as we get home so the children cannot get into the kitchen.”

164. A mother arrives at a clinic with her toddler and tells the nurse that she has a difficult time getting the child to go to bed at night. What measure is most appropriate for the nurse to suggest to the mother?
1. Allow the child to set bedtime limits.
2. Allow the child to have temper tantrums.
3. Avoid letting the child nap during the day.
4. Inform the child of bedtime a few minutes before it is time for bed.

165. The mother of a 3-year-old is concerned because her child still is insisting on a bottle at nap time and at bedtime. Which is the most appropriate suggestion to the mother?
1. Allow the bottle if it contains juice.
2. Allow the bottle if it contains water.
3. Do not allow the child to have the bottle.
4. Allow the bottle during naps but not at bedtime.

166. The nurse is preparing to care for a 5-year-old who has been placed in traction following a fracture of the femur. The nurse plans care, knowing that which is the most appropriate activity for this child?
1. A radio
2. A sports video
3. Large picture books
4. Crayons and a coloring book

167. The mother of a 3-year-old asks a clinic nurse about appropriate and safe toys for the child. The nurse should tell the mother that the most appropriate toy for a 3-year-old is which?
1. A wagon
2. A golf set
3. A farm set
4. A jack set with marbles

168. Which interventions are appropriate for the care of an infant? Select all that apply.

☐ 1. Provide swaddling.
☐ 2. Talk in a loud voice.
☐ 3. Provide the infant with a bottle of juice at nap time.
☐ 4. Hang mobiles with black and white contrast designs.
☐ 5. Caress the infant while bathing or during diaper changes.
☐ 6. Allow the infant to cry for at least 10 minutes before responding.

169. The nurse is preparing to care for a dying client, and several family members are at the client’s bedside. Which therapeutic techniques should the nurse use when communicating with the family? Select all that apply.
1. Discourage reminiscing.
2. Make the decisions for the family.
3. Encourage expression of feelings, concerns, and fears.
4. Explain everything that is happening to all family members.
5. Touch and hold the client’s or family member’s hand if appropriate.
6. Be honest and let the client and family know they will not be abandoned by the nurse.

170. An infant receives a diphtheria, tetanus, and acellular pertussis (DTaP) immunization at a well-baby clinic. The parent returns home and calls the clinic to report that the infant has developed swelling and redness at the site of injection. Which intervention should the nurse suggest to the parent?
   1. Monitor the infant for a fever.
   2. Bring the infant back to the clinic.
   3. Apply a hot pack to the injection site.
   4. Apply a cold pack to the injection site.

171. A child is receiving a series of the hepatitis B vaccine and arrives at the clinic with his parent for the second dose. Before administering the vaccine, the nurse should ask the child and parent about a history of a severe allergy to which substance?
   1. Eggs
   2. Penicillin
   3. Sulfonamides
   4. A previous dose of hepatitis B vaccine or component

172. A parent brings her 4-month-old infant to a well-baby clinic for immunizations. The child is up to date with the immunization schedule. The nurse should prepare to administer which immunizations to this infant?
   1. Varicella, hepatitis B vaccine (HepB)
   2. Diphtheria, tetanus, acellular pertussis (DTaP); measles, mumps, rubella (MMR); inactivated poliovirus vaccine (IPV)
   3. MMR, Haemophilus influenzae type b (Hib), DTaP
   4. DTaP, Hib, IPV, pneumococcal vaccine (PCV), rotavirus vaccine (RV)

173. The clinic nurse is assessing a child who is scheduled to receive a live virus vaccine (immunization). What are the general contraindications associated with receiving a live virus vaccine? Select all that apply.
   1. The child has symptoms of a cold.
   2. The child had a previous anaphylactic reaction to the vaccine.
   3. The mother reports that the child is having intermittent episodes of diarrhea.
   4. The mother reports that the child has not had an appetite and has been fussy.
5. The child has a disorder that caused a severely deficient immune system.

6. The mother reports that the child has recently been exposed to an infectious disease.

Answers

157. Answer: 1

**Rationale:** Although the preschooler already may be spending some time away from parents at a day care center or preschool, illness adds a stressor that makes separation more difficult. The child may ask repeatedly when parents will be coming for a visit or may constantly want to call the parents. Options 3 and 4 increase stress related to separation anxiety. Option 2 is unrelated to the subject of the question and, in addition, may not be appropriate for a child who may be immunocompromised and at risk for infection.

**Test-Taking Strategy:** Note that the subject relates to the child’s fear. Options 3 and 4 will increase anxiety and fear further and should be eliminated. Bearing the subject of the question in mind and considering the child’s diagnosis will assist you in eliminating option 2.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Caring

**Content Area:** Developmental Stages: Preschool and School Age

**Health Problem:** Pediatric-Specific: Cancers

**Priority Concepts:** Anxiety; Development

158. Answer: 4

**Rationale:** Adolescents often are not sure whether they want their parents with them when they are hospitalized. Because of the importance of their peer group, separation from friends is a source of anxiety. Ideally, the members of the peer group will support their ill friend. Options 1, 2, and 3 isolate the client from the peer group.

**Test-Taking Strategy:** Note the strategic words, most appropriate. Consider the psychosocial needs of the adolescent and remember that the peer group is very important. Options 1, 2, and 3 are comparable or alike in that they isolate the client from his or her own peer group.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Caring

**Content Area:** Developmental Stages: Adolescent

**Health Problem:** Pediatric-Specific: Appendicitis

**Priority Concepts:** Development; Health Promotion

159. **Answer:** 2

**Rationale:** All children whose weight or height is above the forward-facing limit for their car safety seat should use a belt-positioning booster seat until the vehicle seat belt fits properly, typically when they have reached 4 feet, 9 inches in height (145 cm) and are between 8 and 12 years of age. Infants should ride in a car in a semireclined, rear-facing position in an infant-only seat or a convertible seat until they weigh at least 20 pounds (9 kg) and are at least 1 year of age. The transition point for switching to the forward-facing position is defined by the manufacturer of the convertible car safety seat but is generally at a body weight of 9 kilograms (20 pounds) and 1 year of age.

**Test-Taking Strategy:** Focus on the **subject**, car safety, and note the age and height of the child to identify the appropriate safety device. Remember that children should remain in a booster seat until they are 8 to 12 years old and at least 4 feet, 9 inches (145 cm) tall.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Foundations of Care: Safety  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Safety  
**References:** Hockenberry, Wilson, Rodgers (2017), pp. 252-253.  
https://www.healthychildren.org/English/safety-prevention/on-the-go/Pages/Car-Safety-Seats-Information-for-Families.aspx

160. **Answer:** 2

**Rationale:** The normal respiratory rate in a 12-month-old infant is 20 to 40 breaths per minute. The normal apical heart rate is 90 to 130 beats per minute, and the average blood pressure is 90/56 mm Hg. The nurse would document the findings.

**Test-Taking Strategy:** Focus on the **data in the question** and note the strategic **words, most appropriate.** Recalling the normal vital signs of an infant and noting that the respiratory rate identified in the question is within the normal range will direct you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Developmental Stages: Infant  
**Health Problem:** N/A  
**Priority Concepts:** Clinical Judgment; Gas Exchange  

161. **Answer:** 2

**Rationale:** The anterior fontanel is diamond-shaped and located on the top of the head. The fontanel should be soft and flat in a normal infant, and it normally closes by 12 to 18 months of age. The nurse would document the finding because it is
normal. There is no useful reason to increase oral fluids, notify the pediatrician, or elevate the head of the bed to 90 degrees.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*, and the words *soft* and *flat*. This should provide you with the clue that this is a normal finding. A bulging or tense fontanel may result from crying or increased intracranial pressure.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Developmental Stages: Infant

**Health Problem:** N/A

**Priority Concepts:** Development; Intracranial Regulation

162. **Answer:** 2

**Rationale:** By age 2 years, the child can use a cup and spoon correctly but with some spilling. By age 3 to 4 years, the child begins to use a fork. By the end of the preschool period, the child should be able to pour milk into a cup and begin to use a knife for cutting.

**Test-Taking Strategy:** Focus on the **subject**, the developmental level of a 2-year-old. Option 4 can be eliminated first because of the word *knife*. Next, think about the fine motor skills that need to be developed in selecting the correct option. With this in mind, eliminate options 1 and 3.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Developmental Stages: Toddler

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Development

163. **Answer:** 1

**Rationale:** Toddlers, with their increased mobility and development of motor skills, can reach hot water or hot objects placed on counters and stoves and can reach open fires or stove burners above their eye level. The nurse should encourage parents to remain in the kitchen when preparing a meal, use the back burners on the stove, and turn pot handles inward and toward the middle of the stove. Hot liquids should never be left unattended or within the child’s reach, and the toddler should always be supervised. The statements in options 2, 3, and 4 do not indicate an understanding of the principles of safety.

**Test-Taking Strategy:** Note the words *indicates an understanding*. Option 2 can be eliminated because it is mandating that the toddler understand what is and is not safe. The toddler is not developmentally able to understand danger. Options 3 and 4 are comparable or alike in that they isolate the child from the environment. The correct option is the only one that reflects an understanding of safety principles by the parents.
164. **Answer:** 4

**Rationale:** Toddlers often resist going to bed. Bedtime protests may be reduced by establishing a consistent before-bedtime routine and enforcing consistent limits regarding the child’s bedtime behavior. Informing the child of bedtime a few minutes before it is time for bed is the most appropriate option. Most toddlers take an afternoon nap and, until their second birthday, also may require a morning nap. Firm, consistent limits are needed for temper tantrums or when toddlers try stalling tactics.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*, and focus on the **subject**, the toddler. Eliminate options 1, 2, and 3 by using concepts related to growth and development. Remember that preparing the toddler for an event will minimize resistive behavior.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Developmental Stages: Toddler

**Health Problem:** N/A

**Priority Concepts:** Client Education; Development

165. **Answer:** 2

**Rationale:** A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries. If a bottle is allowed at nap time or bedtime, it should contain only water.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*. Eliminate options 3 and 4 first because they are comparable or alike statements. From the remaining options, recalling that nursing (bottle-mouth) caries is a concern in a child will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Developmental Stages: Toddler

**Health Problem:** N/A

**Priority Concepts:** Development; Safety

**Reference:** McKinney et al. (2018), pp. 94-95.
166. **Answer:** 4

**Rationale:** In the preschooler, play is simple and imaginative and includes activities such as crayons and coloring books, puppets, felt and magnetic boards, and Play-Doh. A radio or a sports video is most appropriate for the adolescent. Large picture books are most appropriate for the infant.

**Test-Taking Strategy:** Note the **strategic words**, most appropriate. Note the age of the child, and think about the age-related activity that would be most appropriate. Eliminate options 1 and 2, knowing that they are most appropriate for the adolescent. From the remaining options, the word large in option 3 should provide you with the clue that this activity would be more appropriate for a child younger than age 5 years.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Planning

**Content Area:** Developmental Stages: Preschool and School Age

**Health Problem:** Pediatric-Specific: Fractures

**Priority Concepts:** Coping; Development

167. **Answer:** 1

**Rationale:** Toys for the toddler must be strong, safe, and too large to swallow or place in the ear or nose. Toddlers need supervision at all times. Push-pull toys, large balls, large crayons, large trucks, and dolls are some of the appropriate toys. A farm set, a golf set, and jacks with marbles may contain items that the child could swallow.

**Test-Taking Strategy:** Note the **strategic words**, most appropriate, and focus on the subject, the appropriate toy for a 3-year-old. Options 2, 3, and 4 can be eliminated because they are comparable or alike and could contain items that the child could swallow. Remember that large and strong toys are safest for the toddler.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Developmental Stages: Toddler

**Health Problem:** N/A

**Priority Concepts:** Development; Safety

168. **Answer:** 1, 4, 5

**Rationale:** Holding, caressing, and swaddling provide warmth and tactile stimulation for the infant. To provide auditory stimulation, the nurse should talk to the infant in a soft voice and should instruct the mother to do so also. Additional interventions include playing a music box, radio, or television, or having a ticking clock or metronome nearby. Hanging a bright shiny object in midline within 20 to 25 cm of the infant’s face and hanging mobiles with contrasting colors, such as black...
and white, provide visual stimulation. Crying is an infant’s way of communicating; therefore, the nurse would respond to the infant’s crying. The mother is taught to do so also. An infant or child should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or another sweet liquid because of the risk of nursing (bottle-mouth) caries.

**Test-Taking Strategy:** Focus on the subject, care of the infant. Noting the word loud and the words at least 10 minutes before responding will assist in eliminating these interventions. Also, recalling the concerns related to dental caries will assist in eliminating option 3.

**Level of Cognitive Ability:** Applying
**Client Needs:** Health Promotion and Maintenance
**Integrated Process:** Nursing Process—Implementation
**Content Area:** Developmental Stages: Infant
**Health Problem:** N/A
**Priority Concepts:** Development; Safety

169. **Answer:** 3, 5, 6

**Rationale:** The nurse must determine whether there is a spokesperson for the family and how much the client and family want to know. The nurse needs to allow the family and client the opportunity for informed choices and assist with the decision-making process if asked. The nurse should encourage expression of feelings, concerns, and fears and reminiscing. The nurse needs to be honest and let the client and family know they will not be abandoned. The nurse should touch and hold the client’s or family member’s hand, if appropriate.

**Test-Taking Strategy:** Use therapeutic communication techniques and recall client and family rights to assist in directing you to the correct options.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Psychosocial Integrity
**Integrated Process:** Caring
**Content Area:** Developmental Stages: End-of-Life Care
**Health Problem:** N/A
**Priority Concepts:** Family Dynamics; Palliation
**Reference:** Potter et al. (2017), pp. 761-762.

170. **Answer:** 4

**Rationale:** On occasion, tenderness, redness, or swelling may occur at the site of the DTaP injection. This can be relieved with cold packs for the first 24 hours, followed by warm or cold compresses if the inflammation persists. Bringing the infant back to the clinic is unnecessary. Option 1 may be an appropriate intervention but is not specific to the subject of the question, a localized reaction at the injection site. Hot packs are not applied and can be harmful by causing burning of the skin.

**Test-Taking Strategy:** Focus on the subject, a localized reaction at the injection site. Option 1 can be eliminated first because it does not relate specifically to the subject of the question. Eliminate option 2 next as an unnecessary intervention. From
the remaining options, general principles related to the effects of heat and cold will direct you to the correct option. Also noting the word *hot* in option 3 will assist in eliminating this option.

*Level of Cognitive Ability:* Applying  
*Client Needs:* Physiological Integrity  
*Integrated Process:* Nursing Process—Implementation  
*Content Area:* Pediatrics: Infectious/Communicable Diseases  
*Health Problem:* Pediatric-Specific: Immunizations  
*Priority Concepts:* Client Education; Health Promotion  

171. **Answer:** 4

**Rationale:** A contraindication to receiving the hepatitis B vaccine is a previous anaphylactic reaction to a previous dose of hepatitis B vaccine or to a component (aluminum hydroxide or yeast protein) of the vaccine. An allergy to eggs, penicillin, and sulfonamides is unrelated to the contraindication to receiving this vaccine.

*Test-Taking Strategy:* Focus on the subject, a contraindication to receiving the hepatitis B vaccine. Note the relationship of the words *hepatitis B vaccine* in the question and the correct option.

*Level of Cognitive Ability:* Analyzing  
*Client Needs:* Physiological Integrity  
*Integrated Process:* Nursing Process—Assessment  
*Content Area:* Pediatrics: Infectious/Communicable Diseases  
*Health Problem:* Pediatric-Specific: Immunizations  
*Priority Concepts:* Clinical Judgment; Safety  

172. **Answer:** 4

**Rationale:** DTaP, Hib, IPV, PCV, and RV are administered at 4 months of age. DTaP is administered at 2, 4, and 6 months of age; at 15 to 18 months of age; and at 4 to 6 years of age. Hib is administered at 2, 4, and 6 months of age and at 12 to 15 months of age. IPV is administered at 2, 4, and 6 months of age and at 4 to 6 years of age. PCV is administered at 2, 4, and 6 months of age and at 12 to 15 months of age. The first dose of MMR vaccine is administered at 12 to 15 months of age; the second dose is administered at 4 to 6 years of age (if the second dose was not given by 4 to 6 years of age, it should be given at the next visit). The first dose of HepB is administered at birth, the second dose is administered at 1 month of age, and the third dose is administered at 6 months of age. Varicella-zoster vaccine is administered at 12 to 15 months of age and again at 4 to 6 years of age.

*Test-Taking Strategy:* Focus on the subject, immunization schedule for a 4-month-old infant, and use knowledge regarding the immunization schedule to answer this question. Noting the age of the infant will assist in directing you to the correct
option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Pediatrics: Infectious/Communicable Diseases  
**Health Problem:** Pediatric-Specific: Immunizations  
**Priority Concepts:** Development; Health Promotion  
**References:** Centers for Disease Control and Prevention (CDC), 

173. **Answer:** 2, 5

**Rationale:** The general contraindications for receiving live virus vaccines include a previous anaphylactic reaction to a vaccine or a component of a vaccine. In addition, live virus vaccines generally are not administered to individuals with a severely deficient immune system, individuals with a severe sensitivity to gelatin, or pregnant women. A vaccine is administered with caution to an individual with a moderate or severe acute illness, with or without fever. Options 1, 3, 4, and 6 are not contraindications to receiving a vaccine.

**Test-Taking Strategy:** Focus on the **subject**, contraindications for a live virus vaccine. This indicates that you need to select the situations in which a live virus vaccine cannot be given because doing so can cause harm to the child. Noting the word *anaphylactic* in option 2 and the words *severely deficient* in option 5 will direct you to these options.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Infectious/Communicable Diseases  
**Health Problem:** Pediatric-Specific: Immunizations

CHAPTER 19

Care of the Older Client

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Development, Safety

I. Aging and Gerontology
   A. Aging is the biopsychosocial process of change that occurs in a person between birth and death.
   B. Gerontology is the study of the aging process.

II. Physiological Changes
   A. Integumentary system
      1. Loss of pigment in hair and skin
      2. Wrinkling of the skin
      3. Thinning of the epidermis and easy bruising and tearing of the skin
      4. Decreased skin turgor, elasticity, and subcutaneous fat
      5. Increased nail thickness and decreased nail growth
      6. Decreased perspiration
      7. Dry, itchy, scaly skin
      8. Seborrheic dermatitis and keratosis formation (overgrowth and thickening of certain areas of the skin)
   B. Neurological system
      1. Slowed reflexes
      2. Slight tremors and difficulty with fine motor movement
      3. Loss of balance
      4. Increased incidence of awakening after sleep onset
      5. Increased susceptibility to hypothermia and hyperthermia
      6. Short-term memory decline possible
      7. Long-term memory usually maintained
   C. Musculoskeletal system
      1. Decreased muscle mass and strength and atrophy of muscles
2. Decreased mobility, range of motion, flexibility, coordination, and stability
3. Change of gait, with shortened step and wider base
4. Posture and stature changes causing a decrease in height, also known as kyphosis (Fig. 19-1)
5. Increased brittleness of the bones due to demineralization
6. Deterioration of joint capsule components

The older client is at risk for falls because of the changes that occur in the neurological and musculoskeletal systems.

D. Cardiovascular system
1. Diminished energy and endurance, with lowered tolerance to exercise
2. Decreased compliance of the heart muscle can be due to remodeling of the heart after myocardial infarction or long-standing hypertension, with heart valves becoming thicker and more rigid due to calcification
3. Decreased cardiac output and decreased efficiency of blood return to the heart
4. Decreased compensatory response, so less able to respond to increased demands on the cardiovascular system
5. Decreased resting heart rate, which may be medication-related
6. Peripheral pulses can be weak due to lower cardiac output
7. Increased blood pressure but susceptible to postural hypotension, especially with certain cardiac medications such as diuretics

E. Respiratory system
1. Decreased stretch and compliance of the chest wall
2. Decreased strength and function of respiratory muscles
3. Decreased size and number of alveoli
4. Respiratory rate usually unchanged
5. Decreased depth of respirations
6. Decreased ability to cough and expectorate sputum

F. Hematological system
1. Hemoglobin and hematocrit levels average toward the
low end of normal

2. Prone to increased blood clotting

3. Decreased protein available for protein-bound medications

G. Immune system
1. Tendency for lymphocyte counts to be low with altered immunoglobulin production

2. Decreased resistance to infection and disease

H. Gastrointestinal system
1. Decreased caloric needs because of lowered basal metabolic rate

2. Decreased appetite, thirst, and oral intake

3. Decreased lean body weight

4. Slowed gastric motility

5. Increased tendency toward constipation due to poor oral intake and slowed motility

6. Increased susceptibility for dehydration

7. Tooth loss

8. Difficulty in chewing and swallowing food

I. Endocrine system
1. Decreased secretion of hormones, with specific changes related to each hormone’s function

2. Decreased metabolic rate

3. Decreased glucose tolerance, with resistance to insulin in peripheral tissues

J. Renal/urinary system
1. Decreased kidney size, function, and ability to concentrate urine

2. Decreased glomerular filtration rate

3. Decreased capacity of the bladder

4. Increased residual urine and increased incidence of infection and possibly incontinence

5. Impaired medication excretion

K. Reproductive system
1. Decreased testosterone production and decreased size of the testes

2. Changes in the prostate gland, leading to urinary problems such as retention, hesitancy, or stress incontinence, predisposing to urinary tract infections

3. Decreased secretion of hormones with the cessation of menses

601
4. Vaginal changes, including decreased muscle tone and lubrication
5. Impotence or sexual dysfunction for both sexes; sexual function varies and depends on general physical condition, mental health status, and medications

L. Special senses
1. Decreased visual acuity
2. Decreased accommodation in eyes, requiring increased adjustment time to changes in light
3. Decreased peripheral vision and increased sensitivity to glare
4. Presbyopia and cataract formation
5. Possible loss of hearing ability; low-pitched tones are heard more easily
6. Inability to discern taste of food
7. Decreased sense of smell
8. Changes in touch sensation
9. Decreased pain awareness

III. Psychosocial Concerns
A. Adjustment to deterioration in physical and mental health and well-being
B. Threat to independent functioning and fear of becoming a burden to loved ones
C. Adjustment to retirement and loss of income
D. Loss of skills and competencies developed early in life
E. Coping with changes in role function and social life
F. Diminished quantity and quality of relationships and coping with loss
G. Dependence on governmental and social systems
H. Access to social support systems
I. Costs of health care and medications
J. Loss of independence in living, driving, and other daily functions

IV. Mental Health Concerns
A. Depression: The increased dependency that older adults may experience can lead to hopelessness, helplessness, lowered sense of self-control, and decreased self-esteem and self-worth; these changes can interfere with daily functioning and lead to depression.
B. Grief: Client reacts to the perception of loss, including physical, psychological, social, and spiritual aspects.
C. Isolation: Client is alone and desires contact with others but is unable to make that contact.
D. Suicide: Depression can lead to thoughts of self-harm.
E. Depression differs from delirium and dementia (Table 19-1).

Any suicide threat made by an older client should be taken seriously.

V. Pain

A. Description
1. Pain can occur from numerous causes and most often occurs from degenerative changes in the musculoskeletal system.
2. The nurse needs to monitor the older client closely for signs of pain; failure to alleviate pain in the older client can lead to functional limitations affecting his or her ability to function independently.

B. Assessment
1. Restlessness
2. Verbal reporting of pain
3. Agitation
4. Moaning
5. Crying

C. Interventions
1. Monitor the client for signs and symptoms of pain.
2. Identify the type and pattern of pain.
3. Identify the precipitating factor(s) for the pain.
4. Monitor the impact of the pain on activities of daily living.
5. Set realistic goals for pain management, and use functional outcome as a measure of attaining the goal.
6. Provide pain relief through measures such as distraction, relaxation, massage, biofeedback, ice, heat, and stretching.
7. Administer pain medication as prescribed, and instruct the client in its use. Opioid use should be avoided as much as possible.
8. Over-the-counter preparations such as acetaminophen, ibuprofen, lidocaine patches, and creams may be prescribed.
9. Evaluate the effects of pain-reducing measures.

VI. Infection (Box 19-1)

A. Altered mental status is a common sign of infection in the older adult, especially infection of the urinary tract.
B. Carefully monitor the older adult with infection because of the diminished and altered immune response.
C. Nonspecific symptoms may indicate illness or infection (see Box 19-1).

VII. Medications
A. Major problems with prescriptive medications include adverse effects, medication interactions, medication errors, nonadherence, polypharmacy, and cost. See Box 19-2 for information on medications to avoid in the older adult client. This information is based on Beers Criteria from the American Geriatrics Society. Information on this criteria and a full list of medications to avoid can be located at https://geriatricscareonline.org/ProductAbstract/american-geriatrics-society-updated-beers-criteria-for-potentially-inappropriate-medication-use-in-older-adults/CL001

B. Determine the use of over-the-counter medications.

C. Polypharmacy

1. Routinely monitor the number of prescription and nonprescription medications used and determine whether any can be eliminated or combined.
2. Keep the use of medications to a minimum.
3. Overprescribing medications leads to increased problems with more side and adverse effects, increased interaction between medications, duplication of medication treatment, diminished quality of life, and increased costs.

D. Medication dosages normally are prescribed at one-third to one-half of normal adult dosages.

E. Closely monitor the client for adverse effects and response to therapy because of the increased risk for medication toxicity (see Box 19-2).

F. Assess for medication interactions in the client taking multiple medications.

G. Advise the client to use one pharmacy and notify the consulting primary health care provider(s) of the medications taken.

H. Safety measures for medication administration (see Priority Nursing Actions box)

1. The client should be in a sitting position when taking medication.
2. The mouth is checked for dryness because medication may stick and dissolve in the mouth.
3. Liquid preparations can be used if the client has difficulty swallowing tablets.
4. Tablets can be crushed if necessary and given with textured food (nectar, applesauce) if not contraindicated.

A common sign of an adverse reaction to a medication in the older client is a sudden change in mental status.
5. Enteric-coated tablets are not crushed, and capsules are not opened.

6. If administering a suppository, avoid inserting the suppository immediately after removing it from the refrigerator; a suppository may take a while to dissolve because of decreased body core temperature.

7. When administering parenteral solution or medication, monitor the site because it may ooze or bleed because of decreased tissue elasticity; an immobile limb is not used for administering parenteral medication.

8. Monitor client adherence with taking prescribed medications.

9. Monitor the client for safety in correctly taking medications, including an assessment of his or her ability to read the instructions and discriminate among the pills and their colors and shapes.

10. Use a medication cassette or checklists/schedules to facilitate proper administration of medication.

11. Encourage client to keep a complete and up-to-date list of medications with them at all times.

12. Educate the client on each medication, common side effects, and when to notify the primary health care provider.

13. Allow time for the client to ask questions, and use the teach-back method when appropriate. Include support persons in the teaching.

### Priority Nursing Actions

**Administering Oral Medications to a Client at Risk for Aspiration**

1. Check the medication prescription and compare against the medical record. Clarify any incomplete prescriptions prior to administration. Check the rights of medication administration.

2. Review pertinent information related to the medication and any related nursing considerations, such as laboratory parameters.

3. Assess for any contraindications to the administration of oral medications, such as NPO (nothing by mouth) status or decreased level of consciousness.

4. Place the client in a sitting position. Assess aspiration risk using a screening tool or per agency policy. Check for an ability to swallow and cough on command. Check for the presence of a gag reflex. Following this assessment, if aspiration is a serious concern, the nurse would collaborate with the primary health care provider and speech therapist before administering the medication.

5. Prepare the medication in the form that is easiest to swallow, checking the rights of medication administration again. Mix medications whole or crush medications and mix with applesauce or pudding if indicated (use sugar-free and low carbohydrate products for clients with diabetes). Do not crush sustained-release tablets, and use liquid preparations when possible. Thicken liquids when indicated, and avoid the use of straws.

6. Check the rights of medication administration one more time, and administer the medications 1 at a time in the prepared form, ensuring that the client has effectively swallowed everything. Ensure that the client is comfortable and safe, and document the medications given using an electronic system or per agency policy.
VIII. Mistreatment of the Older Adult

A. Domestic mistreatment takes place in the home of the older adult and is usually carried out by a family member or significant other; this can include physical, psychological, financial, and sexual maltreatment, neglect, or abandonment.

B. Institutional mistreatment takes place when an older adult experiences abuse when hospitalized or living somewhere other than home (e.g., long-term care facility).

C. Self-neglect is the choice by a mentally competent individual to avoid medical care or other services that could improve optimal function, to not care for oneself, and to engage in actions that negatively affect his or her personal safety; unless declared legally incompetent, an individual has the right to refuse care.

Individuals at most risk for abuse include those who are dependent because of their immobility or altered mental status.

D. For additional information on abuse of the older client, see Chapter 67.
FIG. 19-1 A normal spine at 40 years of age and osteoporotic changes at 60 and 70 years of age. These changes can cause a loss of as much as 6 inches (15 cm) in height and can result in the so-called dowager’s hump (far right) in the upper thoracic vertebrae.

Table 19-1

Differentiating Delirium, Depression, and Dementia
### Box 19-1

#### Nonspecific Symptoms That Possibly Indicate Illness or Infection

- Anorexia
- Apathy
- Changes in functional status
- Altered mental status, including delirium
- Tachypnea
- Hyperglycemia
- Dyspnea
- Falling
- Fatigue
- Incontinence
- Self-neglect
- Shortness of breath
- Blood pressure below baseline

### Box 19-2

#### Medications to Avoid in the Older Client

Analgesics
• Indomethacin
• Ketorolac
• Nonsteroidal antiinflammatory drugs (NSAIDs)
• Meperidine

Antidepressants

• First-generation tricyclic antidepressants

Antihistamines

• First-generation antihistamines

Antihypertensives

• Alpha\textsubscript{1}-blockers
• Centrally acting alpha\textsubscript{2}-agonists

Urge Incontinence Medications

• Oxybutynin
• Tolterodine

Muscle Relaxants

• Carisoprodol
• Cyclobenzaprine
• Metaxalone
• Methocarbamol

Sedative-Hypnotics

• Barbiturates
• Benzodiazepines

Reference

Based on Beers Criteria from the American Geriatrics Society. Information on this criteria and a full list of medications to avoid can be located at https://geriatricscareonline.org/ProductAbstract/american-geriatrics-society-updated-beers-criteria-for-potentially-inappropriate-medication-use-in-older-adults/CL001
Practice Questions

174. The nurse is providing medication instructions to an older client who is taking digoxin daily. The nurse explains to the client that decreased lean body mass and decreased glomerular filtration rate, which are age-related body changes, could place the client at risk for which complication with medication therapy?

1. Decreased absorption of digoxin
2. Increased risk for digoxin toxicity
3. Decreased therapeutic effect of digoxin
4. Increased risk for side effects related to digoxin

175. The nurse is caring for an older client in a long-term care facility. Which action contributes to encouraging autonomy in the client?

1. Planning meals
2. Decorating the room
3. Scheduling haircut appointments
4. Allowing the client to choose social activities

176. The home care nurse is visiting an older client whose spouse died 6 months ago. Which behaviors by the client indicates effective coping? Select all that apply.

- [ ] 1. Neglecting personal grooming
- [ ] 2. Looking at old snapshots of family
- [ ] 3. Participating in a senior citizens program
- [ ] 4. Visiting the spouse’s grave once a month
- [ ] 5. Decorating a wall with the spouse’s pictures and awards received

177. The nurse is providing instructions to the assistive personnel (AP) regarding care of an older client with hearing loss. What should the nurse tell the AP about older clients with hearing loss?

1. They are often distracted.
2. They have middle ear changes.
3. They respond to low-pitched tones.
4. They develop moist cerumen production.

178. The nurse is providing an educational session to new employees, and the topic is abuse of the older client. The nurse helps the employees identify which client as most typically a victim of abuse?

1. A man who has moderate hypertension
2. A man who has newly diagnosed cataracts
3. A woman who has advanced Parkinson’s disease
4. A woman who has early diagnosed Lyme disease

179. The nurse is performing an assessment on an older client who is having difficulty sleeping at night. Which statement by the client indicates the need for further teaching regarding measures to improve sleep?

1. “I swim 3 times a week.”
2. “I have stopped smoking cigars.”
3. “I drink hot chocolate before bedtime.”
4. “I read for 40 minutes before bedtime.”

180. The visiting nurse observes that the older male client is confined by his daughter-in-law to his room. When the nurse suggests that he walk to the den and join the family, he says, “I’m in everyone’s way; my daughter-in-law needs me to stay here.” Which is the most important action for the nurse to take?

1. Say to the daughter-in-law, “Confining your father-in-law to his room is inhumane.”
2. Suggest to the client and daughter-in-law that they consider a nursing home for the client.
3. Say nothing, because it is best for the nurse to remain neutral and wait to be asked for help.
4. Suggest appropriate resources to the client and daughter-in-law, such as respite care and a senior citizens center.

181. The nurse is performing an assessment on an older adult client. Which assessment data would indicate a potential complication associated with the skin?

1. Crusting
2. Wrinkling
3. Deepening of expression lines
4. Thinning and loss of elasticity in the skin

182. The home health nurse is visiting a client for the first time. While assessing the client’s medication history, it is noted that there are 19 prescriptions and several over-the-counter medications that the client has been taking. Which intervention should the nurse take first?

1. Check for medication interactions.
2. Determine whether there are medication duplications.
3. Determine whether a family member supervises medication administration.
4. Call the prescribing primary health care provider (PHCP) and report polypharmacy.

183. The long-term care nurse is performing assessments on several of the residents. Which are normal age-related physiological changes the nurse should expect to note? Select all that apply.

[ ] 1. Increased heart rate
[ ] 2. Decline in visual acuity
[ ] 3. Decreased respiratory rate
[ ] 4. Decline in long-term memory
[ ] 5. Increased susceptibility to urinary tract infections
[ ] 6. Increased incidence of awakening after sleep onset

Answers
174. **Answer:** 2

**Rationale:** The older client is at risk for medication toxicity because of decreased lean body mass and an age-associated decreased glomerular filtration rate. This age-related change is not specifically associated with decreased absorption, decreased therapeutic effect, or increased risk for side effects. Toxicity, or toxic effects, occurs as a result of excessive accumulation of the medication in the body.

**Test-Taking Strategy:** Focus on the **subject**, age-related body changes that could place the client at risk for medication toxicity. Recall that toxicity occurs as a result of medication accumulation in the body, which usually occurs as a result of decreased renal function. Note that the correct option is the only one that addresses renal excretion.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood  
**Health Problem:** N/A  
**Priority Concepts:** Client Education; Safety  
**Reference:** Lewis et al. (2017), pp. 72-73.

175. **Answer:** 4

**Rationale:** Autonomy is the personal freedom to direct one’s own life as long as it does not impinge on the rights of others. An autonomous person is capable of rational thought. This individual can identify problems, search for alternatives, and select solutions that allow continued personal freedom as long as others and their rights and property are not harmed. Loss of autonomy, and therefore independence, is a real fear of older clients. The correct option is the only one that allows the client to be a decision maker.

**Test-Taking Strategy:** Focus on the **subject**, encouraging autonomy. Recalling the definition of autonomy will direct you to the correct option. Remember that giving the client choices is essential to promote independence.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Caring  
**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood  
**Health Problem:** N/A  
**Priority Concepts:** Health Care Quality; Professionalism  

176. **Answer:** 2, 3, 4, 5

**Rationale:** Coping mechanisms are behaviors used to decrease stress and anxiety. In response to a death, ineffective coping is manifested by an extreme behavior that in some cases may be harmful to the individual physically or psychologically. Neglecting personal grooming is indicative of a behavior that identifies ineffective coping in the grieving process. The remaining options identify appropriate and
effective coping mechanisms.

**Test-Taking Strategy:** Note the strategic word, effective, and focus on the subject, effective coping behaviors. Note that options 2, 3, 4, and 5 are comparable or alike and are positive activities in which the individual is engaging to get on with his or her life.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Psychosocial Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Mental Health  
**Health Problem:** Mental Health: Coping  
**Priority Concepts:** Coping; Family Dynamics  
**Reference:** Potter et al. (2017), pp. 775, 777.

177. **Answer:** 3

**Rationale:** Presbycusis refers to the age-related irreversible degenerative changes of the inner ear that lead to decreased hearing ability. As a result of these changes, the older client has a decreased response to high-frequency sounds. Low-pitched voice tones are heard more easily and can be interpreted by the older client. Options 1, 2, and 4 are not accurate characteristics related to aging.

**Test-Taking Strategy:** Focus on the subject, age-related changes related to hearing. Think about the physiological changes associated with aging. Recalling that the client with a hearing loss responds to low-pitched tones will direct you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood  
**Health Problem:** Adult Health: Ear: Hearing Loss  
**Priority Concepts:** Development; Sensory Perception  
**Reference:** Lewis et al. (2017), pp. 361, 391.

178. **Answer:** 3

**Rationale:** Elder abuse includes physical, sexual, or psychological abuse; misuse of property; and violation of rights. The typical abuse victim is a woman of advanced age with few social contacts and at least 1 physical or mental impairment that limits her ability to perform activities of daily living. In addition, the client usually lives alone or with the abuser and depends on the abuser for care.

**Test-Taking Strategy:** Focus on the subject, elder abuse. Note the strategic word, most. Read each option carefully and identify the client who is most defenseless as the result of the disease process. This will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood  
**Health Problem:** Mental Health: Abusive Behaviors
**Priority Concepts:** Interpersonal Violence; Safety  

179. **Answer:** 3

**Rationale:** Many nonpharmacological sleep aids can be used to influence sleep. However, the client should avoid caffeinated beverages and stimulants such as tea, cola, and chocolate. The client should exercise regularly, because exercise promotes sleep by burning off tension that accumulates during the day. A 20- to 30-minute walk, swim, or bicycle ride 3 times a week is helpful. Smoking and alcohol should be avoided. Reading is also a helpful measure and is relaxing.

**Test-Taking Strategy:** Note the **strategic words**, need for further teaching. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 are positive statements indicating that the client understands the methods of improving sleep. Remember that chocolate contains caffeine.

**Level of Cognitive Ability:** Evaluating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood  
**Health Problem:** N/A  
**Priority Concepts:** Client Education; Palliation  
**Reference:** Potter et al. (2017), p. 1006.

180. **Answer:** 4

**Rationale:** Assisting clients and families to become aware of available community support systems is a role and responsibility of the nurse. Observing that the client has begun to be confined to his room makes it necessary for the nurse to intervene legally and ethically, so option 3 is not appropriate and is passive in terms of advocacy. Option 2 suggests committing the client to a nursing home and is a premature action on the nurse’s part. Although the data provided tell the nurse that this client requires nursing care, the nurse does not know the extent of the nursing care required. Option 1 is incorrect and judgmental.

**Test-Taking Strategy:** Note the **strategic words**, most important. Using principles related to the ethical and legal responsibility of the nurse and knowledge of the nurse’s role will direct you to the correct option. Option 1 is a nontherapeutic statement, option 2 is a premature action, and option 3 avoids the situation.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood  
**Health Problem:** Mental Health: Abusive Behaviors  
**Priority Concepts:** Ethics; Health Care Law  
**Reference:** Lewis et al. (2017), 69.

181. **Answer:** 1
**Rationale:** The normal physiological changes that occur in the skin of older adults include thinning of the skin, loss of elasticity, deepening of expression lines, and wrinkling. Crusting noted on the skin would indicate a potential complication.

**Test-Taking Strategy:** Note the subject, a potential complication. Think about the normal physiological changes that occur in the aging process in the integumentary system to direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Developmental Stages: Early Adulthood to Later Adulthood

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Tissue Integrity

**Reference:** Lewis et al. (2017), p. 397.

182. **Answer:** 2

**Rationale:** Polypharmacy is a concern in the older client. Duplication of medications needs to be identified before medication interactions can be determined, because the nurse needs to know what the client is taking. Asking about medication administration supervision may be part of the assessment but is not a first action. The phone call to the PHCP is the intervention after all other information has been collected.

**Test-Taking Strategy:** Note the **strategic word**, first. Also note that the nurse is visiting the client for the first time. Options 1, 3, and 4 should be done after possible medication duplication has been identified.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Foundations of Care: Safety

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Safety

**Reference:** Potter et al. (2017), pp. 187-188.

183. **Answer:** 2, 5, 6

**Rationale:** Anatomical changes to the eye affect the individual’s visual ability, leading to potential problems with activities of daily living. Light adaptation and visual fields are reduced. Although lung function may decrease, the respiratory rate usually remains unchanged. Heart rate decreases and heart valves thicken. Age-related changes that affect the urinary tract increase an older client’s susceptibility to urinary tract infections. Short-term memory may decline with age, but long-term memory usually is maintained. Change in sleep patterns is a consistent, age-related change. Older persons experience an increased incidence of awakening after sleep onset.

**Test-Taking Strategy:** Focus on the subject, normal age-related changes. Read each characteristic carefully and think about the physiological changes that occur with aging to select the correct items.
**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Assessment

Introduction

Pyramid to Success

The Pyramid to Success focuses on the physiological and psychosocial aspects related to the experience of pregnancy, birth, and the postpartum period. Pyramid Points begin with the assessment and knowledge of expected findings of the pregnant client and fetus during the antepartum period. Instructing the pregnant client in measures that promote a healthy environment for the mother and the fetus is included. The focus is on the importance of antepartum follow-up, nutrition, and interventions for common discomforts that occur during pregnancy. Knowledge of the purpose of the commonly prescribed diagnostic tests and procedures in the antepartum period is also part of the Pyramid to Success. The focus is on disorders that can occur during pregnancy, particularly gestational hypertension and diabetes. The labor and birth process and the immediate interventions for conditions in which the maternal or fetal status is compromised, such as prolapsed cord or altered fetal heart rate, are part of the Pyramid to Success. Review of the fetus/newborn of a mother with human immunodeficiency virus or acquired immunodeficiency syndrome or a substance-abusing mother is recommended. The Pyramid to Success also includes a focus on the normal expectations of the postpartum period and the complications that can occur during this time. The next Pyramid Point focuses on the normal physical assessment findings and early identification of disorders in the neonate. The last Pyramid Point in this unit focuses on maternity and newborn medications.

Client Needs: Learning Objectives

Safe and Effective Care Environment

Consulting with the interprofessional health care team
Ensuring that informed consent for diagnostic tests and procedures has been obtained
Establishing priorities of care
Handling hazardous and infectious materials safely
Maintaining confidentiality
Providing continuity of client care
Promoting a safe environment to protect the client from potential teratogenic threats
Upholding client’s rights
Using surgical asepsis when providing care
Using standard and transmission-based precautions when providing care

**Health Promotion and Maintenance**

Assessing for growth and development  
Discussing expected body image changes with the client  
Discussing family planning and birthing and parenting issues  
Identifying at-risk clients during pregnancy  
Identifying health and wellness concepts and providing health care screening  
Identifying lifestyle choices and high-risk behaviors  
Performing techniques of physical assessment  
Providing antepartum, intrapartum, postpartum, and newborn care  
Teaching regarding antepartum, intrapartum, and postpartum care, and care to the newborn

**Psychosocial Integrity**

Considering cultural, religious, and spiritual influences regarding birth and motherhood  
Discussing situational role changes in the family  
Ensuring therapeutic interactions within the family  
Identifying available support systems  
Identifying coping mechanisms

**Physiological Integrity**

Instructing the client about prescribed diagnostic tests and procedures  
Monitoring for expected outcomes and effects related to pharmacological and parenteral therapies  
Monitoring for normal expectations during pregnancy  
Monitoring for side effects and adverse effects related to prescribed pharmacological and parenteral therapies  
Monitoring the client during the labor and birth process  
Providing interventions for unexpected events during pregnancy  
Providing nonpharmacological comfort interventions and pharmacological pain management during labor  
Supporting families who are experiencing fertility issues  
Teaching the client about nutrition during pregnancy and in the postpartum period  
Teaching the client about the physiological changes that occur during pregnancy
CHAPTER 20

Reproductive System

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Reproduction, Sexuality

I. Female Reproductive Structures
A. Ovaries
1. Form and expel ova
2. Secrete estrogen and progesterone
B. Fallopian tubes
1. Muscular tubes (oviducts) lying near the ovaries and connected to the uterus
2. Tubes that propel the ova from the ovaries to the uterus
C. Uterus
1. Muscular, pear-shaped cavity in which the fetus develops
2. Cavity from which menstruation occurs
D. Cervix
1. The internal os of the cervix opens into the body of the uterine cavity.
2. The cervical canal is located between the internal os and the external os.
3. The external cervical os opens into the vagina.
E. Vagina
1. Muscular tube that extends from the cervix to the vaginal opening in the perineum
2. Known as the birth canal
3. Passageway for menstrual blood flow, for penis for intercourse, and for the fetus

II. Male Reproductive Structures
A. Penis
1. Structures include the body or shaft, glans penis, and urethra.
2. Primary functions include pathway for urination and the organ used for intercourse.
B. Scrotum
1. Structures include the testes, epididymis, and vas deferens.
2. Normal temperature is slightly cooler than body temperature.

C. Prostate gland
1. Secretes a milky alkaline fluid
2. Enhances sperm movement and neutralizes acidic vaginal secretions

III. Menstrual Cycle (Box 20-1)
A. Ovarian hormones
1. Ovarian hormones, released by the anterior pituitary gland, include follicle-stimulating hormone (FSH) and luteinizing hormone (LH).
2. The hormones produce changes in the ovaries and in the endometrium.
3. The menstrual cycle, the regularly recurring physiological changes in the endometrium that culminate in its shedding, may vary in length, with the average length being about 28 days.

B. Ovarian and uterine phases (Box 20-1)

IV. Female Pelvis and Measurements
A. True pelvis
1. Lies below the pelvic brim
2. Consists of the pelvic inlet, midpelvis, and pelvic outlet

B. False pelvis
1. The shallow portion above the pelvic brim
2. Supports the abdominal viscera

C. Types of pelvis
1. Gynecoid
   a. Normal female pelvis
   b. Transversely rounded or blunt
   
   The gynecoid pelvis is most favorable for successful labor and birth. If cephalopelvic disproportion (CPD) exists, the normal labor process will be delayed and most likely result in a cesarean delivery.

2. Anthropoid
   a. Oval shape
   b. Adequate outlet, with a narrow pubic arch

3. Android
   a. Heart-shaped or angulated
   b. Resembles a male pelvis
   c. Not favorable for labor and vaginal birth
   d. Narrow pelvic planes can cause slow
descent and midpelvic arrest.

4. Platypelloid  
   a. Flat with an oval inlet  
   b. Wide transverse diameter, but short anteroposterior diameter, making labor and vaginal birth difficult

D. Pelvic inlet diameters  
   1. Anteroposterior diameters  
      a. Diagonal conjugate: Distance from the lower margin of the symphysis pubis to the sacral promontory  
      b. True conjugate or conjugate vera: Distance from the upper margin of the symphysis pubis to the sacral promontory  
      c. Obstetric conjugate: Extends from the sacral promontory to the top of the symphysis pubis. It is the smallest front-to-back distance through which the fetal head must pass in moving through the pelvic inlet.

   2. Transverse diameter: The largest of the pelvic inlet diameters; located at right angles to the true conjugate  
   3. Oblique (diagonal) diameter: Not clinically measurable  
   4. Posterior sagittal diameter: Distance from the point where the anteroposterior and transverse diameters cross each other to the middle of the sacral promontory

E. Pelvic midplane diameters  
   1. Transverse (interspinous diameter)  
   2. Midplane normally is the largest plane and has the longest diameter.

F. Pelvic outlet diameters  
   1. Transverse (intertuberous diameter)  
   2. Outlet presents the smallest plane of the pelvic canal.

V. Fertilization and Implantation

A. Fertilization  
   1. Fertilization occurs in the ampulla of the fallopian (uterine) tube when sperm and ovum unite.  
   2. When fertilized, the membrane of the ovum undergoes changes that prevent entry of other sperm.  
   3. Each reproductive cell carries 23 chromosomes.  
   4. Sperm carry an X or a Y chromosome—XY, male; XX, female.
B. Implantation

1. The zygote is propelled toward the uterus and implants 6 to 8 days after ovulation.
2. The blastocyst secretes chorionic gonadotropin to ensure that the corpus luteum remains viable and secretes estrogen and progesterone for the first 2 to 3 months of gestation.

VI. Fetal Development (Box 20-2)

VII. Fetal Environment
A. Amnion

1. Encloses the amniotic cavity
2. Is the inner membrane that forms about the second week of embryonic development
3. Forms a fluid-filled sac that surrounds the embryo and later the fetus

B. Chorion

1. Is the outer membrane enclosing the amniotic cavity
2. Becomes vascularized and forms the fetal part of the placenta

C. Amniotic fluid

1. Consists of 800 to 1200 mL by the end of pregnancy
2. Surrounds, cushions, and protects the fetus and allows for fetal movement
3. Maintains the body temperature of the fetus
4. Contains fetal urine and is a measure of fetal kidney function
5. The fetus modifies the amniotic fluid through the processes of swallowing, urinating, and movement of fluid through the respiratory tract.

D. Placenta

1. The placenta provides for exchange of nutrients and waste products between the fetus and mother.
2. The placenta begins to form at implantation; the structure is complete by week 12.
3. It produces hormones to maintain pregnancy and assumes full responsibility for the production of these hormones by the 12th week of gestation.
4. In the third trimester, transfer of maternal immunoglobulin provides the fetus with passive immunity to certain diseases for the first few months after birth.
5. By week 10 to 12, genetic testing can be done via chorionic villus sampling (CVS).
Large particles such as bacteria cannot pass through the placenta, but nutrients, medications, alcohol, antibodies, and viruses can pass through the placenta.

VIII. Fetal Circulation

A. Umbilical cord
   1. It contains 2 arteries and 1 vein.
   2. The arteries carry deoxygenated blood and waste products from the fetus.
   3. The vein carries oxygenated blood and provides oxygen and nutrients to the fetus.

B. Fetal heart rate (FHR)
   1. FHR depends on gestational age; FHR is 160 to 170 beats per minute in the first trimester but slows with fetal growth to 110 to 160 beats per minute.
   2. FHR is about twice the maternal heart rate.

C. Fetal circulation bypass (Fig. 20-1)
   1. Fetal circulation bypass is present because of nonfunctioning lungs.
   2. Bypasses must close after birth to allow blood to flow through the lungs and the liver.
   3. The ductus arteriosus connects the pulmonary artery to the aorta, bypassing the lungs.
   4. The ductus venosus connects the umbilical vein and the inferior vena cava, bypassing the liver.
   5. The foramen ovale is the opening between the right and left atria of the heart, bypassing the lungs.

IX. Family Planning

A. Description
   1. Involves choosing when to have children
   2. Includes contraception, prevention of pregnancy, and methods to achieve pregnancy

B. Birth control
   1. The focus of counseling on contraception must meet the needs and feelings of the woman and her partner.
   2. Several factors should be considered when choosing a method of birth control, including effectiveness, safety, and personal preference.
   3. The woman’s preferences are most important, and cultural practices and beliefs and religious or other personal beliefs may affect the choice of contraceptives.
   4. Other factors that bear on selection of a contraceptive method include family planning goals, age, frequency of intercourse, and the individual’s capacity for...
compliance.
5. If family planning goals have already been met, sterilization of either the male or the female partner may be desirable (it is important for the couple to understand that tubal reconstruction may be unsuccessful).
6. For women who frequently engage in coitus, oral contraceptives or a long-term method such as implants or an intrauterine device (IUD) may be considered.
7. When sexual activity is limited, use of spermicide, condoms, or a diaphragm may be most appropriate.
8. Because some methods have adverse effects, a signed informed consent form may be needed.
9. For additional information on the use of contraceptives, see Chapter 28.

C. Infertility
1. Infertility is the involuntary inability to conceive when desired.
2. Some factors contributing to infertility in men include abnormalities of the sperm, abnormal erections or ejaculations, or abnormalities of the seminal fluid.
3. Some factors that contribute to infertility in women include disorders of ovulation or abnormalities of the fallopian tubes or cervix.
4. Several diagnostic tests are available to determine the probable cause of infertility, and the therapy recommended may depend on the cause of the infertility.
5. Infertility options
   a. Options include medication, surgical procedures, and therapeutic insemination.
   b. Other therapies are available, such as in vitro fertilization, surrogate mothers, and embryo hosts.
   c. Adoption may also be an option.
6. The nurse needs to provide support to the couple in their decision-making process and during therapy.

---

**Box 20-1**

**Menstrual Cycle**

**Ovarian Changes**

**Preovulatory Phase**
Hypothalamus releases gonadotropin-releasing hormone through the portal system to the anterior pituitary system. Secretion of follicle-stimulating hormone (FSH) by the anterior lobe of the pituitary gland stimulates growth of follicles. Most follicles die, leaving one to mature into a large graafian follicle. Estrogen produced by the follicle stimulates increased secretions of luteinizing hormone (LH) by the anterior lobe of the pituitary gland. The follicle ruptures and releases an ovum into the peritoneal cavity.

**Luteal Phase**

Begins with ovulation. Body temperature decreases and then increases by 0.5° F to 1° F around the time of ovulation. Corpus luteum is formed from follicle cells that remain in the ovary after ovulation. Corpus luteum secretes estrogen and progesterone during the remaining 14 days of the cycle. Corpus luteum degenerates if the ovum is not fertilized, and secretion of estrogen and progesterone declines. Decline of estrogen and progesterone stimulates the anterior pituitary to secrete more FSH and LH, initiating a new reproductive cycle.

**Uterine Changes**

**Menstrual Phase**

Consists of 4 to 6 days of bleeding as the endometrium breaks down because of the decreased levels of estrogen and progesterone. The level of FSH increases, enabling the beginning of a new cycle.

**Proliferative Phase**

Lasts about 9 days. Estrogen stimulates proliferation and growth of the endometrium. As estrogen increases, it suppresses secretion of FSH and increases secretion of LH. Secretion of LH stimulates ovulation and the development of the corpus luteum. Ovulation occurs between days 12 and 16. Estrogen level is high, and progesterone level is low.

**Secretory Phase**

Lasts about 12 days and follows ovulation. This phase is initiated in response to the increase in LH level.
The graafian follicle is replaced by the corpus luteum. The corpus luteum secretes progesterone and estrogen. Progesterone prepares the endometrium for pregnancy if a fertilized ovum is implanted.

**Box 20-2**

**Fetal Development**

**Preembryonic Period**

First 2 weeks after conception

**Embryonic Period**

Beginning day 15 through approximately week 8 after conception

**Fetal Period**

Week 9 after conception to birth

**Week 1**

Blastocyst is free-floating.

**Weeks 2 to 3**

Embryo is 1.5 to 2 mm in length.
Lung buds appear.
Blood circulation begins.
Heart is tubular and begins to beat.
Neural plate becomes brain and spinal cord.

**Week 5**

Embryo is 0.4 to 0.5 cm in length.
Embryo is 0.4 g.
Double heart chambers are visible.
Heart is beating.
Limb buds form.

**Week 8**

Embryo is 3 cm in length.
Embryo is 2 g.
Eyelids begin to fuse.
Circulatory system through umbilical cord is well established.
Every organ system is present.

**Week 12**

Fetus is 6 to 9 cm in length.
Fetus is 19 g.
Face is well formed.
Limbs are long and slender.
Kidneys begin to form urine.
Spontaneous movements occur.
Heartbeat is detected by Doppler transducer between 10 and 12 weeks.

**Week 16**

Fetus is 11.5 to 13.5 cm in length.
Fetus is 100 g.
Active movements are present.
Fetal skin is transparent.
Lanugo hair begins to develop.
Skeletal ossification occurs.
Sex of fetus is visually recognizable on ultrasound.

**Week 20**

Fetus is 16 to 18.5 cm in length.
Fetus is 300 g.
Lanugo covers the entire body.
Fetus has nails.
Muscles are developed.
Enamel and dentin are depositing.
Heartbeat is detected by regular (nonelectronic) fetoscope.

**Week 24**

Fetus is 23 cm in length.
Fetus is 600 g.
Hair on head is well formed.
Skin is reddish and wrinkled.
Reflex hand grasp functions are present.
Vernix caseosa covers entire body.
Fetus has ability to hear.

**Week 28**
Fetus is 27 cm in length.
Fetus is 1100 g.
Limbs are well flexed.
Brain is developing rapidly.
Eyelids open and close.
Lungs are developed sufficiently to provide gas exchange (lecithin forming).
If born, neonate can breathe at this time.

**Week 32**

Fetus is 31 cm in length.
Fetus is 1800 to 2100 g.
Bones are fully developed.
Subcutaneous fat has collected.
Lecithin-to-sphingomyelin (L/S) ratio is 1.2:1.

**Week 36**

Fetus is 35 cm in length.
Fetus is 2200 to 2900 g.
Skin is pink and body is rounded.
Skin is less wrinkled.
Lanugo is disappearing.
L/S ratio is greater than 2:1.

**Week 40**

Fetus is 40 cm in length.
Fetus is more than 3200 g.
Skin is pinkish and smooth.
Lanugo may be present on upper arms and shoulders.
Vernix caseosa decreases.
Fingernails extend beyond fingertips.
Sole (plantar) creases run down to the heel.
Testes are in the scrotum.
Labia majora are well developed.
FIG. 20-1  Fetal circulation. Three shunts (ductus venosus, ductus arteriosus, and foramen ovale) allow most blood from the placenta to bypass the fetal lungs and liver.

**Practice Questions**

184. The nurse is preparing to teach a prenatal class about fetal circulation. Which statements should be included in the teaching plan? **Select all that apply.**

- 1. “The ductus arteriosus allows blood to bypass the fetal lungs.”
- 2. “One vein carries oxygenated blood from the placenta to the fetus.”
- 3. “The normal fetal heart beat range is 160 to 180 beats per
4. “Two arteries carry deoxygenated blood and waste products away from the fetus to the placenta.”

5. “Two veins carry blood that is high in carbon dioxide and other waste products away from the fetus to the placenta.”

185. The nursing instructor asks the student to describe fetal circulation, specifically the ductus venosus. Which statement by the student indicates an understanding of the ductus venosus?

1. “It connects the pulmonary artery to the aorta.”
2. “It is an opening between the right and left atria.”
3. “It connects the umbilical vein to the inferior vena cava.”
4. “It connects the umbilical artery to the inferior vena cava.”

186. A pregnant client tells the clinic nurse that she wants to know the sex of her baby as soon as it can be determined. The nurse informs the client that she should be able to find out the sex at 16 weeks’ gestation because of which factor?

1. The appearance of the fetal external genitalia
2. The beginning of differentiation in the fetal groin
3. The fetal testes are descended into the scrotal sac
4. The internal differences in males and females become apparent

187. The nurse is performing an assessment on a client who is at 38 weeks’ gestation and notes that the fetal heart rate (FHR) is 174 beats per minute. On the basis of this finding, what is the priority nursing action?

1. Document the finding.
2. Check the mother’s heart rate.
3. Notify the obstetrician (OB).
4. Tell the client that the fetal heart rate is normal.

188. The nurse is conducting a prenatal class on the female reproductive system. When a client in the class asks why the fertilized ovum stays in the fallopian tube for 3 days, what is the nurse’s best response?

1. “It promotes the fertilized ovum’s chances of survival.”
2. “It promotes the fertilized ovum’s exposure to estrogen and progesterone.”
3. “It promotes the fertilized ovum’s normal implantation in the top portion of the uterus.”
4. “It promotes the fertilized ovum’s exposure to luteinizing hormone and follicle-stimulating hormone.”

189. The nursing instructor asks a nursing student to explain the characteristics of the amniotic fluid. The student responds correctly by explaining which as characteristics of amniotic fluid? Select all that apply.

1. Allows for fetal movement
2. Surrounds, cushions, and protects the fetus
3. Maintains the body temperature of the fetus
4. Can be used to measure fetal kidney function
5. Prevents large particles such as bacteria from passing to the fetus
6. Provides an exchange of nutrients and waste products between the mother and the fetus

190. A couple comes to the family planning clinic and asks about sterilization procedures. Which question by the nurse should determine whether this method of family planning would be most appropriate?
1. “Have you ever had surgery?”
2. “Do you plan to have any other children?”
3. “Do either of you have diabetes mellitus?”
4. “Do either of you have problems with high blood pressure?”

191. The nurse should make which statement to a pregnant client found to have a gynecoid pelvis?
1. “Your type of pelvis has a narrow pubic arch.”
2. “Your type of pelvis is the most favorable for labor and birth.”
3. “Your type of pelvis is a wide pelvis, but it has a short diameter.”
4. “You will need a cesarean section because this type of pelvis is not favorable for a vaginal delivery.”

192. Which purposes of placental functioning should the nurse include in a prenatal class? Select all that apply.
1. It cushions and protects the baby.
2. It maintains the temperature of the baby.
3. It is the way the baby gets food and oxygen.
4. It prevents all antibodies and viruses from passing to the baby.
5. It provides an exchange of nutrients and waste products between the mother and developing fetus.

193. A 55-year-old male client confides in the nurse that he is concerned about his sexual function. What is the nurse’s best response?
1. “How often do you have sexual relations?”
2. “Please share with me more about your concerns.”
3. “You are still young and have nothing to be concerned about.”
4. “You should not have a decline in testosterone until you are in your 80s.”

Answers

184. Answer: 1, 2, 4

Rationale: The ductus arteriosus is a unique fetal circulation structure that allows blood to bypass the nonfunctioning fetal lungs. Oxygenated blood is transported to the fetus by one umbilical vein. The normal fetal heart beat range is considered to be 110 to 160 beats per minute. Two arteries carry deoxygenated blood and waste
products from the fetus, and one umbilical vein carries oxygenated blood and
provides oxygen and nutrients to the fetus. Blood pumped by the embryo’s heart
leaves the embryo through two umbilical arteries.

**Test-Taking Strategy:** Focus on the subject, fetal circulation. Recall that three
umbilical vessels are within the umbilical cord (two arteries and one vein) and that
the vein carries oxygenated blood and the arteries carry deoxygenated blood. Also
recalling the normal fetal heart beat will assist in answering correctly.

**Content Area:** Maternity: Antepartum

**Health Problem:** N/A

**Priority Concepts:** Client Education; Perfusion

**Reference:** McKinney et al. (2018), pp. 210-211.

185. **Answer:** 3

**Rationale:** The ductus venosus connects the umbilical vein to the inferior vena
cava. The foramen ovale is a temporary opening between the right and left atria. The
ductus arteriosus joins the aorta and the pulmonary artery.

**Test-Taking Strategy:** Focus on the subject, the description of the ductus venosus.
Note the relationship of the word *venosus* in the question and *vein* in the correct
option.

**Reference:** McKinney et al. (2018), pp. 210-211.

186. **Answer:** 1

**Rationale:** Between weeks 16 and 20, the external genitalia of the fetus have
developed to such a degree that the sex of the fetus can be determined visually.
Differentiation of the external genitalia occurs at the end of the ninth week. Testes
begin to descend into the scrotal sac at the end of the 38th week. Internal differences
in the male and female occur at the end of the seventh week.

**Test-Taking Strategy:** Focus on the subject, sex of the fetus. Remember that the
sex of the fetus can be recognizable visually on ultrasound by the appearance of the
external genitalia by gestational weeks 16 and 20.

187. **Answer:** 3

**Rationale:** The FHR depends on gestational age and ranges from 160 to 170 beats per minute in the first trimester but slows with fetal growth to 110 to 160 beats per minute. If the FHR is less than 110 beats per minute or more than 160 beats per minute with the uterus at rest, the fetus may be in distress. Because the FHR is increased from the reference range, the nurse should notify the OB. Options 2 and 4 are inappropriate actions based on the information in the question. Although the nurse documents the findings, based on the information in the question, the OB needs to be notified.

**Test-Taking Strategy:** Focus on the **data in the question** and note the **strategic word**, priority. Then, note if an abnormality exists. Also note the FHR and that the client is at 38 weeks of gestation. Remember that the normal FHR is 110 to 160 beats per minute.

188. **Answer:** 3

**Rationale:** The tubal isthmus remains contracted until 3 days after conception to allow the fertilized ovum to develop within the tube. This initial growth of the fertilized ovum promotes its normal implantation in the fundal portion of the uterine corpus. Estrogen is a hormone produced by the ovarian follicles, corpus luteum, adrenal cortex, and placenta during pregnancy. Progesterone is a hormone secreted by the corpus luteum of the ovary, adrenal glands, and placenta during pregnancy. Luteinizing hormone and follicle-stimulating hormone are excreted by the anterior pituitary gland. The survival of the fertilized ovum does not depend on it staying in the fallopian tube for 3 days.

**Test-Taking Strategy:** Note the **strategic word**, best, and use knowledge of the anatomy and physiology of the female reproductive system. Remember that fertilization occurs in the fallopian tube and the fertilized ovum remains in the fallopian tube for about 3 days. This promotes its normal implantation.

189. **Answer:** 1, 2, 3, 4

**Rationale:** The amniotic fluid surrounds, cushions, and protects the fetus. It allows the fetus to move freely and maintains the body temperature of the fetus. In addition, the amniotic fluid contains urine from the fetus and can be used to assess fetal kidney function. The placenta prevents large particles such as bacteria from passing to the fetus and provides an exchange of nutrients and waste products between the mother and the fetus.

**Test-Taking Strategy:** Focus on the **subject**, the characteristics of amniotic fluid. Visualizing the location of the amniotic fluid will assist in answering this question.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Health Problem:** N/A

**Priority Concepts:** Client Education; Reproduction

190. **Answer:** 2

**Rationale:** Sterilization is a method of contraception for couples who have completed their families. It should be considered a permanent end to fertility, because reversal surgery is not always successful. The nurse would ask the couple about their plans for having children in the future. Options 1, 3, and 4 are unrelated to this procedure.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*. Focus on the **subject**, sterilization procedure. Note the relationship between the word *sterilization* and the words *plan to have any other children* in the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

191. **Answer:** 2

**Rationale:** A gynecoid pelvis is a normal female pelvis and is the most favorable for successful labor and birth. An android pelvis (resembling a male pelvis) would be unfavorable for labor because of the narrow pelvic planes. An anthropoid pelvis has an outlet that is adequate, with a normal or moderately narrow pubic arch. A platypelloid pelvis (flat pelvis) has a wide transverse diameter, but the anteroposterior diameter is short, making the outlet inadequate.

**Test-Taking Strategy:** Focus on the **subject**, female pelvis types. Recalling that the gynecoid pelvis is the normal female pelvis will direct you to the correct option.

**Level of Cognitive Ability:** Applying

192. Answer: 3, 5

Rationale: The placenta provides an exchange of oxygen, nutrients, and waste products between the mother and the fetus. The amniotic fluid surrounds, cushions, and protects the fetus and maintains the body temperature of the fetus. Nutrients, medications, antibodies, and viruses can pass through the placenta.

Test-Taking Strategy: Focus on the subject, the purpose of the placenta. Remember that the placenta provides oxygen and nutrients.

Content Area: Maternity: Antepartum
Health Problem: N/A
Priority Concepts: Development; Reproduction

193. Answer: 2

Rationale: The nurse needs to establish trust when discussing sexual relationships with men. The nurse should open the conversation with broad statements to determine the true nature of the client’s concerns. The frequency of intercourse is not a relevant first question to establish trust. Testosterone declines with the aging process.

Test-Taking Strategy: Note the strategic word, best. Determine whether further assessment or validation is needed. In this case, more information is needed to determine the nature of the client’s concerns. Keeping these concepts in mind and using therapeutic communication techniques will assist in directing you to the correct option.

CHAPTER 21

Prenatal Period

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Development, Reproduction

I. Gestation
   A. Time from fertilization of the ovum until the date of delivery
   B. About 280 days
   C. Näegele’s rule for estimating the date of delivery, also known as date of birth (Box 21-1)
      1. Use of Näegele’s rule requires that the woman have a regular 28-day menstrual cycle.
      2. Subtract 3 months and add 7 days to the first day of the last menstrual period; then add 1 year if appropriate. Alternatively, add 7 days to the first day of the last menstrual period and count forward 9 months.

II. Gravidity and Parity
   A. Gravidity
      1. Gravida refers to a pregnant woman.
      2. Gravidity refers to the number of pregnancies.
      3. A nulligravida is a woman who has never been pregnant.
      4. A primigravida is a woman who is pregnant for the first time.
      5. A multigravida is a woman in at least her second pregnancy.
   B. Parity
      1. Parity is the number of births (not the number of fetuses, e.g., twins) carried past 20 weeks of gestation, whether or not the fetus was born alive.
      2. A nullipara is a woman who has not had a birth at more than 20 weeks of gestation.
      3. A primipara is a woman who has had 1 birth that occurred after the 20th week of gestation.
      4. A multipara is a woman who has had 2 or more pregnancies to the stage of fetal viability.

637
C. Use of GTPAL: Pregnancy outcomes can be described with the acronym GTPAL (Box 21-2).

1. G is gravidity, the number of pregnancies, including the present one.
2. T is term births, the number born at term (longer than 37 weeks of gestation).
3. P is preterm births, the number born before 37 weeks of gestation.
4. A is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks of gestation)
5. L is the number of current living children. This number can be greater than the P if multiples were delivered, or less than the P if a loss occurred.
6. Note: Multiples count as a 1 for gravidity, as well as a 1 for term, preterm, or abortions, but are recorded as the actual number for living.

III. Pregnancy Signs

A. Presumptive signs
1. Amenorrhea
2. Nausea and vomiting
3. Increased size and increased feeling of fullness in breasts
4. Pronounced nipples
5. Urinary frequency
6. **Quickening:** The first perception of fetal movement by the mother may occur at the 16th to 20th week of gestation.
7. Fatigue
8. Discoloration of the vaginal mucosa

B. Probable signs
1. Uterine enlargement
2. **Hegar’s sign:** Compressibility and softening of the lower uterine segment that occurs at about week 6
3. **Goodell’s sign:** Softening of the cervix that occurs at the beginning of the second month
4. **Chadwick’s sign:** Violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about week 6
5. **Ballottement:** Rebounding of the fetus against the examiner’s fingers on palpation
6. Braxton Hicks contractions (irregular painless contractions that may occur intermittently throughout pregnancy)
7. Positive pregnancy test for determination of the
presence of human chorionic gonadotropin

C. Positive signs (diagnostic)
   1. Fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation
   2. Active fetal movements palpable by examiner
   3. Outline of fetus via radiography or ultrasonography

IV. Fundal Height (Box 21-3)
   A. Fundal height is measured to evaluate the gestational age of the fetus.
   B. During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals fetal age in weeks ± 2 cm (Fig. 21-1).
   C. At 16 weeks, the fundus can be found approximately halfway between the symphysis pubis and the umbilicus.
   D. At 20 to 22 weeks, the fundus is approximately at the location of the umbilicus.
   E. At 36 weeks, the fundus is at the xiphoid process.

When assessing fundal height, monitor the client closely for supine hypotension when placed in the supine position.

V. Physiological Maternal Changes

Culture often determines health beliefs, values, and family expectations. Therefore, it is important to assess cultural beliefs during care of the maternity client.

A. Cardiovascular system
   1. Circulating blood volume increases, plasma increases, and total red blood cell volume increases (total volume increases by approximately 40% to 50%).
   2. Physiological anemia occurs as the plasma increase exceeds the increase in production of red blood cells.
   3. Iron requirements are increased.
   4. Heart size increases, and the heart is elevated slightly upward and to the left because of displacement of the diaphragm as the uterus enlarges (Fig. 21-2).
   5. Retention of sodium and water may occur.

B. Respiratory system
   1. Oxygen consumption increases by approximately 15% to 20%.
   2. Diaphragm is elevated because of the enlarged uterus (Fig. 21-2).
3. Shortness of breath may be experienced.

During pregnancy, a woman’s pulse rate may increase about 10 to 15 beats per minute; the blood pressure slightly decreases in the second trimester, then increases in the third trimester, but not above the prepregnancy level; and the respiratory rate remains unchanged or slightly increases.

C. Gastrointestinal system
1. Nausea and vomiting may occur as a result of the secretion of human chorionic gonadotropin; it typically subsides by the third month.
2. Poor appetite may occur because of decreased gastric motility.
3. Alterations in taste and smell may occur.
4. Constipation may occur because of an increase in progesterone production or pressure of the uterus resulting in decreased gastrointestinal motility.
5. Flatulence and heartburn may occur because of decreased gastrointestinal motility and slowed emptying of the stomach caused by an increase in progesterone production.
6. Hemorrhoids may occur because of increased venous pressure.
7. Gum tissue may become swollen and easily bleed because of increasing levels of estrogen.
8. Ptyalism (excessive secretion of saliva) may occur because of increasing levels of estrogen.

D. Renal system
1. Frequency of urination increases in the first and third trimesters because of increased bladder sensitivity and pressure of the enlarging uterus on the bladder.
2. Decreased bladder tone may occur and is caused by an increase in progesterone and estrogen levels; bladder capacity increases in response to increasing levels of progesterone.
3. Renal threshold for glucose may be reduced.

E. Endocrine system
1. Basal metabolic rate increases and metabolic function increases.
2. The anterior lobe of the pituitary gland enlarges and produces serum prolactin needed for the lactation process.
3. The posterior lobe of the pituitary gland produces oxytocin, which stimulates uterine contractions.
4. The thyroid enlarges slightly, and thyroid activity increases.
5. The parathyroid increases in size.
6. Aldosterone levels gradually increase.
7. Body weight increases.
8. Water retention is increased, which can contribute to weight gain.

F. Reproductive system

1. Uterus
   a. Uterus enlarges, increasing in mass from approximately 60 to 1000 g as a result of hyperplasia (influence of estrogen) and hypertrophy.
   b. Size and number of blood vessels and lymphatics increase.
   c. Irregular contractions occur, typically beginning after 16 weeks of gestation.

2. Cervix
   a. Cervix becomes shorter, more elastic, and larger in diameter.
   b. Endocervical glands secrete a thick mucous plug, which is expelled from the canal when dilation begins.
   c. Increased vascularization and an increase in estrogen cause softening and a violet discoloration known as Chadwick’s sign, which occurs at about 6 weeks of gestation.

3. Ovaries
   a. A major function of the ovaries is to secrete progesterone for the first 6 to 7 weeks of pregnancy.
   b. The maturation of new follicles is blocked.
   c. The ovaries cease ovum production.

4. Vagina
   a. Hypertrophy and thickening of the muscle occur.
   b. An increase in vaginal secretions is experienced; secretions are usually thick, white, and acidic.

5. Breasts: Breast changes occur because of the increasing effects of estrogen and progesterone.
   a. Breast size increases, and breasts may be tender.
   b. Nipples become more pronounced.
   c. The areolae become darker in color.
   d. Superficial veins become prominent.
   e. Hypertrophy of Montgomery’s follicles occurs.
   f. Colostrum may leak from the breast.
G. Skin

1. Some changes occur because the levels of melanocyte-stimulating hormone increase as a result of an increase in estrogen and progesterone levels; these changes include the following:
   a. Increased pigmentation
   b. Dark streak down the midline of the abdomen (linea nigra)
   c. Chloasma (mask of pregnancy)—a blotchy brownish hyperpigmentation over the forehead, cheeks, and nose
   d. Reddish-purple stretch marks (striae gravidarum) on the abdomen, breasts, thighs, and upper arms

2. Vascular spider nevi may occur on the neck, chest, face, arms, and legs.

3. Rate of hair growth may increase.

H. Musculoskeletal system

1. Changes in the center of gravity begin in the second trimester and are caused by the hormones relaxin and progesterone.

2. The lumbosacral curve increases.

3. Aching, numbness, and weakness may result; walking becomes more difficult, and the woman develops a waddling gait and is at risk for falls.

4. Relaxation and increased mobility of pelvic joints occur, which permit enlargement of pelvic dimensions.

5. Abdominal wall stretches with loss of tone throughout pregnancy, regained postpartum.

6. Umbilicus flattens or protrudes.

During pregnancy, postural changes occur as the increased weight of the uterus causes a forward pull of the bony pelvis. It is important for the nurse to encourage the client to implement measures that maintain safety and correct posture to prevent a backache.

VI. Psychological Maternal Changes

A. Ambivalence

1. Ambivalence may occur early in pregnancy, even when the pregnancy is planned.

2. The mother may experience a dependence—dependence conflict and ambivalence related to role changes.

3. The partner may experience ambivalence related to the new role being assumed, increased financial responsibilities, and sharing the mother’s attention with the child.
B. Acceptance: Factors that may be related to acceptance of the pregnancy are the woman’s readiness for the experience and her identification with the motherhood role. Specific developmental tasks must be accomplished successfully for positive maternal role adaptation. These tasks include accepting the pregnancy, identifying with the mothering role, solidifying her relationship with her partner, establishing a relationship with her unborn infant, and preparing for her birth experience.

C. Emotional lability
   1. Emotional lability may be manifested by frequent changes of emotional states or extremes in emotional states.
   2. These emotional changes are common, but the mother may think that these changes are abnormal.

D. Body image changes
   1. The changes in a woman’s perception of her image during pregnancy occur gradually and may be positive or negative.
   2. The physical changes and signs and symptoms that the woman experiences during pregnancy contribute to her body image.

E. Relationship with the fetus
   1. The woman may daydream to prepare for motherhood and think about the maternal qualities that she would like to possess.
   2. The woman first accepts the biological fact that she is pregnant.
   3. The woman next accepts the growing fetus as distinct from herself and a person to nurture.
   4. Finally, the woman prepares realistically for the birth and parenting of the child.

VII. Discomforts of Pregnancy

A. Nausea and vomiting
   1. Occurs in the first trimester and usually subsides by the third month
   2. Caused by elevated levels of human chorionic gonadotropin and other pregnancy hormones as well as changes in carbohydrate metabolism
   3. Interventions
      a. Eating dry crackers before arising
      b. Avoiding brushing teeth immediately after arising
      c. Eating small, frequent, low-fat meals during the day
      d. Drinking liquids between meals rather
than at meals
e. Avoiding fried foods and spicy foods
f. Asking the primary health care provider (PHCP) about acupressure (some types may require a prescription)
g. Asking the PHCP about the use of herbal remedies
h. Taking antiemetic medications as prescribed

B. Syncope
1. Usually occurs in the first trimester; supine hypotension occurs particularly in the second and third trimesters.
2. May be triggered hormonally or caused by the increased blood volume, anemia, fatigue, sudden position changes, or lying supine
3. Interventions
   a. Sitting with the feet elevated
   b. Risk for falls; teach to change positions slowly

The nurse needs to instruct the pregnant woman to avoid lying in the supine position, particularly in the second and third trimesters. The supine position places the woman at risk for supine hypotension, which occurs as a result of pressure of the uterus on the inferior vena cava.

C. Urinary urgency and frequency
1. Usually occurs in the first and third trimesters
2. Caused by pressure of the uterus on the bladder
3. Interventions
   a. Drinking no less than 2000 mL of fluid during the day
   b. Limiting fluid intake in the evening
   c. Voiding at regular intervals
   d. Sleeping side-lying at night
   e. Wearing perineal pads, if necessary
   f. Performing Kegel exercises

D. Breast tenderness
1. Can occur in the first through the third trimesters
2. Caused by increased levels of estrogen and progesterone
3. Interventions
   a. Wearing a supportive bra
   b. Avoiding the use of soap on the nipples and areolar area to prevent drying of skin
E. Increased vaginal discharge
1. Can occur in the first through the third trimesters
2. Caused by hypertrophy and thickening of the vaginal mucosa and increased mucus production
3. Interventions
   a. Using proper cleansing and hygiene techniques
   b. Wearing cotton underwear
   c. Avoiding douching
   d. Consulting the PHCP if infection is suspected

F. Nasal stuffiness
1. Occurs in the first through third trimesters
2. Results from increased estrogen, which causes edema of the nasal tissues and dryness
3. Interventions
   a. Encouraging the use of a humidifier
   b. Avoiding the use of nasal sprays or antihistamines (the PHCP should be consulted about their use)

G. Fatigue
1. Occurs usually in the first and third trimesters
2. Usually results from hormonal changes
3. Interventions
   a. Arranging frequent rest periods throughout the day
   b. Using correct posture and body mechanics
   c. Obtaining regular exercise
   d. Performing muscle relaxation and strengthening exercises for the legs and hip joints
   e. Avoiding eating and drinking foods containing stimulants throughout the pregnancy

H. Heartburn
1. Occurs in the second and third trimesters
2. Results from increased progesterone levels, decreased gastrointestinal motility, esophageal reflux, and displacement of the stomach by the enlarging uterus
3. Interventions
   a. Eating small, frequent meals
   b. Sitting upright for 30 minutes after a meal
   c. Drinking milk between meals
   d. Avoiding fatty and spicy foods
   e. Performing tailor-sitting exercises
   f. Consulting with the PHCP about the
I. Ankle edema
   1. Usually occurs in the second and third trimesters
   2. Results from vasodilation, venous stasis, and increased venous pressure below the uterus
   3. Interventions
      a. Elevating the legs at least twice a day and when resting
      b. Sleeping in a side-lying position
      c. Wearing supportive stockings or support hose
      d. Avoiding sitting or standing in 1 position for long periods

J. Varicose veins
   1. Usually occur in the second and third trimesters
   2. Result from weakening walls of the veins or valves and venous congestion
   3. Thrombophlebitis is rare, but it may occur.
   4. Interventions
      a. Wearing supportive stockings or support hose
      b. Elevating the feet when sitting
      c. Lying with the feet and hips elevated
      d. Avoiding long periods of standing or sitting
      e. Moving about while standing to improve circulation
      f. Avoiding leg crossing
      g. Avoiding constricting articles of clothing such as knee-high stockings
      h. Teaching leg exercises
      i. Avoiding airline because of sitting position

K. Headaches
   1. Usually considered benign in the first trimester. May need further investigation if occurring in the second and third trimesters
   2. Result from changes in blood volume and vascular tone
   3. Interventions
      a. Changing position slowly
      b. Applying a cool cloth to the forehead
      c. Eating a small snack
      d. Using acetaminophen only if prescribed by the PHCP

L. Hemorrhoids
   1. Usually occur in the second and third trimesters
   2. Result from increased venous pressure and
constipation

3. Interventions
   a. Soaking in a warm sitz bath
   b. Sitting on a soft pillow
   c. Eating high-fiber foods and drinking sufficient fluids to avoid constipation
   d. Increasing exercise, such as walking
   e. Applying ointments, suppositories, or compresses as prescribed by the PHCP

M. Constipation
   1. Usually occurs in the second and third trimesters
   2. Results from an increase in progesterone production, decreased intestinal motility, displacement of the intestines, pressure of the uterus, and taking iron supplements
   3. Interventions
      a. Eating high-fiber foods such as whole grains, fruits, and vegetables
      b. Drinking no less than 2000 mL per day
      c. Exercising regularly, such as a daily 20-minute walk
      d. Consulting with the PHCP about interventions such as the use of stool softeners, laxatives, or enemas

N. Backache
   1. Usually occurs in the second and third trimesters
   2. Caused by an exaggerated lumbosacral curve resulting from an enlarged uterus
   3. Risk for falls; teach to move about slowly
   4. Interventions
      a. Obtaining rest
      b. Using correct posture and body mechanics
      c. Wearing low-heeled, comfortable, and supportive shoes
      d. Performing pelvic tilt (rock) exercises and conscious relaxation exercises
      e. Sleeping on a firm mattress

O. Leg cramps
   1. Usually occur in the second and third trimesters
   2. Result from an altered calcium-phosphorus balance and pressure of the uterus on nerves or from fatigue
   3. Interventions
      a. Getting regular exercise, especially walking
      b. Dorsiflexing the foot of the affected leg
      c. Increasing calcium intake

P. Shortness of breath
1. Can occur in the second and third trimesters
2. Results from pressure on the diaphragm from the enlarged uterus
3. Interventions
   a. Taking frequent rest periods
   b. Sitting and sleeping with the head elevated or on the side
   c. Avoiding overexertion

VIII. Maternal Risk Factors
   A. Maternal age: Women younger than 20 years and older than 35 years are at risk for adverse perinatal outcomes.

   B. Adolescent pregnancy
   1. Factors that result in adolescent pregnancy include the early onset of menarche, sexual behaviors in this age group, problems with family relationships, poverty, and lack of knowledge of reproduction and birth control.
   2. Major concerns related to adolescent pregnancy include poor nutritional status; emotional and behavioral difficulties; lack of support systems; increased risk of stillbirth; low-birth-weight infants; fetal mortality; cephalopelvic disproportion; and increased risk of maternal complications, such as hypertension, anemia, prolonged labor, and infections.
   3. The role of the nurse in reducing risks and consequences of adolescent pregnancy is twofold: first, to encourage early and continued prenatal care; and second, to refer the adolescent, if necessary, for appropriate assistance, which can help counter the effects of a negative socioeconomic environment on the pregnancy.

   C. Nutrition: Adequate nutrition is necessary for normal fetal growth and development. Nutrition needs are determined by the stage of pregnancy and nutrition should support recommended weight gain during the various stages.

   Women of childbearing age should take folic acid supplements to prevent neural tube defects and orofacial clefts in the fetus.

   D. Genetic considerations: Genetic abnormalities such as defective genes or transmissible inherited disorders can result in congenital anomalies; the nurse should perform a genetic risk assessment to determine an inheritable risk.

   E. Health care: Failure to seek and obtain prenatal care, including dental care, increases the risk for preterm birth and low birth
weight.

F. Abuse and violence: Physical abuse and violence can increase the risk for abruptio placentae, preterm birth, and infections from unwanted and forced sex.

G. Medical conditions: Concurrent medical conditions, such as, but not limited to, diabetes mellitus, hypertensive disorder, or cardiac disease, increase the risk of complications during pregnancy.

H. German measles (rubella): Maternal infection during the first 8 weeks of gestation carries the highest rate of fetal infection.

I. Sexually transmitted infections
   1. Syphilis
      a. Organism may cross the placenta.
      b. Infection usually leads to spontaneous abortions and increases the incidence of mental subnormality and physical deformities.
   2. Condyloma acuminatum (human papillomavirus)
      a. Transmission may occur during vaginal birth.
      b. Infection is associated with the development of epithelial tumors of the mucous membranes of the larynx in children.
   3. Gonorrhea
      a. Fetus is contaminated at the time of birth.
      b. Maternal infection may result in postpartum infection of the neonate.
      c. Risks to the neonate include ophthalmia neonatorum, pneumonia, and sepsis.
   4. Chlamydial infection
      a. Transmission may occur during vaginal birth and can result in neonatal conjunctivitis or pneumonitis.
      b. Infection can cause premature rupture of the membranes, premature labor, and postpartum endometritis.
   5. Trichomoniasis: Associated with premature rupture of the membranes and postpartum endometritis.
   6. Genital herpes simplex virus
      a. Characterized by painful lesions, fever, chills, malaise, and severe dysuria and may last 2 to 3 weeks
      b. Assessment includes questioning all women about signs and symptoms and inspecting the vulvar, perineal, and vaginal areas for vesicles or areas of
ulceration or crusting; this is done during pregnancy and at the onset of labor.

c. Vaginal birth may be acceptable; cesarean birth is required if visible lesions are present.
d. Infants who are born through an infected vagina should be observed carefully, and samples should be taken for culture.

J. Human immunodeficiency virus (HIV)

1. HIV is transmitted through blood; blood products; and other bodily fluids such as urine, semen, and vaginal secretions; the virus is also transmitted through exposure to infected secretions during birth and through breast milk.

2. Repeated exposure to the virus during pregnancy through unsafe sex practices or intravenous drug use can increase the risk of transmission to the fetus.

3. Perinatal administration of zidovudine may be recommended to decrease the risk of transmission of HIV from mother to fetus.

K. Substance abuse

1. Substance abuse threatens normal fetal growth and successful term completion of the pregnancy.

2. Substance abuse places the pregnancy at risk for fetal growth restriction, abruptio placentae, and fetal bradycardia.

3. Many substances cross the placenta and can be teratogenic (drugs, tobacco, alcohol, medications, certain foods such as raw fish); no over-the-counter medications should be taken unless prescribed by the PHCP.

4. Smoking (tobacco) can result in low birth weight, a higher incidence of birth defects, and stillbirths.

5. Physical signs of drug abuse may include dilated or contracted pupils, fatigue, track (needle) marks, skin abscesses, inflamed nasal mucosa, and inappropriate behavior by the mother.

6. Consumption of alcohol during pregnancy may lead to fetal alcohol syndrome and can cause jitteriness, physical abnormalities, congenital anomalies, and growth deficits in the newborn.

L. Viral hepatitis (see Chapters 22, 33, and 48 for information regarding hepatitis B infection)
IX. Antepartum Diagnostic Testing

The usual schedule for antepartum health care visits is every 4 weeks for the first 28 to 32 weeks, every 2 weeks from 32 to 36 weeks, and every week from 36 to 40 weeks.

A. Blood type and Rh factor

1. ABO typing is performed to determine the woman’s blood type in the ABO antigen system.
2. Rh typing is done to determine the woman’s blood type in the rhesus antigen system. (Rh positive indicates the presence of the antigen; Rh negative indicates the absence of the antigen.)
3. If the client is Rh negative and has a negative antibody screen, she will need repeat antibody screens and should receive Rh\textsubscript{o}(D) immune globulin (RhoGAM) at 28 weeks of gestation.

B. Rubella titer

1. If the client has a negative titer (less than 1:8), indicating susceptibility to the rubella virus, she should receive the appropriate immunization postpartum.
2. The client must be using effective birth control at the time of the immunization and must be counseled not to become pregnant for 1 to 3 months after immunization (as specified by the PHCP) and to avoid contact with anyone who is immunocompromised.
3. If the rubella vaccine is administered at the same time as Rh\textsubscript{o}(D) immune globulin, it may not be effective.
4. Rubella vaccine is administered postpartum (before discharge) via the subcutaneous route if the titer is less than 1:8; inquire about sensitivity to eggs.

C. Hemoglobin and hematocrit levels

1. Hemoglobin and hematocrit levels decline during gestation as a result of increased plasma volume.
2. A decrease in the hemoglobin level to less than 10 g/dL (100 mmol/L) or in the hematocrit level to less than 30% indicates anemia.
D. Papanicolaou’s smear may be done during the initial prenatal examination to screen for cervical neoplasia if the woman has not had a screening before or is beyond the recommended timeframe since her last screening.

E. Sexually transmitted infections (Table 21-1)

F. Sickle cell screening
1. Screening is indicated for clients at risk for sickle cell disease.
2. A positive test may indicate a need for further screening.

G. Tuberculin skin test
1. The PHCP may prefer to perform this skin test after birth.
2. A positive skin test indicates the need for a chest radiograph (using an abdominal lead shield) to rule out active disease; in a pregnant client, chest radiography would not be performed until after 20 weeks of gestation (after the fetal organs are formed).
3. Converters to positive may be referred for treatment with medication after birth.

H. Hepatitis B surface antigens
1. Testing for hepatitis antigens is recommended for all women because of the prevalence of the disease in the general population.
2. Vaccination for hepatitis B antigen may be specifically indicated for the following:
   a. Health care workers
   b. Intravenous drug users
   c. Clients born in Asia, Africa, Haiti, or the Pacific islands
   d. Clients with previously undiagnosed jaundice or chronic liver disease
   e. Clients with tattoos
   f. Clients with histories of blood transfusions
   g. Clients with histories of multiple episodes of sexually transmitted infections
   h. Clients who have been rejected previously as blood donors
   i. Clients with histories of dialysis or renal transplantation
   j. Clients from households having members infected with hepatitis B or hemodialysis clients
3. Hepatitis B vaccine is not contraindicated during pregnancy and may be recommended by the PHCP.
4. See Chapters 22, 33, and 48 for additional information about hepatitis.

I. Glucose challenge test (GCT)

1. Screening for gestational diabetes mellitus begins at the initial prenatal visit and is diagnosed by a fasting blood glucose greater than 126 mg/dL (7.0 mmol/L), A1C greater than 6.5%, or a random plasma glucose level greater than 200 mg/dL (11.1 mmol/L), then subsequently confirmed by an elevated fasting glucose level or A1C.

2. According to the American Congress of Obstetricians and Gynecologists (ACOG), a GCT using a two-step approach should be used in screening for gestational diabetes mellitus (GDM).

3. A 50-g oral glucose load without regard to time of day is given. After 1 hour a plasma or serum glucose level is drawn and is considered elevated if it is greater than 140 mg/dL (7.8 mmol/L) and a 3-hour GCT should be done.

4. If the 3-hour GCT is above 130 to 140 mg/dL (7.2 to 7.8 mmol/L), it is considered a positive result and may be indicative of GDM.

5. It is important to note that the GCT has 86% sensitivity, and some false positives may be noted.

J. Urinalysis and urine culture

1. A urine specimen for glucose and protein determinations should be obtained at every antepartum visit.

2. Glycosuria is a common result of decreased renal threshold that occurs during pregnancy.

3. If glycosuria persists, it may indicate diabetes.

4. White blood cells in the urine may indicate infection.

5. Ketonuria may result from insufficient food intake or vomiting.

6. Levels of 2+ to 4+ protein in the urine may indicate infection or preeclampsia.

K. Ultrasonography

1. Outlines and identifies fetal and maternal structures

2. Assists in confirming gestational age and estimated date of delivery and evaluating amniotic fluid volume (amniotic fluid index), which is done via special measurements

3. May be done abdominally or transvaginally during pregnancy

4. Can be used to determine the presence of premature dilation of the cervix (incompetent cervix). A transvaginal ultrasound is used during the first trimester to check the length of the cervix.
5. Interventions
   a. If an abdominal ultrasound is being performed, the woman may need to drink water to fill the bladder before the procedure to obtain a better image of the fetus.
   b. If a transvaginal ultrasound is being performed, a lubricated probe is inserted into the vagina.
   c. The client should be informed that the test presents no known risks to the client or the fetus.

L. Biophysical profile
   1. Noninvasive assessment of the fetus that includes fetal breathing movements, fetal movements, fetal tone, amniotic fluid index, and fetal heart rate patterns via a nonstress test
   2. Normal fetal biophysical activities indicate that the central nervous system is functional and that the fetus is not hypoxemic.

M. Doppler blood flow analysis: Noninvasive (ultrasonography) method of studying the blood flow in the fetus and placenta

N. Percutaneous umbilical blood sampling
   1. Percutaneous umbilical blood sampling is performed if fetal blood sampling is necessary; it involves insertion of a needle directly into the fetal umbilical vessel under ultrasound guidance.
   2. Fetal heart rate monitoring is necessary for 1 hour after the procedure, and a follow-up ultrasound to check for bleeding or hematoma formation is done 1 hour after the procedure.

O. α-Fetoprotein screening
   1. Assesses the quantity of fetal serum proteins; abnormal protein levels are associated with open neural tube and abdominal wall defects
   2. Assists in screening for spina bifida and Down syndrome
   3. If abnormal, repeat test; false positive is common.
   4. Interventions
      a. α-Fetoprotein level is determined by a maternal blood sample drawn between 16 and 18 weeks of gestation.
      b. If the level is abnormal and the gestation is less than 18 weeks, a second sample is drawn and screened.
      c. An ultrasound is performed for elevated levels to rule out fetal abnormalities or multiple gestation.
P. Deoxyribonucleic acid (DNA) genetic testing
1. Can be used to detect abnormalities related to an inherited condition
2. Assists in determining if the woman is at risk for having a fetus with Down syndrome (trisomy 21), Edwards syndrome (trisomy 18), or Patau syndrome (trisomy 13).
3. Interventions: This type of testing can be done as early as 7 weeks of gestation, and a blood sample is used.

Q. Chorionic villus sampling
1. Performed for the purpose of detecting genetic abnormalities; the PHCP aspirates a small sample of chorionic villus tissue at 10 to 13 weeks of gestation.
2. Interventions
   a. Ensure informed consent was obtained.
   b. The client may need to drink water to fill the bladder before the procedure to aid in the visualization of the uterus for catheter insertion.
   c. Obtain baseline vital signs and fetal heart rate; monitor frequently after the procedure.
   d. Rh-negative women may be given Rh\textsubscript{0}(D) immune globulin, because chorionic villus sampling increases the risk of Rh sensitization.

R. Amniocentesis
1. Aspiration of amniotic fluid; best performed between 15 and 20 weeks of pregnancy because amniotic fluid volume is adequate and many viable fetal cells are present in the fluid by this time
2. Performed to determine genetic disorders, metabolic defects, and fetal lung maturity
3. Risks
   a. Maternal hemorrhage
   b. Infection
   c. Rh isoimmunization
   d. Abruptio placentae
   e. Amniotic fluid emboli
   f. Premature rupture of the membranes
4. Interventions
   a. Ensure informed consent was obtained.
   b. If less than 20 weeks of gestation, the client should have a full bladder to support the uterus; if performed after 20 weeks of gestation, the client should
have an empty bladder to minimize the chance of puncture.

c. Prepare the client for ultrasonography, which is performed to locate the placenta and avoid puncture.

d. Obtain baseline vital signs and fetal heart rate; monitor every 15 minutes.

e. Position the client supine during the examination and on the left side after the procedure.

After chorionic villus sampling and amniocentesis, instruct the client that if chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping occurs, she must notify the PHCP.

S. Kick counts (fetal movement counting)

1. Beginning at 28 weeks’ gestation, the client sits quietly or lies down on her side and counts fetal kicks as instructed.

2. Instruct the client to notify the PHCP if there are fewer than 10 kicks in 2 consecutive 2-hour periods or as instructed by the PHCP.

T. Fern test

1. The fern test is a microscopic slide test to determine the presence of amniotic fluid leakage.

2. Using sterile technique, a specimen is obtained from the external os of the cervix and vaginal pool and is examined on a slide under a microscope.

3. A fern-like pattern produced by the effects of salts of the amniotic fluid indicates the presence of amniotic fluid; may be done in conjunction with the Nitrazine test.

4. Interventions

   a. Position the client in the dorsal lithotomy position.

   b. Instruct the client to cough, which causes the amniotic fluid to leak from the uterus if the membranes are ruptured.

U. Nitrazine test

1. A nitrazine test strip is used to detect the presence of amniotic fluid in vaginal secretions.

2. Vaginal secretions have a pH of 4.5 to 5.5 and do not affect the nitrazine strip or swab.

3. Amniotic fluid has a pH of 7.0 to 7.5 and turns the
nitrazine strip or swab blue.

4. Interventions
   a. Position the client in the dorsal lithotomy position.
   b. Touch the test tape to the fluid.
   c. Assess the test tape for a blue-green, blue-gray, or deep blue color, which indicates that the membranes are ruptured, causing leakage of amniotic fluid.

V. Fibronectin test
   1. Sampling of cervical and vaginal secretions for fetal fibronectin; done between week 22 and week 34 of pregnancy if the primary health care provider is concerned about preterm labor.
   2. Positive results may indicate the onset of labor in 1 to 3 weeks; negative test results are more predictive that preterm labor will not begin.
   3. Test used if at risk for preterm labor, before 37 weeks of gestation
   4. Interventions
      a. Client is placed in lithotomy position for sterile speculum exam.
      b. Cervical secretions are obtained with cotton swab.
      c. Laboratory tests are done for the presence of fibronectin.

W. Nonstress test (Box 21-4)
X. Contraction stress test (Box 21-5)

X. Nutrition
   A. General guidelines
      1. Guidelines for health and nutrition information for breast-feeding and pregnant women are located at the U.S. Department of Agriculture ChooseMyPlate website at [www.choosemyplate.gov/moms-pregnancy-breastfeeding](http://www.choosemyplate.gov/moms-pregnancy-breastfeeding). The woman should be assisted with accessing this site and preparing a nutritional plan.
      2. The average expected weight gain during pregnancy is 25 to 35 lb (11 to 16 kg) for women with a normal prepregnancy weight.
      3. An increase of about 300 calories/day is needed during pregnancy.
      4. Calorie needs are greater in the last 2 trimesters than in the first.
      5. An increase of about 500 calories/day is needed during lactation.
      6. A diet high in folic acid or folic acid supplements is
necessary for all women of childbearing age to prevent neural tube defects and orofacial clefts in the fetus.

7. At least 8 to 10 (8-oz) glasses of fluid are needed each day, of which 4 to 6 glasses should be water.
8. Sodium is not restricted unless specifically prescribed by the PHCP.

B. Vegan and Vegetarian Diets (see Chapter 11)
1. Ensure that the client eats a sufficient amount of varied foods to meet normal nutrient and energy needs.
2. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
3. Potential deficiencies in vegetarian diets include energy, protein, vitamin B\textsubscript{12}, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
4. Protein consumption can be increased by consumption of a variety of vegetable protein sources based on whole grains, legumes, seeds, nuts, and vegetables combined to provide all essential amino acids.
5. To enhance absorption of iron, vegetarians should include a good source of iron and vitamin C with each meal.
6. Foods commonly eaten include tofu, tempeh, soy milk and soy products, meat analogs, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.

C. Lactose intolerance
1. Lactose consumed by an individual with lactose intolerance can cause abdominal distention, discomfort, nausea, vomiting, cramps, and loose stools.
2. Clients with lactose intolerance need to incorporate sources of calcium other than dairy products into their dietary patterns regularly.
3. Milk may be tolerated in cooked form, such as in custards or fermented dairy products.
4. Cheese and yogurt sometimes are tolerated.
5. Lactase, an enzyme, may be prescribed and is taken before ingesting milk or milk products.
6. Lactase-treated milk or lactose-free products are also available commercially.

D. Pica
1. Pica refers to eating nonfood substances, such as dirt, clay, starch, and freezer frost.
2. The cause is unknown; cultural values, such as beliefs regarding the effect of a material on the mother or
fetus, may make pica a common practice.
3. Iron deficiency anemia may occur as a result of pica.

**Box 21-1**

**Näegele’s Rule for Estimating the Date of Delivery**

First day of last menstrual period: September 12, 2021  
Subtract 3 months: June 12, 2021  
Add 7 days: June 19, 2021  
Add 1 year: June 19, 2022  
Estimated date of delivery: June 19, 2022

**Box 21-2**

**Describing Pregnancy Outcome with GTPAL**

- **G** = Gravidity 
- **T** = Term births 
- **P** = Preterm births 
- **A** = Abortions or miscarriages 
- **L** = Current living children

**Example:** A woman is pregnant for the fourth time. She had 1 elective abortion in the first trimester, a daughter who was born at 40 weeks of gestation, and a son who was born at 36 weeks of gestation. She is gravida (G), 4; term (T), 1 (the daughter born at 40 weeks); preterm (P), 1 (the son born at 36 weeks); abortion (A), 1 (the abortion is counted in the gravidity, but is not included in the parity because it occurred before 20 weeks); living children (L), 2. Parity is the number of births (not the number of fetuses) carried past 20 weeks of gestation, whether or not the fetus was born alive. Therefore, the parity for this woman is 2.

\[ GTPAL = 4, 1, 1, 1, 2 \]

**Box 21-3**

**Measuring Fundal Height**
1. Place the client in the supine position.
2. Place the end of the tape measure at the level of the symphysis pubis.
3. Stretch the tape to the top of the uterine fundus.
4. Note and record the measurement.
FIG. 21-1  Height of fundus by weeks of normal gestation with a single fetus. *Dashed line,* Height after lightening (descent of the fetus toward the pelvic inlet before labor).

### Table 21-1

**Monitoring for Sexually Transmitted Infections**

<table>
<thead>
<tr>
<th>Disease</th>
<th>Laboratory Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gonorrhea</td>
<td>Vaginal culture is done during initial prenatal examination to screen for gonorrhea. Culture may be repeated during third trimester in high-risk clients.</td>
</tr>
<tr>
<td>Syphilis</td>
<td>Culture of lesions (if present) is done during initial prenatal examination to screen for syphilis. Diagnosis depends on microscopic examination of primary and secondary lesion tissue and serology (Venereal Disease Research Laboratory [VDRL] or rapid plasma reagin [RPR] test) during latency and late infection. Culture may be repeated during the third trimester in high-risk clients.</td>
</tr>
<tr>
<td>Condyloma acuminatum (human papillomavirus)</td>
<td>Culture is indicated for clients with positive history or with active lesions. Test is performed to determine route of delivery. Weekly cultures may be done at week 35 or 36 of pregnancy until birth.</td>
</tr>
<tr>
<td>Chlamydia</td>
<td>Vaginal culture is indicated for all pregnant clients if client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia.</td>
</tr>
<tr>
<td>Trichomoniasis</td>
<td>Normal saline wet smear of vaginal secretions is checked for presence of protozoa. Associated with premature rupture of membranes and postpartum endometritis</td>
</tr>
<tr>
<td>Genital herpes simplex virus (HSV-2)</td>
<td>Culture is done of lesions (if present) during initial prenatal examination to screen for HSV. Microscopic examination is done to determine presence of virus. Additional screening may be necessary as pregnancy progresses.</td>
</tr>
<tr>
<td>HIV</td>
<td>Testing may be done for a high-risk client. Common tests to determine the presence of antibodies include ELISA, Western blot, and immunofluorescence assay (IFA).</td>
</tr>

*ELISA*, Enzyme-linked immunosorbent assay; *HIV*, human immunodeficiency virus.
Box 21-4

Nonstress Test

Description

Test is performed to assess placental function and oxygenation.
Test determines fetal well-being.
Test evaluates the fetal heart rate (FHR) response to fetal movement.

Interventions

An external ultrasound transducer and tocodynamometer are applied to the client, and a tracing of at least 20 minutes’ duration is obtained so that the FHR and uterine activity can be observed.
Baseline blood pressure is obtained, and blood pressure is monitored frequently.
The client is placed in the lateral (side-lying) position to avoid vena cava compression.
The client may be asked to press a button every time she feels fetal movement; the monitor records a mark at each point of fetal movement, which is used as a reference point to assess the FHR response.

Results

Reactive Nonstress Test (Normal, Negative)

“Reactive” indicates a healthy fetus.
The result requires 2 or more FHR accelerations of at least 15 beats per minute, lasting at least 15 seconds from the beginning of the acceleration to the end, in association with fetal movement, during a 20-minute period.

Nonreactive Nonstress Test (Abnormal)

No accelerations or accelerations of less than 15 beats per minute or lasting less than 15 seconds in duration occur during a 40-minute observation.

Unsatisfactory

The result cannot be interpreted because of the poor quality of the FHR tracing.

Box 21-5

Contraction Stress Test
Description

Test assesses placental oxygenation and function. Test determines fetal ability to tolerate labor and determines fetal well-being. Fetus is exposed to the stress of contractions to assess the adequacy of placental perfusion under simulated labor conditions. Test is performed if nonstress test is abnormal.

Interventions

External fetal monitor is applied to the client, and a 20- to 30-minute baseline strip is recorded. The uterus is stimulated to contract by the administration of a dilute dose of oxytocin or by having the client use nipple stimulation until 3 palpable contractions with a duration of 40 seconds or more in a 10-minute period have been achieved. Frequent maternal blood pressure readings are done, and the mother is monitored closely while increasing doses of oxytocin are given.

Results

Negative Contraction Stress Test (Normal)

A negative result is represented by no late decelerations of the fetal heart rate (FHR).

Positive Contraction Stress Test (Abnormal)

A positive result is represented by late decelerations of the FHR, with 50% or more of the contractions in the absence of hyperstimulation of the uterus.

Equivocal

An equivocal result contains decelerations, but with less than 50% of the contractions, or uterine activity shows a hyperstimulated uterus.

Unsatisfactory

An unsatisfactory result means that adequate uterine contractions cannot be achieved, or the FHR tracing is of insufficient quality for adequate interpretation.

Practice Questions

194. The nurse is providing instructions to a pregnant client who is scheduled for
an amniocentesis. What instruction should the nurse provide?
1. Strict bed rest is required after the procedure.
2. Hospitalization is necessary for 24 hours after the procedure.
3. An informed consent needs to be signed before the procedure.
4. A fever is expected after the procedure because of the trauma to the abdomen.

195. A pregnant client in the first trimester calls the nurse at a health care clinic and reports that she has noticed a thin, colorless vaginal drainage. The nurse should make which statement to the client?
1. “Come to the clinic immediately.”
2. “The vaginal discharge may be bothersome, but is a normal occurrence.”
3. “Report to the emergency department at the maternity center immediately.”
4. “Use tampons if the discharge is bothersome, but be sure to change the tampons every 2 hours.”

196. A nonstress test is performed on a client who is pregnant, and the results of the test indicate nonreactive findings. The primary health care provider prescribes a contraction stress test, and the results are documented as negative. How should the nurse document this finding?
1. A normal test result
2. An abnormal test result
3. A high risk for fetal demise
4. The need for a cesarean section

197. A rubella titer result of a 1-day postpartum client is less than 1:8, and a rubella virus vaccine is prescribed to be administered before discharge. The nurse provides which information to the client about the vaccine? Select all that apply.
1. Breast-feeding needs to be stopped for 3 months.
2. Pregnancy needs to be avoided for 1 to 3 months.
3. The vaccine is administered by the subcutaneous route.
4. Exposure to immunosuppressed individuals needs to be avoided.
5. A hypersensitivity reaction can occur if the client has an allergy to eggs.
6. The area of the injection needs to be covered with a sterile gauze for 1 week.

198. The nurse in a health care clinic is instructing a pregnant client how to perform “kick counts.” Which statement by the client indicates a need for further instruction?
1. “I will record the number of movements or kicks.”
2. “I need to lie flat on my back to perform the procedure.”
3. “If I count fewer than 10 kicks in a 2-hour period, I should count the kicks again over the next 2 hours.”
4. “I should place my hands on the largest part of my abdomen and
concentrate on the fetal movements to count the kicks.”

199. The nurse is performing an assessment of a pregnant client who is at 28 weeks of gestation. The nurse measures the fundal height in centimeters and notes that the fundal height is 30 cm. How should the nurse interpret this finding?

1. The client is measuring large for gestational age.
2. The client is measuring small for gestational age.
3. The client is measuring normal for gestational age.
4. More evidence is needed to determine size for gestational age.

200. The nurse is performing an assessment on a client who suspects that she is pregnant and is checking the client for probable signs of pregnancy. The nurse should assess for which probable signs of pregnancy? Select all that apply.

- 1. Ballottement
- 2. Chadwick’s sign
- 3. Uterine enlargement
- 4. Positive pregnancy test
- 5. Fetal heart rate detected by a nonelectronic device
- 6. Outline of fetus via radiography or ultrasonography

201. A pregnant client is seen for a regular prenatal visit and tells the nurse that she is experiencing irregular contractions. The nurse determines that she is experiencing Braxton Hicks contractions. On the basis of this finding, which nursing action is appropriate?

1. Contact the primary health care provider.
2. Instruct the client to maintain bed rest for the remainder of the pregnancy.
3. Inform the client that these contractions are common and may occur throughout the pregnancy.
4. Call the maternity unit and inform them that the client will be admitted in a preterm labor condition.

202. A client arrives at the clinic for the first prenatal assessment. She tells the nurse that the first day of her last normal menstrual period was October 19, 2020. Using Näegele’s rule, which expected date of delivery should the nurse document in the client’s chart?

1. July 12, 2021
2. July 26, 2021
3. August 12, 2021
4. August 26, 2021

203. The nurse is collecting data during an admission assessment of a client who is pregnant with twins. The client has a healthy 5-year-old child who was delivered at 38 weeks and tells the nurse that she does not have a history of any type of abortion or fetal demise. Using GTPAL, what should the nurse document in the client’s chart?

1. G = 3, T = 2, P = 0, A = 0, L = 1
2. G = 2, T = 1, P = 0, A = 0, L = 1
Answers

194. **Answer:** 3

**Rationale:** Because amniocentesis is an invasive procedure, informed consent needs to be obtained before the procedure. After the procedure, the client is instructed to rest, but may resume light activity after the cramping subsides. The client is instructed to keep the puncture site clean and to report any complications, such as chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping. Amniocentesis is an outpatient procedure and may be done in the obstetrician’s office or in a special prenatal testing unit. Hospitalization is not necessary after the procedure.

**Test-Taking Strategy:** Focus on the **subject**, nursing implications related to amniocentesis. Recalling that this procedure is invasive will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity: Antepartum

**Health Problem:** N/A

**Priority Concepts:** Client Education; Health Care Law

195. **Answer:** 2

**Rationale:** Leukorrhea begins during the first trimester. Many clients notice a thin, colorless, or yellow vaginal discharge throughout pregnancy. Some clients become distressed about this condition, but it does not require that the client report to the health care clinic or emergency department immediately. If vaginal discharge is profuse, the client may use panty liners, but she should not wear tampons because of the risk of infection. If the client uses panty liners, she should change them frequently.

**Test-Taking Strategy:** Eliminate options 1 and 3 first because they are **comparable or alike**, indicating that the client requires medical attention. From the remaining options, recalling that this manifestation is a normal physiological occurrence or that tampons should be avoided will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Antepartum

**Health Problem:** N/A

**Priority Concepts:** Health Promotion; Reproduction

**Reference:** Lowdermilk et al. (2016), p. 289.
196. **Answer:** 1

**Rationale:** Contraction stress test results may be interpreted as negative (normal), positive (abnormal), or equivocal. A negative test result indicates that no late decelerations occurred in the fetal heart rate, although the fetus was stressed by 3 contractions of at least 40 seconds’ duration in a 10-minute period. Options 2, 3, and 4 are incorrect interpretations.

**Test-Taking Strategy:** Note that options 2, 3, and 4 are **comparable or alike** in that they indicate an abnormal test result finding.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Antepartum

**Health Problem:** N/A

**Priority Concepts:** Perfusion; Reproduction

197. **Answer:** 2, 3, 4, 5

**Rationale:** Rubella vaccine is administered to women who have not had rubella or women who are not serologically immune. The vaccine may be administered in the immediate postpartum period to prevent the possibility of contracting rubella in future pregnancies. The live attenuated rubella virus is not communicable in breast milk; breast-feeding does not need to be stopped. The client is counseled not to become pregnant for 1 to 3 months after immunization or as specified by the obstetrician because of a possible risk to a fetus from the live virus vaccine; the client must be using effective birth control at the time of the immunization. The client should avoid contact with immunosuppressed individuals because of their low immunity toward live viruses and because the virus is shed in the urine and other body fluids. The vaccine is administered by the subcutaneous route. A hypersensitivity reaction can occur if the client has an allergy to eggs because the vaccine is made from duck eggs. There is no useful or necessary reason for covering the area of the injection with a sterile gauze.

**Test-Taking Strategy:** Focus on the subject, client instructions regarding the rubella vaccine. Recalling that the rubella vaccine is a live virus vaccine will assist in selecting options 2 and 5. Next, recalling the route of administration and the contraindications associated with its use will assist in selecting options 3 and 4.

**Content Area:** Maternity: Postpartum

**Health Problem:** Maternity: Infections/Inflammations

**Priority Concepts:** Client Education; Immunity

198. **Answer:** 2
Rationale: The client should sit or lie quietly on her side to perform kick counts. Lying flat on the back is not necessary to perform this procedure, can cause discomfort, and presents a risk of vena cava (supine hypotensive) syndrome. The client is instructed to place her hands on the largest part of the abdomen and concentrate on the fetal movements. The client records the number of movements felt during a specified time period. The client needs to notify the primary health care provider (PHCP) if she feels fewer than 10 kicks over two consecutive 2-hour intervals or as instructed by the PHCP.

Test-Taking Strategy: Note the strategic words, need for further instruction. These words indicate a negative event query and ask you to select an option that is an incorrect statement. If you are unfamiliar with this procedure, recalling that the risk of vena cava (supine hypotensive) syndrome exists when the client lies on her back will direct you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Health Promotion and Maintenance

Content Area: Maternity: Antepartum
Health Problem: N/A
Priority Concepts: Client Education; Perfusion

199. Answer: 3

Rationale: During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus’s age in weeks ± 2 cm. Therefore, if the client is at 28 weeks’ gestation, a fundal height of 30 cm would indicate that the client is measuring normal for gestational age. At 16 weeks, the fundus can be located halfway between the symphysis pubis and the umbilicus. At 20 to 22 weeks, the fundus is at the umbilicus. At 36 weeks, the fundus is at the xiphoid process.

Test-Taking Strategy: Focus on the subject, the location of fundal height. Remember that during the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus’s age in weeks ± 2 cm.

Health Problem: N/A
Priority Concepts: Development; Reproduction

200. Answer: 1, 2, 3, 4

Rationale: The probable signs of pregnancy include uterine enlargement, Hegar’s sign (compressibility and softening of the lower uterine segment that occurs at about week 6), Goodell’s sign (softening of the cervix that occurs at the beginning of the second month), Chadwick’s sign (violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about week 4), ballottement (rebounding of
the fetus against the examiner’s fingers on palpation), Braxton Hicks contractions, and a positive pregnancy test for the presence of human chorionic gonadotropin. Positive signs of pregnancy include fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation, active fetal movements palpable by the examiner, and an outline of the fetus by radiography or ultrasonography.

**Test-Taking Strategy:** Focusing on the **subject**, probable signs of pregnancy, will assist in answering this question. Remember that detection of the fetal heart rate and an outline of the fetus via radiography or ultrasonography are positive signs of pregnancy.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Antepartum

**Health Problem:** N/A

**Priority Concepts:** Development; Reproduction

**Reference:** Lowdermilk et al. (2016), pp. 286, 302.

**201. Answer:** 3

**Rationale:** Braxton Hicks contractions are irregular, painless contractions that may occur intermittently throughout pregnancy. Because Braxton Hicks contractions may occur and are normal in some pregnant women during pregnancy, there is no reason to notify the primary health care provider. This client is not in preterm labor and, therefore, does not need to be placed on bed rest or be admitted to the hospital to be monitored.

**Test-Taking Strategy:** Options 1 and 4 are **comparable or alike** and can be eliminated first. From the remaining options, knowing that Braxton Hicks contractions are common and normal and can occur throughout pregnancy will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Antepartum

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Reproduction

**202. Answer:** 2

**Rationale:** Accurate use of Näegele’s rule requires that the woman have a regular 28-day menstrual cycle. Subtract 3 months and add 7 days to the first day of the last menstrual period, and then add 1 year to that date: first day of the last menstrual period, October 19, 2020; subtract 3 months, July 19, 2020; add 7 days, July 26, 2020; add 1 year, July 26, 2021.

**Test-Taking Strategy:** Focus on the **subject** and use knowledge regarding Näegele’s rule to answer this question. This rule requires addition and subtraction,
so read all options carefully, noting the dates and years in the options, before selecting an answer.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Maternity: Antepartum  
**Health Problem:** N/A  
**Priority Concepts:** Development; Reproduction  

203. **Answer:** 2

**Rationale:** Pregnancy outcomes can be described with the acronym **GTPAL**. **G** is gravidity, the number of pregnancies; **T** is term births, the number born at term (longer than 37 weeks); **P** is preterm births, the number born before 37 weeks of gestation; **A** is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks of gestation; included in parity [number of births] if past 20 weeks of gestation); and **L** is the number of current living children. A woman who is pregnant with twins and has a child has a gravida of 2. Because the child was delivered at 38 weeks, the number of term births is 1, and the number of preterm births is 0. The number of abortions is 0, and the number of living children is 1.

**Test-Taking Strategy:** Focus on the subject of the question. Recalling the meaning of the acronym **GTPAL** and focusing on the information in the question will direct you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance

CHAPTER 22

Risk Conditions Related to Pregnancy

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Reproduction, Safety

I. Bleeding During Pregnancy
   A. Implantation bleeding: Bleeding that occurs 10 to 14 days after conception. Usually lasts 1 to 2 days and is lighter than the typical menstrual period. Often confused with a normal menstrual period. No treatment is necessary.
   B. Other causes include abortion, malignancy, polyps, trauma, ectopic pregnancy, idiopathic, infection, molar pregnancy, subchorionic hemorrhage, vaginitis, urinary tract infection, cervicitis, cervical polyps, postcoital bleeding, placenta previa, and abruptio placentae.

II. Abortion
   A. Description: A pregnancy that ends before 20 weeks’ gestation, spontaneously or electively
   B. Types (Box 22-1)
   C. Risk factors
      1. Advanced maternal age
      2. Those who have experienced a previous miscarriage are at a higher risk
      3. Previous elective abortion
      4. Uterine abnormalities such as adhesions or fibroids
      5. Prolonged time to achieve pregnancy
      6. Low serum progesterone
      7. Celiac disease
      8. Polycystic ovarian syndrome
      9. Thyroid dysfunction or Cushing’s syndrome
     10. Systemic lupus erythematosus
     11. Infection, fever, trauma
     12. Low body mass index (BMI), less than 18.5
     13. Smoking, alcohol, cocaine use, certain medications, high caffeine intake
   D. Assessment
      1. Spontaneous vaginal bleeding
      2. Low uterine cramping or contractions
      3. Blood clots or tissue through the vagina

672
4. Hemorrhage and shock can result if bleeding is excessive.

E. Interventions
1. Maintain bed rest as prescribed.
2. Monitor vital signs.
3. Monitor for cramping and bleeding.
4. Count perineal pads to evaluate blood loss, and save expelled tissues and clots.
5. Maintain intravenous (IV) fluids as prescribed; monitor for signs of hemorrhage or shock.
6. Prepare the client for dilation and curettage as prescribed for incomplete abortion.
7. Administer Rh\(_0\)(D) immune globulin, as prescribed, for an Rh-negative woman.
8. Provide psychological support.

III. Cardiac Disease

A. Description: A pregnant client with cardiac disease may be unable physiologically to cope with the added plasma volume and increased cardiac output that occur during pregnancy; blood volume peaks at weeks 32 to 34 and then declines slightly to week 40.

B. Maternal cardiac disease risk groups (Box 22-2)

C. Assessment
1. Signs and symptoms of cardiac decompensation
   a. Cough and respiratory congestion
   b. Dyspnea and fatigue
   c. Palpitations and tachycardia
   d. Peripheral edema
   e. Chest pain
2. Signs of respiratory infection
3. Signs of heart failure and pulmonary edema

D. Interventions
1. Monitor vital signs, fetal heart rate, and condition of the fetus.
2. Limit physical activities, and stress the need for sufficient rest.
3. Monitor for signs of cardiac stress and decompensation, such as cough, fatigue, dyspnea, chest pain, and tachycardia; also monitor for signs of heart failure and pulmonary edema.
4. Encourage adequate nutrition to prevent anemia, which would worsen the cardiac status; in addition, a low-sodium diet may be prescribed to prevent fluid retention and heart failure.
5. Avoid excessive weight gain.
6. During labor, prepare to do the following:
   a. Monitor vital signs frequently.
   b. Place the client on a cardiac monitor and on an external fetal monitor.
   c. Maintain bed rest, with the client lying on her side with her head and shoulders elevated.
   d. Administer oxygen as prescribed.
   e. Manage pain early in labor. Cardiology clearance may be required for epidural, spinal, or general anesthetic agents.
   f. Use controlled pushing efforts to decrease cardiac stress.

Excessive weight gain places stress on the heart. In addition, obesity places the client at increased risk for complications during pregnancy.

IV. Chorioamnionitis
   A. Description
      1. Bacterial infection of the amniotic cavity; can result from premature or prolonged rupture of the membranes, vaginitis, amniocentesis, or intrauterine procedures
      2. May result in the development of postpartum endometritis and neonatal sepsis
   B. Assessment
      1. Uterine tenderness and contractions
      2. Elevated temperature
      3. Maternal or fetal tachycardia
      4. Foul odor to amniotic fluid
      5. Leukocytosis
   C. Interventions
      1. Monitor maternal vital signs and fetal heart rate.
      3. Monitor results of blood cultures.
      4. Prepare for amniocentesis to obtain amniotic fluid for Gram stain and leukocyte count and other testing as prescribed.
      5. Administer antibiotics as prescribed after cultures are obtained.
      6. Administer oxytocic medications as prescribed to increase uterine tone.
      7. Prepare to obtain neonatal cultures after birth.
V. Diabetes Mellitus

A. Description

1. Pregnancy places demands on carbohydrate metabolism and causes insulin requirements to change.
2. Insulin resistance and hyperinsulinemia may predispose some women to diabetes.
3. Maternal glucose crosses the placenta, but insulin does not.
4. The fetus produces its own insulin and pulls glucose from the mother, which predisposes the mother to hypoglycemic reactions.
5. The newborn of a diabetic mother may be large in size but has functions related to gestational age rather than size.
6. The newborn of a diabetic mother is at risk for hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, and congenital anomalies.

During the first trimester, maternal insulin needs decrease.

During the second and third trimesters, increases in placental hormones cause an insulin-resistant state, requiring an increase in the client’s insulin dose. After placental delivery, placental hormone levels abruptly decrease and insulin requirements decrease.

B. Gestational diabetes mellitus

1. Gestational diabetes occurs in pregnancy (during the second or third trimester) in clients not previously diagnosed as diabetic and occurs when the pancreas cannot respond to the demand for more insulin.
2. Women may be diagnosed with overt diabetes while pregnant as well, and as a result of personal risk factors such as being overweight or obese, there is an increased likelihood of overt, unrecognized diabetes. An HbA1C level may be helpful in making this determination.
3. There is an increased incidence of gestational diabetes when a woman also has polycystic ovarian syndrome.
4. Pregnant women should be screened for gestational diabetes between 24 and 28 weeks of gestation via the 1-hour glucose challenge test.
5. If the 1-hour glucose challenge test is abnormal, a 3-hour oral glucose tolerance test is performed to confirm gestational diabetes mellitus.
6. Gestational diabetes frequently can be treated by diet alone; however, some clients may need insulin (selected oral medications that are safe during pregnancy may be prescribed).

7. Most women with gestational diabetes return to a euglycemic state after birth; however, these individuals have an increased risk of developing diabetes mellitus in their lifetimes.

8. Early screening at an initial prenatal visit is done if the client has predisposing conditions as risk factors. See Chapter 21 for additional information on screening for gestational diabetes mellitus and interpreting glucose challenge test results.

9. The need for cesarean section is more likely, and neonatal hypoglycemia and macrosomia may be evident.

C. Predisposing conditions/risk factors to gestational diabetes
   1. Older than 35 years
   2. Obesity — BMI greater than 30
   3. Nonwhite race
   4. Previous unexplained perinatal loss
   5. Previous child born with congenital anomalies
   6. Polycystic ovarian syndrome
   7. Multiple gestation
   8. First-degree relative with diabetes mellitus or gestational diabetes
   9. Previous delivery of a fetus weighing greater than 9 lb
   10. Maternal birth weight less than 6 lb or greater than 9 lb
   11. Previous pregnancy with gestational diabetes
   12. Glycosuria
   13. Essential or pregnancy-related hypertension
   14. Use of glucocorticoids

D. Assessment
   1. Excessive thirst
   2. Hunger
   3. Weight loss
   4. Frequent urination
   5. Blurred vision
   6. Recurrent urinary tract infections and vaginal yeast infections
   7. Glycosuria and ketonuria
   8. Signs of gestational hypertension and preeclampsia
   9. Polyhydramnios
   10. Large for gestational age fetus

E. Interventions
   1. Employ diet, medications (if diet cannot control blood glucose levels), exercise, and blood glucose
determinations 4 times daily (fasting and 1 to 2 hours after meals) to maintain blood glucose levels as follows: fasting less than 95 mg/dL (5.4 mmol/L), 1-hour post-prandial less than 130 to 140 mg/dL (7.4 to 8 mmol/L), 2-hour post-prandial less than 120 mg/dL (6.8 mmol/L).

2. Encourage moderate physical activity.
3. Facilitate referral to a diabetic educator and nutritionist.
4. Observe for signs of hyperglycemia, glycosuria and ketonuria, and hypoglycemia.
5. Monitor weight.
6. Maintain calorie intake as prescribed, with adequate oral medication or insulin therapy so that glucose moves into the cells.
7. Assess for signs of maternal complications such as preeclampsia, a serious blood pressure disorder that can affect all organs in the body (hypertension is characteristic of the condition).
8. Monitor for signs of infection.
9. Instruct the client to report burning and pain on urination, vaginal discharge or itching, or any other signs of infection to the primary health care provider (PHCP).
10. Assess fetal status and monitor for signs of fetal compromise.
11. Schedule visits every 2 weeks until 36 weeks, and then every week from 36 weeks and up.

F. Interventions during labor

1. Monitor fetal status continuously for signs of distress and, if noted, prepare the client for immediate cesarean section.
2. Carefully regulate insulin and provide glucose intravenously as prescribed because labor depletes glycogen.

G. Interventions during the postpartum period

1. Observe the mother closely for a hypoglycemic reaction because a precipitous decline in insulin requirements normally occurs (the mother may not require insulin for the first 24 hours).
2. Reregulate insulin needs as prescribed after the first day, according to blood glucose testing.
3. Assess dietary needs, based on blood glucose testing and insulin requirements.
4. Monitor for signs of infection or postpartum
hemorrhage.

VI. Disseminated Intravascular Coagulation (DIC)

A. Description: DIC is a maternal condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation (Fig. 22-1).

The rapid and extensive formation of clots that occurs in DIC causes the platelets and clotting factors to be depleted; this results in bleeding and the potential vascular occlusion of organs from thromboembolus formation.

B. Predisposing conditions (Box 22-3)

C. Assessment

1. Uncontrolled bleeding
2. Bruising, purpura, petechiae, and ecchymosis
3. Presence of occult blood in excretions such as stool
4. Hematuria, hematemesis, or vaginal bleeding
5. Signs of shock
6. Decreased fibrinogen level, platelet count, and hematocrit level
7. Increased prothrombin time and partial thromboplastin time, clotting time, and fibrin degradation products

D. Interventions

1. Remove underlying cause.
2. Monitor vital signs; assess for bleeding and signs of shock.
3. Prepare for oxygen therapy, volume replacement, blood component therapy, and possibly heparin therapy.
5. Monitor urine output and maintain at least 30 mL/hr (renal failure is a complication of DIC).

VII. Ectopic Pregnancy

A. Description

1. Implantation of the fertilized ovum outside of the uterine cavity
2. Most common location is the ampulla of the fallopian tube (Fig. 22-2).

B. Assessment

1. Missed menstrual period
2. Abdominal pain
3. Vaginal spotting to bleeding that is dark red or brown
4. Rupture: Increased pain, referred shoulder
pain, signs of shock

C. Interventions

1. Obtain assessment data and vital signs.
2. Monitor bleeding and initiate measures to prevent rupture and shock.
3. Methotrexate, a folic acid antagonist, may be prescribed to inhibit cell division in the developing embryo.
4. Prepare the client for laparotomy and removal of the pregnancy and tube, if necessary, or repair of the tube.
5. Administer antibiotics; Rh₀(D) immune globulin is prescribed for Rh-negative women.

VIII. Fetal Death in Utero

A. Description

1. Fetal death in utero refers to the death of a fetus after the twentieth week of gestation and before birth.
2. The client can develop DIC if the dead fetus is retained in the uterus for 3 to 4 weeks or longer.

B. Assessment

1. Absence of fetal movement
2. Absence of fetal heart tones
3. Maternal weight loss
4. Lack of fetal growth or decrease in fundal height
5. No evidence of fetal cardiac activity
6. Other characteristics suggestive of fetal death noted on ultrasound

C. Interventions

1. Prepare for the birth of the fetus.
2. Support the client’s decision about labor, birth, and the postpartum period.
3. Provide support and ask what can be helpful; provide assistance as appropriate and requested.
4. Accept behaviors such as sadness, anger, and hostility from the parents.
5. Refer the parents to an appropriate support group.

Cultural, spiritual, and religious practices and beliefs are important to consider when caring for the parents of a fetus who has died. Be aware of these cultural, spiritual, and religious practices and beliefs and ensure that their beliefs are respected and implemented as appropriate.

IX. Hepatitis B

A. Description
1. The risks of prematurity, low birth weight, and neonatal death increase if the mother has hepatitis B infection.

2. Hepatitis is transmitted through blood, saliva, vaginal secretions, semen, and breast milk and across the placental barrier.

B. Interventions

1. Minimize the risk for intrapartum ascending infections (limit the number of vaginal examinations).
2. Remove maternal blood from the neonate immediately after birth.
3. Suction the fluids from the neonate immediately after birth.
4. Bathe the neonate before any invasive procedures including injections.
5. Clean and dry the face and eyes of the neonate before instilling eye prophylaxis.
6. Infection of the neonate can be prevented by the administration of hepatitis B immune globulin and hepatitis B vaccine soon after birth but after the newborn is bathed.
7. Discourage the mother from kissing the neonate until the neonate has received the vaccine.
8. Inform the mother that the hepatitis B vaccine will be administered to the neonate and that a second dose should be administered at 1 month after birth and a third dose at 6 months after birth.

Support breast-feeding after neonatal treatment for hepatitis B; breast-feeding is not contraindicated if the neonate has been vaccinated.

X. Hematoma

A. Description

1. Hematoma occurs following the escape of blood into the maternal tissue after birth.
2. Predisposing conditions include operative delivery with forceps or injury to a blood vessel.

B. Assessment (Box 22-4)

C. Interventions

1. Monitor vital signs.
2. Monitor client for abnormal pain, especially when forceps delivery has been performed.
3. Apply ice to the hematoma site.
4. Administer analgesics as prescribed.
5. Monitor intake and output.
6. Encourage fluids and voiding; prepare for urinary catheterization if the client is unable to void.
7. Administer blood replacements as prescribed.
8. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
9. Administer antibiotics as prescribed; infection is common after hematoma formation.
10. Prepare for incision and evacuation of the hematoma if necessary.

XI. Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS)

A. Description

1. HIV is the causative agent of AIDS.
2. Women infected with HIV may first show signs and symptoms at the time of pregnancy or possibly develop life-threatening infections because normal pregnancy involves some suppression of the maternal immune system.
3. Repeated exposure to the virus during pregnancy through unsafe sex practices or intravenous (IV) drug use can increase the risk of transmission to the fetus.
4. Three-drug combination HAART (highly active antiretroviral therapy) treatment, which is monitored by an infectious disease specialist, is recommended to reduce mother-to-child transmission (MTCT). Zidovudine is recommended for the prevention of MTCT and is administered based on the following recommendations:
   a. Antepartum: Orally beginning after 12 weeks of gestation, maternal HAART is given to reduce the viral load to undetectable.
   b. Intrapartum: Intravenously during labor, zidovudine is given 1 hour before a vaginal birth and 3 hours before a cesarean section if the HIV RNA is greater than or equal to 400 copies/mL or unknown. Of note, this may not be required if the HIV RNA is less than 400 copies/mL but is given at the discretion of the provider. A vaginal birth is acceptable if the viral load is less than 1000 copies/mL; otherwise, a cesarean section is recommended.
c. Postpartum: In the form of syrup to the newborn 2 hours after birth and every 12 hours for 6 weeks; depending on agency procedures, the newborn may need to be placed in the newborn intensive care unit (NICU) to begin initial therapy.

B. Transmission

1. Sexual exposure to genital secretions of an infected person
2. Parenteral exposure to infected blood and tissue
3. Perinatal exposure of an infant to infected maternal secretions through birth or breast-feeding

C. Risks to the mother: A mother with HIV is managed as high risk because she is vulnerable to infections.

D. Diagnosis

1. Tests used to determine the presence of antibodies to HIV include enzyme-linked immunosorbent assay (ELISA), Western blot, and immunofluorescence assay (IFA).
2. A single reactive ELISA test by itself cannot be used to diagnose HIV, and the test should be repeated with the same blood sample; if the result is again reactive, follow-up tests using Western blot or IFA should be done.
3. A positive Western blot or IFA is considered confirmatory for HIV.
4. A positive ELISA that fails to be confirmed by Western blot or IFA should not be considered negative, and repeat testing should be done in 3 to 6 months.

E. Assessment (see Chapter 62)

F. Interventions

1. Prenatal period
   a. Institute measures to prevent opportunistic infections.
   b. Avoid procedures that increase the risk of perinatal transmission, such as amniocentesis and fetal scalp sampling.
2. Intrapartum period
   a. If the fetus has not been exposed to HIV in utero, the highest risk exists during delivery through the birth canal.
b. Avoid the use of internal scalp electrodes for monitoring of the fetus.
c. Avoid episiotomy to decrease the amount of maternal blood in and around the birth canal.
d. Avoid the administration of oxytocin, because contractions induced by oxytocin can be strong, causing vaginal tears or necessitating an episiotomy.
e. Place heavy absorbent pads under the mother’s hips to absorb amniotic fluid and maternal blood.
f. Minimize the neonate’s exposure to maternal blood and body fluids; promptly remove the neonate from the mother’s blood after delivery.
g. Suction fluids from the neonate promptly.
h. Prepare to administer zidovudine as prescribed to the mother during labor and delivery.

3. Postpartum period
   a. Monitor for signs of infection.
   b. Place the mother in protective isolation if she is immunosuppressed.
   c. Breast-feeding is likely to be restricted; follow PHCP’s recommendations regarding breast-feeding.
   d. Instruct the mother to monitor for signs of infection and report any signs if they occur.
   e. The newborn can room with the mother; however, depending on agency procedures, the newborn may be placed in NICU for the first 24 hours of life to complete baseline laboratory studies and receive the initial treatment.

G. The newborn and HIV (refer to Chapter 27 for this information)

XII. Hydatidiform Mole
   A. Description
   1. Hydatidiform mole is a form of gestational trophoblastic disease that occurs when the trophoblasts, which are the peripheral cells that attach the fertilized ovum to the uterine wall, develop abnormally.
   2. The mole manifests as an edematous grape-like cluster that may be nonmalignant or may develop into
choriocarcinoma.

B. Assessment

1. Fetal heart rate not detectable
2. Vaginal bleeding, which may occur by the fourth week or not until the second trimester; may be bright red or dark brown in color and may be slight, profuse, or intermittent
3. Signs of preeclampsia (progressive blood pressure elevations) before the 20th week of gestation; note that preeclampsia usually occurs after 20 weeks of pregnancy, typically in the third trimester.
4. Fundal height greater than expected for gestational date
5. Elevated human chorionic gonadotropin levels
6. Characteristic snowstorm pattern shown on ultrasound

C. Interventions

1. Prepare the client for uterine evacuation (before evacuation, diagnostic tests are done to detect metastatic disease).
2. Evacuation of the mole is done by vacuum aspiration; oxytocin may be administered after evacuation to contract the uterus.
3. Monitor for postprocedure hemorrhage and infection.
4. Tissue is sent to the laboratory for evaluation, and follow-up is important to detect changes suggestive of malignancy.
5. Human chorionic gonadotropin levels are monitored every 1 to 2 weeks until normal prepregnancy levels are attained; levels are checked every 1 to 2 months for 1 year.
6. Instruct the client and her partner about birth control measures so that pregnancy can be prevented during the 1-year follow-up period.

XIII. Hyperemesis Gravidarum

A. Description: Intractable nausea and vomiting during the first trimester that causes disturbances in nutrition and fluid and electrolyte balance

B. Assessment

1. Nausea most pronounced on arising; may occur at other times during the day
2. Persistent vomiting
3. Weight loss
4. Signs of dehydration
5. Fluid and electrolyte imbalances

C. Interventions

1. Initiate measures to alleviate nausea, including medication therapy; if unsuccessful, and weight loss and fluid and electrolyte imbalances occur, intravenously administered fluid and electrolyte replacement or parenteral nutrition may be necessary.
2. Monitor vital signs, intake and output, weight, and calorie count.
3. Monitor laboratory data and for signs of dehydration and electrolyte imbalances.
5. Monitor fetal heart rate, activity, and growth.
6. Encourage intake of small portions of food (low-fat, easily digestible carbohydrates, such as cereals, rice, and pasta).
7. Encourage the intake of liquids between meals to avoid distending the stomach and triggering vomiting.
8. Encourage the client to sit upright after meals.

XIV. Hypertensive Disorders of Pregnancy

A. Description and types: Four major categories include preeclampsia, chronic/preexisting hypertension, chronic hypertension with superimposed preeclampsia, and gestational hypertension.

B. Blood pressure elevations can lead to preeclampsia and then eclampsia (seizures) (Table 22-1).

C. Women who have had preeclampsia, especially those who delivered preterm, have an increased risk later in life of cardiovascular disease and kidney disease, including heart attack, stroke, and high blood pressure.

D. Having preeclampsia once increases the risk of having it again in a future pregnancy.

E. Preeclampsia also can lead to eclampsia (seizures).

F. HELLP syndrome can result. HELLP stands for hemolysis, elevated liver enzymes, and low platelet count. In this condition, red blood cells are damaged or destroyed, blood clotting is impaired, and the liver can bleed internally, causing chest or abdominal pain. HELLP syndrome is a medical emergency; the woman can die from HELLP syndrome or have lifelong health problems as a result.

G. Assessment (Table 22-2)
Proteinuria is not a reliable indicator of preeclampsia. Evidence demonstrates that kidney or liver dysfunction can occur without signs of protein, and that the amount of protein in the urine does not predict how severely the disease will progress.

1. Persistent hypertension
2. Swelling of the face or hands
3. Headache
4. Changes in eyesight
5. Pain in the upper abdomen or shoulder
6. Nausea and vomiting (in the second half of pregnancy)
7. Sudden weight gain
8. Difficulty breathing

H. Risk factors
1. Previous preeclampsia or gestational hypertension, previous placental abruption, or fetal demise
2. Primigravida
3. Family history or first-degree relative with preeclampsia
4. Women who are 40 years or older
5. African American ethnicity
6. Women who are carrying more than one fetus
7. History of chronic hypertension, kidney disease, or both
8. Women who have medical conditions such as chronic hypertension, renal disease, connective tissue disease, diabetes mellitus, thrombophilia, or lupus erythematosus
9. BMI greater than 26
10. Metabolic syndrome
11. Multifetal pregnancy
12. Hydatidiform mole, hydrops fetalis, unexplained intrauterine growth retardation (IUGR)
13. Mother had IUGR as a newborn
14. Women who had in vitro fertilization

I. Complications of hypertension and gestational hypertension disorders
1. Abruptio placentae
2. Disseminated intravascular coagulopathy
3. Fetal growth restriction
4. Preeclampsia and eclampsia
5. Intracranial hemorrhage; maternal cerebral hemorrhage or infarction
6. Subcapsular hepatic hematoma
7. HELLP (hemolysis, elevated liver enzyme levels, low platelet count) syndrome
8. Oligohydramnios
9. Placental insufficiency
10. The need for preterm delivery or cesarean delivery
11. Maternal and/or fetal death

J. Interventions for hypertension and preeclampsia

1. Close blood pressure and weight monitoring throughout the pregnancy; the client may need to be taught how to take her blood pressure at home.
2. Weekly or twice weekly health care visits may be necessary; delivery may be recommended at 37 weeks of gestation (earlier if there is evidence of fetal distress).
3. Monitor fetal activity (teach the client how to perform Kick counts) and fetal growth (ultrasounds will be prescribed).
4. Encourage frequent rest periods, instructing the client to lie in the lateral position; for preeclampsia with severe features, the client may be hospitalized and bed rest may be prescribed (client should be placed in the lateral position).
5. Administer medications as prescribed to reduce blood pressure; blood pressure should not be reduced rapidly, because placental perfusion can be compromised.
6. Provide adequate fluids.
7. Monitor intake and output; a urinary output of 30 mL/hr indicates adequate renal perfusion.
8. Monitor neurological status, because changes can indicate cerebral hypoxia or impending seizure.
9. Monitor deep tendon reflexes and for the presence of hyperreflexia or clonus, because hyperreflexia indicates increased central nervous system irritability (Box 22-5).
10. Monitor for HELLP syndrome.
11. Evaluate renal function through prescribed studies such as blood urea nitrogen, serum creatinine, and 24-hour urine levels for creatinine clearance and protein.
12. Magnesium sulfate (use a controlled infusion device) may be prescribed to prevent seizures; magnesium sulfate may be continued for 24 to 48 hours postpartum.
13. Monitor for signs of magnesium toxicity with the administration of magnesium sulfate, including flushing, sweating, hypotension, depressed deep tendon reflexes, decreased urine output, and central nervous system depression including respiratory depression; keep antidote (calcium gluconate) available for immediate use, if necessary.
14. Corticosteroids may be prescribed to promote fetal
lung maturity.

15. Prepare the client for delivery as prescribed.

K. Eclampsia

1. Assessment: Characterized by generalized seizures (Box 22-6)
2. Interventions (see Priority Nursing Actions)

**Priority Nursing Actions**

<table>
<thead>
<tr>
<th>Eclampsia Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Remain with the client and call for help.</td>
</tr>
<tr>
<td>2. Ensure an open airway, turn the client on her side, and administer oxygen by face mask at 8 to 10 L/minute.</td>
</tr>
<tr>
<td>4. Administer medications to control the seizures as prescribed.</td>
</tr>
<tr>
<td>5. After the seizure has ended, insert an oral airway and suction the client’s mouth as needed.</td>
</tr>
<tr>
<td>6. Prepare for delivery of the fetus after stabilization of the client, if warranted.</td>
</tr>
</tbody>
</table>

Lowdermilk et al. (2016), p. 667

XV. Incompetent Cervix

A. Description

1. *Incompetent cervix* refers to premature dilation of the cervix, which occurs most often in the fourth or fifth month of pregnancy and is associated with structural or functional defects of the cervix.

2. Treatment involves surgical placement of a cervical cerclage.

B. Assessment

1. Vaginal bleeding
2. Fetal membranes visible through the cervix

C. Interventions

1. Provide bed rest, hydration, and tocolysis, as prescribed, to inhibit uterine contractions.

2. Prepare for cervical cerclage (at 10 to 14 weeks of gestation as prescribed), in which a band of fascia or nonabsorbable ribbon is placed around the cervix beneath the mucosa to constrict the internal os.

3. After cervical cerclage, the client is told to refrain from intercourse and to avoid prolonged standing and heavy lifting.

4. The cervical cerclage is removed at 37 weeks of
gestation or left in place and a cesarean birth is performed; if removed, cerclage needs to be repeated with each successive pregnancy.

5. After placement of the cervical cerclage, monitor for contractions, rupture of the membranes, and signs of infection.

6. Instruct the client to report to the PHCP immediately any postprocedure vaginal bleeding or increased uterine contractions.

XVI. Infections (TORCH Complex Acronym)

A. Toxoplasmosis (“T”)
   1. Caused by infection with the intracellular protozoan parasite *Toxoplasma gondii*
   2. Produces a rash and symptoms of acute, flu-like infection in the mother
   3. Transmitted to the mother through ingestion of raw meat or handling of cat litter of infected cats
   4. Organism is transmitted to the fetus across the placenta
   5. Can cause miscarriage in the first trimester
   6. Client education regarding preventing infection is critical

B. Other Infections (“O,” includes HIV—discussed earlier, syphilis—discussed under Sexually Transmitted Infections, parvovirus, hepatitis B virus [HBV], West Nile, etc.)

C. Rubella (German measles) (“R”)
   1. Teratogenic in the first trimester
   2. Organism is transmitted to the fetus across the placenta.
   3. Causes congenital defects of the eyes, heart, ears, and brain
   4. Blood titer studies will be done. If not immune (titer less than 1:8), the client should be vaccinated in the postpartum period; the client must wait 1 to 3 months (as specified by the PHCP) before becoming pregnant.

D. Cytomegalovirus (“C”)
   1. Organism is transmitted through close personal contact; it is transmitted across the placenta to the fetus, or the fetus may be infected through the birth canal.
   2. The mother may be asymptomatic; most infants are asymptomatic at birth.
   3. Cytomegalovirus causes low birth weight, intrauterine growth restriction, enlarged liver and spleen, jaundice, blindness, hearing loss, and seizures.
   4. Antiviral medications may need to be prescribed for severe infections in the mother, but these medications
are toxic and may only temporarily suppress shedding of the virus; risk versus benefit will be considered by the PHCP.

5. Maintain contact precautions.

E. Herpes simplex virus ("H")

1. Herpes simplex virus affects the external genitalia, vagina, and cervix and causes draining, painful vesicles.
2. Acyclovir may be prescribed to treat recurrent outbreaks during pregnancy or used as suppressive therapy late in pregnancy to prevent an outbreak during labor and birth.
3. Virus usually is transmitted to the fetus during birth through the infected vagina or via an ascending infection after rupture of the membranes.
4. No vaginal examinations are done in the presence of active vaginal herpetic lesions.
5. Herpes can cause death or severe neurological impairment in the newborn.
6. Delivery of the fetus is usually by cesarean section if active lesions are present in the vagina; delivery may be performed vaginally if the lesions are in the anal, perineal, or inner thigh area (strict precautions are necessary to protect the fetus during delivery).
7. Maintain contact precautions.

F. Group B Streptococcus (GBS) (may be included as an “O” under TORCH complex)

1. GBS is a leading cause of life-threatening perinatal infections.
2. The gram-positive bacterium colonizes the rectum, vagina, cervix, and urethra of pregnant and nonpregnant women.
3. Meningitis, fasciitis, and intra-abdominal abscess can occur in the pregnant client if she is infected at the time of birth.
4. Transmission occurs during vaginal delivery.
5. Early-onset newborn GBS occurs within the first week after birth, usually within 48 hours, and can include infections such as sepsis, pneumonia, or meningitis; permanent neurological disability can result.
6. Diagnosis of the mother is done via vaginal and rectal cultures at 35 to 37 weeks of gestation.
7. Antibiotics may be prescribed for the mother during labor and birth; IV antibiotics may be prescribed for infected infants.
8. Maintain contact precautions.

XVII. Multiple Gestation

A. Description
1. Multiple gestation results from fertilization of 2 ova (fraternal or dizygotic) or a splitting of 1 fertilized ovum (identical or monozygotic).
2. Complications include miscarriage, anemia, congenital anomalies, hyperemesis gravidarum, intrauterine growth restriction, gestational hypertension, polyhydramnios, postpartum hemorrhage, premature rupture of membranes, and preterm labor and delivery.

B. Assessment

1. Excessive fetal activity
2. Uterus large for gestational age
3. Palpation of 3 or 4 large parts in the uterus
4. Auscultation of more than 1 fetal heart rate
5. Excessive weight gain

C. Interventions

1. Monitor vital signs.
3. Monitor for cervical changes.
4. Prepare the client for ultrasound as prescribed.
5. Monitor for anemia; administer supplemental vitamins as prescribed.
6. Monitor for preterm labor, and treat preterm labor promptly.
7. Prepare for cesarean delivery for abnormal presentations.
8. Prepare to administer oxytocic medications as prescribed after delivery to prevent postpartum hemorrhage from uterine overdistention.

XVIII. Placental Abnormalities

A. Description: Placenta accreta is an abnormally adherent placenta; placenta increta occurs when the placenta penetrates the uterine muscle itself; placenta percreta occurs when the placenta goes all the way through the uterus.

B. Assessment: May cause hemorrhage immediately after birth because the placenta does not separate easily

C. Intervention

1. Monitor for hemorrhage and shock.
2. Prepare the client for a hysterectomy if a large portion of the placenta is abnormally adherent.

XIX. Placenta Previa

A. Description

1. Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os (Fig. 22-3).
2. Total (complete): The internal cervical os is covered entirely by the placenta when the cervix is dilated fully.
3. Partial: The lower border of the placenta is within 3 cm of the internal cervical os but does not fully cover it.
4. Marginal (low-lying): The placenta is implanted in the lower uterus, but its lower border is more than 3 cm from the internal cervical os.
5. Management depends on the classification of the placenta previa and gestational age of the fetus.

B. Assessment

1. Sudden onset of painless, bright red vaginal bleeding occurs in the last half of pregnancy.
2. Uterus is soft, relaxed, and nontender.
3. Fundal height may be more than expected for gestational age.

C. Interventions

1. Monitor maternal vital signs, fetal heart rate, and fetal activity.
2. Prepare for ultrasound to confirm the diagnosis.
3. Vaginal examinations or any other actions that would stimulate uterine activity are avoided.
4. Maintain bed rest in a side-lying position as prescribed.
5. Monitor amount of bleeding (treat signs of shock).
6. Administer intravenous (IV) fluids, blood products, or tocolytic medications as prescribed; Rh₀(D) immune globulin may be prescribed.
7. If bleeding is heavy, a cesarean delivery may be performed.

XX. Abruptio Placentae

A. Description: Premature separation of the placenta from the uterine wall after the 20th week of gestation and before the fetus is delivered (Fig. 22-4)

B. Assessment

1. Dark red vaginal bleeding. If the bleeding is high in the uterus or is minimal, there can be an absence of visible blood.
2. Uterine pain or tenderness or both
3. Uterine rigidity
4. Severe abdominal pain
5. Signs of fetal distress
6. Signs of maternal shock if bleeding is excessive

C. Interventions

1. Monitor maternal vital signs and fetal heart rate.
2. Assess for excessive vaginal bleeding, abdominal pain, and an increase in fundal height.
3. Maintain bed rest; administer oxygen, IV fluids, and blood products as prescribed.
4. Place the client in Trendelenburg’s position if indicated to decrease the pressure of the fetus on the placenta, or place in the lateral position with the head of the bed flat if hypovolemic shock occurs.
6. Prepare for delivery of the fetus as quickly as possible, with vaginal delivery preferable if the fetus is healthy and stable and the presenting part is in the pelvis; emergency cesarean delivery is performed if the fetus is alive but shows signs of distress.
7. Monitor for signs of disseminated intravascular coagulation in the postpartum period.

Know the differences between placenta previa and abruptio placenta. In placenta previa, there is painless, bright red vaginal bleeding, and the uterus is soft, relaxed, and nontender. In abruptio placenta, there is dark red vaginal bleeding, uterine pain or tenderness or both, and uterine rigidity.

XXI. Pyelonephritis
A. Description
1. Results from bacterial infections that extend upward from the bladder through the blood vessels and lymphatics (also see Section XXIV)
2. Frequently follows untreated urinary tract infections and is associated with increased incidence of anemia, low birth weight, gestational hypertension, premature labor and delivery, and premature rupture of the membranes

B. Assessment and Interventions (refer to Chapter 54)

XXII. Sexually Transmitted Infections
A. Chlamydia
1. Description
   a. Sexually transmitted pathogen
associated with an increased risk for premature birth, stillbirth, neonatal conjunctivitis, and newborn chlamydial pneumonia
b. Can cause salpingitis, pelvic abscesses, ectopic pregnancy, chronic pelvic pain, and infertility
c. Diagnostic test is culture for Chlamydia trachomatis.

2. Assessment
a. Usually asymptomatic—may have dysuria or dyspareunia
b. Bleeding between periods or after coitus
c. Mucoid or purulent cervical discharge
d. Dysuria and pelvic pain

3. Interventions
a. Screen the client to determine whether she is high risk; this is indicated for all pregnant clients if the client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia.
b. Instruct the client in the importance of rescreening, because reinfection can occur as the client nears term.
c. Ensure that the sexual partner is treated for the infection.
d. Treatment for both gonorrhea and chlamydia should be done, which includes antibiotics.
e. Complications in pregnancy may include septic spontaneous abortion or miscarriage, preterm delivery, premature rupture of the membranes (PROM), chorioamnionitis, disseminated gonococcal infection, ophthalmia neonatorum, postpartum metritis.

B. Syphilis

1. Description
a. Syphilis is a chronic infectious disease caused by the organism Treponema pallidum.
b. Transmission is by physical contact with syphilitic lesions, which usually are found on the skin, mucous membranes of the mouth, or genitals.
c. The infection may cause abortion or premature labor and is passed to the fetus after the fourth month of pregnancy as congenital syphilis.

2. Assessment (Box 22-7)
3. Interventions
   a. A serum test (Venereal Disease Research Laboratory or rapid plasma reagin) for syphilis is done on the first prenatal visit; prepare to repeat the test at 36 weeks of gestation because the disease may be acquired after the initial visit.
   b. If the test result is positive, treatment with an antibiotic may be necessary.
   c. Sonographic evaluation is necessary to assess for signs of placental syphilis.
   d. Instruct the client that treatment of her partner is necessary if infection is present, and intercourse should be avoided until treatment is instituted.
   e. Complications include transmission to fetus (100% in primary and secondary stages), congenital anomalies, deafness, neurological impairment (mortality rate is 50%).
   f. Those with syphilis should also be tested for HIV.

C. Gonorrhea
   1. Description
      a. Gonorrhea is an infection caused by *Neisseria gonorrhoeae*, which causes inflammation of the mucous membranes of the genital and urinary tracts.
      b. Transmission of the organism is by sexual intercourse.
      c. Infection may be transmitted to the newborn’s eyes during delivery, causing blindness (ophthalmia neonatorum).

2. Assessment: Usually asymptomatic; vaginal discharge, urinary frequency, and lower abdominal pain possible
3. Interventions
   a. Testing is done during the initial prenatal examination to screen for gonorrhea; the screening may be
repeated during the third trimester in high-risk clients.

b. Instruct the client that treatment of her partner is necessary if infection is present.

c. Complications are similar to those of chlamydia.

D. Condyloma acuminatum (human papillomavirus)

1. Description

a. Condyloma acuminatum is caused by human papillomavirus.

b. Infection affects the cervix, urethra, anus, penis, and scrotum.

c. Human papillomavirus is transmitted through sexual contact.

2. Assessment

a. Infection produces small to large wart-like growths on the genitals.

b. Cervical cell changes may be noted because human papillomavirus is associated with cervical malignancies.

3. Interventions

a. Lesions are removed by the use of cytotoxic agents, cryotherapy, electrocautery, and laser, but this is done for symptomatic relief only and is usually delayed until after birth. The genital warts often regress after delivery, and treatment outcomes may be poor until after delivery.

b. Encourage annual Papanicolaou test.

c. Sexual contact should be avoided until lesions are healed (condoms reduce transmission).

d. Cesarean delivery is indicated only if genital warts are obstructing the pelvic outlet or if vaginal delivery would result in excessive bleeding.

E. Trichomoniasis

1. Description

a. Trichomoniasis is caused by *Trichomonas vaginalis* and is transmitted via sexual contact.

b. A normal saline wet smear of vaginal secretions indicates the presence of protozoa.

c. Infection is associated with premature rupture of the membranes and
2. Assessment
a. Yellowish to greenish, frothy, mucopurulent, copious, malodorous vaginal discharge
b. Inflammation of vulva, vagina, or both may occur.

3. Interventions
a. Metronidazole may be prescribed.
b. Sexual partner may need to be treated.

F. Bacterial vaginosis
1. Description
a. Caused by *Haemophilus vaginalis* (*Gardnerella vaginalis*) and transmitted via sexual contact
b. Associated with premature labor and birth

2. Assessment
a. Client complains of “fishy odor” to vaginal secretions and increased odor after intercourse.
b. Microscopic examination of vaginal secretions identifies the infection.

3. Interventions
a. Metronidazole may be prescribed.
b. Sexual partner may need to be treated.

G. Vaginal candidiasis
1. Description
a. *Candida albicans* is the most common causative organism.
b. Predisposing factors include use of antibiotics, diabetes mellitus, and obesity.
c. Vaginal candidiasis is diagnosed by identifying spores of *Candida albicans*.

2. Assessment
a. Vulvar and vaginal pruritus
b. White, lumpy, cottage cheese–like discharge from vagina

3. Interventions
a. An antifungal vaginal preparation may be prescribed. Oral fluconazole should be avoided during pregnancy due to the risk of miscarriage.
b. For extensive irritation and swelling, sitz baths may be helpful.
c. Sexual partner may need to be treated.
XXIII. Tuberculosis

A. Description

1. Highly communicable disease caused by *Mycobacterium tuberculosis*
2. Transmitted by the airborne route
3. Multidrug-resistant strains of tuberculosis can result from improper compliance, noncompliance with treatment programs, or development of mutations in tubercle bacillus.

B. Transmission

1. Transplacental transmission is rare.
2. Transmission can occur during birth through aspiration of infected amniotic fluid.
3. The newborn can become infected from contact with infected individuals.

C. Risk to mother: Active disease during pregnancy has been associated with an increase in hypertensive disorders of pregnancy.

D. Diagnosis: If a chest radiograph is required for the mother, it is done only after 20 weeks of gestation, and a lead shield for the abdomen is required.

Tuberculin skin testing is safe during pregnancy; however, the PHCP may want to delay testing until after delivery.

E. Assessment

1. Mother
   a. Possibly asymptomatic
   b. Fever and chills
   c. Night sweats
   d. Weight loss
   e. Fatigue
   f. Cough with hemoptysis or green or yellow sputum
   g. Dyspnea
   h. Pleural pain
2. Newborn
   a. Fever
   b. Lethargy
   c. Poor feeding
   d. Failure to thrive
   e. Respiratory distress
f. Hepatosplenomegaly

F. Interventions

1. Pregnant client
   a. Administration of isoniazid, pyrazinamide, and rifampin daily for 9 months (as prescribed); ethambutol is added if medication resistance is likely.
   b. Pyridoxine should be administered with isoniazid to the pregnant client to prevent fetal neurotoxicity caused by isoniazid.
   c. Promote breast-feeding only if the client is noninfectious.

2. Newborn
   a. Management focuses on preventing disease and treating early infection.
   b. Skin testing is performed on the newborn at birth, and the newborn may be placed on isoniazid therapy; the skin test is repeated in 3 to 4 months, and isoniazid may be stopped if the skin test results remain negative.
   c. If the skin test result is positive, the newborn should receive isoniazid for at least 6 months (as prescribed).
   d. If the mother’s sputum is free of organisms, the newborn does not need to be isolated from the mother while in the hospital.

XXIV. Urinary Tract Infection (Acute Cystitis and Acute Pyelonephritis)

A. Description: A urinary tract infection can occur during pregnancy (pregnancy is a predisposing factor). A urinary tract infection can be either lower urinary tract (cystitis) or upper urinary tract (pyelonephritis).

B. Women may also experience asymptomatic bacteriuria.

C. Predisposing conditions
   1. History of urinary tract infections
   2. Urinary tract anomalies
   3. Low socioeconomic status
   4. Sexual activity
   5. Young age
   6. Sickle cell trait
   7. Poor hygiene
   8. Anemia
   9. Diabetes mellitus
10. Obesity
11. Catheterization

D. Screening is done at the first prenatal visit or at 12 to 16 weeks’ gestation. Rescreening is done based on risk factors.

E. Assessment and Interventions (refer to Chapter 54): It is important to differentiate between cystitis and the progression to pyelonephritis. If progressed to pyelonephritis, hospitalization may be required for antibiotic therapy and possible tocolysis.

XXV. Obesity in Pregnancy

A. Description: Obesity in every population, including adults and children, is a problem in the United States. Obesity in pregnancy places the client at risk for several complications during pregnancy, including gestational diabetes, gestational hypertension, preeclampsia, venous thromboembolism, and increased need for cesarean birth.

B. Delivery complications can result from difficulty obtaining IV access, epidural access, intubation, and decreased oxygen consumption with associated increased cardiac output, stressing the heart.

C. Obesity in pregnancy can have negative effects on the newborn, including stillbirth, premature birth, congenital anomalies, future obesity, heart disease, and difficulty with breast-feeding.

D. Obese women have lower prolactin response to suckling in the first week postpartum, contributing to high rates of breast-feeding failure in this population.

E. Potential postdelivery complications and associated interventions
   1. Thromboembolism formation is a concern; as prescribed, thromboembolism stockings, sequential compression devices (SCDs), and pharmacological venous thromboembolism prophylaxis may be necessary postdelivery.
   2. Postpartum hemorrhage is more common, as well as difficulty locating the fundus, predisposing further to this problem.
   3. Endometritis is common in this population.
   4. Early ambulation is encouraged to prevent venous thromboembolism formation.
   5. Frequent monitoring and cleaning of surgical incisions (episiotomy or cesarean incision) is needed to prevent infection or dehiscence due to excess abdominal fat.

XXVI. Additional complications during pregnancy: See Table 22-3.

---

**Box 22-1**

**Types of Abortions**
**Miscarriage:** Pregnancy ends because of natural causes.

**Induced:** Therapeutic or elective reasons exist for terminating pregnancy.

**Threatened:** Spotting and cramping occur without cervical change.

**Inevitable:** Spotting and cramping occur and cervix begins to dilate and efface.

**Incomplete:** Loss of some of the products of conception occurs, with part of the products retained (most often placenta is retained).

**Complete:** Loss of all products of conception.

**Missed:** Products of conception are retained in utero after fetal death.

**Habitual:** Miscarriages occur in 3 or more successive pregnancies.

---

**Box 22-2**

**Maternal Cardiac Disease Risk Groups**

**Group I (Mortality Rate, 1%)**

- Atrial septal defect
- Ventricular septal defect (uncomplicated)
- Patent ductus arteriosus
- Pulmonic and tricuspid disease
- Biosynthetic valve prosthesis (porcine and human allograft)
- Tetralogy of Fallot (corrected)
- Mitral stenosis (New York Heart Association [NYHA] class I and II) see http://www.heart.org/HEARTORG/Conditions/HeartFailure/AboutHeartFailure_UCM_306328_Article.jsp#.WyvejiAnY2w

**Group II (Mortality Rate, 5% to 15%)**

- Mitral stenosis NYHA class III and IV or with atrial fibrillation
- Aortic stenosis
- Coarctation of aorta (uncomplicated)
- Uncorrected tetralogy of Fallot
- Previous myocardial infarction
- Marfan syndrome with normal aorta
- Artificial heart valve

**Group III (Mortality Rate, 25% to 50%)**

- Pulmonary hypertension
- Coarctation of the aorta (complicated)
- Endocarditis
- Marfan syndrome with aortic involvement
- Eisenmenger syndrome
FIG. 22-1 Pathophysiology of disseminated intravascular coagulation.

Box 22-3
**Predisposing Conditions for Disseminated Intravascular Coagulation**

- Abruptio placentae
- Amniotic fluid embolism
- Gestational hypertension
- HELLP syndrome
- Intrauterine fetal death
- Liver disease
- Sepsis
- Severe postpartum hemorrhage and blood loss

**FIG. 22-2** Sites of tubal ectopic pregnancy. Numbers indicate the order of prevalence.

**Box 22-4**

**Hematoma: Assessment Findings**

- Abnormal, severe pain
- Pressure in perineal area (client states that she feels like she has to have a bowel movement)
- Palpable, sensitive swelling in the perineal area, with discolored skin
- Inability to void
- Decreased hemoglobin and hematocrit levels
- Signs of shock, such as pallor, tachycardia, and hypotension, if significant blood
Table 22-1

Classification of Hypertensive Stages of Pregnancy

<table>
<thead>
<tr>
<th>Type of Hypertension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Lessthan 120/80 mm Hg</td>
</tr>
<tr>
<td>Elevated</td>
<td>Systolic between 120 and 129 and diastolic less than 80 mm Hg</td>
</tr>
<tr>
<td>Stage 1 hypertension</td>
<td>Systolic between 130 and 139 or diastolic between 80 and 89 mm Hg</td>
</tr>
<tr>
<td>Stage 2 hypertension</td>
<td>Systolic at least 140 or diastolic at least 90 mm Hg</td>
</tr>
<tr>
<td>Chronic hypertension</td>
<td>Hypertension that is present and observable before pregnancy or that occurs in the first half (before 20 weeks) of the pregnancy.</td>
</tr>
</tbody>
</table>

Gestational Hypertensive Disorders

<table>
<thead>
<tr>
<th>Gestational hypertension</th>
<th>Blood pressure elevation that first occurs in the second half (after 20 weeks) of pregnancy. Although gestational hypertension usually resolves after childbirth, it may increase the risk of developing hypertension in the future.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preeclampsia</td>
<td>Usually occurs after 20 weeks of pregnancy, typically in the third trimester. When it occurs before 32 weeks of pregnancy, it is called early-onset preeclampsia. It also can occur in the postpartum period.</td>
</tr>
<tr>
<td>Eclampsia</td>
<td>Seizures occurring in pregnancy and linked to high blood pressure.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Persistent right upper quadrant or epigastric pain or pain penetrating to back (distention of liver capsule); nausea and vomiting  | Absent  | May be present and often precedes seizure  

Visual disturbances (spots or “sparkles”; temporary blindness; photophobia)  | Absent to minimal  | Common  

Pulmonary edema; heart failure; cyanosis  | Absent  | May be present  

Fetal growth restriction  | Normal growth  | Growth restriction; reduced amniotic fluid volume

Box 22-5
Assessment of Reflexes

**Biceps**

Position thumb over client’s biceps tendon, supporting client’s elbow with the palm of the hand. 
Strike a downward blow over the thumb with percussion hammer. 
*Normal response:* Flexion of the arm at the elbow

**Patellar**

Position client with her legs dangling over the edge of the examining table or lying on her back with her legs slightly flexed. 
Strike patellar tendon just below kneecap with percussion hammer. 
*Normal response:* Extension or kicking out of the leg

**Clonus**

Position client with her legs dangling over the edge of examining table. 
Support the leg with 1 hand and sharply dorsiflex client’s foot with the other hand. 
Maintain the dorsiflexed position for a few seconds and then release foot. 
*Normal response* (negative clonus response): 
  Foot remains steady in dorsiflexed position. 
  No rhythmic oscillations or jerking of foot is felt.
When released, foot drops to plantar-flexed position with no oscillations.
Abnormal response (positive clonus response):
Rhythmic oscillations occur when foot is dorsiflexed.
Similar oscillations are noted when foot drops to plantar-flexed position.

**Grading Response**

0 Reflex absent
1+ Reflex present but hypoactive
2+ Normal reflex
3+ Hyperactive reflex
4+ Hyperactive reflex with clonus present

**Box 22-6**

**Eclampsia**

1. Seizure typically begins with twitching around the mouth.
2. Body then becomes rigid in a state of tonic muscular contractions that last 15 to 20 seconds.
3. Facial muscles and then all body muscles alternately contract and relax in rapid succession (clonic phase may last about 1 minute).
4. Respiration ceases during seizure because diaphragm tends to remain fixed (breathing resumes shortly after the seizure).
5. Postictal sleep occurs.

Box 22-7
Stages of Syphilis

Primary Stage
- Most infectious stage
- Appearance of ulcerative, painless lesions produced by spirochetes at point of entry into the body

Secondary Stage
- Highly infectious stage
- Appearance of lesions about 6 weeks to 6 months after primary stage; located anywhere on the skin and mucous membranes
- Generalized lymphadenopathy

Tertiary Stage
- Entrance of spirochetes into internal organs, causing permanent damage; symptoms occur 10 to 30 years after untreated primary lesion
- Invasion of central nervous system, causing meningitis, ataxia, general paresis, and progressive mental deterioration
- Deleterious effects on aortic valve and aorta

Adapted from: Cibulka NJ, Barron ML. *Guidelines for nurse practitioners in ambulatory*
Practice Questions

204. The nurse is providing instructions to a pregnant client with human immunodeficiency virus (HIV) infection regarding care to the newborn after delivery. The client asks the nurse about the feeding options that are available. Which response should the nurse make to the client?
   1. “You will need to bottle-feed your newborn.”
   2. “You will need to feed your newborn by nasogastric tube feeding.”
   3. “You will be able to breast-feed for 6 months and then will need to switch to bottle-feeding.”
   4. “You will be able to breast-feed for 9 months and then will need to switch to bottle-feeding.”

205. The home care nurse visits a pregnant client who has a diagnosis of preeclampsia. Which assessment finding indicates a worsening of the preeclampsia and the need to notify the primary health care provider (PHCP)?
   1. Urinary output has increased.
   2. Dependent edema has resolved.
   3. Blood pressure reading is at the prenatal baseline.
   4. The client complains of a headache and blurred vision.

206. A stillborn baby was delivered in the birthing suite a few hours ago. After the delivery, the family remained together, holding and touching the baby. Which statement by the nurse would assist the family in their period of grief?
   1. “What can I do for you?”
   2. “Now you have an angel in heaven.”
   3. “Don’t worry, there is nothing you could have done to prevent this from happening.”
   4. “We will see to it that you have an early discharge so that you don’t have to be reminded of this experience.”

207. The nurse implements a teaching plan for a pregnant client who is newly diagnosed with gestational diabetes mellitus. Which statement made by the client indicates a need for further teaching?
   1. “I should stay on the diabetic diet.”
   2. “I should perform glucose monitoring at home.”
   3. “I should avoid exercise because of the negative effects on insulin production.”
   4. “I should be aware of any infections and report signs of infection immediately to my obstetrician.”

208. The nurse is performing an assessment on a pregnant client in the last trimester with a diagnosis of preeclampsia. The nurse reviews the assessment findings and determines that which finding is most closely associated with a complication of this diagnosis?
1. Enlargement of the breasts
2. Complaints of feeling hot when the room is cool
3. Periods of fetal movement followed by quiet periods
4. Evidence of bleeding, such as in the gums, petechiae, and purpura

209. The nurse in a maternity unit is reviewing the clients’ records. Which clients should the nurse identify as being at the most risk for developing disseminated intravascular coagulation (DIC)? Select all that apply.

☐ 1. A primigravida with abruptio placenta
☐ 2. A primigravida who delivered a 10-lb infant 3 hours ago
☐ 3. A gravida 2 who has just been diagnosed with dead fetus syndrome
☐ 4. A gravida 4 who delivered 8 hours ago and has lost 500 mL of blood
☐ 5. A primigravida at 29 weeks of gestation who was recently diagnosed with gestational hypertension

210. The home care nurse is monitoring a pregnant client who is at risk for preeclampsia. At each home care visit, the nurse assesses the client for which sign of preeclampsia?

1. Hypertension
2. Low-grade fever
3. Generalized edema
4. Increased pulse rate

211. The nurse is assessing a pregnant client with type 1 diabetes mellitus about her understanding regarding changing insulin needs during pregnancy. The nurse determines that further teaching is needed if the client makes which statement?

1. “I will need to increase my insulin dosage during the first 3 months of pregnancy.”
2. “My insulin dose will likely need to be increased during the second and third trimesters.”
3. “Episodes of hypoglycemia are more likely to occur during the first 3 months of pregnancy.”
4. “My insulin needs should return to prepregnant levels within 7 to 10 days after birth if I am bottle-feeding.”

212. A pregnant client reports to a health care clinic, complaining of loss of appetite, weight loss, and fatigue. After assessment of the client, tuberculosis is suspected. A sputum culture is obtained and identifies *Mycobacterium tuberculosis*. Which instruction should the nurse include in the client’s teaching plan?

1. Therapeutic abortion is required.
2. Isoniazid plus rifampin will be required for 9 months.
3. She will have to stay at home until treatment is completed.
4. Medication will not be started until after delivery of the fetus.

213. The nurse is providing instructions to a pregnant client with a history of cardiac disease regarding appropriate dietary measures. Which statement, if
made by the client, indicates an understanding of the information provided by the nurse?

1. “I should increase my sodium intake during pregnancy.”
2. “I should lower my blood volume by limiting my fluids.”
3. “I should maintain a low-calorie diet to prevent any weight gain.”
4. “I should drink adequate fluids and increase my intake of high-fiber foods.”

214. The clinic nurse is performing a psychosocial assessment of a client who has been told that she is pregnant. Which assessment findings indicate to the nurse that the client is at risk for contracting human immunodeficiency virus (HIV)? **Select all that apply.**

- [ ] 1. The client has a history of intravenous drug use.
- [ ] 2. The client has a significant other who is heterosexual.
- [ ] 3. The client has a history of sexually transmitted infections.
- [ ] 4. The client has had one sexual partner for the past 10 years.
- [x] 5. The client has a previous history of gestational diabetes mellitus.

215. The nurse in a maternity unit is providing emotional support to a client and her significant other who are preparing to be discharged from the hospital after the birth of a dead fetus. Which statement made by the client indicates a component of the normal grieving process?

1. “We want to attend a support group.”
2. “We never want to try to have a baby again.”
3. “We are going to try to adopt a child immediately.”
4. “We are okay, and we are going to try to have another baby immediately.”

216. The nurse evaluates the ability of a hepatitis B–positive mother to provide safe bottle-feeding to her newborn during postpartum hospitalization. Which maternal action **best** exemplifies the mother’s knowledge of potential disease transmission to the newborn?

1. The mother requests that the window be closed before feeding.
2. The mother holds the newborn properly during feeding and burping.
3. The mother tests the temperature of the formula before initiating feeding.
4. The mother washes and dries her hands before and after self-care of the perineum and asks for a pair of gloves before feeding.

217. A client in the first trimester of pregnancy arrives at a health care clinic and reports that she has been experiencing vaginal bleeding. A threatened abortion is suspected, and the nurse instructs the client regarding management of care. Which statement made by the client indicates a **need for further instruction**?

1. “I will watch to see if I pass any tissue.”
2. “I will maintain strict bed rest throughout the remainder of the pregnancy.”
3. “I will count the number of perineal pads used on a daily basis and note the amount and color of blood on the pad.”
4. “I will avoid sexual intercourse until the bleeding has stopped and for 2 weeks following the last episode of bleeding.”

218. The nurse is planning to admit a pregnant client who is obese. In planning care for this client, which potential client needs should the nurse anticipate?
Select all that apply.

☐ 1. Bed rest as a necessary preventive measure may be prescribed.
☐ 2. Administration of subcutaneous heparin postdelivery as prescribed.
☐ 3. An overbed lift may be necessary if the client requires a cesarean section.
☐ 4. Less frequent cleansing of a cesarean incision, if present, may be prescribed.
☐ 5. Thromboembolism stockings or sequential compression devices may be prescribed.

219. The nurse is assessing a pregnant client in the second trimester of pregnancy who was admitted to the maternity unit with a suspected diagnosis of abruptio placentae. Which assessment finding should the nurse expect to note if this condition is present?
1. Soft abdomen
2. Uterine tenderness
3. Absence of abdominal pain
4. Painless, bright red vaginal bleeding

220. The maternity nurse is preparing for the admission of a client in the third trimester of pregnancy who is experiencing vaginal bleeding and has a suspected diagnosis of placenta previa. The nurse reviews the primary health care provider’s prescriptions and should question which prescription?
1. Prepare the client for an ultrasound.
2. Obtain equipment for a manual pelvic examination.
3. Prepare to draw a hemoglobin and hematocrit blood sample.
4. Obtain equipment for external electronic fetal heart rate monitoring.

221. An ultrasound is performed on a client at term gestation who is experiencing moderate vaginal bleeding. The results of the ultrasound indicate that abruptio placentae is present. On the basis of these findings, the nurse should prepare the client for which anticipated prescription?
1. Delivery of the fetus
2. Strict monitoring of intake and output
3. Complete bed rest for the remainder of the pregnancy
4. The need for weekly monitoring of coagulation studies until the time of delivery

222. The nurse in the postpartum unit is caring for a client who has just delivered a newborn infant following a pregnancy with placenta previa. The nurse
reviews the plan of care and prepares to monitor the client for which risk associated with placenta previa?

1. Infection
2. Hemorrhage
3. Chronic hypertension
4. Disseminated intravascular coagulation

223. The nurse is performing an assessment on a client diagnosed with placenta previa. Which assessment findings should the nurse expect to note? Select all that apply.

   - 1. Uterine rigidity
   - 2. Uterine tenderness
   - 3. Severe abdominal pain
   - 4. Bright red vaginal bleeding
   - 5. Soft, relaxed, nontender uterus
   - 6. Fundal height may be greater than expected for gestational age

Answers

204. Answer: 1

Rationale: Perinatal transmission of HIV can occur during the antepartum period, during labor and birth, or in the postpartum period if the mother is breast-feeding. Clients who have HIV will most likely be advised not to breast-feed; however, PHCPs recommendations regarding breast-feeding are always followed. There is no physiological reason why the newborn needs to be fed by nasogastric tube.

Test-Taking Strategy: Use knowledge regarding the transmission of HIV. Eliminate options 3 and 4 first because these options are comparable or alike in that they both address breast-feeding. From the remaining options, select the correct option, knowing that it is unnecessary to feed the newborn by nasogastric tube.

Level of Cognitive Ability: Applying
Client Needs: Safe and Effective Care Environment
Integrated Process: Teaching and Learning
Content Area: Maternity: Postpartum
Health Problem: Maternity: Infections/Inflammations
Priority Concepts: Client Education; Infection

205. Answer: 4

Rationale: If the client complains of a headache and blurred vision, the PHCP should be notified because these are signs of worsening preeclampsia. Options 1, 2, and 3 are normal findings.
**Test-Taking Strategy:** Note the word *worsening* in the question. Eliminate options 1, 2, and 3 because these options are comparable or alike and indicate normal findings.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Maternity: Antepartum  
**Health Problem:** Maternity: Gestational hypertension/preeclampsia and eclampsia  
**Priority Concepts:** Clinical Judgment; Perfusion  
**Reference:** Lowdermilk et al. (2016), pp. 654, 660.

206. Answer: 1

**Rationale:** When a loss or death occurs, the nurse should ensure that parents have been honestly told about the situation by their primary health care provider or others on the health care team. It is important for the nurse to be with the parents at this time and to use therapeutic communication techniques. The nurse must also consider cultural and religious/spiritual practices and beliefs. The correct option provides a supportive, giving, and caring response. Options 2, 3, and 4 are blocks to communication and devalue the parents’ feelings.

**Test-Taking Strategy:** Use knowledge of *therapeutic communication techniques* to answer the question. The correct option is the only option that reflects use of *therapeutic communication techniques*.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Psychosocial Integrity  
**Integrated Process:** Caring  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Fetal distress/demise  
**Priority Concepts:** Communication; Coping  
**Reference:** Lowdermilk et al. (2016), pp. 911, 918.

207. Answer: 3

**Rationale:** Exercise is safe for a client with gestational diabetes mellitus and is helpful in lowering the blood glucose level. Dietary modifications are the mainstay of treatment, and the client is placed on a standard diabetic diet. Many clients are taught to perform blood glucose monitoring. If the client is not performing the blood glucose monitoring at home, it is performed at the clinic or obstetrician’s office. Signs of infection need to be reported to the obstetrician.

**Test-Taking Strategy:** Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and the need to select an incorrect client statement. Also, noting the **closed-ended word** “avoid” in the correct option will assist in answering the question.

**Level of Cognitive Ability:** Evaluating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Maternity: Antepartum
208. **Answer:** 4

**Rationale:** Severe preeclampsia can trigger disseminated intravascular coagulation (DIC) because of the widespread damage to vascular integrity. Bleeding is an early sign of DIC and should be reported to the primary health care provider if noted on assessment. Options 1, 2, and 3 are normal occurrences in the last trimester of pregnancy.

**Test-Taking Strategy:** Note the *strategic word*, *most*. Focus on the *subject*, a complication of preeclampsia. Eliminate options 1, 2, and 3 because they are *comparable or alike* and are normal occurrences in the last trimester of pregnancy.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Antepartum

**Health Problem:** Maternity: Gestational hypertension/preeclampsia and eclampsia

**Priority Concepts:** Clinical Judgment; Clotting

209. **Answer:** 1, 3, 5

**Rationale:** In a pregnant client, DIC is a condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation. Predisposing conditions include abruptio placentae, amniotic fluid embolism, gestational hypertension, HELLP syndrome, intrauterine fetal death, liver disease, sepsis, severe postpartum hemorrhage, and blood loss. Delivering a large newborn is not considered a risk factor for DIC. Hemorrhage is a risk factor for DIC; however, a loss of 500 mL is not considered hemorrhage.

**Test-Taking Strategy:** Note the *strategic word*, *most*. Focus on the *subject*, the client at most risk for DIC. Think about the pathophysiology associated with DIC and select the options that identify abnormal conditions. This will direct you to the correct options.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: DIC

**Priority Concepts:** Clinical Judgment; Clotting

210. **Answer:** 1

**Rationale:** A sign of preeclampsia is persistent hypertension. A low-grade fever or increased pulse rate is not associated with preeclampsia. Generalized edema may
occur but is not a specific sign of preeclampsia because it can occur in many conditions.

**Test-Taking Strategy:** Focus on the subject, a sign of preeclampsia. Thinking about the pathophysiology associated with preeclampsia will direct you to the correct option. Remember that hypertension is associated with preeclampsia.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Antepartum

**Health Problem:** Maternity: Gestational hypertension/preeclampsia and eclampsia

**Priority Concepts:** Clinical Judgment; Perfusion

**211. Answer:** 1

**Rationale:** Insulin needs decrease in the first trimester of pregnancy because of increased insulin production by the pancreas and increased peripheral sensitivity to insulin. The statements in options 2, 3, and 4 are accurate and signify that the client understands control of her diabetes during pregnancy.

**Test-Taking Strategy:** Note the strategic words, further teaching is needed. These words indicate a negative event query and the need to select an incorrect client statement. Eliminate options 2, 3, and 4 because they are comparable or alike and are accurate statements. Remember that insulin needs decrease in the first trimester of pregnancy.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity: Antepartum

**Health Problem:** Maternity: Diabetes

**Priority Concepts:** Client Education; Glucose Regulation

**212. Answer:** 2

**Rationale:** More than one medication may be used to prevent the growth of resistant organisms in a pregnant client with tuberculosis. Treatment must continue for a prolonged period. The preferred treatment for the pregnant client is isoniazid plus rifampin daily for 9 months. Ethambutol is added initially if medication resistance is suspected. Pyridoxine (vitamin B₆) often is administered with isoniazid to prevent fetal neurotoxicity. The client does not need to stay at home during treatment, and therapeutic abortion is not required.

**Test-Taking Strategy:** Focus on the subject, therapeutic management for a client with tuberculosis. Recalling the pathophysiology associated with tuberculosis and its treatment will assist in eliminating options 1, 3, and 4.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning
Rationale: Constipation can cause the client to use the Valsalva maneuver. The Valsalva maneuver should be avoided in clients with cardiac disease because it can cause blood to rush to the heart and overload the cardiac system. Constipation can be prevented by the addition of fluids and a high-fiber diet. A low-calorie diet is not recommended during pregnancy and could be harmful to the fetus. Sodium should be restricted as prescribed by the primary health care provider, because excess sodium would cause an overload to the circulating blood volume and contribute to cardiac complications. Diets low in fluid can cause a decrease in blood volume, which could deprive the fetus of nutrients.

Test-Taking Strategy: Focus on the subject, the pregnant client with heart disease. Think about the physiology of the cardiac system, maternal and fetal needs, and the factors that increase the workload on the heart. This will direct you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Evaluation
Content Area: Maternity: Antepartum
Health Problem: Maternity: Cardiac disease
Priority Concepts: Clinical Judgment; Perfusion

214. Answer: 1, 3

Rationale: HIV is transmitted by intimate sexual contact and the exchange of body fluids, exposure to infected blood, and passage from an infected woman to her fetus. Clients who fall into the high-risk category for HIV infection include individuals who have used intravenous drugs, individuals who experience persistent and recurrent sexually transmitted infections, and individuals who have a history of multiple sexual partners. Gestational diabetes mellitus does not predispose the client to HIV. A client with a heterosexual partner, particularly a client who has had only one sexual partner in 10 years, does not have a high risk for contracting HIV.

Test-Taking Strategy: Focus on the subject, risk factors for HIV. Recalling that exchange of blood and body fluids places the client at high risk for HIV infection will direct you to the correct options.

Level of Cognitive Ability: Analyzing
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Antepartum
Health Problem: Maternity: Infections/Inflammations
Priority Concepts: Infection; Sexuality

215. Answer: 1

Rationale: A support group can help the parents work through their pain by nonjudgmental sharing of feelings. The correct option identifies a statement that indicates positive, normal grieving. Although the other options may indicate reactions of the client and significant other, they are not specifically a part of the normal grieving process.

Test-Taking Strategy: Read all options carefully before selecting an answer and focus on the subject, the normal grieving process. Note that options 2, 3, and 4 are comparable or alike in that they relate to childbearing.

Level of Cognitive Ability: Applying
Client Needs: Psychosocial Integrity
Integrated Process: Caring
Content Area: Maternity: Postpartum
Health Problem: Maternity: Fetal distress/Demise
Priority Concepts: Coping; Family Dynamics

216. Answer: 4

Rationale: Hepatitis B virus is highly contagious and is transmitted by direct contact with blood and body fluids of infected persons. The rationale for identifying childbearing clients with this disease is to provide adequate protection of the fetus and the newborn, to minimize transmission to other individuals, and to reduce maternal complications. The correct option provides the best evaluation of maternal understanding of disease transmission. Option 1 will not affect disease transmission since hepatitis B does not spread through airborne transmission. Options 2 and 3 are appropriate feeding techniques for bottle-feeding but do not minimize disease transmission for hepatitis B.

Test-Taking Strategy: Note the strategic word, best. Focus on the subject, disease transmission to the newborn. This focus will direct you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Evaluation
Content Area: Maternity: Postpartum
Health Problem: Maternity: Infections/Inflammations
Priority Concepts: Client Education; Infection

217. Answer: 2

Rationale: Strict bed rest throughout the remainder of the pregnancy is not required for a threatened abortion. The client should watch for the evidence of the passage of tissue. The client is instructed to count the number of perineal pads used daily and to note the quantity and color of blood on the pad. The client is advised to
curtail sexual activities until bleeding has ceased and for 2 weeks after the last evidence of bleeding or as recommended by the health care provider.

**Test-Taking Strategy:** Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and the need to select an incorrect client statement. Noting the word strict in the correct option will assist in directing you to this option.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity: Antepartum

**Health Problem:** Maternity: Abortions

**Priority Concepts:** Client Education; Reproduction

218. **Answer:** 2, 3, 5

**Rationale:** The obese pregnant client is at risk for complications such as venous thromboembolism and increased need for cesarean section. Additionally, the obese client requires special considerations pertaining to nursing care. To prevent venous thromboembolism, particularly in the client who required cesarean section, frequent and early ambulation (not bed rest), prior to and after surgery, is recommended. Routine administration of prophylactic pharmacological venous thromboembolism medications such as heparin is also commonly prescribed. An overbed lift may be needed to transfer a client from a bed to an operating table if cesarean section is necessary. Increased monitoring and cleansing of a cesarean incision, if present, is necessary due to the increased risk for infection secondary to increased abdominal fat. Thromboembolism stockings or sequential compression devices will likely be prescribed because of the client’s increased risk of blood clots.

**Test-Taking Strategy:** Note the **subject**, planning care for the pregnant client who is obese. If you can recall the general complications associated with obesity, this will help you choose the correct options. Recall that preventive measures need to be taken to prevent blood clots and infection in clients at higher risk for these complications.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity: Antepartum

**Health Problem:** Maternity: Infections/Inflammations

**Priority Concepts:** Infection; Perfusion

**Reference:** Lowdermilk et al. (2016), p. 778.

219. **Answer:** 2

**Rationale:** Abruptio placentae is the premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered. In abruptio placentae, acute abdominal pain is present. Uterine tenderness accompanies placental abruption, especially with a central abruption and trapped
blood behind the placenta. The abdomen feels hard and board-like on palpation as the blood penetrates the myometrium and causes uterine irritability. A soft abdomen and painless, bright red vaginal bleeding in the second or third trimester of pregnancy are signs of placenta previa.

**Test-Taking Strategy:** Focus on the subject, assessment findings in abruptio placentae. Remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bleeding with placenta previa.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Abruptio placentae

**Priority Concepts:** Clinical Judgment; Perfusion

**Reference:** McKinney et al. (2018), pp. 531-532.

220. **Answer:** 2

**Rationale:** Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Manual pelvic examinations are contraindicated when vaginal bleeding is apparent until a diagnosis is made and placenta previa is ruled out. Digital examination of the cervix can lead to hemorrhage. A diagnosis of placenta previa is made by ultrasound. The hemoglobin and hematocrit levels are monitored, and external electronic fetal heart rate monitoring is initiated. Electronic fetal monitoring (external) is crucial in evaluating the status of the fetus, who is at risk for severe hypoxia.

**Test-Taking Strategy:** Focus on the subject, nursing care of the client with placenta previa. Use knowledge of the pathophysiology associated with placenta previa. Note the words question which prescription in the event query. Also, note that the correct option is the only procedure that is invasive to the pregnancy and endangers the physiological safety of the client and the fetus.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Placenta previa

**Priority Concepts:** Collaboration; Safety

**Reference:** McKinney et al. (2018), pp. 529-530.

221. **Answer:** 1

**Rationale:** Abruptio placentae is the premature separation of the placenta from the uterine wall after the 20th week of gestation and before the fetus is delivered. The goal of management in abruptio placentae is to control the hemorrhage and deliver the fetus as soon as possible. Delivery is the treatment of choice if the fetus is at term gestation or if the bleeding is moderate to severe and the client or fetus is in jeopardy. Because delivery of the fetus is necessary, options 2, 3, and 4 are incorrect.
regarding management of a client with abruptio placentae.

**Test-Taking Strategy:** Focus on the **subject**, management of abruptio placentae. Use knowledge regarding the pathophysiology and management of abruptio placentae to answer the question. Note the words *term gestation* and *moderate vaginal bleeding*. Knowing that the goal is to deliver the fetus will direct you easily to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Complex Care: Emergency Situations/Management

**Health Problem:** Maternity: Abruptio placentae

**Priority Concepts:** Perfusion; Safety

**Reference:** Lowdermilk et al. (2016), p. 684.

222. **Answer:** 2

**Rationale:** In placenta previa, the placenta is implanted in the lower uterine segment. The lower uterine segment does not contain the same intertwining musculature as the fundus of the uterus, and this site is more prone to bleeding. Options 1, 3, and 4 are not risks that are related specifically to placenta previa.

**Test-Taking Strategy:** Focus on the **subject**, the risks associated with placenta previa. Thinking about the pathophysiology associated with this disorder and recalling that bleeding is a primary concern in this client will direct you easily to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Postpartum

**Health Problem:** Maternity: Placenta previa

**Priority Concepts:** Clinical Judgment; Perfusion

**Reference:** Lowdermilk et al. (2016), p. 682.

223. **Answer:** 4, 5, 6

**Rationale:** Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Painless, bright red vaginal bleeding in the second or third trimester of pregnancy is a sign of placenta previa. The client has a soft, relaxed, nontender uterus, and fundal height may be more than expected for gestational age. In abruptio placentae, severe abdominal pain is present. Uterine tenderness accompanies placental abruption. In addition, in abruptio placentae, the abdomen feels hard and board-like on palpation, as the blood penetrates the myometrium and causes uterine irritability.

**Test-Taking Strategy:** First, eliminate options 1 and 2 because they are comparable or alike. Next, remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bright red bleeding with placenta previa.

**Level of Cognitive Ability:** Analyzing
Client Needs: Physiological Integrity

CHAPTER 23

Labor and Birth

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Oxygenation, Perfusion

I. Process of Labor—4 Ps
   A. Description
      1. Labor: Coordinated sequence of involuntary, intermittent uterine contractions
      2. Birth: Actual event of birth
   B. Four major factors (4 Ps) interact during normal childbirth; the 4 Ps are interrelated and depend on each other for a safe birth and are Powers, Passageway, Passenger, and Psyche.
   C. Powers: Uterine contractions
      1. Forces acting to expel the fetus
      2. Effacement: Shortening and thinning of the cervix during the first stage of labor
      3. Dilation: Enlargement of cervical os and cervical canal during the first stage of labor
      4. Pushing efforts of mother during the second stage
   D. Passageway: The mother’s rigid bony pelvis and the soft tissues of the cervix, pelvic floor, vagina, and introitus (external opening to the vagina)
   E. Passenger: The fetus, membranes, and placenta
   F. Psyche: A woman’s emotional structure that can determine her entire response to labor and influence physiological and psychological functioning; the mother may experience anxiety or fear.
   G. Attitude
      1. Attitude is the relationship of the fetal body parts to one another.
      2. Normal intrauterine attitude is flexion, in which the fetal back is rounded, the head is forward on the chest, and the arms and legs are folded in against the body. The other attitude, extension, tends to present larger fetal diameters.
H. Lie

1. Relationship of the spine of the fetus to the spine of the mother
2. Longitudinal or vertical (Fig. 23-1)
   a. Fetal spine is parallel to the mother’s spine.
   b. Fetus is in cephalic or breech presentation.
3. Transverse or horizontal (Fig. 23-1)
   a. Fetal spine is at a right angle, or perpendicular, to the mother’s spine.
   b. Presenting part is the shoulder.
   c. Delivery by cesarean section is necessary.

I. Presentation

1. Portion of the fetus that enters the pelvic inlet first
2. Cephalic: Head first
   a. Cephalic is the most common presentation.
   b. Cephalic presentation has 4 variations: vertex, military, brow, and face.
   a. Delivery by cesarean section may be required, although vaginal birth is often possible.
   b. Breech presentation has 3 variations: frank, full (complete), and footling
4. Shoulder
   a. Fetus is in a transverse lie, or the arm, back, abdomen, or side could present.
   b. If the fetus does not spontaneously rotate, or if it is impossible to turn the fetus manually, a cesarean section may need to be performed.

J. Presenting part: The specific fetal structure lying nearest to the cervix

K. Position: Relationship of assigned area of the presenting part or landmark to the maternal pelvis (Fig. 23-2 and Box 23-1)

L. Station

1. The measurement of the progress of descent in centimeters above or below the midplane from the presenting part to the ischial spine
2. Station 0: At ischial spine
3. Minus station: Above ischial spine
4. Plus station: Below ischial spine
5. Engagement: When the widest diameter of the presenting part has passed the inlet; corresponds to a 0 station

II. Mechanisms of Labor (Box 23-2)

A. Assessment

1. Lightening or dropping: Is also known as engangement and occurs when the fetus descends into the pelvis about 2 weeks before birth; lightening or dropping is most noticeable in first pregnancies.
2. Braxton Hicks contractions increase.
3. The vaginal mucosa is congested, and vaginal discharge increases.
4. Brownish or blood-tinged cervical mucus is passed.
5. Cervix ripens, becomes soft and partly effaced, and may begin to dilate.
6. The mother has a sudden burst of energy, also known as “nesting,” often 24 to 48 hours before onset of labor.
7. Weight loss of 1 to 3 lb results from fluid shifts produced by the changes in progesterone and estrogen levels 24 to 48 hours before the onset of labor.
8. Spontaneous rupture of membranes occurs.
   a. True labor: Contractions may manifest as back pain in some women; contractions often resemble menstrual cramps during early labor (Box 23-3).
   b. False labor: Also known as prodromal labor, contractions are felt in the abdomen and groin and may be more annoying than painful (Box 23-3).

In true labor, contractions increase in duration and intensity and cervical dilation and effacement are progressive, with engagement and descent of the fetus. In false labor, contractions are irregular and do not produce dilation, effacement, or descent.

III. Leopold’s Maneuvers

A. Description: Methods of palpation to determine presentation and position of the fetus and aid in location of fetal heart sounds
B. If the head is in the fundus, a hard, round, movable object is felt. The buttocks feel soft and have an irregular shape and are more
difficult to move.
C. The fetus’s back, which is a smooth, hard surface, should be felt on 1 side of the abdomen.
D. Irregular knobs and lumps, which may be the hands, feet, elbows, and knees, are felt on the opposite side of the abdomen.

IV. Breathing Techniques (Box 23-4)
A. Provide a focus during contractions, interfering with pain sensory transmission
B. Promote relaxation and oxygenation
C. Begin with simple breathing patterns and progress to more complex ones as needed.

V. Fetal Monitoring
A. Description
1. The fetal monitor displays the fetal heart rate (FHR).
2. The device monitors uterine activity.
3. The monitor assesses frequency, duration, and intensity of contractions.
4. The monitor assesses FHR in relation to maternal contractions.
5. Baseline FHR is measured between contractions; the normal FHR at term is 110 to 160 beats per minute.
B. External fetal monitoring
1. External fetal monitoring is noninvasive and is performed with a tocotransducer or Doppler ultrasonic transducer.
2. Leopold’s maneuvers are performed to determine on which side the fetal back is located, and the ultrasound transducer is placed over this area (fasten with a belt or stocking tubing).
3. The tocotransducer is placed over the fundus of the uterus, where contractions feel the strongest (fasten with a belt or stocking tubing).
4. The client is allowed to assume a comfortable position, avoiding vena cava compression (maternal supine hypotensive syndrome).
5. The preferred position is to have the client lie on her side to increase perfusion.
C. Internal fetal monitoring
1. Internal fetal monitoring is invasive and requires rupturing of the membranes and attaching an electrode to the presenting part of the fetus.
2. The client must be dilated 2 to 3 cm to perform internal monitoring.

D. Periodic patterns in FHR

729
1. Fetal bradycardia and tachycardia
   a. Bradycardia: FHR is less than 110 beats per minute for 10 minutes or longer.
   b. Tachycardia: FHR is more than 160 beats per minute for 10 minutes or longer.

   If fetal bradycardia or tachycardia occurs, change the position of the mother, administer oxygen, and assess the mother’s vital signs. Notify the primary health care provider (PHCP) as soon as possible.

2. Variability (Box 23-5)
   a. Fluctuations in baseline FHR
   b. Absent or undetected variability is considered nonreassuring.
   c. Decreased variability can result from fetal hypoxemia, acidosis, or certain medications.
   d. A temporary decrease in variability can occur when the fetus is in a sleep state (sleep states do not usually last longer than 30 minutes).

3. Accelerations
   a. Brief, temporary increases in FHR of at least 15 beats per minute more than baseline and lasting at least 15 seconds
   b. Usually are a reassuring sign, reflecting a responsive, nonacidotic fetus
   c. Usually occur with fetal movement
   d. May be nonperiodic (having no relation to contractions) or periodic (with contractions)
   e. May occur with uterine contractions, vaginal examinations, or mild cord compression, or when the fetus is in a breech presentation

4. Early decelerations (Fig. 23-3)
   a. Early decelerations are decreases in FHR below baseline; the rate at the lowest point of the deceleration usually remains greater than 100 beats per minute.
   b. Early decelerations occur during contractions as the fetal head is pressed against the mother’s pelvis or soft tissues, such as the cervix, and return to baseline FHR by the end of
the contraction.
c. Tracing shows a uniform shape and mirror image of uterine contractions.
d. Early decelerations are not associated with fetal compromise and require no intervention.

5. Late decelerations (Fig. 23-3)
a. Late decelerations are nonreassuring patterns that reflect impaired placental exchange or uteroplacental insufficiency.
b. The patterns look similar to early decelerations but begin well after the contraction begins and return to baseline after the contraction ends.
c. The degree of decline in FHR from baseline is not related to the amount of uteroplacental insufficiency.

Interventions for late decelerations include immediately improving placental blood flow and fetal oxygenation.

6. Variable decelerations (Fig. 23-3).
a. Variable decelerations are caused by conditions that restrict flow through the umbilical cord.
b. Variable decelerations do not have the uniform appearance of early and late decelerations.
c. The shape, duration, and degree of decline below baseline FHR are variable; these fall and rise abruptly with the onset and relief of cord compression.
d. Variable decelerations also may be nonperiodic, occurring at times unrelated to contractions.
e. Baseline rate and variability are considered when evaluating variable decelerations.
f. Variable decelerations are significant when FHR repeatedly declines to less than 70 beats per minute and persists at that level for at
least 60 seconds before returning to baseline.

If variable decelerations occur, discontinue oxytocin if infusing, change the position of the mother, administer oxygen, and assess the mother’s vital signs. Notify the PHCP. Assist with amnioinfusion (intrauterine instillation of warmed saline to decrease compression on the umbilical cord) if prescribed.

7. Hypertonic uterine activity
   a. Assessment of uterine activity includes frequency, duration, intensity of contractions, and uterine resting tone; assessment is performed either by palpating by hand or with an internal uterine pressure catheter (IUPC).
   b. The uterus should relax between contractions for 60 seconds or longer.
   c. Uterine contraction intensity is about 50 to 75 mm Hg (with an IUPC) during labor and may reach 110 mm Hg with pushing during the second stage.
   d. The average resting tone is 5 to 15 mm Hg.
   e. In hypertonic uterine activity, the uterine resting tone between contractions is high, reducing uterine blood flow and decreasing fetal oxygen supply.

8. Nonreassuring FHR patterns (Box 23-6)

9. Interventions for nonreassuring patterns (see Priority Nursing Actions)

Priority Nursing Actions

Nonreassuring Fetal Heart Rate Pattern

1. Identify the cause.
2. Discontinue oxytocin infusion.
3. Change the mother’s position.
4. Administer oxygen by face mask at 8 to 10 L/minute and infuse intravenous (IV) fluids as prescribed.
5. Prepare to initiate continuous electronic fetal monitoring with internal devices if not contraindicated.
6. Prepare for cesarean delivery if necessary.
7. Document the event, actions taken, and the mother’s response.

Reference

VI. Four Stages of Labor (Table 23-1)

A. Stage 1: Latent phase
   1. Description: Stage 1 is the longest. A labor curve, such as the Friedman curve, may be used to identify whether a woman’s cervical dilation is progressing at the expected rate (Fig. 23-4).
   2. Assessment
      a. Cervical dilation is 1 to 4 cm.
      b. Uterine contractions occur every 15 to 30 minutes, are 15 to 30 seconds in duration, and are of mild intensity.
   3. Interventions
      a. Encourage mother and partner to participate in care.
      b. Assist with comfort measures, changes of position, and ambulation.
      c. Keep mother and partner informed of progress.
      d. Offer fluids and ice chips.
      e. Encourage voiding every 1 to 2 hours.

B. Stage 1: Active phase
   1. Assessment
      a. Cervical dilation is 4 to 7 cm.
      b. Uterine contractions occur every 3 to 5 minutes, are 30 to 60 seconds in duration, and are of moderate intensity.
   2. Interventions
      a. Encourage maintenance of effective breathing patterns.
      b. Provide a quiet environment.
      c. Keep mother and partner informed of progress.
      d. Promote comfort with back rubs, sacral pressure, pillow support, and position changes.
      e. Instruct partner in effleurage (light stroking of abdomen).
      f. Offer fluids and ice chips and ointment
C. Stage 1: Transition phase

1. Assessment
   a. Cervical dilation is 8 to 10 cm.
   b. Uterine contractions occur every 2 to 3 minutes, are 45 to 90 seconds in duration, and are of strong intensity.

2. Interventions
   a. Encourage rest between contractions.
   b. Wake mother at beginning of contraction so she can begin breathing pattern.
   c. Keep mother and partner informed of progress.
   d. Provide privacy.
   e. Offer fluids and ice chips and ointment for dry lips.
   f. Encourage voiding every 1 to 2 hours.

D. Interventions throughout stage 1

1. Monitor maternal vital signs.
2. Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.
3. Assess FHR before, during, and after a contraction, noting that the normal FHR is 110 to 160 beats per minute.
4. Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
5. Assess status of cervical dilation and effacement.
6. Assess fetal station presentation and position by Leopold’s maneuvers.
7. Assist with pelvic examination and prepare for a fern test.

If the membranes have ruptured, assess the FHR because of the risk of prolapsed umbilical cord, and assess the color of the amniotic fluid, because meconium-stained fluid can indicate fetal distress.

E. Stage 2

1. Assessment
   a. Cervical dilation is complete.
   b. Progress of labor is measured by descent of fetal head through the birth canal (change in fetal station).
   c. Uterine contractions occur every 2 to 3 minutes, lasting 60 to 75 seconds, and are of strong intensity.
d. Increase in bloody show occurs.
e. Mother feels urge to push (Ferguson reflex); assist mother in pushing efforts.

2. Interventions
   a. Perform assessments every 5 minutes.
b. Monitor maternal vital signs.
c. Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.
d. Assess FHR before, during, and after a contraction, noting that the normal FHR is 110 to 160 beats per minute.
e. Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
f. Provide mother with encouragement and praise and provide for rest between contractions.
g. Keep mother and partner informed of progress.
h. Maintain privacy.
i. Provide ice chips and ointment for dry lips.
j. Assist mother into a position that promotes comfort and facilitates pushing efforts, such as lithotomy, semisitting, kneeling, side-lying, or squatting.
k. Monitor for signs of approaching birth, such as perineal bulging or visualization of the fetal head.
l. Prepare for birth (expulsion of the fetus).

F. Stage 3

1. Assessment
   a. Contractions occur until the placenta is expelled.
b. Placental separation and expulsion occur.
c. Expulsion of the placenta occurs 5 to 30 minutes after the birth of the infant.
d. Schultze mechanism: Center portion of the placenta separates first, and its shiny fetal surface emerges from the vagina.
e. Duncan mechanism: Margin of the placenta separates, and the dull, red,
rough maternal surface emerges from the vagina first.

f. Method of placental presentation is of no clinical significance.

2. Interventions
   a. Assess maternal vital signs.
   b. Assess uterine status.
   c. Provide parents with an explanation regarding expulsion of the placenta.
   d. After expulsion of the placenta, uterine fundus remains firm and is located 2 fingerbreadths below the umbilicus.
   e. Examine placenta for cotyledons and membranes to verify that it is intact.
   f. Assess mother for shivering and provide warmth.
   g. Promote parental-neonatal attachment.

G. Stage 4
   1. Description: Period 1 to 4 hours after birth
   2. Assessment
      a. Blood pressure returns to prelabor level.
      b. Pulse is slightly lower than during labor.
      c. Fundus remains contracted, in the midline, 1 or 2 fingerbreadths below the umbilicus.

      Monitor lochia discharge. Lochia may be moderate in amount and red in color in stage 4.

   3. Interventions
      a. Perform maternal assessments every 15 minutes for 1 hour, every 30 minutes for 1 hour, and hourly for 2 hours (or as per agency policy).
      b. Provide warm blankets.
      c. Apply ice packs to the perineum.
      d. Massage the uterus if needed, and teach the mother to massage the uterus.
      e. Provide breast-feeding support as needed.
      f. See Chapter 27 for information on caring for the newborn.

VII. Anesthesia
   A. Local anesthesia
      1. Local anesthesia is used for blocking pain during
episiotomy.
2. Local anesthesia is administered just before the birth of the infant.
3. The anesthetic has no effect on the fetus.

B. Lumbar epidural block
1. Injection site is in epidural space at L3 to L4.
2. The block is administered after labor is established or as partial anesthesia just before a scheduled cesarean birth.
3. The anesthetic relieves pain from contractions and numbs the vagina and perineum.
4. The block may cause hypotension, bladder distention, and a prolonged second stage.
5. The anesthetic does not cause a headache because the dura mater is not penetrated.
6. Assess maternal blood pressure and assess bladder frequently.
7. Maintain the mother in a side-lying position or place a rolled blanket beneath the right hip to displace the uterus from the vena cava.
8. Administer intravenous (IV) fluids as prescribed.
9. Increase fluids as prescribed if hypotension occurs.
10. Observe for any adverse effects from opioid epidurals, such as nausea and vomiting, pruritus, or respiratory depression.

C. Intrathecal opioid analgesics
1. The medication is injected into the subarachnoid space and has a rapid onset of action.
2. It may be used in combination with a lumbar epidural block.

D. Subarachnoid (spinal) block
1. Injection site is in the spinal subarachnoid space at L3 to L5.
2. The block is administered just before birth.
3. The anesthetic relieves uterine and perineal pain and numbs the vagina, perineum, and lower extremities.
4. The anesthetic may cause maternal hypotension.
5. The anesthetic may cause postpartum headache.
6. The mother must lie flat for 8 to 12 hours after spinal injection.
7. Administer IV fluids as prescribed.

E. General anesthesia
1. General anesthesia may be used for some surgical interventions.
2. The mother is not awake.
General anesthesia presents a maternal danger of respiratory depression, vomiting, and aspiration.

VIII. Obstetrical Procedures

A. Bishop score (Table 23-2)

1. The Bishop score is used to determine maternal readiness for labor and evaluates cervical status and fetal position.
2. The Bishop score is indicated before the induction of labor.
3. The 5 factors are assigned a score of 0 to 3, and the total score is calculated.
4. A score of 8 or greater indicates that the chance of a successful vaginal delivery is good and the cervix is favorable for induction.

B. Induction

1. Induction is a deliberate initiation of uterine contractions that stimulates labor.
2. Elective induction may be accomplished by oxytocin infusion.
3. Obtain a baseline tracing of uterine contractions and FHR.
4. Increase the IV dosage of oxytocin as prescribed only after assessing contractions, FHR, and maternal blood pressure and pulse.
5. Do not increase the rate of oxytocin when the desired contraction pattern is obtained (contraction frequency of 2 to 3 minutes and lasting 60 seconds).

An oxytocin infusion is discontinued if uterine contraction frequency is less than 2 minutes or duration is longer than 90 seconds, or if fetal distress is noted.

C. Amniotomy

1. Artificial rupture of the membranes is performed by the obstetrician or nurse-midwife to stimulate labor.
2. Amniotomy is performed if the fetus is at 0 or a plus station.
3. Amniotomy increases the risk of prolapsed cord and infection.
4. Monitor FHR before and after amniotomy.
5. Record time of amniotomy, FHR, and characteristics of the fluid.
6. Meconium-stained amniotic fluid may be associated with fetal distress.
7. Bloody amniotic fluid may indicate abruptio placentae or fetal trauma.
8. An unpleasant odor to amniotic fluid is associated with infection.
9. Polyhydramnios is associated with maternal diabetes and certain congenital disorders.
10. Oligohydramnios is associated with intrauterine growth restriction and congenital disorders.
11. Expect more variable decelerations after rupture of the membranes as a result of possible cord compression during contractions.
12. Limit client activity if prescribed.

D. External version

1. External version is the manipulation of the fetus from an unfavorable presentation into a favorable presentation for birth.
2. External version is indicated for an abnormal presentation that exists after the 34th week.
3. Monitor vital signs.
4. If the mother is Rh-negative, ensure that Rho(D) immune globulin was given at 28 weeks of gestation.
5. Prepare for a nonstress test to evaluate fetal well-being.
6. IV fluids and tocolytic therapy may be administered to relax the uterus and permit easier manipulation of the fetus.
7. Ultrasound is used during the procedure to evaluate fetal position and placental placement and guide direction of the fetus.
8. The abdominal wall is manipulated to direct the fetus into a cephalic presentation if possible.
9. Monitor blood pressure to identify vena cava compression.
10. Monitor for unusual pain.
11. After the procedure, do the following:
   a. Perform a nonstress test to evaluate fetal well-being.
   b. Monitor for uterine activity, bleeding, ruptured membranes, and decreased fetal activity.
   c. With Rh-negative clients, perform Kleihauer-Betke test as prescribed to detect the presence and amount of fetal blood in the maternal circulation and to identify clients who need additional Rh_{0}(D) immune globulin.
E. Episiotomy

1. An episiotomy is an incision made into the perineum to enlarge the vaginal outlet and facilitate birth.
2. The use of this procedure has declined dramatically in recent years.
3. Check the episiotomy site.
4. Institute measures to relieve pain.
5. Provide ice packs during the first 24 hours.
6. Instruct the client in the use of an ice pack for the first 24 hours, and then sitz baths thereafter.
7. Apply analgesic spray or ointment as prescribed.
8. Provide perineal care, using clean technique.
9. Instruct the client in the proper care of the incision.
10. Instruct the client to dry the perineal area from front to back and to blot the area rather than wipe it.
11. Instruct the client to shower rather than bathe in a tub.
12. Apply a perineal pad without touching the inside surface of the pad.
13. Report any bleeding or discharge from the episiotomy site to the PHCP.

F. Forceps delivery

1. Two double-crossed, spoon-like articulated blades are used to assist in the delivery of the fetal head.
2. Reassure the mother and explain the need for forceps.
3. Monitor the mother and fetus during delivery.
4. Check the neonate and mother after delivery for any possible injury.
5. Assist with repair of any lacerations.

G. Vacuum extraction

1. A cap-like suction device is applied to the fetal head to facilitate extraction.
2. Suction is used to assist in delivery of the fetal head.
3. Traction is applied during uterine contractions until descent of the fetal head is achieved.
4. The suction device should not be kept in place any longer than 25 minutes.
5. Monitor FHR frequently; fetal monitoring should be used.
6. Assess infant at birth and throughout the postpartum period for signs of cerebral trauma.
7. Monitor for developing cephalhematoma.
8. Caput succedaneum is normal and resolves in 24 hours.
H. Cesarean delivery

1. Cesarean section is delivery of the fetus usually through a transabdominal, low-segment incision of the uterus.

2. Preoperative
   a. If planned, prepare the mother and partner.
   b. If an emergency, quickly explain the need and procedure to the mother and partner.
   c. Obtain informed consent.
   d. Ensure that the preoperative diagnostic tests are done, including Rh factor determination.
   e. Prepare to insert an IV line and an indwelling urinary catheter.
   f. Prepare the abdomen as prescribed.
   g. Monitor the mother and fetus continuously.
   h. Provide emotional support.
   i. Administer preoperative medications as prescribed.

3. Postoperative
   a. Monitor vital signs.
   b. Perform a fundal assessment; evaluate incision.
   c. Provide pain relief.
   d. Encourage turning, coughing, and deep breathing.
   e. Encourage ambulation.
   f. Encourage bonding and attachment with newborn.
   g. Provide psychological support.
   h. Monitor for signs of infection and bleeding.
   i. Burning and pain on urination may indicate a bladder infection.
   j. A tender uterus and foul-smelling lochia may indicate endometritis.
   k. A productive cough or chills may indicate pneumonia.
   l. Pain, redness, or edema of an extremity may indicate thrombophlebitis.
FIG. 23-1  Fetal lie.  

A, In a longitudinal lie, the long axis of the fetus is parallel to the long axis of the mother. 

B, In a transverse lie, the long axis of the fetus is at a right angle to the long axis of the mother. The mother’s abdomen has a wide, short appearance.
FIG. 23-2  Fetal vertex (occiput) presentations in relation to the front, back, or side of the maternal pelvis.

Box 23-1

**Fetal Positions**

**Vertex Presentations**

- **ROA**: Right occipitoanterior
- **LOA**: Left occipitoanterior
- **ROP**: Right occipitoposterior
- **LOP**: Left occipitoposterior
- **ROT**: Right occipitotransverse
- **LOT**: Left occipitotransverse
Face Presentations

- **RMA**: Right mentoanterior
- **LMA**: Left mentoanterior
- **RMP**: Right mentoposterior

Breech Presentations

- **LSA**: Left sacroanterior
- **LSP**: Left sacroposterior

Other Presentations

- Brow presentation
- Shoulder presentation

---

**Box 23-2**

**Mechanisms of Labor**

**Engagement**

- Engagement is the mechanism whereby the fetus nestles into the pelvis.
- Engagement occurs when the presenting part reaches the level of the ischial spines.

**Descent**

- Descent is the process that the fetal head undergoes as it begins its journey through the pelvis.
- Descent is a continuous process from prior to engagement until birth and is assessed by the measurement called *station*.

**Flexion**

- Flexion is a process of nodding of the fetal head forward toward the fetal chest.

**Internal Rotation**

- Internal rotation of the fetus occurs most commonly from the occipitotransverse position, assumed at engagement into the pelvis, to the occipitoanterior position while continuously descending.
Extension

- Extension enables the head to emerge when the fetus is in a cephalic position.
- Extension begins after the head crowns.
- Extension is complete when the head passes under the symphysis pubis and occiput, and the anterior fontanel, brow, face, and chin pass over the sacrum and coccyx and are over the perineum.

Restitution

- Restitution is realignment of the fetal head with the body after the head emerges.

External Rotation

- The shoulders externally rotate after the head emerges and restitution occurs, so that the shoulders are in the anteroposterior diameter of the pelvis.

Expulsion

- Expulsion is the birth of the entire body.

Box 23-3
True Labor Versus False Labor

True Labor

- Contractions occur regularly, become stronger, last longer, and occur closer together.
- Cervical dilation and effacement are progressive.
- The fetus usually becomes engaged in the pelvis and begins to descend.

False Labor

- False labor does not produce dilation, effacement, or descent.
- Contractions are irregular, without progression.
- Activity, such as walking, often relieves false labor.

Example: If a woman has been sleeping and wakes up with contractions, gets up, and moves around, and her contractions become stronger and closer together, this is true labor. If the contractions go away, this is false labor.
Box 23-4

Breathing Techniques

First-Stage Breathing

Cleansing Breath

Each contraction begins and ends with a deep inspiration and expiration.

Slow-Paced Breathing

Slow-paced breathing promotes relaxation.
Slow-paced breathing is used for as long as possible during labor.

Modified-Paced Breathing

Modified-paced breathing is used when slow-paced breathing is no longer effective.
Breathing is shallow and fast.

Pattern-Paced Breathing

Pattern-paced breathing sometimes is referred to as pant-blow.
After a certain number of breaths (modified-paced breathing), the woman exhales with a slight blow and then begins modified-paced breathing again.

Breathing to Prevent Pushing

The woman blows repeatedly, using short puffs, when the urge to push is strong.

Second-Stage Breathing

Several variations of breathing can be used in the pushing stage of labor, and the woman may grunt, groan, sigh, or moan as she pushes. Prolonged breath holding while pushing with a closed glottis may result in a decrease in cardiac output. If breath holding while pushing is used, the open glottis method or limiting breath holding to less than 6 to 8 seconds should be done.

Box 23-5

Variability in Fetal Heart Rate

Absent Variability: Undetected variability
<table>

Practice Questions

224. The nurse is caring for a client in labor. Which assessment findings indicate to the nurse that the client is beginning the second stage of labor? **Select all that apply.**

- [ ] 1. The contractions are regular.
- [ ] 2. The membranes have ruptured.
- [ ] 3. The cervix is dilated completely.
- [ ] 4. The client begins to expel clear vaginal fluid.
- [ ] 5. The Ferguson reflex is initiated from perineal pressure.

225. The nurse in the labor room is caring for a client in the active stage of the first phase of labor. The nurse is assessing the fetal patterns and notes a late deceleration on the monitor strip. What is the **most appropriate** nursing action?

1. Administer oxygen via face mask.
2. Place the mother in a supine position.
3. Increase the rate of the oxytocin intravenous infusion.
4. Document the findings and continue to monitor the fetal patterns.

226. The nurse is performing an assessment of a client who is scheduled for a cesarean delivery at 39 weeks of gestation. Which assessment finding indicates the need to contact the primary health care provider (PHCP)?

1. Hemoglobin of 11 g/dL (110 mmol/L)
2. Fetal heart rate of 180 beats per minute
3. Maternal pulse rate of 85 beats per minute
4. White blood cell count of 12,000/mm³ (12 × 10⁹/L)

227. The nurse is reviewing the record of a client in the labor room and notes that the primary health care provider has documented that the fetal presenting part is at the −1 station. This documented finding indicates that the fetal presenting part is located at which area? **Refer to figure.**
228. A client arrives at a birthing center in active labor. After examination, it is determined that her membranes are still intact and she is at a −2 station. The primary health care provider prepares to perform an amniotomy. What will the nurse relay to the client as the most likely outcomes of the amniotomy? Select all that apply.

1. Less pressure on her cervix
2. Decreased number of contractions
3. Increased efficiency of contractions
4. The need for increased maternal blood pressure monitoring
5. The need for frequent fetal heart rate monitoring to detect the presence of a prolapsed cord

229. The nurse is monitoring a client in labor. The nurse suspects umbilical cord compression if which is noted on the external monitor tracing during a contraction?

1. Variability
2. Accelerations
3. Early decelerations
4. Variable decelerations

230. A client in labor is transported to the delivery room and prepared for a cesarean delivery. After the client is transferred to the delivery room table, the nurse should place the client in which position?

1. Supine position with a wedge under the right hip
2. Trendelenburg’s position with the legs in stirrups
3. Prone position with the legs separated and elevated
4. Semi-Fowler’s position with a pillow under the knees

231. The nurse is monitoring a client in active labor and notes that the client is
having contractions every 3 minutes that last 45 seconds. The nurse notes that the fetal heart rate between contractions is 100 beats per minute. Which nursing action is most appropriate?

1. Notify the primary health care provider (PHCP).
2. Continue monitoring the fetal heart rate.
3. Encourage the client to continue pushing with each contraction.
4. Instruct the client’s coach to continue to encourage breathing techniques.

232. The nurse is caring for a client in labor and is monitoring the fetal heart rate patterns. The nurse notes the presence of episodic accelerations on the electronic fetal monitor tracing. Which action is most appropriate?

1. Notify the primary health care provider of the findings.
2. Reposition the mother and check the monitor for changes in the fetal tracing.
3. Take the mother’s vital signs and tell the mother that bed rest is required to conserve oxygen.
4. Document the findings and tell the mother that the pattern on the monitor indicates fetal well-being.

233. The nurse is admitting a pregnant client to the labor room and attaches an external electronic fetal monitor to the client’s abdomen. After attachment of the electronic fetal monitor, what is the next nursing action?

1. Identify the types of accelerations.
2. Assess the baseline fetal heart rate.
3. Determine the intensity of the contractions.
4. Determine the frequency of the contractions.

234. The nurse is reviewing true and false labor signs with a multiparous client. The nurse determines that the client understands the signs of true labor if she makes which statement?

1. “I won’t be in labor until my baby drops.”
2. “My contractions will be felt in my abdominal area.”
3. “My contractions will not be as painful if I walk around.”
4. “My contractions will increase in duration and intensity.”

235. Which assessment finding after an amniotomy should be conducted first?

1. Cervical dilation
2. Bladder distention
3. Fetal heart rate pattern
4. Maternal blood pressure

236. The nurse has been working with a laboring client and notes that she has been pushing effectively for 1 hour. What is the client’s primary physiological need at this time?

1. Ambulation
2. Rest between contractions
3. Change positions frequently
4. Consume oral food and fluids

237. The nurse is assisting a client undergoing induction of labor at 41 weeks of gestation. The client’s contractions are moderate and occurring every 2 to 3 minutes, with a duration of 60 seconds. An internal fetal heart rate monitor is in place. The baseline fetal heart rate has been 120 to 122 beats per minute for
the past hour. What is the priority nursing action?
1. Notify the health care provider.
2. Discontinue the infusion of oxytocin.
3. Place oxygen on at 8 to 10 L/minute via face mask.
4. Contact the client’s primary support person(s) if not currently present.

Answers

224. Answer: 3, 5

Rationale: The second stage of labor begins when the cervix is dilated completely and ends with birth of the neonate. The woman has a strong urge to push in stage 2 when the Ferguson reflex is activated. Options 1, 2, and 4 are not specific assessment findings of the second stage of labor and occur in stage 1.

Test-Taking Strategy: Eliminate options 2 and 4 first because they are comparable or alike. From the remaining options, recalling that regular contractions occur before the second stage of labor will direct you to the correct option.

Level of Cognitive Ability: Applying
Client Needs: Health Promotion and Maintenance
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Intrapartum
Health Problem: N/A
Priority Concepts: Clinical Judgment; Reproduction

225. Answer: 1

Rationale: Late decelerations are due to uteroplacental insufficiency and occur because of decreased blood flow and oxygen to the fetus during the uterine contractions. Hypoxemia results; oxygen at 8 to 10 L/minute via face mask is necessary. The supine position is avoided because it decreases uterine blood flow to the fetus. The client should be turned onto her side to displace pressure of the gravid uterus on the inferior vena cava. An intravenous oxytocin infusion is discontinued when a late deceleration is noted. The oxytocin would cause further hypoxemia because of increased uteroplacental insufficiency resulting from stimulation of contractions by this medication. Although the nurse would document the occurrence, option 4 would delay necessary treatment.

Test-Taking Strategy: Note the strategic words, most appropriate. Use the ABCs—airway, breathing, and circulation—and knowledge related to the significance of a late deceleration to answer this question.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Maternity: Intrapartum
Health Problem: Maternity: Fetal Distress/Demise
**Priority Concepts:** Clinical Judgment; Perfusion  
**Reference:** McKinney et al. (2018), pp. 342, 344

**226. Answer:** 2

**Rationale:** A normal fetal heart rate is 110 to 160 beats per minute. A fetal heart rate of 180 beats per minute could indicate fetal distress and would warrant immediate notification of the PHCP. By full term, a normal maternal hemoglobin range is 11 to 13 g/dL (110 to 130 mmol/L) because of the hemodilution caused by an increase in plasma volume during pregnancy. The maternal pulse rate during pregnancy increases 10 to 15 beats per minute over prepregnancy readings to facilitate increased cardiac output, oxygen transport, and kidney filtration. White blood cell counts in a normal pregnancy begin to increase in the second trimester and peak in the third trimester, with a normal range of, 11,000–15,000/mm$^3$ (11–15 $\times$ 10$^9$/L) up to 18,000/mm$^3$ (18 $\times$ 10$^9$/L) During the immediate postpartum period, the white blood cell count may be 25,000–30,000/mm$^3$ (25–30 $\times$ 10$^9$/L) because of increased leukocytosis that occurs during delivery.

**Test-Taking Strategy:** Focus on the subject, normal assessment and laboratory findings and those that indicate the need to contact the PHCP. Knowledge regarding the normal and abnormal findings in a pregnant client and fetus will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity

**Reference:** Lowdermilk et al. (2016), pp. 411, 788.

**227. Answer:** 3

**Rationale:** Station is the measurement of the progress of descent in centimeters above or below the midplane from the presenting part to the ischial spine. It is measured in centimeters and noted as a negative number above the line and as a positive number below the line. At the negative 1 (−1) station, the fetal presenting part is 1 cm above the ischial spine. Option 1 is at the negative 5 (−5) station and the fetal presenting part is 5 cm above the ischial spine. Option 2 is at the negative 2 (−2) station, and the fetal presenting part is 2 cm above the ischial spine. Option 5 is at the positive 3 (+ 3), and the fetal presenting part is 2 cm below the ischial spine.

**Test-Taking Strategy:** Recalling that station is measured in centimeters and uses the ischial spine as a reference point will assist in answering this question. Focus on the data in the question and note the location of the ischial spine and that the stations range from −5 cm to + 5 cm above or below this reference point.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Maternity: Intrapartum

754
Health Problem: N/A
Priority Concepts: Clinical Judgment; Reproduction

228. Answer: 3, 5

Rationale: Amniotomy (artificial rupture of the membranes) can be used to induce labor when the condition of the cervix is favorable (ripe) or to augment labor if the progress begins to slow. Rupturing of the membranes allows the fetal head to contact the cervix more directly and may increase the efficiency of contractions. Increased monitoring of maternal blood pressure is unnecessary after this procedure. The fetal heart rate needs to be monitored frequently, as there is an increased likelihood of a prolapsed cord with ruptured membranes and a high presenting part.

Test-Taking Strategy: Note the strategic words, most likely. Focus on the subject, an amniotomy. Recalling that amniotomy is performed to augment labor if the progress begins to slow will direct you to the correct option.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Maternity: Intrapartum
Health Problem: N/A
Priority Concepts: Client Education; Reproduction

229. Answer: 4

Rationale: Variable decelerations occur if the umbilical cord becomes compressed, reducing blood flow between the placenta and the fetus. Variability refers to fluctuations in the baseline fetal heart rate. Accelerations are a reassuring sign and usually occur with fetal movement. Early decelerations result from pressure on the fetal head during a contraction.

Test-Taking Strategy: Focus on the subject, umbilical cord compression. Recalling that variable decelerations occur if the umbilical cord becomes compressed will direct you to the correct option.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Intrapartum
Health Problem: Maternity: Fetal Distress/Demise
Priority Concepts: Clinical Judgment; Perfusion

230. Answer: 1

Rationale: Vena cava and descending aorta compression by the pregnant uterus impedes blood return from the lower trunk and extremities. This leads to decreasing cardiac return, cardiac output, and blood flow to the uterus and subsequently the
fetus. The best position to prevent this would be side-lying, with the uterus displaced off the abdominal vessels. Positioning for abdominal surgery necessitates a supine position, however; a wedge placed under the right hip provides displacement of the uterus. Trendelenburg’s position places pressure from the pregnant uterus on the diaphragm and lungs, decreasing respiratory capacity and oxygenation. A prone or semi-Fowler’s position is not practical for this type of abdominal surgery.

**Test-Taking Strategy:** Focus on the **subject**, positioning the pregnant woman. Visualizing each of the positions identified in the options and considering the effect that the position may have on the mother and the fetus will direct you to the correct option.

**Level of Cognitive Ability:** Applying
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Implementation
**Content Area:** Maternity: Intrapartum
**Health Problem:** Maternity: Supine Hypotension
**Priority Concepts:** Clinical Judgment; Perfusion

231. **Answer:** 1

**Rationale:** A normal fetal heart rate is 110 to 160 beats per minute, and the fetal heart rate should be within this range between contractions. Fetal bradycardia between contractions may indicate the need for immediate medical management, and the PHCP or nurse-midwife needs to be notified. Options 2, 3, and 4 are inappropriate nursing actions in this situation and delay necessary intervention.

**Test-Taking Strategy:** Note the **strategic words, most appropriate.** Focus on the **data in the question.** Knowledge that the normal fetal heart rate is 110 to 160 beats per minute will assist you to recognize that fetal bradycardia is present.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Implementation
**Content Area:** Maternity: Intrapartum
**Health Problem:** Maternity: Fetal Distress/Demise
**Priority Concepts:** Clinical Judgment; Perfusion
**Reference:** Lowdermilk et al. (2016), pp. 419-420.

232. **Answer:** 4

**Rationale:** Accelerations are transient increases in the fetal heart rate that often accompany contractions or are caused by fetal movement. Episodic accelerations are thought to be a sign of fetal well-being and adequate oxygen reserve. Options 1, 2, and 3 are inaccurate nursing actions and are unnecessary.

**Test-Taking Strategy:** Note the **strategic words, most appropriate.** Options 1, 2, and 3 are **comparable or alike** in that they indicate the need for further intervention. Also, knowing that accelerations indicate fetal well-being will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Maternity: Intrapartum
Health Problem: N/A
Priority Concepts: Clinical Judgment; Perfusion

233. Answer: 2

Rationale: Assessing the baseline fetal heart rate is important so that abnormal variations of the baseline rate can be identified if they occur. The intensity of contractions is assessed by an internal fetal monitor, not an external fetal monitor. Options 1 and 4 are important to assess, but not as the first priority. Fetal heart rate is evaluated by assessing baseline and periodic changes. Periodic changes occur in response to the intermittent stress of uterine contractions and the baseline beat-to-beat variability of the fetal heart rate.

Test-Taking Strategy: Note the strategic word, next. Use the ABCs—airway, breathing, and circulation. Fetal heart rate reflects the ABCs.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Intrapartum
Health Problem: N/A
Priority Concepts: Clinical Judgment; Perfusion

234. Answer: 4

Rationale: True labor is present when contractions increase in duration and intensity. Lightening or dropping leads to engagement (presenting part reaches the level of the ischial spine) and occurs when the fetus descends into the pelvis about 2 weeks before delivery. Contractions felt in the abdominal area and contractions that ease with walking are signs of false labor.

Test-Taking Strategy: Focus on the subject, the signs of true labor. Noting the word true in the question and its relationship to the words increase in duration and intensity in the correct option will direct you to this option.

Level of Cognitive Ability: Evaluating
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Maternity: Intrapartum
Health Problem: N/A
Priority Concepts: Clinical Judgment; Reproduction
Reference: McKinney et al. (2018), pp. 298-299

235. Answer: 3

Rationale: Fetal heart rate is assessed immediately after amniotomy to detect any
changes that may indicate cord compression or prolapse. When the membranes are ruptured, minimal vaginal examinations would be done because of the risk of infection. Bladder distention or maternal blood pressure would not be the first thing to check after an amniotomy.

**Test-Taking Strategy:** Note the **strategic word**, *first*. Because of the risk of a prolapsed cord after an amniotomy, the first action is to check the fetal heart rate for signs of nonreassuring fetal heart rate patterns.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Fetal Distress/Demise

**Priority Concepts:** Clinical Judgment; Perfusion

**Reference:** Lowdermilk et al. (2016), p. 783.

236. **Answer:** 2

**Rationale:** The birth process expends a great deal of energy, particularly during the transition stage. Encouraging rest between contractions conserves maternal energy, facilitating voluntary pushing efforts with contractions. Uteroplacental perfusion also is enhanced, which promotes fetal tolerance of the stress of labor. Ambulation is encouraged during early labor. Ice chips should be provided. Changing positions frequently is not the primary physiological need. Food and fluids are likely to be withheld at this time.

**Test-Taking Strategy:** Note the **strategic word**, *primary*. Also, noting the words *pushing effectively* will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Intrapartum

**Health Problem:** N/A

**Priority Concepts:** Clinical Judgment; Reproduction

237. **Answer:** 2

**Rationale:** The priority nursing action is to stop the infusion of oxytocin. Oxytocin can cause forceful uterine contractions and decrease oxygenation to the placenta, resulting in decreased variability. After stopping the oxytocin, the nurse should reposition the laboring mother. Notifying the primary health care provider, applying oxygen, and increasing the rate of the intravenous (IV) fluid (the solution without the oxytocin) are also actions that are indicated in this situation, but not the priority action. Contacting the client’s primary support person(s) is not the priority action at this time.

**Test-Taking Strategy:** Focus on the **strategic word**, *priority*. Focus on the **data in the question** and note the relationship of the words *undergoing induction* and the correct option. Also recall that physiological needs are prioritized over psychosocial
needs.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Maternity: Intrapartum  
**Health Problem:** Maternity: Dystocia  
**Priority Concepts:** Clinical Judgment; Perfusion  
**Reference:** Lowdermilk et al. (2016), p. 784.
CHAPTER 24

Problems with Labor and Birth

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Reproduction, Safety

I. Premature Rupture of the Membranes
   A. Description
      1. Premature rupture of the membranes refers to spontaneous rupture of the amniotic membranes before the onset of labor.
      2. Gestational age usually determines the plan and intervention.
      3. When the rupture of membranes is before term and birth will be delayed, infection becomes a risk.

   B. Assessment
      1. Presence of fluid pooling in vaginal vault; nitrazine test is positive.
      2. Amount, color, consistency, and odor of fluid need to be assessed.
      3. Vital signs are monitored; an elevated temperature may indicate infection.
      4. Fetal monitoring is necessary; tachycardia in the fetus may indicate maternal infection.

   C. Interventions
      1. Assist with tests to assess gestational age.
      2. Avoid vaginal examinations because of the risk of infection.
      3. Monitor maternal and fetal status for signs of compromise or infection.
      4. Administer antibiotics as prescribed.

II. Prolapsed Umbilical Cord
   A. Description
      1. The umbilical cord is displaced between the presenting part and the amnion or protruding through the cervix, causing compression of the cord and compromising fetal circulation (Fig. 24-1).
B. Assessment

1. The client has a feeling that something is coming through the **vagina**.
2. Umbilical cord is visible or palpable.
3. Fetal heart rate is irregular and slow.
4. Fetal heart monitor shows variable decelerations or bradycardia after rupture of the membranes.
5. If fetal hypoxia is severe, violent fetal activity may occur and then cease.

C. Interventions (see **Priority Nursing Actions**)

---

**Priority Nursing Actions**

**Umbilical Cord Prolapse**

1. Elevate the fetal presenting part that is lying on the cord by applying finger pressure with a gloved hand to relieve cord pressure.
2. Place the client into extreme Trendelenburg’s or modified Sims’ position or a knee-chest position.
3. Administer oxygen, 8 to 10 L/minute, by face mask to the client.
4. Monitor fetal heart rate and assess the fetus for hypoxia.
5. Prepare to start intravenous fluids or increase the rate of administration of an existing appropriate solution.
7. Document the event, actions taken, and the client’s response.

---

**Reference**

---

1. The nurse stays with the client and asks another nurse to call the primary health care provider immediately.
2. The goal is to relieve cord pressure immediately so that the fetus receives adequate oxygenation.
3. The nurse never attempts to push the cord into the uterus.
4. If the umbilical cord is protruding from the vagina, the cord is wrapped loosely in a sterile towel saturated with warm sterile normal saline.
5. This situation is an emergency and delivery must occur, usually via a cesarean section.

---

III. Supine Hypotension (Vena Cava Syndrome)

A. Description

1. Supine hypotension (also known as vena cava syndrome) occurs when the venous return to the heart is impaired by the weight of the **uterus** on the vena cava.
2. The syndrome results in partial occlusion of the vena cava and aorta and in reduced cardiac return, cardiac output, and blood pressure.

B. Assessment
1. Pallor
2. Faintness, dizziness, breathlessness
3. Tachycardia, hypotension
4. Sweating, cool and damp skin
5. Fetal distress

C. Interventions
1. Position the client on her side to shift the weight of the fetus off the vena cava until the client’s signs and symptoms subside and vital signs stabilize.
2. Monitor vital signs and fetal heart rate.

[To prevent supine hypotension, avoid the supine position; position the client by placing a pillow or wedge under the client’s hip to displace the gravid uterus off the vena cava.]

IV. Preterm Labor
A. Description
1. Preterm labor occurs after the 20th week but before the 37th week of gestation.
2. Risk factors include a history of medical conditions; present and past obstetric problems; infection; and social and environmental factors, including substance abuse.
3. Additional risk factors include a multifetal pregnancy, which contributes to overdistention of the uterus; anemia, which decreases oxygen supply to the uterus; and age younger than 18 years or first pregnancy and age older than 40 years.

B. Assessment
1. Uterine contractions (painful or painless)
2. Abdominal cramping (may be accompanied by diarrhea)
3. Low back pain
4. Pelvic pressure or heaviness
5. Change in character and amount of usual discharge—may be thicker or thinner, bloody, brown or colorless, odorous
6. Rupture of amniotic membranes
7. Presence of fetal fibronectin in cervical canal
8. Shortening of cervical length

C. Interventions
1. Focus on stopping the labor: Identify and treat infection, restrict activity, and ensure hydration.
2. Maintain bed rest and a lateral position.
4. Administer fluids.
5. Administer medications as prescribed and monitor for side effects of tocolytics (see Table 28-1 for a description of medications used to treat preterm labor).
6. Use of 17 alpha-hydroxyprogesterone caproate known as 17P injection to decrease risk of preterm delivery.

V. Precipitous Labor and Delivery
   A. Description: Labor lasting less than 3 hours
   B. Interventions

1. Ensure that a precipitous delivery tray is available (hemostats, scissors, and cord clamp).
2. Stay with the client at all times.
3. Provide emotional support and keep the client calm.
4. Encourage the client to pant between contractions.
5. Prepare for rupturing membranes when the head crowns, if they are not already ruptured.
6. Do not try to prevent the fetus from being delivered.
7. If delivery is necessary before the arrival of the primary health care provider, do the following:
   a. Apply gentle pressure to the fetal head upward toward the vagina to prevent damage to the fetal head and vaginal lacerations; support the perineal area. Both actions constitute the Ritgen maneuver.
   b. Support the infant’s body during delivery.
   c. Deliver the infant between contractions, checking for the cord around the neck.
   d. Use restitution to deliver the posterior shoulder.
   e. Use gentle downward pressure to move the anterior shoulder under the pubic symphysis.
   f. Bulb suction the infant’s mouth first and then suction each naris.
   g. Dry and cover the infant to keep the body warm.
   h. Allow the placenta to separate naturally.
   i. Place the infant on the mother’s abdomen or breast to induce uterine
VI. Dystocia

A. Description
1. Dystocia is difficult labor that is prolonged or more painful.
2. Occurs because of problems caused by uterine contractions, the fetus, or the bones and tissues of the maternal pelvis.
3. The fetus may be excessively large, malpositioned, or in an abnormal presentation.
4. Contractions may be hypotonic or hypertonic.
5. Hypotonic contractions are short, irregular, and weak; amniotomy and oxytocin infusion may be treatment measures.
6. Hypertonic contractions are painful, occur frequently (6 or more in a 10-minute time period), and are uncoordinated; treatment depends on the cause and includes pain relief measures and rest.
7. Can result in maternal dehydration, infection, fetal injury, or death.

B. Assessment
1. Excessive abdominal pain
2. Abnormal contraction pattern
3. Fetal distress
4. Maternal or fetal tachycardia
5. Lack of progress in labor

C. Interventions
1. Assess fetal heart rate; monitor for fetal distress.
3. Monitor maternal temperature and heart rate.
4. Assist with pelvic examination, measurements, ultrasound, and other procedures.
5. Administer prophylactic antibiotics if prescribed to prevent infection.
6. Administer IV fluids as prescribed.
7. Monitor intake and output.
8. Maintain hydration.
9. Instruct the client in breathing techniques and relaxation exercises.
10. Perform fetal monitoring per protocol if oxytocin is prescribed for hypotonic uterine contractions (oxytocin is not prescribed for hypertonic uterine contractions); refer to Chapter 28 for information on oxytocin.
11. Monitor color of amniotic fluid.
12. Provide rest and comfort as with a normal delivery, such as back rubs and position changes.
13. Assess client’s fatigue and pain, and administer sedatives and pain medications as prescribed.

VII. Amniotic Fluid Embolism
A. Description
1. Amniotic fluid embolism is the escape of amniotic fluid into the maternal circulation.
2. The debris-containing amniotic fluid deposits in the pulmonary arterioles and is usually fatal to the mother.

B. Assessment
1. Abrupt onset of respiratory distress and chest pain
2. Cyanosis
3. Fetal bradycardia and distress if delivery has not occurred at the time of the embolism

C. Interventions
1. Institute emergency measures to maintain life.
2. Administer oxygen, 8 to 10 L/minute, by face mask or resuscitation bag delivering 100% oxygen.
3. Prepare for intubation and mechanical ventilation.
4. Position the client on her side.
5. Administer IV fluids, blood products, and medications as prescribed to correct coagulation failure.
7. Prepare for emergency delivery when the client is stabilized.
8. Provide emotional support to the client, partner, and family.

VIII. Fetal Distress
A. Assessment
1. Fetal heart rate less than 110 beats per minute or greater than 160 beats per minute
2. Meconium-stained amniotic fluid
3. Fetal hypoactivity or hyperactivity
4. Progressive decrease in baseline variability
5. Severe variable decelerations
6. Late decelerations

B. Interventions
1. Discontinue oxytocin if infusing.
2. Place the client in a lateral position.
3. Administer oxygen, 8 to 10 L/minute, via face mask.
4. Administer IV fluids (usually as a bolus)
5. Monitor maternal and fetal status.

In the event of fetal distress, prepare the client for emergency cesarean delivery.

IX. Intrauterine Fetal Demise

A. Assessment
1. Loss of fetal movement
2. Absence of fetal heart tones
3. Disseminated intravascular coagulation (DIC) screen
   (monitor for coagulation abnormalities because DIC is a complication related to intrauterine fetal demise)
4. Low hemoglobin and hematocrit; low platelet count; prolonged bleeding and clotting time
5. Bleeding from puncture sites (could indicate DIC)

B. Interventions
1. Encourage the client and her family to verbalize feelings; provide emotional support.
2. Incorporate religious, spiritual, and cultural health care beliefs and practices in the plan of care.
3. Allow the client choices relating to labor and delivery.
4. Administer IV fluids, medications, and blood and blood products as prescribed if DIC occurs.

X. Rupture of the Uterus

A. Description
1. Complete or incomplete separation of the uterine tissue as a result of a tear in the wall of the uterus from the stress of labor
2. Complete: Direct communication between the uterine and peritoneal cavities
3. Incomplete: Rupture into the peritoneum covering the uterus, but not into the peritoneal cavity
4. Manifestations vary with the degree of rupture.
5. Risk factors: Labor after previous cesarean section, overdistended uterus (e.g., multiple fetuses or hydramnios) after cesarean section, abdominal trauma

B. Assessment
1. Abdominal pain or tenderness
2. Chest pain
3. Contractions may stop or fail to progress
4. Rigid abdomen
5. Absent fetal heart rate
6. Signs of maternal shock
7. Fetus palpated outside the uterus (complete rupture)

C. Interventions
1. Monitor for and treat signs of shock (administer oxygen, IV fluids, and blood products).
2. Prepare the client for cesarean delivery (possible hysterectomy may be necessary).
3. Provide emotional support for the client and partner.

XI. Uterine Inversion
A. Description
1. Uterus completely or partly turns inside out.
2. This can occur during delivery or after delivery of the placenta.
3. Risk factors: Fundal implantation of the placenta, manual extraction of the placenta, short umbilical cord, uterine atony, leiomyomas, and abnormally adherent placental tissue

B. Assessment
1. A depression in the fundal area of the uterus is noted.
2. The interior of the uterus may be seen through the cervix or protruding through the vagina.
3. The client has severe pain.
4. Hemorrhage is evident.
5. The client shows signs of shock.

C. Interventions
1. Monitor for hemorrhage and signs of shock, and treat shock.
2. Prepare the client for a return of the uterus to the correct position via the vagina; if unsuccessful, laparotomy with replacement to the correct position is done.

FIG. 24-1 Prolapse of umbilical cord. Note the pressure of the presenting part on the umbilical cord, which endangers fetal circulation. A, Occult (hidden) prolapse of cord. B,
Complete prolapse of cord. Membranes are intact. C, Cord presenting in front of the fetal head may be seen in the vagina. D, Frank breech presentation with prolapsed cord.

Practice Questions

238. The nurse is performing an assessment on a client who has just been told that a pregnancy test is positive. Which assessment finding indicates that the client is at risk for preterm labor?
   1. The client is a 35-year-old primigravida.
   2. The client has a history of cardiac disease.
   3. The client’s hemoglobin level is 13.5 g/dL (135 mmol/L).
   4. The client is a 20-year-old primigravida of average weight and height.

239. The nurse is monitoring a client who is in the active stage of labor. The nurse documents that the client is experiencing labor dystocia. The nurse determines that which risk factors in the client’s history placed her at risk for this complication? **Select all that apply.**
   - [ ] 1. Age 54 years
   - [ ] 2. Body mass index of 28
   - [ ] 3. Previous difficulty with fertility
   - [ ] 4. Administration of oxytocin for induction
   - [ ] 5. Potassium level of 3.6 mEq/L (3.6 mmol/L)

240. The nurse in a birthing room is monitoring a client with dysfunctional labor for signs of fetal or maternal compromise. Which assessment finding should alert the nurse to a compromise?
   1. Maternal fatigue
   2. Coordinated uterine contractions
   3. Progressive changes in the cervix
   4. Persistent nonreassuring fetal heart rate

241. The nurse in a labor room is preparing to care for a client with hypertonic uterine contractions. The nurse is told that the client is experiencing uncoordinated contractions that are erratic in their frequency, duration, and intensity. What is the **priority** nursing action?
   1. Provide pain relief measures.
   2. Prepare the client for an amniotomy.
   3. Promote ambulation every 30 minutes.
   4. Monitor the oxytocin infusion closely.

242. The nurse is reviewing the primary health care provider’s (PHCP’s) prescriptions for a client admitted for premature rupture of the membranes. Gestational age of the fetus is determined to be 37 weeks. Which prescription should the nurse question?
   1. Monitor fetal heart rate continuously.
   2. Monitor maternal vital signs frequently.
3. Perform a vaginal examination every shift.
4. Administer an antibiotic per prescription and per agency protocol.

243. The nurse has created a plan of care for a client experiencing dystocia and includes several nursing actions in the plan of care. What is the priority nursing action?
   1. Providing comfort measures
   2. Monitoring the fetal heart rate
   3. Changing the client’s position frequently
   4. Keeping the significant other informed of the progress of the labor

244. Fetal distress is occurring with a laboring client. As the nurse prepares the client for a cesarean birth, what is the most important nursing action?
   1. Slow the intravenous flow rate.
   2. Continue the oxytocin drip if infusing.
   3. Place the client in a high Fowler’s position.
   4. Administer oxygen, 8 to 10 L/minute, via face mask.

245. The nurse in a labor room is performing a vaginal assessment on a pregnant client in labor. The nurse notes the presence of the umbilical cord protruding from the vagina. What is the first nursing action with this finding?
   1. Gently push the cord into the vagina.
   2. Place the client in Trendelenburg’s position.
   3. Find the closest telephone and page the primary health care provider stat.
   4. Call the delivery room to notify the staff that the client will be transported immediately.

**Answers**

238. **Answer: 2**

*Rationale:* Preterm labor occurs after the 20th week but before the 37th week of gestation. Several factors are associated with preterm labor, including a history of medical conditions, present and past obstetric problems, social and environmental factors, and substance abuse. Other risk factors include a multifetal pregnancy, which contributes to overdistention of the uterus; anemia, which decreases oxygen supply to the uterus; and age younger than 18 years or first pregnancy at age older than 40 years.

*Test-Taking Strategy:* Options 1, 3, and 4 are comparable or alike and are average and normal findings. Also note that the correct option is the only option that identifies an abnormal condition.

*Level of Cognitive Ability:* Analyzing  
*Client Needs:* Physiological Integrity  
*Integrated Process:* Nursing Process — Assessment  
*Content Area:* Maternity: Antepartum  
*Health Problem:* Maternity: Preterm labor  
*Priority Concepts:* Clinical Judgment; Perfusion  
239. **Answer:** 1, 2, 3

**Rationale:** Risk factors that increase a woman’s risk for dysfunctional labor include the following: advanced maternal age, being overweight, electrolyte imbalances, previous difficulty with fertility, uterine overstimulation with oxytocin, short stature, prior version, masculine characteristics, uterine abnormalities, malpresentations and position of the fetus, cephalopelvic disproportion, maternal fatigue, dehydration, fear, administration of an analgesic early in labor, and use of epidural analgesia. Age 54 years is considered advanced maternal age, and a body mass index of 28 is considered overweight. Previous difficulty with fertility is another risk factor for labor dystocia. A potassium level of 3.6 mEq/L (3.6 mmol/L) is normal, and administration of oxytocin alone is not a risk factor; risk exists only if uterine hyperstimulation occurs.

**Test-Taking Strategy:** Focus on the subject, risk factors for labor dystocia. Additionally, focus on the data in the question, look at each option, and determine whether these are normal assessment findings.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Dystocia

**Priority Concepts:** Clinical Judgment; Perfusion

**Reference:** Lowdermilk et al. (2016), p. 773.

240. **Answer:** 4

**Rationale:** Signs of fetal or maternal compromise include a persistent, nonreassuring fetal heart rate, fetal acidosis, and the passage of meconium. Maternal fatigue and infection can occur if the labor is prolonged but do not indicate fetal or maternal compromise. Coordinated uterine contractions and progressive changes in the cervix are a reassuring pattern in labor.

**Test-Taking Strategy:** Focus on the subject, signs of fetal or maternal compromise. Eliminate options 1, 2, and 3 because they are comparable or alike and are normal expectations during labor.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Dystocia

**Priority Concepts:** Clinical Judgment; Perfusion

241. **Answer:** 1

**Rationale:** Hypertonic uterine contractions are painful, occur frequently, and are uncoordinated. Management of hypertonic labor depends on the cause. Relief of pain is the primary intervention to promote a normal labor pattern. An amniotomy
and oxytocin infusion are not treatment measures for hypertonic contractions; however, these treatments may be used in clients with hypotonic dysfunction. A client with hypertonic uterine contractions would not be encouraged to ambulate every 30 minutes but would be encouraged to rest.

**Test-Taking Strategy:** Focus on the **strategic word**, priority. Also note that options 2, 3, and 4 are **comparable or alike** and are therapeutic measures for hypotonic dysfunction.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Dystocia

**Priority Concepts:** Clinical Judgment; Pain

**Reference:** McKinney et al. (2018), pp. 574-575.

242. **Answer:** 3

**Rationale:** Vaginal examinations should not be done routinely on a client with premature rupture of the membranes because of the risk of infection. The nurse would expect to monitor fetal heart rate, monitor maternal vital signs, and administer an antibiotic.

**Test-Taking Strategy:** Note the word **question**. This word indicates the activity that the nurse should not implement without clarification. Options 1, 2, and 4 are **comparable or alike** and are expected activities for the nurse to perform for a client with premature rupture of the membranes. Performing a vaginal examination every shift should not be done on a client with premature rupture of the membranes because of the risk of infection, so the nurse would question this prescription.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Intrapartum

**Health Problem:** Maternity: Premature rupture of the membranes

**Priority Concepts:** Collaboration; Safety

243. **Answer:** 2

**Rationale:** Dystocia is difficult labor that is prolonged or more painful than expected. The priority is to monitor the fetal heart rate. Although providing comfort measures, changing the client’s position frequently, and keeping the significant other informed of the progress of the labor are components of the plan of care, the fetal status would be the priority.

**Test-Taking Strategy:** Note the **strategic word**, priority. Use **Maslow’s Hierarchy of Needs theory** and the ABCs—airway, breathing, and circulation—to assist in answering the question. These strategies will direct you to the correct option.

**Level of Cognitive Ability:** Creating

**Client Needs:** Physiological Integrity
Integrated Process: Nursing Process—Planning
Content Area: Maternity: Intrapartum
Health Problem: Maternity: Dystocia
Priority Concepts: Clinical Judgment; Perfusion

244. Answer: 4

Rationale: Oxygen is administered, 8 to 10 L/minute, via face mask to optimize oxygenation of the circulating blood. Option 1 is incorrect, because the intravenous infusion should be increased (per primary health care provider prescription) to increase the maternal blood volume. Option 2 is incorrect, because oxytocin stimulation of the uterus is discontinued if fetal heart rate patterns change for any reason. Option 3 is incorrect because the client is placed in the lateral position with her legs raised to increase maternal blood volume and improve fetal perfusion.

Test-Taking Strategy: Note the strategic words, most important. Use the ABCs—airway, breathing, and circulation. Oxygen is the only option that would improve cardiac output and improve perfusion to the fetus. The other options would not improve perfusion to the fetus.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Complex Care: Emergency Situations/Management
Health Problem: Maternity: Fetal distress/Demise
Priority Concepts: Clinical Judgment; Perfusion

245. Answer: 2

Rationale: When cord prolapse occurs, prompt actions are taken to relieve cord compression and increase fetal oxygenation. The client should be positioned with the hips higher than the head to shift the fetal presenting part toward the diaphragm. The nurse should push the call light to summon help, and other staff members should call the primary health care provider and notify the delivery room. If the cord is protruding from the vagina, no attempt should be made to replace it because to do so could traumatize it and reduce blood flow further. Also as a first action, the examiner should place a gloved hand into the vagina and hold the presenting part off the umbilical cord. Oxygen, 8 to 10 L/minute, by face mask is administered to the client to increase fetal oxygenation.

Test-Taking Strategy: Note the strategic word, first, and that the umbilical cord is protruding from the vagina. Options 3 and 4 can be eliminated first because these actions delay necessary and immediate treatment. Recalling that the goal is to relieve cord compression and to increase fetal oxygenation will direct you to the correct option. Also remember that the cord should not be pushed back into the vagina.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Complex Care: Emergency Situations/Management
Health Problem: Maternity: Prolapsed umbilical cord
Priority Concepts: Clinical Judgment; Perfusion
CHAPTER 25

Postpartum Period

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Health Promotion, Reproduction

I. Postpartum
   A. Description: Period when the reproductive tract returns to the normal, nonpregnant state
   B. The postpartum period starts immediately after birth and is usually completed by week 6 following birth.

II. Physiological Maternal Changes
   A. Involution
      1. Description
      a. Involution is the rapid decrease in the size of the uterus as it returns to the nonpregnant state.
      b. Clients who breast-feed may experience a more rapid involution because of the release of oxytocin during breastfeeding.
      2. Assessment
      a. The weight of the uterus decreases from approximately 2 lb (900 g) to 2 oz (57 g) in 6 weeks.
      b. The endometrium regenerates.
      c. The fundus steadily descends into the pelvis.
      d. Fundal height decreases about 1 cm/day (Fig. 25-1).
      e. By 10 days postpartum, the uterus cannot be palpated abdominally.
      f. A flaccid fundus indicates uterine atony, and it should be massaged until firm; a tender fundus indicates an infection.
      g. Afterpains decrease in frequency after the first few days.

B. Lochia
1. Description: Discharge from the uterus that consists of blood from the vessels of the placental site and debris from the decidua

2. Assessment (Box 25-1)
   a. Rubra is bright red discharge that occurs from day of birth to day 3.
   b. Serosa is brownish pink discharge that occurs from days 4 to 10.
   c. Alba is white discharge that occurs from days 11 to 14.
   d. Discharge should smell like normal menstrual flow.
   e. Discharge decreases daily in amount.
   f. Discharge may increase with ambulation.

C. Cervix: Cervical involution occurs, and the muscle begins to regenerate after 1 week.

D. Vagina: Vaginal distention decreases, although muscle tone is never restored completely to the pregravid state.

E. Ovarian function and menstruation
   1. Ovarian function depends on the rapidity with which pituitary function is restored.
   2. Menstrual flow resumes within 1 to 2 months in non-breast-feeding mothers.
   3. Menstrual flow usually resumes within 3 to 6 months in breast-feeding mothers.
   4. Breast-feeding mothers may experience amenorrhea during the entire period of lactation so long as they are exclusively breastfeeding.

   Women may ovulate without menstruating, so breast-feeding should not be considered a form of birth control.

F. Breasts
   1. Breasts continue to secrete colostrum for the first 48 to 72 hours after birth.
   2. A decrease in estrogen and progesterone levels after birth stimulates increased prolactin levels, which promote breast milk production.
   3. Breasts become distended with milk on the third day.
   4. Engorgement occurs on approximately day 4 in both breast-feeding and non-breast-feeding mothers. Box 25-2 summarizes care of breasts for non-breast-feeding mothers.
   5. Breast-feeding relieves engorgement.

G. Urinary tract
   1. The client may have urinary retention as a result of
loss of elasticity and tone and loss of sensation in the bladder from trauma, medications, anesthesia, and lack of privacy.

2. Diuresis usually begins within the first 12 hours after birth.

H. Gastrointestinal tract
   1. Clients are usually hungry after birth.
   2. Constipation can occur, with bowel movement (soft, formed stool) by the second or third postpartum day.
   3. Hemorrhoids are common.

I. Vital signs (Table 25-1)

III. Postpartum Interventions
   A. Assessment
      1. Monitor vital signs.
      2. Assess pain level.
      3. Assess height, consistency, and location of the fundus (have client empty the bladder before fundal assessment) (Fig. 25-2).
      4. Monitor color, amount, and odor of lochia.
      5. Assess breasts for engorgement.
      6. Monitor perineum for swelling or discoloration.
      7. Monitor for perineal lacerations or episiotomy for healing.
      8. Assess incisions or dressings of client who had a cesarean birth.
     10. Monitor intake and output.
     11. Encourage frequent voiding.
     12. Encourage ambulation.
     13. Assess extremities for thrombophlebitis (redness, tenderness, or warmth of the leg).
     14. Administer Rho(D) immune globulin if prescribed within 72 hours postpartum to Rh-negative client who has given birth to Rh-positive _newborn_.
     15. Evaluate rubella immunity. If not immune, administer rubella immunization.
     16. Assess bonding with the newborn.
     17. Assess emotional status.

B. Client teaching
1. Demonstrate newborn care skills as necessary.
2. Provide the opportunity for the client to bathe the newborn.
3. Instruct in feeding technique.
4. Instruct the client to avoid heavy lifting for at least 3 weeks.
5. Instruct the client to plan at least 1 rest period per day.
6. Instruct the client that contraception should begin after birth or with the initiation of intercourse (intercourse should be postponed at least until lochia ceases). With rubella immunization, avoid conception for 1 to 3 months based on primary health care provider (PHCP) or obstetrician/gynecologist (OB/GYN) recommendation.
7. Instruct the client in the importance of follow-up, which should be scheduled at 4 to 6 weeks.
8. Instruct the client to report any signs of chills, fever, increased lochia, or depressed feelings to the PHCP immediately.

IV. Postpartum Discomforts

A. Afterbirth pains
   1. Occur as a result of contractions of the uterus.
   2. Are more common in multiparas, breast-feeding mothers, clients treated with oxytocin, and clients who had an overdistended uterus during pregnancy, such as with carrying twins.

B. Perineal discomfort
   1. Apply ice packs to the perineum during the first 24 hours to reduce swelling.
   2. After the first 24 hours, apply warmth by sitz baths.

C. Episiotomy
   1. If done, instruct the client to administer perineal care after each voiding.
   2. Encourage the use of an analgesic spray as prescribed.
   3. Administer analgesics as prescribed if comfort measures are unsuccessful.

D. Perineal lacerations
   1. Care as for an episiotomy; administer perineal care and use analgesic spray and analgesics for comfort.
   2. Rectal suppositories and enemas may be contraindicated (to avoid injury to sutures).

E. Breast discomfort from engorgement
   1. Encourage the client to wear a support bra at all times, even while she is sleeping.
   2. Encourage the use of ice packs between feedings if the client is not breast-feeding. Use of ice packs could diminish milk supply in the breast-feeding mother.
3. Encourage the use of warm soaks or a warm shower before feeding for the breast-feeding mother.
4. Administer analgesics as prescribed if comfort measures are unsuccessful.

F. Constipation
1. Encourage adequate intake of fluids (2000 mL/day).
2. Encourage diet high in fiber.
3. Encourage ambulation.
4. Administer stool softener, laxative, enema, or suppository if needed and prescribed.

G. Postpartum emotional changes (Box 25-3)
1. Acknowledge the client’s feelings and demonstrate a caring attitude.
2. Determine availability of family support and other support systems and resources as needed.
3. Encourage and assist the client to verbalize her feelings.
4. Monitor the newborn for appropriate growth and development expectations.
5. Assist the significant other and other appropriate family members to discuss feelings and identify ways to assist the client.

All clients should be assessed for depression during pregnancy and in the postpartum period.

V. Nutritional Counseling
A. Discuss caloric intake with breast-feeding and non–breast-feeding mothers.
B. Nutritional needs depend on prepregnancy weight, ideal weight for height, and whether the client is breast-feeding.
C. If the client is breast-feeding, calorie needs increase by 200 to 500 calories/day, and the client may require increased fluids and the continuance of prenatal vitamins and minerals.

VI. Breast-Feeding
A. Interventions
1. Put the newborn to the mother’s breast as soon as the mother’s and newborn’s conditions are stable (on delivery table, if possible).
2. Stay with the client each time she nurses until she feels secure and confident with the newborn and her feelings.
3. Assess LATCH (latch achieved by newborn; audible swallowing; type of nipple; comfort of mother; hold or position of baby).
4. Uterine cramping may occur the first day after birth while the client is nursing, when oxytocin stimulation causes the uterus to contract.
5. Instruct the client to use general hygiene and wash the breasts once daily.
6. If engorgement occurs, breast-feed frequently, apply warm packs before feeding, apply ice packs between feedings, and massage the breasts.
7. The client should not use soap on the breasts because it tends to remove natural oils, which increases the chance of cracked nipples.
8. If cracked nipples develop, the client should expose the nipples to air for 10 to 20 minutes after feeding, rotate the position of the baby for each feeding, and ensure that the baby is latched on to the areola, not just the nipple. Colostrum can also be expressed after the feeding as a moisturizer for the nipple to prevent cracked, dry skin.
9. The bra should be well fitted and supporting; avoid an underwire bra.
10. Breasts may leak between feedings or during coitus; place breast pad in bra.
11. Calories should be increased by 200 to 500 calories/day, and the diet should include additional fluids; prenatal vitamins should be taken as prescribed.
12. Newborn’s stools are usually light yellow, seedy, watery, and frequent.
13. Medications, including over-the-counter medications, need to be avoided unless prescribed because they may be unsafe when breast-feeding.
14. Gas-producing foods and caffeine should be avoided.
15. Oral contraceptives containing estrogen are not recommended for breast-feeding mothers; progestin-only birth control pills are less likely to interfere with the milk supply.
16. The infant will develop her or his own feeding schedule.

B. Breast-feeding procedure for the mother (Box 25-4)
Involution of the uterus. The height of the uterine fundus decreases by approximately 1 cm/day.

**Box 25-1**

**Amount of Lochia**

*Scant:* Less than 2.5 cm (< 1 inch) on menstrual pad in 1 hour  
*Light:* Less than 10 cm (< 4 inches) on menstrual pad in 1 hour  
*Moderate:* Less than 15 cm (< 6 inches) on menstrual pad in 1 hour  
*Heavy:* Saturated menstrual pad in 1 hour  
*Excessive:* Menstrual pad saturated in 15 minutes

Box 25-2

Breast Care for Non–Breast-Feeding Mothers

- Avoid nipple stimulation.
- Apply a breast binder, wear a snug-fitting bra, apply ice packs, or take a mild analgesic for engorgement.
- Engorgement usually resolves within 24 to 36 hours after it begins.

Table 25-1

Normal Postpartum Vital Signs

<table>
<thead>
<tr>
<th>Vital Sign</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>May increase to 100.4° F (38.0° C) during the first 24 hr postpartum because of dehydrating effects of labor. Any higher elevation may be caused by infection and must be reported.</td>
</tr>
<tr>
<td>Pulse</td>
<td>May decrease to 50 beats per minute (normal puerperal bradycardia). Pulse &gt; 100 beats per minute may indicate excessive blood loss or infection.</td>
</tr>
<tr>
<td>Blood pressure</td>
<td>Should be normal; suspect hypovolemia if it decreases.</td>
</tr>
<tr>
<td>Respiration</td>
<td>Rarely change; if respirations increase significantly, suspect pulmonary embolism, uterine atony, or hemorrhage.</td>
</tr>

FIG. 25-2  A full bladder displaces and prevents contraction of the uterus.

Box 25-3  
Signs and Symptoms of Emotional Changes

Postpartum Blues

- Anger
- Anxiety
- Cries easily for no apparent reason
- Emotionally labile
- Expresses a let-down feeling
- Fatigue
- Headache
• Insomnia
• Restlessness
• Sadness

Postpartum Depression

• Anxiety
• Appetite changes
• Crying, sadness
• Difficulty concentrating or making decisions
• Fatigue, unable to sleep
• Feelings of guilt
• Irritability and agitation
• Lack of energy
• Less responsive to the infant
• Loss of pleasure in normal activities
• Suicidal thoughts

Postpartum Psychosis

• Break with reality
• Confusion
• Delirium
• Delusions
• Hallucinations
• Panic

Box 25-4

Breast-Feeding Procedure for the Mother

1. Wash hands and assume a comfortable position.
2. Start with the breast with which the last feeding ended.
3. Brush the newborn’s lower lip with nipple.
4. Tickle the lips to have the newborn open the mouth wide.
5. Guide the nipple and surrounding areola into the newborn’s mouth.
6. Encourage the newborn to nurse on each breast for 15 to 20 minutes.
7. After the newborn has nursed, release suction by depressing the newborn’s chin or inserting a clean finger into the newborn’s mouth.
8. Burp the newborn after the first breast.
9. Repeat the procedure on the second breast until the newborn stops nursing.
10. Burp the newborn again.
11. Listen for audible sucking and swallowing.

Practice Questions

246. The postpartum nurse is taking the vital signs of a client who delivered a healthy newborn 4 hours ago. The nurse notes that the client’s temperature is 100.2° F. What is the priority nursing action?
   1. Document the findings.
   2. Notify the obstetrician.
   3. Retake the temperature in 15 minutes.
   4. Increase hydration by encouraging oral fluids.

247. The nurse is assessing a client who is 6 hours postpartum after delivering a full-term healthy newborn. The client complains to the nurse of feelings of faintness and dizziness. Which nursing action is most appropriate?
   1. Raise the head of the client’s bed.
   2. Obtain hemoglobin and hematocrit levels.
   3. Instruct the client to request help when getting out of bed.
   4. Inform the nursery room nurse to avoid bringing the newborn to the client until the client’s symptoms have subsided.

248. The postpartum nurse is providing instructions to a client after birth of a healthy newborn. Which time frame should the nurse relay to the client regarding the return of bowel function?
   1. 3 days postpartum
   2. 7 days postpartum
   3. On the day of birth
   4. Within 2 weeks postpartum

249. The nurse is planning care for a postpartum client who had a vaginal delivery 2 hours ago. The client required an episiotomy and has several hemorrhoids. What is the priority nursing consideration for this client?
   1. Client pain level
   2. Inadequate urinary output
   3. Client perception of body changes
   4. Potential for imbalanced body fluid volume

250. The nurse is providing postpartum instructions to a client who will be breast-feeding her newborn. The nurse determines that the client has understood the instructions if she makes which statements? Select all that apply.
   1. “I should wear a bra that provides support.”
   2. “Drinking alcohol can affect my milk supply.”
   3. “The use of caffeine can decrease my milk supply.”
4. “I will start my estrogen birth control pills again as soon as I get home.”

5. “I know if my breasts get engorged, I will limit my breast-feeding and supplement the baby.”

6. “I plan on having bottled water available in the refrigerator so I can get additional fluids easily.”

251. The nurse is teaching a postpartum client about breast-feeding. Which instruction should the nurse include?
   1. The diet should include additional fluids.
   2. Prenatal vitamins should be discontinued.
   3. Soap should be used to cleanse the breasts.
   4. Birth control measures are unnecessary while breast-feeding.

252. The nurse is preparing to assess the uterine fundus of a client in the immediate postpartum period. After locating the fundus, the nurse notes that the uterus feels soft and boggy. Which nursing intervention is appropriate?
   1. Elevate the client’s legs.
   2. Massage the fundus until it is firm.
   3. Ask the client to turn on her left side.
   4. Push on the uterus to assist in expressing clots.

253. The nurse is caring for four 1-day postpartum clients. Which client assessment requires the need for follow-up?
   1. The client with mild afterpains
   2. The client with a pulse rate of 60 beats per minute
   3. The client with colostrum discharge from both breasts
   4. The client with lochia that is red and has a foul-smelling odor

254. When performing a postpartum assessment on a client, the nurse notes the presence of clots in the lochia. The nurse examines the clots and notes that they are larger than 1 cm. Which nursing action is most appropriate?
   1. Document the findings.
   2. Notify the obstetrician (OB).
   3. Reassess the client in 2 hours.
   4. Encourage increased oral intake of fluids.

255. The nurse is monitoring the amount of lochia drainage in a client who is 2 hours postpartum and notes that the client has saturated a perineal pad in 15 minutes. How should the nurse respond to this finding initially?
   1. Document the finding.
   2. Encourage the client to ambulate.
   3. Encourage the client to increase fluid intake.
   4. Contact the obstetrician (OB) and inform him or her of this finding.

256. The nurse has provided discharge instructions to a client who delivered a healthy newborn by cesarean delivery. Which statement made by the client indicates a need for further instruction?
   1. “I will begin abdominal exercises immediately.”
   2. “I will notify my obstetrician if I develop a fever.”
3. “I will turn on my side and push up with my arms to get out of bed.”
4. “I will lift nothing heavier than my newborn baby for at least 2 weeks.”

257. After a precipitous delivery, the nurse notes that the new mother is passive and touches her newborn infant only briefly with her fingertips. What should the nurse do to help the woman process the delivery?
1. Encourage the mother to breast-feed soon after birth.
2. Support the mother in her reaction to the newborn infant.
3. Tell the mother that it is important to hold the newborn infant.
4. Document a complete account of the mother’s reaction on the birth record.

Answers

246. Answer: 4

Rationale: The client’s temperature should be taken every 4 hours while she is awake. Temperatures up to 100.4°F (38°C) in the first 24 hours after birth often are related to the dehydrating effects of labor. The appropriate action is to increase hydration by encouraging oral fluids, which should bring the temperature to a normal reading. Although the nurse also would document the findings, the appropriate action would be to increase hydration. Taking the temperature in another 15 minutes is an unnecessary action. Contacting the obstetrician is not necessary.

Test-Taking Strategy: Note the strategic word, priority, and use knowledge regarding the physiological findings in the immediate postpartum period to answer this question. Recalling that a temperature elevation often is related to the dehydrating effects of labor will direct you to the correct option. Also, increasing hydration relates to a physiological client need.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Maternity: Postpartum
Health Problem: Maternity: Infections/Inflammation
Priority Concepts: Reproduction; Thermoregulation

247. Answer: 3

Rationale: Orthostatic hypotension may be evident during the first 8 hours after birth. Feelings of faintness or dizziness are signs that caution the nurse to focus interventions on the client’s safety. The nurse should advise the client to get help the first few times she gets out of bed. Option 1 is not a helpful action in this situation and would not relieve the symptoms. Option 2 requires a prescription. Option 4 is unnecessary.
Test-Taking Strategy: Note the strategic words, most appropriate. Focus on the subject, client safety. Option 4 is unnecessary and should be eliminated first. Elevating the client’s head is not a helpful intervention. To select from the remaining options, recall that safety is a primary issue.

Level of Cognitive Ability: Applying
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Maternity: Postpartum
Health Problem: N/A
Priority Concepts: Perfusion; Safety

248. Answer: 1

Rationale: After birth, the nurse should auscultate the client’s abdomen in all 4 quadrants to determine the return of bowel sounds. Normal bowel elimination usually returns 2 to 3 days postpartum. Surgery, anesthesia, and the use of opioids and pain control agents also contribute to the longer period of altered bowel functions. Options 2, 3, and 4 are incorrect.

Test-Taking Strategy: Focus on the subject and use general principles related to postpartum care. Eliminate options 2 and 4 first because of the length of time stated in these options. From the remaining options, eliminate option 3, because it would seem unreasonable that bowel function would return that quickly in the postpartum woman.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Maternity: Postpartum
Health Problem: N/A
Priority Concepts: Client Education; Elimination

249. Answer: 1

Rationale: The priority nursing consideration for a client who delivered 2 hours ago and who has an episiotomy and hemorrhoids is client pain level. Most clients have some degree of discomfort during the immediate postpartum period. There are no data in the question that indicate inadequate urinary output, the presence of client perception of body changes, and potential for imbalanced body fluid volume.

Test-Taking Strategy: Note the strategic word, priority. Use Maslow’s Hierarchy of Needs theory to eliminate option 3, because this is a psychosocial, not a physiological, need. To select from the remaining options, focus on the data in the question.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Analysis
Content Area: Maternity: Postpartum
Health Problem: N/A
Priority Concepts: Pain; Reproduction

250. Answer: 1, 2, 3, 6

Rationale: The postpartum client should wear a bra that is well fitted and supportive. Common causes of decreased milk supply include formula use; inadequate rest or diet; smoking by the mother or others in the home; and use of caffeine, alcohol, or medications. Breast-feeding clients should increase their daily fluid intake; having bottled water available indicates that the postpartum client understands the importance of increasing fluids. If engorgement occurs, the client should not limit breast-feeding but should breast-feed frequently. Oral contraceptives containing estrogen are not recommended for breast-feeding mothers.

Test-Taking Strategy: Focus on the subject and note the words understood the instructions. Think about the physiology associated with milk production and the complications of breast-feeding to answer correctly.

Level of Cognitive Ability: Evaluating
Client Needs: Health Promotion and Maintenance
Integrated Process: Nursing Process—Evaluation
Content Area: Maternity: Postpartum
Health Problem: N/A
Priority Concepts: Health Promotion; Reproduction

251. Answer: 1

Rationale: The diet for a breast-feeding client should include additional fluids. Prenatal vitamins should be taken as prescribed, and soap should not be used on the breasts because it tends to remove natural oils, which increases the chance of cracked nipples. Breast-feeding is not a method of contraception, so birth control measures should be resumed.

Test-Taking Strategy: Note the subject, teaching for the breast-feeding client. Remember that fluids and calories should be increased when the client is breast-feeding.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Maternity: Postpartum
Health Problem: N/A
Priority Concepts: Client Education; Nutrition

252. Answer: 2

Rationale: If the uterus is not contracted firmly, the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated
in the uterus. Elevating the client’s legs and positioning the client on the side would not assist in managing uterine atony. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage.

**Test-Taking Strategy:** Focus on the subject, a soft and boggy uterus. Visualize the situation and recall the therapeutic management for uterine atony. Remember that a full bladder displaces the uterus.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Health Promotion and Maintenance  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Postpartum Uterine Problems  
**Priority Concepts:** Health Promotion; Reproduction  
**Reference:** McKinney et al. (2018), pp. 600-601.

253. **Answer:** 4

**Rationale:** Lochia, the discharge present after birth, is red for the first 1 to 3 days and gradually decreases in amount. Normal lochia has a fleshy odor or an odor similar to menstrual flow. Foul-smelling or purulent lochia usually indicates infection, and these findings are not normal. The other options are normal findings for a 1-day postpartum client.

**Test-Taking Strategy:** Note the strategic words, need for follow-up. These words indicate a negative event query and the need to select the abnormal assessment finding. Note the words foul-smelling in the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Analysis  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Infection/Inflammations  
**Priority Concepts:** Infection; Reproduction  

254. **Answer:** 2

**Rationale:** Normally, a few small clots may be noted in the lochia in the first 1 to 2 days after birth from pooling of blood in the vagina. Clots larger than 1 cm are considered abnormal. The cause of these clots, such as uterine atony or retained placental fragments, needs to be determined and treated to prevent further blood loss. Although the findings would be documented, the appropriate action is to notify the OB. Reassessing the client in 2 hours would delay necessary treatment. Increasing oral intake of fluids would not be a helpful action in this situation.

**Test-Taking Strategy:** Note the strategic words, most appropriate. Focus on the words larger than 1 cm. Think about the significance of lochial clots in the postpartum period to answer correctly.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation
**Rationale:** Lochia is the discharge from the uterus in the postpartum period; it consists of blood from the vessels of the placental site and debris from the decidua. The following can be used as a guide to determine the amount of flow: scant = less than 2.5 cm (< 1 inch) on menstrual pad in 1 hour; light = less than 10 cm (< 4 inches) on menstrual pad in 1 hour; moderate = less than 15 cm (< 6 inches) on menstrual pad in 1 hour; heavy = saturated menstrual pad in 1 hour; and excessive = menstrual pad saturated in 15 minutes. If the client is experiencing excessive bleeding, the nurse should contact the OB in the event that postpartum hemorrhage is occurring. It may be appropriate to encourage increased fluid intake, but this is not the initial action. It is not appropriate to encourage ambulation at this time. Documentation should occur once the client has been stabilized.

**Test-Taking Strategy:** Note the **strategic word**, initially. Focus on the **data in the question**, a saturated perineal pad in 15 minutes. Next, **determine if an abnormality exists**. The data and the use of guidelines determine the amount of lochial flow will help you determine that this is abnormal and warrants notification of the OB.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Complex Care: Emergency Situations/Management

**Health Problem:** Maternity: Postpartum Uterine Problems

**Priority Concepts:** Clotting; Reproduction

Rationale: Precipitous labor is labor that lasts 3 hours or less. Women who have experienced precipitous labor often describe feelings of disbelief that their labor progressed so rapidly. To assist the client to process what has happened, the best option is to support the client in her reaction to the newborn infant. Options 1, 3, and 4 do not acknowledge the client’s feelings.

Test-Taking Strategy: Use therapeutic communication techniques. The correct option is the only option that acknowledges the client’s feelings.

Level of Cognitive Ability: Applying
Client Needs: Psychosocial Integrity
Integrated Process: Caring
Content Area: Maternity: Postpartum
Health Problem: Maternity: Precipitous Labor and Delivery
Priority Concepts: Caregiving; Reproduction
CHAPTER 26

Postpartum Complications

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Caregiving, Reproduction

I. Cystitis
A. Description: Cystitis, an infection of the bladder, can occur in the postpartum period, and the postpartum woman should be encouraged to consume adequate fluids and void frequently to avoid bladder distention.
B. Assessment and interventions (refer to Chapter 54)

If a urine specimen for culture and sensitivity is prescribed, obtain the specimen by straight catheterization (if prescribed) before initiating antibiotic therapy.

II. Hematoma
A. Description
1. A hematoma is a localized collection of blood in the tissues and can occur internally, involving the vaginal sulcus or other organs; vulvar hematomas are the most common (Fig. 26-1).
2. Predisposing conditions include operative delivery with forceps and injury to a blood vessel.
3. A hematoma can result in shock.
B. Assessment
1. Abnormal, severe pain not relieved with treatment or comfort measures
2. Pressure in the perineal area
3. Sensitive, bulging mass in the perineal area with discolored skin
4. Inability to void
5. Decreased hemoglobin and hematocrit levels
6. Restlessness; changes in vital signs indicating shock such as tachycardia and hypotension
C. Interventions
1. Monitor client for abnormal pain or perineal pressure, especially when forceps delivery has occurred.
2. Monitor vital signs and for signs of shock.
3. Place ice at the hematoma site.
4. Administer analgesics as prescribed.
5. Prepare for urinary catheterization if the client is unable to void.
6. Administer blood products as prescribed.
7. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
8. Administer antibiotics as prescribed because infection is common after hematoma formation.
9. Prepare for incision and evacuation of hematoma if necessary.

III. Uterine Atony
A. Description: A poorly contracted uterus that does not adequately compress large open vessels at the placental site; this can result in hemorrhage. This can involve the anterior, posterior, or both areas of the uterus.
B. Assessment: A soft (boggy) uterus noted on palpation of the uterine fundus
C. Interventions
1. Massage the uterus until firm (Fig. 26-2).
2. Empty the woman’s bladder (by voiding or catheterization) if that is contributing to the uterine atony.
3. Notify the obstetrician (OB) if interventions do not resolve the atony, because this could be an indication of hemorrhage.

IV. Hemorrhage and Shock
A. Description
1. Bleeding of greater than 1000 mL or more after delivery or a 10% drop in hemoglobin and hematocrit from admission to postdelivery with signs and symptoms of hemorrhage.
2. Can occur early during the first 24 hours after delivery or later after the first 24 hours following delivery
3. Early postpartum hemorrhage is within the first 4 hours postpartum.
4. Late postpartum hemorrhage is anything beyond 4 hours postpartum.
5. While postpartum hemorrhage can occur any time during the postpartum period, the greatest risk is during the 4 hours immediately after delivery, and the second greatest risk is the first 24 hours following
6. Causes and predisposing factors (Box 26-1)

B. Assessment

1. Persistent significant bleeding: Perineal pad is soaked within 15 minutes.
2. Restlessness and increased pulse rate (earlier signs), decrease in blood pressure, cool and clammy skin, ashen or grayish color
3. Complaints of weakness, lightheadedness, dyspnea

C. Interventions: See Priority Nursing Actions

Priority Nursing Actions

Hemorrhage and Shock in the Postpartum Client

1. Notify the obstetrician (OB); stay with the client and ask another nurse to contact the OB.
2. If uterus is atonic, massage firmly to cause it to contract.
3. Elevate her legs to at least a 30-degree angle.
4. Administer oxygen by nonrebreather face mask at 8 to 10 L/min.
5. Monitor vital signs and empty the bladder by catheterization if prescribed.
6. Administer uterotonic medications (e.g., oxytocin, prostaglandins) as prescribed to increase uterine tone.
7. Provide additional or maintain existing intravenous (IV) infusion of lactated Ringer's solution or normal saline solution to restore circulatory volume (woman should have 2 patent IV lines; insert the second IV line using 16- to 18-gauge IV catheter).
8. Administer blood or blood products as prescribed.
9. Insert an indwelling urinary catheter to monitor perfusion of kidneys.
10. Administer emergency medications as prescribed.
11. Prepare for possible surgery or other emergency treatments or procedures.
12. Record event, interventions instituted, and woman's response to interventions.

Reference

Lowdermilk et al. (2016), pp. 439, 486, 808-809.

V. Infection

A. Description: Any infection of the reproductive organs that occurs within 28 days of delivery or abortion; endometritis is inflammation/infection of the inner lining of the uterus.

B. Assessment

1. Fever
2. Chills
3. Anorexia
4. Pelvic discomfort or pain
5. Vaginal discharge that is malodorous; normal vaginal discharge has a fleshy odor or an odor similar to a menstrual period.
6. Elevated white blood cell count

A temperature up to 100.4° F (38° C) is normal during the first 24 hours postpartum because of dehydration; a temperature of 100.4° F (38° C) or greater after 24 hours postpartum indicates infection.

C. Interventions
1. Monitor vital signs and temperature every 2 to 4 hours.
2. Make the client as comfortable as possible; position the client to promote vaginal drainage.
3. Keep the client warm if chilled.
4. Isolate the newborn from the client only if the client can infect the newborn, such as with an airborne illness.
5. Provide a nutritious, high-calorie, high-protein diet.
6. Encourage fluids to 3000 to 4000 mL/day, if not contraindicated.
7. Encourage frequent voiding and monitor intake and output.
8. Monitor culture results if cultures were prescribed.
9. Administer antibiotics according to identified organism, as prescribed.

VI. Mastitis
A. Description
1. Mastitis is inflammation of the breast as a result of a blocked duct and infection.
2. Mastitis occurs primarily in breast-feeding mothers 2 to 3 weeks after delivery but may occur at any time during lactation.

B. Assessment (Fig. 26-3)
1. Localized heat and swelling
2. Pain; tender axillary lymph nodes
3. Elevated temperature
4. Complaints of flu-like symptoms

C. Interventions
1. Instruct the client in good hand-washing and breast hygiene techniques.
2. Promote comfort.
3. Apply heat to the site as prescribed.
5. Encourage manual expression of breast milk or use of a breast pump every 3 to 4 hours.
6. Encourage the client to support the breasts by wearing a supportive bra; avoid wearing an underwire bra.
7. Administer analgesics as prescribed.
8. Administer antibiotics as prescribed.

VII. Pulmonary Embolism

A. Description: Passage of a thrombus, often originating in a uterine or other pelvic vein, into the lungs, where it disrupts the circulation of the blood

B. Assessment

1. Sudden dyspnea and chest pain
2. Tachypnea and tachycardia
3. Cough and lung crackles
4. Hemoptysis
5. Feeling of impending doom

C. Interventions

1. Administer oxygen.
2. Position the client with the head of the bed elevated.
3. Monitor vital signs frequently, especially respiratory and heart rate and breath sounds.
4. Monitor for signs of respiratory distress and for signs of increasing hypoxemia.
5. Administer intravenous fluids as prescribed.
6. Administer anticoagulants as prescribed.
7. Prepare to assist the primary health care provider to administer medications to dissolve the clot, if prescribed.

VIII. Subinvolution

A. Description: Incomplete involution or failure of the uterus to return to its normal size and condition

B. Assessment

1. Uterine pain on palpation
2. Uterus larger than expected
3. More than normal vaginal bleeding

C. Interventions

1. Assess vital signs.
2. Assess uterus and fundus.
4. Elevate legs to promote venous return.
5. Encourage frequent voiding.
7. Prepare to administer methylergonovine maleate, which provides sustained contraction of the
IX. Thrombophlebitis

A. Description
1. A clot forms in a vessel wall as a result of inflammation of the vessel wall.
2. A partial obstruction of the vessel can occur.
3. Increased blood-clotting factors in the postpartum period place the client at risk.
4. Early ambulation in the postoperative period after cesarean section is a preventive measure.

B. Types
1. Superficial thrombophlebitis
2. Femoral thrombophlebitis
3. Pelvic thrombophlebitis

C. Assessment (Box 26-2)

D. Interventions
1. Specific therapies may depend on the location of thrombophlebitis.
2. Assess the lower extremities for edema, tenderness, varices, and increased skin temperature.
3. Maintain bed rest.
4. Elevate the affected leg.
5. Apply a bed cradle and keep bedclothes off the affected leg.
6. Never massage the leg.
7. Monitor for manifestations of pulmonary embolism.
8. Apply hot packs or moist heat to the affected site as prescribed to alleviate discomfort.
9. Apply elastic stockings (support hose) if prescribed.
10. Administer analgesics and antibiotics as prescribed.
11. Heparin sodium intravenously may be prescribed for femoral or pelvic thrombophlebitis to prevent further thrombus formation.

E. Client education (Box 26-3)

X. Perinatal Loss

A. Description
1. Perinatal loss is associated with miscarriage, neonatal death, stillbirth, and therapeutic abortion.
2. Loss and grief also may occur with the birth of a preterm baby, a newborn with complications of birth, or a newborn with congenital anomalies; it also may occur in a client who is giving up a child for adoption.

B. Interventions
Not all interventions are appropriate for every woman and her family who has experienced perinatal loss. It is crucial to consider religious, spiritual, and cultural health care practices and beliefs when planning care for a woman and family who have experienced perinatal loss.

1. Communicate therapeutically and actively listen, providing parents time to grieve.
2. Notify the hospital chaplain or other religious person as appropriate.
3. Discuss with the parents options such as seeing, holding, bathing, or dressing the deceased infant; visitation by other family members or friends; religious, spiritual, or cultural rituals; and funeral arrangements.
4. Prepare a special memories box with keepsakes such as footprints, handprints, locks of hair, and pictures, if appropriate.
5. Admit the mother to a private room; if possible, mark the door to the room with a special card (per agency procedure and maintaining confidentiality) that denotes to hospital staff that this family has experienced a loss.
6. See Chapter 24 for additional information on intrauterine fetal demise.
FIG. 26-1  A vulvar hematoma is caused by rapid bleeding into soft tissue. It causes severe pain and feelings of pressure.
Box 26-1

Postpartum Hemorrhage

Causes

- Uterine atony
- Laceration of the cervix or vagina
- Hematoma development in the cervix, perineum, or labia
- Retained placental fragments

Predisposing Factors

- Previous history of postpartum hemorrhage
- Placenta previa
• Abruptio placentae
• Overdistention of the uterus—polyhydramnios, multiple gestation, large neonate
• Infection
• Multiparity
• Dystocia or labor that is prolonged
• Operative delivery—cesarean or forceps delivery, intrauterine manipulation

**FIG. 26-3** Mastitis.

**Box 26-2**

**Assessment of Types of Thrombophlebitis**

**Superficial**

- Palpable thrombus that feels bumpy and hard
- Tenderness and pain in affected lower extremity
- Warm and pinkish red color over the thrombus area
Femoral

- Malaise
- Chills and fever
- Diminished peripheral pulses
- Shiny white skin over affected area
- Pain, stiffness, and swelling of affected leg

Pelvic

- Severe chills
- Dramatic body temperature changes
- Pulmonary embolism may be the first sign

Box 26-3

Client Education for Thrombophlebitis

- Never massage the leg.
- Avoid crossing the legs.
- Avoid prolonged sitting.
- Avoid constrictive clothing.
- Avoid pressure behind the knees.
- Know how to apply elastic stockings (support hose) if prescribed.
- Understand the importance of compliance with anticoagulant therapy if prescribed.
- Understand the importance of follow-up with the health care provider.

Practice Questions

258. The nurse is monitoring a client in the immediate postpartum period for signs of hemorrhage. Which sign, if noted, would be an early sign of excessive blood loss?

1. A temperature of 100.4° F (38° C)
2. An increase in the pulse rate from 88 to 102 beats per minute
3. A blood pressure change from 130/88 to 124/80 mm Hg
4. An increase in the respiratory rate from 18 to 22 breaths per minute

259. The nurse is preparing a list of self-care instructions for a postpartum client who was diagnosed with mastitis. Which instructions should be included on the list? Select all that apply.

☐ 1. Wear a supportive bra.
2. Rest during the acute phase.
3. Maintain a fluid intake of at least 3000 mL/day.
4. Continue to breast-feed if the breasts are not too sore.
5. Take the prescribed antibiotics until the soreness subsides.
6. Avoid decompression of the breasts by breast-feeding or breast pump.

260. The nurse is providing instructions about measures to prevent postpartum mastitis to a client who is breast-feeding her newborn. Which client statement would indicate a need for further instruction?
1. “I should breast-feed every 2 to 3 hours.”
2. “I should change the breast pads frequently.”
3. “I should wash my hands well before breast-feeding.”
4. “I should wash my nipples daily with soap and water.”

261. The postpartum nurse is assessing a client who delivered a healthy infant by cesarean section for signs and symptoms of superficial venous thrombosis. Which sign should the nurse note if superficial venous thrombosis were present?
1. Paleness of the calf area
2. Coolness of the calf area
3. Enlarged, hardened veins
4. Palpable dorsalis pedis pulses

262. A client in a postpartum unit complains of sudden sharp chest pain and dyspnea. The nurse notes that the client is tachycardic and the respiratory rate is elevated. The nurse suspects a pulmonary embolism. Which should be the initial nursing action?
1. Initiate an intravenous line.
2. Assess the client’s blood pressure.
3. Prepare to administer morphine sulfate.
4. Administer oxygen, 8 to 10 L/minute, by face mask.

263. The nurse is assessing a client in the fourth stage of labor and notes that the fundus is firm, but that bleeding is excessive. Which should be the initial nursing action?
1. Record the findings.
2. Massage the fundus.
3. Notify the obstetrician (OB).
4. Place the client in Trendelenburg’s position.

264. The nurse is preparing to care for four assigned clients. Which client is at most risk for hemorrhage?
1. A primiparous client who delivered 4 hours ago
2. A multiparous client who delivered 6 hours ago
3. A multiparous client who delivered a large baby after oxytocin induction
4. A primiparous client who delivered 6 hours ago and had epidural anesthesia

265. A postpartum client is diagnosed with cystitis. The nurse should plan for
which **priority** action in the care of the client?
1. Providing sitz baths
2. Encouraging fluid intake
3. Placing ice on the perineum
4. Monitoring hemoglobin and hematocrit levels

266. The nurse is monitoring a postpartum client who received epidural anesthesia for delivery for the presence of a vulvar hematoma. Which assessment finding would **best** indicate the presence of a hematoma?
1. Changes in vital signs
2. Signs of heavy bruising
3. Complaints of intense pain
4. Complaints of a tearing sensation

267. The nurse is creating a plan of care for a postpartum client with a small vulvar hematoma. The nurse should include which specific action during the first 12 hours after delivery?
1. Encourage ambulation hourly.
2. Assess vital signs every 4 hours.
3. Measure fundal height every 4 hours.
4. Prepare an ice pack for application to the area.

268. On assessment of a postpartum client, the nurse notes that the uterus feels soft and boggy. The nurse should take which **initial** action?
1. Document the findings.
2. Elevate the client’s legs.
3. Massage the fundus until it is firm.
4. Push on the uterus to assist in expressing clots.

**Answers**

258. Answer: 2

**Rationale:** During the fourth stage of labor, the maternal blood pressure, pulse, and respiration should be checked every 15 minutes during the first hour. An increasing pulse is an early sign of excessive blood loss because the heart pumps faster to compensate for reduced blood volume. A slight increase in temperature is normal. The blood pressure decreases as the blood volume diminishes, but a decreased blood pressure would not be the earliest sign of hemorrhage. The respiratory rate is slightly increased from normal.

**Test-Taking Strategy:** Note the **strategic word**, early. Think about the physiological occurrences of hemorrhage and shock and the expected findings in the postpartum period. This should assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Maternity: Postpartum
**Health Problem:** Maternity: Postpartum Uterine Problems
**Priority Concepts:** Clotting; Perfusion
Rationale: Mastitis is an inflammation of the lactating breast as a result of infection. Client instructions include resting during the acute phase, maintaining a fluid intake of at least 3000 mL/day (if not contraindicated), and taking analgesics to relieve discomfort. Antibiotics may be prescribed and are taken until the complete prescribed course is finished. They are not stopped when the soreness subsides. Additional supportive measures include the use of moist heat or ice packs and wearing a supportive bra. Continued decompression of the breast by breast-feeding or breast pump is important to empty the breast and prevent the formation of an abscess.

Test-Taking Strategy: Focus on the subject, treatment measures for mastitis. Think about the pathophysiology associated with mastitis to answer correctly. Recalling that supportive measures include rest, moist heat or ice packs, antibiotics, analgesics, increased fluid intake, breast support, and decompression of the breasts will assist in answering the question.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Maternity: Postpartum
Health Problem: Maternity: Infection/Inflammation
Priority Concepts: Client Education; Inflammation

Rationale: Mastitis is inflammation of the breast as a result of infection. It generally is caused by an organism that enters through an injured area of the nipples, such as a crack or blister. Measures to prevent the development of mastitis include changing nursing pads when they are wet and avoiding continuous pressure on the breasts. Soap is drying and could lead to cracking of the nipples, and the client should be instructed to avoid using soap on the nipples. The mother is taught about the importance of hand washing and that she should breast-feed every 2 to 3 hours.

Test-Taking Strategy: Note the strategic words, need for further instruction. These words indicate a negative event query and the need to select the option that identifies the incorrect client statement. Recalling that the use of soap is drying to the skin and could cause cracking and provide an entry point for organisms will direct you easily to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Health Promotion and Maintenance
Integrated Process: Teaching and Learning
Content Area: Maternity: Postpartum
Health Problem: Maternity: Infection/Inflammation
Priority Concepts: Client Education; Inflammation
Rationale: Thrombosis of superficial veins usually is accompanied by signs and symptoms of inflammation, including swelling, redness, tenderness, and warmth of the involved extremity. It also may be possible to palpate the enlarged, hard vein. Clients sometimes experience pain when they walk. Palpable dorsalis pedis pulses is a normal finding.

Test-Taking Strategy: Eliminate option 4 first because this is a normal and expected finding. Next, eliminate options 1 and 2 because they are comparable or alike.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Postpartum
Health Problem: Maternity: Infection/Inflammation
Priority Concepts: Clotting; Perfusion

262. Answer: 4

Rationale: If pulmonary embolism is suspected, oxygen should be administered, 8 to 10 L/minute, by face mask. Oxygen is used to decrease hypoxia. The client also is kept on bed rest with the head of the bed slightly elevated to reduce dyspnea. Morphine sulfate may be prescribed for the client, but this would not be the initial nursing action. An intravenous line also will be required, and vital signs need to be monitored, but these actions would follow the administration of oxygen.

Test-Taking Strategy: Note the strategic word, initial. Use the ABCs—airway, breathing, and circulation—to assist in directing you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Complex Care: Emergency Situations/Management
Health Problem: Adult Health: Respiratory: Pulmonary Embolism
Priority Concepts: Gas Exchange; Perfusion

263. Answer: 3

Rationale: If bleeding is excessive, the cause may be laceration of the cervix or birth canal. Massaging the fundus if it is firm would not assist in controlling the bleeding. Trendelenburg’s position should be avoided because it may interfere with cardiac and respiratory function. Although the nurse would record the findings, the initial nursing action would be to notify the OB.

Test-Taking Strategy: Note the strategic word, initial. Focus on the data in the question, noting the clinical manifestations identified in the question. Eliminate option 2 first because, if the uterus is firm, it would not be necessary to perform fundal massage. Knowing that Trendelenburg’s position interferes with cardiac and
respiratory function will assist in eliminating option 4. From the remaining options, noting the words bleeding is excessive will assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Complex Care: Emergency Situations/Management  
**Health Problem:** Maternity: Hematoma and Hemorrhage  
**Priority Concepts:** Clinical Judgment; Clotting  

264. **Answer:** 3

**Rationale:** The causes of postpartum hemorrhage include uterine atony; laceration of the vagina; hematoma development in the cervix, perineum, or labia; and retained placental fragments. Predisposing factors for hemorrhage include a previous history of postpartum hemorrhage, placenta previa, abruptio placentae, overdistention of the uterus from polyhydramnios, multiple gestation, a large neonate, infection, multiparity, dystocia or labor that is prolonged, operative delivery such as a cesarean or forceps delivery, and intrauterine manipulation. The multiparous client who delivered a large fetus after oxytocin induction has more risk factors associated with postpartum hemorrhage than do other clients. In addition, there are no specific data in the client descriptions in options 1, 2, and 4 that present the risk for hemorrhage.

**Test-Taking Strategy:** Note the strategic word, most. Focus on the subject, the client at most risk for hemorrhage. Read the client description in each option. Noting the words large and oxytocin in the correct option will direct you to this option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Hematoma and Hemorrhage  
**Priority Concepts:** Clinical Judgment; Clotting  
**Reference:** Lowdermilk et al. (2016), pp. 486, 810.

265. **Answer:** 2

**Rationale:** Cystitis is an infection of the bladder. The client should consume 3000 mL of fluids per day if not contraindicated. Sitz baths and ice would be appropriate interventions for perineal discomfort. Hemoglobin and hematocrit levels would be monitored with hemorrhage.

**Test-Taking Strategy:** Focus on the subject, measures to treat cystitis, and note the strategic word, priority. Remember that increased fluids are a priority intervention.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Infection/Inflammation
**Priority Concepts:** Elimination; Infection  

266. **Answer:** 1

**Rationale:** Because the client has had epidural anesthesia and is anesthetized, she cannot feel pain, pressure, or a tearing sensation. Changes in vital signs indicate hypovolemia in an anesthetized postpartum client with vulvar hematoma. Option 2 (heavy bruising) may be seen, but vital sign changes indicate hematoma caused by blood collection in the perineal tissues.

**Test-Taking Strategy:** Note the strategic word, best. Also note that the client received epidural anesthesia. With this in mind, eliminate options 3 and 4. From the remaining options, use the ABCs—airway, breathing, and circulation—to direct you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Hematoma and Hemorrhage  
**Priority Concepts:** Clinical Judgment; Clotting  

267. **Answer:** 4

**Rationale:** A hematoma is a localized collection of blood in the tissues of the reproductive tissues after delivery. Vulvar hematoma is the most common. Application of ice reduces swelling caused by hematoma formation in the vulvar area. Options 1, 2, and 3 are not interventions that are specific to the plan of care for a client with a small vulvar hematoma. Ambulation hourly increases the risk for bleeding. Client assessment every 4 hours is too infrequent.

**Test-Taking Strategy:** Focus on the subject, a small vulvar hematoma. Think about the effect of each action in the options; this focus will assist in directing you to the correct option.

**Level of Cognitive Ability:** Creating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Maternity: Postpartum  
**Health Problem:** Maternity: Hematoma and Hemorrhage  
**Priority Concepts:** Clinical Judgment; Clotting  
**Reference:** Lowdermilk et al. (2016), p. 804.

268. **Answer:** 3

**Rationale:** If the uterus is not contracted firmly (i.e., it is soft and boggy), the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated in the uterus. Elevating the client’s legs would not assist in managing uterine atony. Documenting the findings is an appropriate action but is
not the initial action. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage.

**Test-Taking Strategy:** Note the **strategic word**, *initial*, in the question. Focus on the **subject**, that the uterus is soft and boggy. Recalling the therapeutic management for uterine atony will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Postpartum

**Health Problem:** Maternity: Postpartum Uterine Problems

**Priority Concepts:** Clinical Judgment; Reproduction

I. Initial Care of the Newborn

A. Assessment
1. Observe or assist with initiation of respirations.
2. Assess Apgar score.
3. Note characteristics of cry.
4. Monitor for nasal flaring, grunting, retractions, and abnormal respirations, such as a seesaw respiratory pattern (rise and fall of the chest and abdomen do not occur together).
5. Assess for central cyanosis and acrocyanosis.
6. Obtain vital signs.
7. Observe the newborn for signs of hypothermia or hyperthermia.
8. Assess for gross anomalies.

B. Interventions
1. Suction the mouth first and then the nares if needed with a bulb syringe.
2. Dry the newborn and stimulate crying by rubbing the back.
3. Maintain temperature stability; wrap the newborn in warm blankets and place a stockinette cap on the newborn’s head.
4. Keep the newborn with the mother to facilitate bonding.
5. Place the newborn at the mother’s breast if breastfeeding is planned, or place the newborn on the mother’s chest for skin-to-skin.
6. Place the newborn in a radiant warmer.
7. Ensure the newborn’s proper identification.
8. Footprint the newborn and fingerprint the mother on the identification sheet per agency policies and procedures; initiate other agency identification and
safety procedures.

9. Place matching identification bracelets on the mother and the newborn.

C. Apgar scoring system

1. Assess each of 5 items to be scored and add the points to determine the newborn’s total score.

2. Five vital indicators (Table 27-1)

3. Interventions: Apgar score (Table 27-2)

The newborn’s Apgar score is routinely assessed and recorded at 1 minute and 5 minutes after birth, and may be repeated later if the score is and remains low.

II. Initial Physical Examination

A. General guidelines

1. Keep the newborn warm during the examination.

2. Begin with general observations, and then perform assessments that are least disturbing to the newborn first.

3. Initiate nursing interventions for abnormal findings and document findings.

4. The Ballard Scale may be used for gestational age assessment; in this scale, scores are assigned to physical and neurological criteria.

The phases of newborn instability occur during the first 6 to 8 hours after birth and are known as the transition period between intrauterine and extrauterine existence. These phases include the first period of reactivity, period of decreased responsiveness, and second period of reactivity.

B. Vital signs

1. Heart rate (resting): 110 to 160 beats per minute (apical), 90 to 110 beats per minute (if sleeping), up to 180 beats per minute (if crying); auscultate at the fourth intercostal space for 1 full minute to detect abnormalities.

2. Respiration: 30 to 60 breaths per minute; assess for 1 full minute.

3. Assess heart rate and respiratory rate first before assessing other vital signs while the newborn is
resting or sleeping.

4. Axillary temperature: 97.7° F (36.5° C) to < 100.3° F (37.9° C)

5. Blood pressure: Usually not done in term newborn unless a cardiac issue is suspected, 80 to 90/40 to 50 mm Hg

C. Body measurements (approximate)
   1. Length: 18 to 22 inches (45 to 55 cm)
   2. Weight: 2500 to 4000 g (5.5 to 8.75 lb)
   3. Head circumference: 33 to 35 cm (13.2 to 14 inches)

D. Head
   1. Head should be one-fourth of the body length (cephalocaudal development).
   2. Bones of the skull are not fused.
   3. Sutures (connective tissue between the skull bones) are palpable and may be overlapping because of head molding but should not be widened.
   4. Fontanels are unossified membranous tissue at the junction of the sutures (Table 27-3).
   5. Molding is asymmetry of the head resulting from pressure in the birth canal; molding disappears in about 72 hours (Fig. 27-1).
   6. Masses from birth trauma
      a. Caput succedaneum is edema of the soft tissue over bone (crosses over suture line); it subsides within a few days.
      b. Cephalhematoma is swelling caused by bleeding into an area between the bone and its periosteum (does not cross over suture line); it usually is absorbed within 6 weeks with no treatment.

7. Head lag
   a. Common when pulling the newborn to a sitting position
   b. When prone, the newborn should be able to lift the head slightly and turn the head from side to side.

E. Eyes
   1. Slate-gray (light skin), dark-blue, or brown-gray (dark skin)
   2. Symmetrical and clear
   3. Pupils equal, round, react to light and accommodation
   4. Blink reflex present
   5. Eyes cross because of weak extraocular muscles
   6. Ability to track and fixate momentarily
   7. Red reflex present
8. Eyelids often edematous as a result of pressure during the birth process and the effects of eye medication

F. Ears
1. Symmetrical
2. Firm cartilage with recoil
3. Top of pinna on or above line drawn from outer canthus of eye
4. Low-set ears associated with Down syndrome, renal anomalies, or other genetic or chromosomal syndromes

G. Nose
1. Flat, broad, in center of face
2. Obligatory nose breathing
3. Occasional sneezing to remove obstructions
4. Nares are patent and should not flare (flaring is an indication of respiratory distress).

H. Mouth
1. Pink, moist gums
2. Soft and hard palates intact
3. Epstein’s pearls (small, white cysts) may be present on hard palate.
4. Uvula in midline
5. Freely moving tongue, symmetrical, has short frenulum
6. Sucking and crying movements symmetrical
7. Able to swallow
8. Root and gag reflexes present

When assessing the newborn’s mouth, look for the presence of thrush (*Candida albicans*), which are white patchy areas on the tongue or gums that cannot be removed with a washcloth; these may be painful.

I. Neck
1. Short and thick
2. Head held in midline
3. Trachea midline
4. Good range of motion and ability to flex and extend
5. Assess for torticollis (head inclined to 1 side as a result of contraction of muscles on that side of the neck)

J. Chest
1. Circular appearance because anteroposterior and lateral diameters are about equal (approximately 30 to 33 cm [12 to 13.2 inches] at birth)
2. Diaphragmatic respirations—chest and abdomen should rise and fall in synchrony, not in a seesaw pattern
3. Bronchial sounds heard on auscultation
4. Nipples prominent and often edematous; milky secretion (witch’s milk) common
5. Breast tissue present
6. Clavicles need to be palpated to assess for fractures.

K. Skin

1. Pinkish red (light-skinned newborn) to pinkish brown or pinkish yellow (dark-skinned newborn)
2. Vernix caseosa, a cheesy white substance, on entire body in preterm newborns, but is more prominent between folds closer to term; may be absent after 42 weeks of gestation
3. Lanugo, fine body hair, might be seen, especially on the back.
5. Dry, peeling skin, increased in postmature newborns
6. Dark-red color (plethoric) common in premature newborns
7. Cyanosis may be noted with hypothermia, infection, and hypoglycemia and with cardiac, respiratory, or neurological abnormalities.
8. Acrocyanosis (peripheral cyanosis of hands and feet) is normal in the first few hours after birth and may be noted intermittently for the next 7 to 10 days (Fig. 27-2).
9. Assess for ecchymosis and petechiae resulting from trauma of birth.
10. Assess skin turgor over the abdomen to determine hydration status.
11. Observe for forceps marks.
12. Harlequin sign
   a. Deep pink or red color develops over 1 side of newborn’s body while the other side remains pale or of normal color.
   b. Harlequin sign may indicate shunting of blood that occurs with a cardiac problem or may indicate sepsis.
13. Birthmarks (Table 27-4)

L. Abdomen

1. Umbilical cord
   a. Umbilical cord should have 3 vessels—2 arteries and 1 vein; if fewer than 3 vessels are noted, notify the primary health care provider (PHCP).
b. While a 2-vessel cord (1 artery, 1 vein) may present no problems or concerns, there is a higher correlation to intrauterine growth restriction (IUGR) and genetic or chromosomal problems.

c. Small, thin cord may be associated with poor fetal growth.

d. Assess for intact cord and ensure that the cord clamp is secured.

e. Cord should be clamped for at least the first 24 hours after birth; clamp can be removed when the cord is dried and occluded and is no longer bleeding.

f. Note any bleeding or drainage from the cord.

g. Cleansing of the cord needs to be done; hospital protocol and PHCP’s preference determine the frequency, technique, and skin preparation used for cord care.

h. If signs of infection, such as moistness, oozing, discharge, and a reddened base, occur, antibiotic treatment is prescribed.

2. Gastrointestinal

a. Monitor cord for meconium staining.

b. Assess for umbilical hernia.

c. Assess for abdominal depression associated with diaphragmatic hernia.

d. Assess for abdominal distention associated with obstruction, mass, or sepsis.

e. Monitor bowel sounds (present within the first hour after birth).

3. Anus

a. Ensure that the anal opening is present.

b. First stool meconium should pass within first 24 hours.

M. Genitals

1. Female

a. Labia may be swollen; clitoris may be enlarged.

b. Smegma may be present (thick, white mucus discharge).

c. Pseudomenstruation, caused by the withdrawal of the maternal hormone estrogen, is possible (blood-tinged mucus).
d. Hymen tag may be visible.

e. First voiding should occur within 24 hours.

2. Male

a. Prepuce (foreskin) covers glans penis.

b. Scrotum may be edematous.

c. Verify meatus at tip of penis.

d. Testes are descended but may retract with cold.

e. Assess for hernia or hydrocele.

f. First voiding should occur within 24 hours.

N. Spine

1. Straight

2. Posture flexed

3. Supportive of head momentarily when prone

4. Chin flexed on upper chest

5. Well-coordinated, sporadic movements

6. A degree of hypotonicity or hypertonicity may indicate central nervous system damage.

7. Assess for hair tufts and dimples along the spinal column (may be indicative of a possible opening).

O. Extremities

1. Flexed

2. Full range of motion; symmetrical movements

3. Fists clenched

4. Ten fingers and 10 toes, all separate

5. Legs bowed

6. Major gluteal folds even

7. Creases on soles of feet

8. Assess for fractures (especially clavicle) or dislocations (hip).

9. Assist PHCP to assess for developmental dysplasia of the hip; when thighs are rotated outward, no clicks should be heard (Ortolani’s sign and Barlow’s sign are the 2 assessment tools for developmental dysplasia of the hip).

10. Pulses palpable (radial, brachial, femoral)

Slight tremors noted in the newborn may be a common finding but could also be a sign of hypoglycemia, hypocalcemia, or drug withdrawal.

III. Body Systems Assessment and Interventions

A. Cardiovascular system

1. Keep the newborn warm.
2. Measure the apical heart rate for 1 full minute.
3. Listen for murmurs; assess oxygen saturation via pulse oximetry if a murmur is heard.
4. Palpate pulses.
5. Assess for cyanosis; blanch the skin on the trunk and extremities to assess circulation.
6. Observe for cardiac distress when the newborn is feeding.

B. Respiratory system
1. Suction the airway as necessary: Use a bulb syringe for upper airway suctioning (compress bulb before insertion) and a French catheter for deeper suctioning.
2. Observe for respiratory distress and hypoxemia.
   a. Nasal flaring
   b. Increasingly severe retractions
   c. Grunting
   d. Cyanosis
   e. Bradycardia and periods of apnea lasting longer than 15 seconds
3. Administer oxygen if necessary and as prescribed.

C. Hepatic system
1. Normal or physiological jaundice appears after the first 24 hours in full-term newborns and after the first 48 hours in premature newborns; jaundice occurring before this time (pathological jaundice) may indicate early hemolysis of red blood cells and must be reported to the PHCP.
2. Physiological jaundice peaks on about the fifth day of life (indirect bilirubin levels 6 to 7 mg/dL [90 to 105 mcmol/L]).
3. Feed early to stimulate intestinal activity and to keep the bilirubin level low.
4. Prevent chilling because hypothermia can cause acidosis that interferes with bilirubin conjugation and excretion.
5. Liver stores the iron passed from the mother for 5 to 6 months.
6. Glycogen storage occurs in the liver.
7. The newborn is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on vitamin K, which is not synthesized until intestinal bacteria are present.
8. Handle the newborn carefully and monitor for any
bruising or bleeding episodes.

9. Watch for meconium stool and subsequent stools.

10. Administer intramuscular dose of phytonadione to the newborn as prescribed to prevent hemorrhagic disorders (usually 0.5 to 1 mg is prescribed); administer in lateral aspect of the middle third of the vastus lateralis muscle (see Chapter 41).

11. Assess the newborn’s hemoglobin and blood glucose levels.

D. Renal system

1. The immature kidneys are unable to concentrate urine.

2. A weight loss of 5% to 10% during the first week of life occurs as a result of water loss and limited intake; birth weight should be regained by 10 to 14 days after birth.

3. Weigh the newborn daily.

4. Monitor intake and output; weigh diapers if necessary (1 g of diaper weight equals 1 mL of urine).

5. If the diaper requires weighing, record the weight before putting it on the newborn; after the newborn voids, reweigh the diaper and subtract the prevoided weight.

6. Assess for signs of dehydration (dry mucous membranes, sunken eyeballs, poor skin turgor, sunken fontanels).

E. Immune system

1. Newborn receives passive immunity via the placenta (immunoglobulin G).

2. Newborn receives passive immunity from colostrum (immunoglobulin A).

3. Elevations in immunoglobulin M indicate infection in utero.

4. Use aseptic technique and standard precautions when caring for the newborn.

5. Ensure meticulous handwashing.

6. Ensure that an infection-free staff cares for the newborn.

7. Monitor the newborn’s temperature.

8. Observe for any cracks or openings in the skin.

9. Administer eye medication within 1 hour after birth to prevent ophthalmia neonatorum (see Chapter 818).
   a. Umbilical clamp can be removed after 24 hours if cord is dried and occluded and is not bleeding.
   b. Teach the mother how to perform cord care.
   c. Keep the cord clean and dry; alcohol wipes may be prescribed for cleaning the cord only if it becomes soiled.
   d. Keep the diaper from covering the cord; fold the diaper below the cord.
   e. Assess the cord for odor, edema, or discharge.
   f. The newborn is typically washed via a sponge bath until the cord falls off (within 7 to 10 days). Follow alternate instructions if provided by PHCP.

11. Provide circumcision care.
   a. Apply petroleum jelly gauze to the penis except when a PlastiBell is used.
   b. Remove petroleum jelly gauze, if applied, after the first voiding following circumcision.
   c. Observe for edema, infection, or bleeding from the circumcision site.
   d. Teach the mother how to care for the circumcision site.
   e. Clean the penis after each voiding by squeezing warm water over the penis.
   f. A milky covering over the glans penis is normal and should not be disrupted.
   g. Monitor for urinary retention.

Educate the parents and caregivers that the newborn needs to void within 24 hours after the circumcision.

F. Metabolic system and gastrointestinal system
   1. Newborns are able to digest simple carbohydrates but are unable to digest fats because of the lack of lipase.
   2. Proteins may be broken down only partially, so they may serve as antigens and provoke an allergic reaction.
   3. The newborn has a small stomach capacity (less than 10 mL at birth, increasing to about 90 mL by day 10), with rapid intestinal peristalsis (bowel emptying time
4. Breast-feeding usually can begin immediately after birth; based on PHCP preference and agency protocols, bottle-fed newborns may be initially offered no more than 30 mL of formula.

5. Observe feeding reflexes, such as rooting, sucking, and swallowing.

6. Assist the mother with breast-feeding or formula feeding; breast-feeding should be done every 2 to 3 hours, and formula feeding (minimum of 30 mL, or 1 oz by day 3) should be done every 3 to 4 hours (or per PHCP preference or agency protocols).

7. Burp the newborn during and after feeding.

8. Assess for regurgitation or vomiting.

9. Position the newborn on the right side after feeding; however, the side-lying position is not recommended for sleep because this position makes it easy for the newborn to roll to the prone position (prone position is contraindicated because it increases the risk of sudden infant death syndrome). Turning the head to the right is another option.

10. Observe for normal stool and the passage of meconium.

   a. Meconium stool, which is greenish black with a thick, sticky, tar-like consistency, usually is passed within the first 24 hours of life.

   b. Transitional stool, the second type of stool excreted by the newborn, is greenish brown and of looser consistency than meconium.

   c. Seedy, yellow stools are usually noted in breast-fed newborns; pale yellow to light-brown stools are usually seen in formula-fed newborns.

11. Perform a newborn screening test (including the test for phenylketonuria [PKU]) as prescribed before discharge after sufficient protein intake occurs; the newborn should be on formula or breast milk for 24 hours before screening.

G. Neurological system

1. Newborn head size is proportionally larger than that of an adult because of cephalocaudal development.

2. Myelination of nerve fibers is incomplete, so
primitive reflexes are present.
3. Fontanels are open to allow for brain growth.
4. Assess for abnormal head size and a bulging or depressed anterior fontanel.
5. Measure and graph the head circumference in relation to chest circumference and length.
6. Assess the newborn’s movements, noting symmetry, posture, and abnormal movements.

7. Observe for jitteriness, marked tremors, and seizures.
8. Test the newborn’s reflexes.
10. Assess pitch of cry.

H. Thermal regulatory system

1. Prevent cold stress (Fig. 27-3).
2. Newborns do not shiver to produce heat.
3. Newborns have brown fat deposits, which produce heat.
4. Prevent heat loss resulting from evaporation by keeping the newborn dry and well wrapped with a blanket.
5. Prevent heat loss resulting from radiation by keeping the newborn away from cold objects and outside walls.
6. Prevent heat loss resulting from convection by shedding the newborn from drafts.
7. Prevent heat loss resulting from conduction by performing all treatments on a warm, padded surface.
8. Keep the room temperature warm.
9. Take the newborn’s axillary temperature every hour for the first 4 hours of life, every 4 hours for the remainder of the first 24 hours, and then every shift (as per agency protocol).

Cold stress causes oxygen consumption and energy to be diverted from maintaining normal brain cell function and cardiac function, resulting in serious metabolic and physiological conditions.

I. Reflexes

1. Sucking and rooting
   a. Touch the newborn’s lip, cheek, or corner of the mouth with a nipple.
   b. The newborn turns the head toward the nipple, opens the mouth, takes hold of
the nipple, and sucks.
c. The rooting reflex usually disappears after 3 to 4 months, but may persist for 1 year.

2. Swallowing reflex
   a. Swallowing reflex occurs spontaneously after sucking and obtaining fluids.
   b. Newborn swallows in coordination with sucking without gagging, coughing, or vomiting.

3. Tonic neck or fencing
   a. While the newborn is falling asleep or sleeping, gently and quickly turn the head to 1 side.
   b. As the newborn faces the left side, the left arm and leg extend outward while the right arm and leg flex.
   c. When the head is turned to the right side, the right arm and leg extend outward while the left arm and leg flex.
   d. Response usually disappears within 3 to 4 months.

4. Palmar-plantar grasp
   a. Place a finger in the palm of the newborn’s hand and then place a finger at the base of the toes.
   b. The newborn’s fingers curl around the examiner’s fingers, and the newborn’s toes curl downward.
   c. Palmar response lessens within 3 to 4 months.
   d. Plantar response lessens within 8 months.

5. Moro reflex
   a. Hold the newborn in a semisitting position and then allow the head and trunk to fall backward to at least a 30-degree angle.
   b. The newborn assumes sharp extension and abduction of the arms with the thumbs and forefingers in a “C” position; this is followed by flexion and adduction to an “embrace” position (legs follow a similar pattern).
   c. The Moro reflex is present at birth and is absent by 6 months of age if neurological maturation is not
A body jerk motion may be the response between 8 and 18 weeks. A persistent response lasting more than 6 months may indicate a neurological abnormality.

6. Startle reflex (often considered the same as the Moro reflex but the response is different)
   a. The response is best elicited if the newborn is at least 24 hours old.
   b. The examiner makes a loud noise or claps hands to elicit the response.
   c. The newborn’s arms adduct while the elbows flex.
   d. The hands stay clenched.
   e. The reflex should disappear within 4 months.

7. Pull-to-sit response
   a. Pull the newborn up by the wrist while the newborn is in the supine position.
   b. The head lags until the newborn is in an upright position, and then the head is level with the chest and shoulders momentarily before falling forward.
   c. The head then lifts for a few minutes.
   d. The response depends on the newborn’s general muscle tone and condition and on maturity level.

8. Babinski’s sign: Plantar reflex
   a. Beginning at the heel of the foot, use a finger to stroke gently upward along the lateral aspect of the sole, and then move the finger along the ball of the foot.
   b. The newborn’s toes hyperextend while the big toe dorsiflexes.
   c. The reflex disappears after the newborn is 1 year old.
   d. Absence of this reflex indicates the need for a neurological examination.

9. Stepping or walking
   a. Hold the newborn in a vertical position, allowing 1 foot to touch a table surface.
   b. The newborn simulates walking, alternately flexing and extending the feet.
   c. The reflex is usually present for 3 to 4 months.
10. Crawling
   a. Place the newborn on the abdomen.
   b. The newborn begins to make crawling movements with the arms and legs.
   c. The reflex usually disappears after about 6 weeks.

IV. Newborn Safety
   A. Newborn identification
      1. Information bracelets are applied to the mother and newborn immediately after birth and before the mother and newborn are separated; in addition, identification pictures of the newborn and footprints from the newborn may be obtained before the newborn leaves the mother’s side in the delivery room.
      2. The bracelets include name, sex, date, time of birth, and identification numbers.
      3. Some agencies use identification bracelets that have radiofrequency transmitters that set off alarms if the newborn is removed from a certain area.
      4. Agencies also conduct unit and hospital-wide drills to prevent newborn abductions.
   B. Newborn abduction
      1. The mother is taught to check the identification of any person who comes to remove the infant from her room and is taught other precautions to prevent newborn abduction (nurses must be wearing photo identification or some other security badge) (Box 27-1).
      2. Closed-circuit televisions, code-alert bands, computer monitoring systems, or other monitoring systems may be used in some agencies.
      3. The newborn is wheeled in a bassinette, not carried in a staff member’s arms.

V. Parent Teaching
   A. Formula feeding
      1. Teach sterilization techniques if the water supply is located in areas where the purification process of the water is questionable.
      2. Remind the mother not to heat the bottle of formula in a microwave oven.
      3. Inform the mother that formula is a sufficient diet for the first 4 to 6 months.
      4. Assess the mother’s ability to burp the newborn.
   B. Breast-feeding
1. Assess the newborn’s ability to attach to the mother’s breast and suck (Fig. 27-4).
2. Teach the mother how to pump her breasts and how to store breast milk properly.
3. Inform the mother that breast milk is a sufficient diet for the first 4 to 6 months.
4. Give the mother the phone numbers of local organizations that offer support to breast-feeding mothers.

C. Bathing
1. Bathe the newborn in a warm room before feeding.
2. Have all equipment for bathing available.
3. Use a mild soap (not on the face).
4. Proceed from the cleanest area to the dirtiest.
5. Clean eyes from the inner canthus outward.
6. Special care should be taken to clean under the folds of the neck, underarms, groin, and genitals.
7. Make bath time enjoyable for the newborn and the mother.

D. Clothing
1. Assess diaper and clothing needs for the newborn with the mother.
2. Instruct the mother that the newborn’s head should be covered in cold weather to prevent heat loss.
3. Instruct the mother to layer the newborn’s clothing in cooler weather.
4. To be comfortable, the newborn should be dressed in 1 more layer of clothing than what the parents are wearing.

F. Circumcision: See earlier for circumcision care, “Body Systems Assessment and Interventions.”

G. Uncircumcised newborn
1. Inform the mother that the foreskin and glans are 2 similar layers of cells that separate from each other and that the separation process normally is complete by 3 years of age, although the layers can remain adhered until puberty.
2. Instruct the mother not to pull back the foreskin, but to allow natural separation to occur.
3. Inform the mother that as the process of separation occurs, sloughed cells build up between the layers of the foreskin and the glans, and that when retraction occurs, daily gentle washing of the glans with soap and water is sufficient to maintain adequate cleanliness.
H. Stimulation: Providing stimulation to the newborn such as touching, cuddling, or talking is an important intervention.

VI. Preterm Newborn
A. Description
1. An infant born before 37 weeks of gestation but greater than 20 weeks of gestation.
2. Primary concern relates to immaturity of all body systems

B. Assessment
1. Respirations are irregular with periods of apnea.
2. Body temperature is below normal.
3. The newborn has poor suck and swallow reflexes.
4. Bowel sounds are diminished.
5. Urinary output is increased or decreased.
6. Extremities are thin, with minimal creasing on soles and palms.
7. The newborn extends extremities and does not maintain flexion.
8. Lanugo, on skin and in the hair on the newborn’s head, is present in woolly patches.
9. Skin is thin, with visible blood vessels and minimal subcutaneous fat pads.
10. Skin may appear jaundiced.
11. Testes are undescended in boys.
12. Labia majora are narrow in girls.

C. Interventions
1. Monitor vital signs every 2 to 4 hours.
2. Maintain airway and cardiopulmonary functions.
3. Administer oxygen and humidification as prescribed.
4. Monitor intake and output and electrolyte balance.
5. Monitor daily weight.
6. Maintain the newborn in a warming device.
7. Avoid exposure to infections.

VII. Postterm Newborn
A. Description: Infant born after 42 weeks of gestation

B. Assessment
1. Hypoglycemia
2. Parchment-like skin (dry and cracked) without lanugo
3. Long fingernails, extended over ends of fingers
4. Profuse scalp hair
5. Long and thin body
6. Wasting of fat and muscle in extremities
7. Meconium staining possibly present on nails and umbilical cord

C. Interventions
1. Provide normal newborn care.
3. Maintain newborn’s temperature.

VIII. Small for Gestational Age
A. Description: Newborn who is plotted at or below the 10th percentile on the intrauterine growth curve
B. Assessment
1. Fetal distress
2. Decreased or elevated body temperature
3. Physical abnormalities
4. Hypoglycemia
5. Signs of polycythemia
   a. Ruddy appearance
   b. Cyanosis
   c. Jaundice
6. Signs of infection
7. Signs of aspiration of meconium
C. Interventions
   1. Maintain airway and cardiopulmonary function.
   2. Maintain body temperature.
   3. Observe for signs of respiratory distress.
   4. Monitor for infection and initiate measures to prevent sepsis.
   5. Monitor for hypoglycemia.
   6. Initiate early feedings and monitor for signs of aspiration.

IX. Large for Gestational Age
A. Description: Newborn who is plotted at or above the 90th percentile on the intrauterine growth curve
B. Assessment
1. Birth trauma or injury
2. Respiratory distress
3. Hypoglycemia
C. Interventions
   1. Monitor vital signs and for respiratory distress.
   3. Initiate early feedings.
   4. Monitor for infection and initiate measures to prevent sepsis.

X. Respiratory Distress Syndrome
A. Description: Serious lung disorder caused by immaturity and inability to produce surfactant, resulting in hypoxia and acidosis
B. Assessment
   1. Respiratory distress; can include tachypnea, nasal flaring, expiratory grunting, retraction, seesaw respirations, decreased breath sounds, and apnea
   2. Pallor and cyanosis
   3. Hypothermia
   4. Poor muscle tone
C. Interventions
   1. Monitor color, respiratory rate, and degree of effort in breathing.
   2. Maintain airway and cardiopulmonary function and support respirations as prescribed.
   3. Monitor arterial blood gases and oxygen saturation levels as prescribed (arterial blood gases from umbilical artery); ensure that oxygen administered to the newborn is at the lowest possible concentration necessary to maintain adequate arterial oxygenation.
   4. Any premature newborn who required oxygen support should be scheduled for an eye examination before discharge to assess for retinal damage.
   5. Position the newborn on the side or back, with the neck slightly extended.
   6. Administer respiratory therapy (percussion and vibration) as prescribed; use padded small plastic cup or small oxygen mask for percussion; use padded electric toothbrush for vibration.
   7. Provide nutrition.
   8. Support bonding.
   9. Prepare parents for short-term to long-term period of oxygen dependency if necessary.
   10. Encourage the mother to pump the breasts for future breast-feeding of her newborn if she desires.
   11. Encourage as much parental participation in the newborn’s care as the condition allows.

Prepare to administer surfactant replacement therapy (instilled into the endotracheal tube) to a newborn with respiratory distress syndrome.

XI. Meconium Aspiration Syndrome
A. Description
   1. Occurs in term or postterm newborns
   2. Exact etiology is unknown, but the release of meconium into the amniotic fluid is thought to be related to a stressful fetal event initiating a biochemical chain of events.
3. Aspiration can occur in utero or with the first breath.

B. Assessment
1. Respiratory distress is present at birth; tachypnea, cyanosis, retractions, nasal flaring, grunting, crackles, and rhonchi may be present.
2. The newborn’s nails, skin, and umbilical cord may be stained a yellow-green color.

C. Interventions
1. If the newborn is delivered in an active, crying state with no evidence of respiratory distress, no intervention is necessary.
2. If the newborn is delivered and exhibits inactivity and lack of cry, endotracheal suctioning is performed. If the newborn also exhibits lack of respiratory effort and a low heart rate, additional interventions will be needed.
3. Newborns with severe meconium aspiration syndrome may benefit from extracorporeal membrane oxygenation; this therapy uses a modified heart-lung machine and provides oxygen to the circulation, allowing the lungs to rest and decreasing pulmonary hypertension and hypoxemia.

XII. Bronchopulmonary Dysplasia
A. Description
1. This chronic pulmonary condition affects newborns who have experienced respiratory failure or have been oxygen-dependent for more than 28 days.
2. X-ray findings are abnormal, indicating areas of overinflation and atelectasis.

B. Assessment
1. Tachypnea
2. Tachycardia
3. Retractions
4. Nasal flaring
5. Labored breathing
6. Crackles and decreased air movement
7. Occasional expiratory wheezing

C. Interventions
1. Monitor airway and cardiopulmonary function; provide oxygen therapy.
2. Fluid restriction may be prescribed.
3. Medications include surfactant at birth, bronchodilators, and possibly diuretics and
corticosteroids.

XIII. Transient Tachypnea of the Newborn
A. Description
   1. Respiratory condition that results from incomplete reabsorption of fetal lung fluid in full-term newborns
   2. Usually disappears within 24 to 48 hours
B. Assessment
   1. Tachypnea
   2. Expiratory grunting
   3. Retractions
   4. Nasal flaring
   5. Fluid breath sounds per auscultation
   6. Cyanosis
C. Interventions
   1. Supportive care
   2. Oxygen administration

XIV. Intraventricular Hemorrhage
A. Description
   1. Bleeding within the ventricles of the brain
   2. Risk factors include prematurity, respiratory distress syndrome, trauma, and asphyxia.
B. Assessment: Diminished or absent Moro reflex, lethargy, apnea, poor feeding, high-pitched shrill cry, seizure activity
C. Interventions: Supportive treatment

XV. Retinopathy of Prematurity
A. Description
   1. Vascular disorder involving gradual replacement of retina by fibrous tissue and blood vessels
   2. Primarily caused by prematurity and use of supplemental oxygen (> 30 days)
B. Assessment: Leukocoria (white tissue on the retrolental space), vitreous hemorrhage, strabismus, cataracts (check for red reflex)
C. Interventions: Laser photocoagulation surgery

XVI. Necrotizing Enterocolitis (NEC)
A. Description
   1. Acute inflammatory disease of the gastrointestinal tract
   2. Usually occurs 4 to 10 days after birth, and is most frequently seen in preterm newborns
B. Assessment: Increased abdominal girth, decreased or absent bowel sounds, bowel loop distention, vomiting, bile-stained emesis, abdominal tenderness, occult blood in stool
C. Prevention
1. Withhold feedings for 24 to 48 hours from infants believed to have suffered birth asphyxia. Breast milk is the preferred nutrient after this time period.

2. The use of probiotics with enteral feedings and breast milk has shown evidence of prevention of NEC.

3. Administration of corticosteroids to the mother prior to birth to promote early gut closure and maturation of the gut mucosa

D. Interventions

1. Hold oral feedings.
2. Insert oral gastric tube to decompress the abdomen.
3. Intravenous antibiotics
4. Intravenous fluids to correct fluid, electrolyte, and acid-base imbalances
5. Surgery if indicated

XVII. Hyperbilirubinemia

A. Description

1. Elevated serum bilirubin level
2. Evaluation is indicated when serum levels are greater than 12 mg/dL (180 mcmol/L) in a term newborn.
3. Therapy is aimed at preventing kernicterus, which results in permanent neurological damage resulting from the deposition of bilirubin in the brain cells.

B. Assessment

1. Jaundice
2. Elevated serum bilirubin levels
3. Enlarged liver
4. Poor muscle tone
5. Lethargy
6. Poor sucking reflex

C. Interventions

1. Monitor for the presence of jaundice; assess skin and sclera for jaundice.
   a. Examine the newborn’s skin color in natural light.
   b. Press a finger over a bony prominence or tip of the newborn’s nose to press out capillary blood from the tissues.
   c. Note that jaundice starts at the head first and spreads to the chest, abdomen, arms and legs, and hands and feet, which are the last to be jaundiced.
2. Keep the newborn well hydrated to maintain blood volume.
3. Facilitate early, frequent feeding to hasten passage of meconium and encourage excretion of bilirubin.
4. Report to the PHCP any signs of jaundice in the first 24 hours of life and any abnormal signs and symptoms.
5. Prepare for phototherapy (bili-light or bili-blanket), and monitor the newborn closely during the treatment.

At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process.

D. Phototherapy

1. Description
   a. Phototherapy is use of light to reduce serum bilirubin levels in the newborn.
   b. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur.

2. Interventions
   a. Follow specific instructions for phototherapy and biliblanket care.
   b. Expose as much of the newborn’s skin as possible.
   c. Cover the genital area, and monitor the genital area for skin irritation or breakdown.
   d. Cover the newborn’s eyes with eye shields or patches; ensure that the eyelids are closed when shields or patches are applied.
   e. Remove the shields or patches at least once per shift (during a feeding time) to inspect the eyes for infection or irritation and to allow for eye contact and bonding with the parents.
   f. Measure the lamp energy output to ensure efficacy of the treatment (done with a special device known as a photometer).
   g. Monitor skin temperature closely.
   h. Increase fluids to compensate for water loss.
   i. Expect loose green stools.
   j. Monitor the newborn’s skin color with the fluorescent light turned off, every 4 to 8 hours.
   k. Monitor the skin for bronze baby
syndrome, a grayish brown discoloration of the skin, a complication of phototherapy.

1. Reposition the newborn every 2 hours; monitor the newborn closely.
2. Provide stimulation.
3. If treatment is done at home, teach the parents about care and indications of the need to notify the PHCP.
4. After treatment, continue monitoring for signs of hyperbilirubinemia, because rebound elevations can occur after therapy is discontinued.
5. Turn off the phototherapy lights before drawing a blood specimen for serum bilirubin levels, and do not leave the blood specimen uncovered under fluorescent lights (to prevent the breakdown of bilirubin in the blood specimen).

XVIII. Erythroblastosis Fetalis

A. Description

1. Erythroblastosis fetalis is the destruction of red blood cells that results from an antigen-antibody reaction.
2. The disorder is characterized by hemolytic anemia or hyperbilirubinemia.
3. Exchange of fetal and maternal blood occurs primarily when the placenta separates at birth (Fig. 27-5).
4. Antibodies are harmless to the mother but attach to the erythrocytes in the fetus and cause hemolysis.
5. Sensitization is rare with the first pregnancy and ABO incompatibility is usually less severe.

B. Assessment

1. Anemia
2. Jaundice that develops rapidly after birth and before 24 hours
3. Edema

C. Interventions

1. Administer Rh(D) immune globulin to the mother during the first 72 hours after birth if the Rh-negative mother delivers an Rh-positive fetus but remains unsensitized.
2. Assist with exchange transfusion after birth or intrauterine transfusion as prescribed.
3. The newborn’s blood is replaced with Rh-negative blood to stop the destruction of the newborn’s red blood cells; the Rh-negative blood is replaced with the...
newborn’s own blood gradually.
4. Provide support to the parents.

XIX. Sepsis
A. Description: Generalized infection resulting from the presence of bacteria in the blood, such as Group B streptococcal infection
B. Assessment
1. Pallor
2. Tachypnea, tachycardia
3. Poor feeding
4. Abdominal distention
5. Temperature instability
C. Interventions
1. Assess for periods of apnea or irregular respirations.
2. If apnea is present, stimulate by gently rubbing the chest or foot.
3. Administer oxygen as prescribed.
4. Monitor vital signs; assess for fever.
5. Maintain warmth in a radiant warmer.
6. Provide isolation as necessary.
7. Monitor intake and output, and obtain daily weight.
8. Monitor for diarrhea.
9. Assess feeding and sucking reflex, which may be poor.
10. Assess for jaundice.
11. Assess for irritability and lethargy.
12. Prepare for blood cultures and administer antibiotics as prescribed, and observe carefully for toxicity because a newborn’s liver and kidneys are immature.

XX. TORCH Infections (see Chapter 22)
XXI. Syphilis
A. Description
1. Syphilis is a sexually transmitted infection.
2. Congenital syphilis can result in premature birth, skin lesions, and abnormal skeletal development.
3. The causative organism, Treponema pallidum, a spirochete, is able to cross the placenta throughout pregnancy and infect the fetus, usually after 18 weeks’ gestation.
4. Risks include preterm birth, stillbirth, and low birth weight.
5. Congenital effects are irreversible and may include central nervous system damage and hearing loss.
B. Assessment
1. Hepatosplenomegaly
2. Joint swelling
3. Palmar rash and lesions (Fig. 27-6)
4. Anemia
5. Jaundice
6. Snuffles
7. Ascites
8. Pneumonitis
9. Cerebrospinal fluid changes

C. Interventions
1. Monitor the newborn for signs of syphilis.
2. Prepare the newborn for serological testing if prescribed.
3. Administer antibiotic therapy as prescribed.
4. Use standard precautions and drainage and secretion (contact) precautions with suspected congenital syphilis.
5. Wear gloves when handling the newborn until antibiotic therapy has been administered for 24 hours.
6. Provide psychological support to the mother, and provide instructions regarding follow-up care to the newborn.

XXII. Addicted Newborn

A. Description
1. A newborn can become passively addicted to drugs that have passed through the placenta.
2. Assessment findings and withdrawal times may vary depending on the specific addicting drug.
3. See also Fetal Alcohol Spectrum Disorders (FASDs) later.

B. Assessment
1. Irritability
2. Tremors
3. Hyperactivity and hypertonicity
4. Respiratory distress
5. Vomiting
6. High-pitched cry
7. Sneezing
8. Fever
9. Diarrhea
10. Excessive sweating
11. Poor feeding
12. Extreme sucking of fists
13. Seizures

C. Interventions
1. Monitor respiratory and cardiac status frequently.
2. Monitor temperature and vital signs.
3. Hold newborn firmly and close to the body during
feeding and when giving care.
4. Initiate seizure precautions (pad sides of the crib).
5. Provide small frequent feedings and allow a longer period for feeding.
6. Monitor intake and output.
7. Administer intravenous hydration if prescribed.
8. Protect the newborn’s skin from injury that can be caused by the constant rubbing from hyperactive jitters.
9. Swaddle the newborn.
10. Place the newborn in a quiet room and reduce stimulation.
11. Allow the mother to express feelings such as anxiety and guilt.
12. Refer the mother for treatment of the substance abuse problem.

XXIII. Fetal Alcohol Spectrum Disorders (FASDs)

A. Description
1. FASDs are a group of conditions caused by maternal alcohol use during pregnancy.
2. The disorders are a result of teratogenesis.
3. FASDs cause cognitive and physical delays.
4. Fetal alcohol syndrome is the most severe of the FASDs. The other disorders included in this category are alcohol-related neurodevelopmental disorder (ARND) and alcohol-related birth defects (ARBDs).

B. Assessment
1. Facial changes (Fig. 27-7)
   a. Short palpebral fissures
   b. Hypoplastic philtrum
   c. Short, upturned nose
   d. Flat midface
   e. Thin upper lip
   f. Low nasal bridge
2. Abnormal palmar creases
3. Respiratory distress (apnea, cyanosis)
4. Congenital heart disorders
5. Irritability and hypersensitivity to stimuli
6. Tremors
7. Poor feeding
8. Seizures

C. Interventions
1. Monitor for respiratory distress.
2. Position the newborn on the side to facilitate drainage of secretions; initiate seizure precautions.
3. Keep resuscitation equipment at the bedside.
5. Assess suck and swallow reflex.
6. Administer small feedings and burp well.
7. Suction as necessary.
8. Monitor intake and output.
9. Monitor weight and head circumference.
10. Decrease environmental stimuli.
11. Make referral to local early intervention system.

XXIV. Newborn of a Mother With Human Immunodeficiency Virus (HIV)

A. Description
1. The fetus of a mother who is positive for HIV antibody should be monitored closely throughout the pregnancy.
2. Serial ultrasound screenings should be done during pregnancy to identify IUGR.
3. Weekly nonstress testing after 32 weeks of gestation and biophysical profiles may be necessary during pregnancy.
4. Newborns born to HIV-positive mothers may test positive because the mother’s antibodies may persist in the newborn for 18 months after birth.
5. The use of antiviral medication, the reduction of newborn exposure to maternal blood and body fluids, and the early identification of HIV in pregnancy reduce the risk of transmission to the newborn.
6. All newborns born to HIV-positive mothers acquire maternal antibody to HIV infection, but not all acquire the infection.
7. The newborn may be asymptomatic for the first several months to years of life.

B. Transmission
1. Across placental barrier
2. During labor and birth
3. Breast milk (breast-feeding not done if the mother is HIV-positive; follow PHCP prescription)

C. Assessment
1. Possibly no outward signs at birth
2. Signs of immunodeficiency
3. Hepatomegaly
4. Splenomegaly
5. Lymphadenopathy
6. Impairment in growth and development

D. Interventions
1. Clean the newborn’s skin carefully before any invasive procedure, such as the administration of phytonadione, heel sticks, or venipunctures.
2. Circumcisions are not done on newborns with HIV-positive mothers until the newborn’s status is determined.
3. Newborn can room with mother if hospital policies allow.
4. All HIV-exposed newborns should be treated with medication to prevent infection by *Pneumocystis jiroveci*.
5. Antiretroviral medications may be administered as prescribed for the first 6 weeks of life or longer if prescribed.
6. Monitor for early signs of immunodeficiency, such as enlarged spleen or liver, lymphadenopathy, and impairment in growth and development.
7. Newborns at risk for HIV infection should be seen by the PHCP at birth and at 1 week, 2 weeks, 1 month, and 2 months of age.
8. Inform the mother that HIV culture is recommended at 1 month and after 4 months of age.

E. Immunizations

1. Immunizations with live vaccines, such as measles-mumps-rubella and varicella, should not be done until the newborn’s, infant’s, or child’s status is confirmed.
2. If infected, live vaccine will not be given.

Newborns at risk for HIV infection need to receive all recommended immunizations at the regular schedule; live vaccines are not administered until HIV status is determined.

XXV. Newborn of a Diabetic Mother

A. Description

1. Infant born to mother with type 1 or type 2 diabetes or gestational diabetes
2. Hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, birth trauma, and congenital anomalies may be present.

B. Assessment

1. Excessive size and weight as a result of excess fat and glycogen in the tissues
2. Edema or puffiness in the face and cheeks
3. Signs of hypoglycemia, such as twitching, apnea, difficulty in feeding, lethargy, seizures, and cyanosis
4. Hyperbilirubinemia
5. Signs of respiratory distress, such as tachypnea, cyanosis, retractions, grunting, and nasal flaring
C. Interventions
1. Monitor for signs of respiratory distress, birth trauma, and congenital anomalies.
2. Monitor bilirubin and blood glucose levels.
4. Feed the newborn soon after birth with breast milk or formula as prescribed.
5. Administer glucose intravenously to treat hypoglycemia if necessary and as prescribed.
7. Monitor for respiratory distress, tremors, or seizures.

XXVI. Hypoglycemia
A. Description
1. Hypoglycemia is an abnormally low level of glucose in the blood (< 45 mg/dL [< 2.5 mmol/L]).
2. Normal blood glucose reference interval is 45 to 60 mg/dL (2.5 to 3.4 mmol/L) in a 1-day-old newborn and 50 to 90 mg/dL (2.9 to 5.1 mmol/L) in a newborn older than 1 day (institutional values for normal newborn blood glucose levels vary).

B. Assessment
1. Increased respiratory rate
2. Twitching, nervousness, or tremors
3. Unstable temperature
4. Lethargy, apnea, seizures, cyanosis

C. Interventions
1. Prevent low blood glucose level through early feedings.
2. Administer formula orally or glucose intravenously as prescribed.
3. Monitor blood glucose levels as prescribed.
5. Monitor for apneic periods.
6. Assess for shrill or intermittent cries.
7. Evaluate lethargy and poor muscle tone.

XXVII. Hypothyroidism
A. Description: Hypothyroidism is a decrease in the production of thyroid hormone.

B. Assessment
1. Protruding or thick tongue
2. Dull look; swollen face
3. Decreased muscle tone
4. Laboratory results reveal low thyroid production

C. Interventions: Focus on thyroid replacement

XXVIII. Relief of Choking in an Infant
A. Description: Choking is also known as foreign body airway obstruction (FBAO).
B. Assessment

1. Signs of mild airway obstruction include good air exchange, ability to cough forcefully, and wheezing between coughs.
2. Signs of severe airway obstruction include poor or no air exchange, weak or ineffective cough or no cough, a high-pitched noise while inhaling or no noise, increased respiratory difficulty, cyanosis, and inability to cry.

C. Interventions

1. For mild obstruction, do not interfere with the infant’s own attempts to expel the object. Stay with them and continue to monitor. If the obstruction persists, activate the emergency response system and relieve the obstruction.
2. Severe obstruction must be relieved as soon as possible (see Priority Nursing Actions).

### Priority Nursing Actions

**Choking Infant**

1. Sit or kneel with the infant in your lap.
2. Remove clothing from the infant’s chest if easily removed.
3. Hold the infant face down with the head lower than the chest while resting on your forearm. The infant’s head and jaw should be supported with the hand. The forearm is rested on the thigh to support the infant (Fig. 27-8).
4. Deliver 5 back slaps between the infant’s shoulder blades using the heel of the other hand with sufficient force. Place free hand on infant’s back while supporting the back of the infant’s head with the palm of the hand. Cradle the infant between the 2 forearms. Turn the infant as a unit while supporting the head and neck.
5. Rest the forearm on the thigh while holding the infant face up. Deliver 5 chest thrusts in the middle of the chest over the lower half of the sternum at a rate of 1 per second with enough force to dislodge the foreign body.
6. Repeat the sequence until the object is removed or the infant becomes unresponsive.
7. If the infant becomes unresponsive, call for help and activate the emergency response system.
8. Begin cardiopulmonary resuscitation (CPR) while checking for a foreign body each time the airway is opened. Do not perform blind finger sweeps.

**Reference**

XXIX. Cardiopulmonary Resuscitation (CPR) Guidelines for Infants

A. Description: Infants include individuals who are 1 year of age or less. The basic life support (BLS) sequence for infants is very similar to that used for child and adult CPR. The main differences include the following:

1. Location of the pulse check is the brachial artery in infants.
2. Compression technique is to use 2 fingers for a single rescuer and to use a 2-thumb-encircling technique for 2 rescuers.
3. Compression depth should be one-third of the chest depth, which is approximately 1.5 inches or 4 cm.
4. The compression to ventilation ratio for 1 rescuer is 30:2; 2 rescuers is 15:2.
5. The emergency response system should be activated if the arrest is not witnessed and the rescuer is alone after providing 2 minutes of CPR; after 2 minutes the single rescuer can activate the emergency response system and get an automated external defibrillator.
6. The emergency response system should be activated and the automated external defibrillator should be retrieved before beginning CPR if the arrest is sudden and witnessed.

B. Refer to Chapter 52 for detailed information on the American Heart Association’s recommendations for the CPR sequence.

Effects of cold stress. When a newborn is stressed by cold, oxygen (O$_2$) consumption increases and pulmonary and peripheral vasoconstriction occur, decreasing O$_2$ uptake by the lungs and O$_2$ delivery to the tissues; anaerobic glycolysis increases; and there is a decrease in partial pressure of oxygen (P$_{O_2}$) and pH, leading to metabolic acidosis.

Box 27-1
Precautions to Prevent Infant Abduction

- All personnel must wear identification that is easily visible at all times.
- Teach parents to allow only hospital staff with proper identification to take their infants from them.
- Question anyone with a newborn near an exit or in an unusual part of the facility.
• Never leave a newborn unattended.
• Teach the parents that the newborn must be observed at all times.
• When the newborn is in the mother’s room, position the crib away from the doorway.
• Teach the parents home safety precautions; suggest that the parents not place announcements in the paper or signs in their yard that might alert an abductor that a new infant is in the home.

**FIG. 27-4** Correct attachment (latch-on) of a newborn at breast.
FIG. 27-5 Development of maternal sensitization to Rh antigens. **A,** Fetal Rh-positive erythrocytes enter the maternal system. Maternal anti-Rh antibodies are formed. **B,** Anti-Rh antibodies cross the placenta and attack fetal erythrocytes.

Practice Questions

269. The nurse assisted with the birth of a newborn. Which nursing action is most effective in preventing heat loss by evaporation?
   1. Warming the crib pad
   2. Closing the doors to the room
   3. Drying the infant with a warm blanket
   4. Turning on the overhead radiant warmer

270. The mother of a newborn calls the clinic and reports that when cleaning the umbilical cord, she noticed that the cord was moist and that discharge was present. What is the most appropriate nursing instruction for this mother?
   1. Bring the infant to the clinic.
   2. This is a normal occurrence and no further action is needed.
   3. Increase the number of times that the cord is cleaned per day.
   4. Monitor the cord for another 24 to 48 hours and call the clinic if the discharge continues.

271. The nurse in a neonatal intensive care unit (NICU) receives a telephone call to prepare for the admission of a 43-week gestation newborn with Apgar scores of 1 and 4. In planning for admission of this newborn, what is the nurse’s highest priority?
   1. Turn on the apnea and cardiorespiratory monitors.
   2. Connect the resuscitation bag to the oxygen outlet.
   3. Set up the intravenous line with 5% dextrose in water.
   4. Set the radiant warmer control temperature at 36.5° C (97.6° F).
272. The nurse is assessing a newborn after circumcision and notes that the circumcised area is red with a small amount of bloody drainage. Which nursing action is most appropriate?
1. Apply gentle pressure.
2. Reinforce the dressing.
3. Document the findings.
4. Contact the primary health care provider (PHCP).

273. The nurse in a newborn nursery is monitoring a preterm newborn for respiratory distress syndrome. Which assessment findings should alert the nurse to the possibility of this syndrome? Select all that apply.

- 1. Cyanosis
- 2. Tachypnea
- 3. Hypotension
- 4. Retractions
- 5. Audible grunts
- 6. Presence of a barrel chest

274. The postpartum nurse is providing instructions to the mother of a newborn with hyperbilirubinemia who is being breast-fed. The nurse should provide which instruction to the mother?
1. Feed the newborn less frequently.
2. Continue to breast-feed every 2 to 4 hours.
3. Switch to bottle-feeding the infant for 2 weeks.
4. Stop breast-feeding and switch to bottle-feeding permanently.

275. The nurse is assessing a newborn who was born to a mother who is addicted to drugs. Which findings should the nurse expect to note during the assessment of this newborn? Select all that apply.

- 1. Lethargy
- 2. Sleepiness
- 3. Irritability
- 4. Constant crying
- 5. Difficult to comfort
- 6. Cuddles when being held

276. The nurse notes hypotonia, irritability, and a poor sucking reflex in a full-term newborn on admission to the nursery. The nurse suspects fetal alcohol syndrome and is aware that which additional sign would be consistent with this syndrome?
1. Length of 19 inches
2. Abnormal palmar creases
3. Birth weight of 6 lb, 14 oz (3120 g)
4. Head circumference appropriate for gestational age

277. The nurse is creating a plan of care for a newborn diagnosed with fetal
alcohol syndrome. The nurse should include which priority intervention in the plan of care?

1. Allow the newborn to establish own sleep-rest pattern.
2. Maintain the newborn in a brightly lighted area of the nursery.
3. Encourage frequent handling of the newborn by staff and parents.
4. Monitor the newborn’s response to feedings and weight gain pattern.

278. The nurse administers erythromycin ointment (0.5%) to the eyes of a newborn and the mother asks the nurse why this is performed. Which explanation is best for the nurse to provide about neonatal eye prophylaxis?

1. Protects the newborn’s eyes from possible infections acquired while hospitalized.
2. Prevents cataracts in the newborn born to a woman who is susceptible to rubella.
3. Minimizes the spread of microorganisms to the newborn from invasive procedures during labor.
4. Prevents an infection called ophthalmia neonatorum from occurring after birth in a newborn born to a woman with an untreated gonococcal infection.

279. The nurse is preparing to care for a newborn receiving phototherapy. Which interventions should be included in the plan of care? Select all that apply.

☐ 1. Avoid stimulation.
☐ 2. Decrease fluid intake.
☐ 3. Expose all of the newborn’s skin.
☐ 5. Reposition the newborn every 2 hours.
☐ 6. Cover the newborn’s eyes with eye shields or patches.

280. The nurse creates a plan of care for a woman with human immunodeficiency virus (HIV) infection and her newborn. The nurse should include which intervention in the plan of care?

1. Monitoring the newborn’s vital signs routinely
2. Maintaining standard precautions at all times while caring for the newborn
3. Initiating referral to evaluate for blindness, deafness, learning problems, or behavioral problems
4. Instructing the breast-feeding mother regarding the treatment of the nipples with nystatin ointment

281. The nurse is planning care for a newborn of a mother with diabetes mellitus. What is the priority nursing consideration for this newborn?

1. Developmental delays because of excessive size
2. Maintaining safety because of low blood glucose levels
3. Choking because of impaired suck and swallow reflexes
4. Elevated body temperature because of excess fat and glycogen

282. Which statement reflects a new mother’s understanding of the teaching
about the prevention of newborn abduction?
1. “I will place my baby’s crib close to the door.”
2. “Some health care personnel won’t have name badges.”
3. “I will ask the nurse to attend to my infant if I am napping and my husband is not here.”
4. “It’s okay to allow the nurse assistant to carry my newborn to the nursery.”

283. The nurse prepares to administer a phytonadione (vitamin K) injection to a newborn, and the mother asks the nurse why her infant needs the injection. What best response should the nurse provide?
1. “Your newborn needs the medicine to develop immunity.”
2. “The medicine will protect your newborn from being jaundiced.”
3. “Newborns have sterile bowels, and the medicine promotes the growth of bacteria in the bowel.”
4. “Newborns are deficient in vitamin K, and this injection prevents your newborn from bleeding.”

**Answers**

269. **Answer:** 3

_Rationale:_ Evaporation of moisture from a wet body dissipates heat along with the moisture. Keeping the newborn dry by drying the wet newborn at birth prevents hypothermia via evaporation. Hypothermia caused by conduction occurs when the newborn is on a cold surface, such as a cold pad or mattress, and heat from the newborn’s body is transferred to the colder object (direct contact). Warming the crib pad assists in preventing hypothermia by conduction. Convection occurs as air moves across the newborn’s skin from an open door and heat is transferred to the air. Radiation occurs when heat from the newborn radiates to a colder surface (indirect contact).

_Test-Taking Strategy:_ Note the **strategic words**, most effective. Recalling that evaporation of moisture from a wet body dissipates heat along with the moisture will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Maternity: Newborn  
**Health Problem:** Newborn: Thermoregulation  
**Priority Concepts:** Caregiving; Thermoregulation  

270. **Answer:** 1

_Rationale:_ Signs of umbilical cord infection are moistness, oozing, discharge, and a reddened base around the cord. If signs of infection occur, the client should be instructed to notify the primary health care provider (PHCP). If these symptoms
occur, antibiotics may be necessary. Options 2, 3, and 4 are not the most appropriate nursing interventions for an umbilical cord infection as described in the question.

**Test-Taking Strategy:** Note the **strategic words**, most appropriate. Focus on the clinical manifestations provided in the question to assist in answering. Noting the word discharge in the question will assist in directing you to the option that indicates that the newborn needs to be seen by the PHCP.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Newborn

**Health Problem:** Newborn: Infections

**Priority Concepts:** Clinical Judgment; Infection

271. **Answer:** 2

**Rationale:** The highest priority on admission to the nursery for a newborn with a low Apgar score is the airway, which would involve preparing respiratory resuscitation equipment and oxygen. The remaining options are also important, although they are of lower priority. The newborn would be placed on an apnea and cardiorespiratory monitor. Setting up an intravenous line with 5% dextrose in water would provide circulatory support. The radiant warmer would provide an external heat source, which is necessary to prevent further respiratory distress.

**Test-Taking Strategy:** Note the **strategic words**, highest priority. This question asks you to prioritize care on the basis of information about a newborn’s condition. Use the ABCs—airway, breathing, and circulation. A method of planning for airway support is to have the resuscitation bag connected to an oxygen source.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Complex Care: Emergency Situations/Management

**Health Problem:** Newborn: Respiratory Problems

**Priority Concepts:** Clinical Judgment; Gas Exchange

272. **Answer:** 3

**Rationale:** The penis is normally red during the healing process after circumcision. A yellow exudate may be noted in 24 hours, and this is part of normal healing. The nurse would expect that the area would be red with a small amount of bloody drainage. Only if the bleeding were excessive would the nurse apply gentle pressure with a sterile gauze. If bleeding cannot be controlled, the blood vessel may need to be ligated, and the nurse would notify the PHCP. Because the findings identified in the question are normal, the nurse would document the assessment findings.

**Test-Taking Strategy:** Note the **strategic words**, most appropriate, and focus on the assessment findings in the question. This should assist in directing you to the correct
option, because this is a normal occurrence after circumcision.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Maternity: Newborn
Health Problem: Newborn: Circumcision
Priority Concepts: Clinical Judgment; Development

273. Answer: 1, 2, 4, 5

Rationale: A newborn infant with respiratory distress syndrome may present with clinical signs of cyanosis, tachypnea or apnea, nasal flaring, chest wall retractions, or audible grunts. Hypotension and a barrel chest are not clinical manifestations associated with respiratory distress syndrome.

Test-Taking Strategy: Focus on the subject, signs of respiratory distress syndrome. Eliminate hypotension, as this is not a finding associated with respiratory distress syndrome. Also, respiratory distress syndrome is an acute occurrence, and a barrel chest develops with a chronic condition. In addition, note the relationship between the diagnosis and the signs noted in the correct options.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Newborn
Health Problem: Newborn: Respiratory Problems
Priority Concepts: Gas Exchange; Perfusion

274. Answer: 2

Rationale: Hyperbilirubinemia is an elevated serum bilirubin level. At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process. Early and frequent feeding hastens the excretion of bilirubin. Breast-feeding should be initiated within 2 hours after birth and every 2 to 4 hours thereafter. The infant should not be fed less frequently. Switching to bottle-feeding for 2 weeks or stopping breast-feeding permanently is unnecessary.

Test-Taking Strategy: Eliminate options 3 and 4 because they are comparable or alike. These options discourage the continuation of breast-feeding and should be eliminated. From the remaining options, recalling the pathophysiology associated with hyperbilirubinemia will assist you in eliminating option 1.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Maternity: Newborn
Health Problem: Newborn: Hyperbilirubinemia
Priority Concepts: Cellular Regulation; Client Education
Rationale: A newborn of a woman who uses drugs is irritable. The infant is overloaded easily by sensory stimulation. The infant may cry incessantly and be difficult to console. The infant would hyperextend and posture rather than cuddle when being held. This infant is not lethargic or sleepy.

Test-Taking Strategy: Lethargy and sleepiness are comparable or alike in that they indicate hypoactivity of the newborn, and therefore can be eliminated. From the remaining options, recalling the pathophysiology associated with an infant born to a drug-addicted mother and that the newborn is irritable will assist you in eliminating that this infant will be easily comforted and cuddle when held.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Newborn
Health Problem: Newborn: Addicted Newborn
Priority Concepts: Addiction; Clinical Judgment

276. Answer: 2

Rationale: Fetal alcohol syndrome, a diagnostic category of fetal alcohol spectrum disorders (FASDs), is caused by maternal alcohol use during pregnancy. Features of newborns diagnosed with fetal alcohol syndrome include craniofacial abnormalities, intrauterine growth restriction, cardiac abnormalities, abnormal palmar creases, and respiratory distress. Options 1, 3, and 4 are normal assessment findings in the full-term newborn infant.

Test-Taking Strategy: Use knowledge regarding normal assessment findings in the full-term newborn infant to answer this question. Length, birth weight, and head circumference are comparable or alike in that all are physical measurements assessed on a newborn and represent normal findings in a full-term newborn.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Maternity: Newborn
Health Problem: Newborn: Addicted Newborn
Priority Concepts: Addiction; Clinical Judgment

277. Answer: 4

Rationale: Fetal alcohol syndrome, a diagnostic category delineated under fetal alcohol spectrum disorders (FASDs), is caused by maternal alcohol use during pregnancy. A primary nursing goal for the newborn diagnosed with fetal alcohol syndrome is to establish nutritional balance after birth. These newborns may exhibit hyperirritability, vomiting, diarrhea, or an uncoordinated sucking and swallowing ability. A quiet environment with minimal stimuli and handling would help
establish appropriate sleep-rest cycles in the newborn as well. Options 1, 2, and 3 are inappropriate interventions.

**Test-Taking Strategy:** Note the strategic word, priority. Think about the pathophysiology that occurs in a newborn with this condition. Also, use Maslow’s Hierarchy of Needs theory to direct you to the correct option. Remember that nutrition is a priority.

**Level of Cognitive Ability:** Creating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity: Newborn

**Health Problem:** Newborn: Addicted Newborn

**Priority Concepts:** Addiction; Clinical Judgment

278. **Answer:** 4

**Rationale:** Erythromycin ophthalmic ointment 0.5% is used as a prophylactic treatment for ophthalmia neonatorum, which is caused by the bacterium *Neisseria gonorrhoeae*. Preventive treatment of gonorrhea is required by law. Options 1, 2, and 3 are not the purposes for administering this medication to a newborn infant.

**Test-Taking Strategy:** Note the strategic word, best. Use knowledge of the purpose of administering erythromycin ophthalmic ointment to a newborn infant. Remember that this is done to prevent ophthalmia neonatorum.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Maternity: Newborn

**Health Problem:** Newborn: Infections

**Priority Concepts:** Health Promotion; Infection

279. **Answer:** 4, 5, 6

**Rationale:** Phototherapy (bili-light or bili-blanket) is the use of intense fluorescent light to reduce serum bilirubin levels in the newborn. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur. Interventions include exposing as much of the newborn’s skin as possible; however, the genital area is covered. The newborn’s eyes are also covered with eye shields or patches, ensuring that the eyelids are closed when shields or patches are applied. The shields or patches are removed at least once per shift to inspect the eyes for infection or irritation and to allow eye contact. The nurse measures the lamp energy output to ensure efficacy of the treatment (done with a special device known as a photometer), monitors skin temperature closely, and increases fluids to compensate for water loss. The newborn may have loose green stools and green-colored urine. The newborn’s skin color is monitored with the fluorescent light turned off every 4 to 8 hours and is monitored for bronze baby syndrome, a grayish brown discoloration of the skin. The newborn is repositioned every 2 hours, and stimulation
is provided. After treatment, the newborn is monitored for signs of hyperbilirubinemia because rebound elevations can occur after therapy is discontinued.

**Test-Taking Strategy:** Focus on the **subject**, phototherapy. Recalling that adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur will assist in determining the correct interventions.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Maternity: Newborn

**Health Problem:** Newborn: Hyperbilirubinemia

**Priority Concepts:** Cellular Regulation; Safety

280. **Answer:** 2

**Rationale:** An infant born to a mother infected with HIV must be cared for with strict attention to standard precautions. This prevents the transmission of HIV from the newborn, if infected, to others and prevents transmission of other infectious agents to the possibly immunocompromised newborn. Options 1 and 3 are not associated specifically with the care of a potentially HIV-infected newborn. Mothers infected with HIV should not breast-feed.

**Test-Taking Strategy:** Eliminate options 1 and 3 first because they are **comparable or alike** and are not associated specifically with the care of a potentially HIV-infected newborn. Recalling that HIV-infected mothers should not breast-feed will direct you to the correct option.

**Level of Cognitive Ability:** Creating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Maternity: Newborn

**Health Problem:** Newborn: Newborn of a Mother with HIV/AIDS

**Priority Concepts:** Infection; Safety

281. **Answer:** 2

**Rationale:** The newborn of a diabetic mother is at risk for hypoglycemia, so maintaining safety because of low blood glucose levels would be a priority. The newborn would also be at risk for hyperbilirubinemia, respiratory distress, hypocalcemia, and congenital anomalies. Developmental delays, choking, and an elevated body temperature are not expected problems.

**Test-Taking Strategy:** Note the **strategic word**, **priority**. Read each option thoroughly and eliminate options 1, 3, and 4 because they are **comparable or alike** in that newborns of diabetic mothers are not at risk for these problems. Also, note the relationship of the words **diabetes mellitus** in the question and the word **glucose** in the correct option.

**Level of Cognitive Ability:** Analyzing
Rationale: Precautions to prevent infant abduction include placing a newborn’s crib away from the door, transporting a newborn only in the crib and never carrying the newborn, expecting health care personnel to wear identification that is easily visible at all times, and asking the nurse to attend to the newborn if the mother is napping and no family member is available to watch the newborn (the newborn is never left unattended). If the mother states that she will ask the nurse to watch the newborn while she is sleeping, she has understood the teaching. Options 1, 2, and 4 are incorrect and indicate that the mother needs further teaching.

Test-Taking Strategy: Focus on the subject, that the client understands precautions to prevent infant abduction. Read each option carefully and select the option that provides protection to the infant. This will direct you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Safe and Effective Care Environment
Integrated Process: Teaching and Learning
Content Area: Maternity: Newborn
Health Problem: N/A
Priority Concepts: Client Education; Safety

Rationale: Phytonadione is necessary for the body to synthesize coagulation factors. It is administered to the newborn to prevent bleeding disorders. It also promotes liver formation of the clotting factors II, VII, IX, and X. Newborns are vitamin K-deficient because the bowel does not have the bacteria necessary to synthesize fat-soluble vitamin K. The normal flora in the intestinal tract produces vitamin K. The newborn’s bowel does not support the normal production of vitamin K until bacteria adequately colonize it. The bowel becomes colonized by bacteria as food is ingested. Vitamin K does not promote the development of immunity or prevent the infant from becoming jaundiced.

Test-Taking Strategy: Note the strategic word, best. Because immunity and jaundice are not related to the action of vitamin K, eliminate options 1 and 2. From the remaining options, recall the action of vitamin K to direct you to the correct option. Remember that vitamin K does not promote the growth of bacteria but is administered to prevent bleeding.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning

CHAPTER 28

Maternity and Newborn Medications

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Health Promotion, Safety

The Food and Drug Administration has initiated the Pregnancy and Lactation Labeling Rule (PLLR). This is a revision to the previous system that used Category A, B, C, D, and X. The PLLR provides more information on the risks and benefits of using medications during pregnancy. The PLLR also provides more information to assist the provider and pregnant mother to make informed decisions together, so as to not deter medication use during pregnancy when it is necessary.

I. Tocolytics
   A. Description: Tocolytics are medications that produce uterine relaxation and suppress uterine activity (Table 28-1).
   B. Uses: To halt uterine contractions and prevent preterm birth; dihydropyridine calcium channel blockers such as nifedipine and magnesium sulfate may be prescribed to achieve this goal. Terbutaline is another medication used for this effect.
   C. Adverse effects and contraindications
      1. See Table 28-1 for a description of adverse effects.
      2. Maternal contraindications include severe preeclampsia and eclampsia, active vaginal bleeding, intrauterine infection, cardiac disease, placental abruption, or poorly controlled diabetes.
      3. Fetal contraindications include estimated gestational age greater than 37 weeks, cervical dilation greater than 4 cm, fetal demise, lethal fetal anomaly, chorioamnionitis, acute fetal distress, and chronic intrauterine growth restriction.
   D. Interventions for the client receiving tocolytic therapy
      1. Position the client on her side to enhance placental perfusion and reduce pressure on the cervix.
      2. Monitor maternal vital signs, fetal status, and labor status frequently according to agency protocol.
      3. Monitor for signs of adverse effects to the medication.
      4. Monitor daily weight and input and output status, and
provide fluid intake as prescribed.
5. Offer comfort measures and provide psychosocial support to the client and family.
6. See Table 28-1 for interventions specific to each tocolytic medication.

II. Magnesium Sulfate

A. Description (Table 28-1)
1. Magnesium sulfate is a central nervous system depressant and antiseizure medication.
2. The medication causes smooth muscle relaxation.
3. The antidote is calcium gluconate.

B. Uses
1. Stopping preterm labor to prevent preterm birth, although it is less commonly used for this effect in practice
2. Preventing and controlling seizures in preeclamptic and eclamptic clients

C. Adverse effects and contraindications
1. Magnesium sulfate can cause respiratory depression, depressed reflexes, flushing, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.
2. Continuous intravenous (IV) infusion increases the risk of magnesium toxicity in the newborn.
3. Magnesium sulfate is stopped for delivery only if the mother is having a C-section.
4. Magnesium sulfate may be prescribed for the first 12 to 24 hours postpartum if it is used for preeclampsia.
5. High doses can cause loss of deep tendon reflexes, heart block, respiratory paralysis, and cardiac arrest.
6. The medication is contraindicated in clients with heart block, myocardial damage, or kidney failure.
7. The medication is used with caution in clients with kidney impairment.

D. Interventions
1. Monitor maternal vital signs, especially respirations, every 30 to 60 minutes.
2. Assess renal function and electrocardiogram for cardiac function.
3. Monitor magnesium levels every 6 hours or if signs and symptoms of toxicity are noted—the target range when used as a tocolytic agent is 4 to 7.5 mEq/L (2 to 3.75 mmol/L); if the magnesium level increases, notify
the obstetrician (OB).
4. Always administer by IV infusion via an infusion monitoring device; carefully monitor the dose being administered, and follow agency protocol for administration.
5. Keep calcium gluconate readily accessible in case of a magnesium sulfate overdose, because calcium gluconate antagonizes the effect of magnesium sulfate.
6. Monitor deep tendon reflexes hourly for signs of developing toxicity.
7. Test the patellar reflex or knee jerk reflex before administering a repeat parenteral dose (used as an indicator of central nervous system depression; suppressed reflex may be a sign of impending respiratory arrest) (Table 28-2).
8. Patellar reflex must be present and respiratory rate must be greater than 12 breaths per minute (or as designated by agency protocol) before each parenteral dose.
9. Monitor intake and output hourly; output should be maintained at 25 to 30 mL/hr because the medication is eliminated through the kidneys.

Monitor a client receiving magnesium sulfate intravenously closely for signs of toxicity. Call the OB if respirations are less than 12 breaths per minute, indicating respiratory depression, or if any other adverse effects occur.

III. Betamethasone and Dexamethasone
A. Description: Corticosteroids that increase the production of surfactant to accelerate fetal lung maturity and reduce the incidence or severity of respiratory distress syndrome
B. Use: For a client in preterm labor between 28 and 32 weeks’ gestation whose labor can be inhibited for 48 hours without jeopardizing the mother or fetus
C. Adverse effects and contraindications
   1. May decrease the mother’s resistance to infection
   2. Pulmonary edema secondary to sodium and fluid retention can occur.
   3. Elevated blood glucose levels can occur in a client with diabetes mellitus.
D. Interventions
   1. Monitor maternal vital signs and lung sounds, and for edema.
2. Monitor mother for signs of infection.
3. Monitor white blood cell count.
4. Monitor blood glucose levels.
5. Administer by deep intramuscular injection.

IV. Opioid Analgesics

A. Description
1. Used to relieve moderate to severe pain associated with labor
2. Administered by intramuscular or IV route
3. Regular use of opioids during pregnancy may produce withdrawal symptoms in the newborn (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, and seizures).
4. Antidotes for opioids
   a. Naloxone is usually the treatment of choice because it rapidly reverses opioid toxicity; the dose may need to be repeated every few hours until opioid concentrations have decreased to nontoxic levels.
   b. These medications can cause withdrawal in opioid-dependent clients.

B. Hydromorphone hydrochloride
1. Can cause dizziness, nausea, vomiting, sedation, decreased blood pressure, decreased respirations, diaphoresis, flushed face, and urinary retention
2. May be prescribed to be administered with an antiemetic such as promethazine to prevent nausea
3. High dosages may result in respiratory depression, skeletal muscle flaccidity, cold clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.
4. Used cautiously in clients delivering preterm newborns
5. Not administered in advanced labor (typically once transition phase during stage 1 of labor has been reached); if the medication is not adequately removed from the fetal circulation, respiratory depression can occur.

C. Fentanyl and sufentanil can cause respiratory depression, dizziness, drowsiness, hypotension, urinary retention, and fetal narcosis and distress; sufentanil is used less commonly than fentanyl.

863
D. Butorphanol tartrate and nalbuphine
1. May be prescribed depending on OB preference
2. Can cause confusion, sedation, sweating, nausea, vomiting, hypotension, and sinusoidal-like fetal heart rhythm
3. Use with caution in a client with preexisting opioid dependency, because these medications can precipitate withdrawal symptoms in the client and the newborn.

E. Interventions
1. Monitor vital signs, particularly respiratory status; if respirations are 12 breaths per minute or less, withhold the medication and contact the OB.
2. Monitor the fetal heart rate and characteristics of uterine contractions.
3. Monitor for blood pressure changes (hypotension); maintain the client in a recumbent position (elevate the hip with a wedge pillow or other device).
4. Record the level of pain relief.
5. Monitor the bladder for distention and retention.
6. Have the antidote naloxone readily accessible, especially if delivery is expected to occur during peak medication absorption time.

Obtain a medication history before the administration of an opioid analgesic. Some medications may be contraindicated if the client has a history of opioid dependency, because these medications can precipitate withdrawal symptoms in the client and newborn.

V. Prostaglandins (Box 28-1)
A. Description
1. Ripen the cervix, making it softer and causing it to begin to dilate and efface
2. Stimulate uterine contractions
3. Administered vaginally

B. Uses
1. Preinduction cervical ripening (ripening of the cervix before the induction of labor when the Bishop score is ≤ 4)
2. Induction of labor
3. Induction of abortion (abortifacient agent)

C. Adverse effects and contraindications
1. Gastrointestinal effects, including diarrhea, nausea, vomiting, and stomach cramps
2. Fever, chills, flushing, headache, and hypotension
3. Uterine tachysystole (≥ 12 uterine contractions in 20 minutes without an alteration in the fetal heart rate pattern)
4. Hyperstimulation of the uterus
5. Fetal passage of meconium
6. Contraindications (Box 28-2)

D. Interventions

1. Monitor maternal vital signs, fetal heart rate pattern, and status of pregnancy, including indications for cervical ripening or the induction of labor, contraindications, adverse effects, signs of labor or impending labor, and the Bishop score (see Chapter 23, Table 23-2 for information about the Bishop score).
2. Have the client void before administration of medication and then have her maintain a supine with lateral tilt or side-lying position for 30 to 60 minutes (gel) up to 2 hours (insert) after administration, depending on the medication administered.
3. Treatment is discontinued when the Bishop score is 8 or more (cervix ripens) or an effective contraction pattern is established (3 or more contractions in a 10-minute period); in addition, signs of adverse effects indicate that the treatment needs to be discontinued.
4. Follow agency protocol for the induction of labor if cervical ripening has occurred and labor has not begun; oxytocin may be initiated if needed 6 to 12 hours after discontinuation of prostaglandin therapy.

VI. Uterine Stimulants (Oxytocics): Oxytocin

A. Description

1. Oxytocin stimulates the smooth muscle of the uterus and increases the force, frequency, and duration of uterine contractions.
2. Oxytocin also promotes milk letdown.
3. For induction of labor, oxytocin is administered by the IV route (other route of administration is intramuscular); if injecting intramuscularly, aspiration is necessary to avoid injection into a blood vessel.
4. Magnesium sulfate should be readily accessible in case relaxation of the myometrium is necessary.
5. Minimal cervical change usually is noted until the active phase of labor is achieved.

B. Uses

1. Induces or augments labor
2. Controls postpartum bleeding
3. Manages an incomplete abortion

C. Adverse effects and contraindications

1. Adverse effects include allergies, dysrhythmias, changes in blood pressure, uterine rupture, and water intoxication.
2. Oxytocin may produce uterine hypertonicity, resulting in fetal or maternal adverse effects.
3. High doses may cause hypotension, with rebound hypertension.
4. Postpartum hemorrhage can occur and should be monitored for, because the uterus may become atonic when the medication wears off.
5. Oxytocin should not be used in a client who cannot deliver vaginally or in a client with hypertonic uterine contractions; it is also contraindicated in a client with active genital herpes.

D. Interventions

1. Monitor maternal vital signs (every 15 minutes), especially the blood pressure and heart rate, weight, intake and output, level of consciousness, and lung sounds.
2. Monitor frequency, duration, and force of contractions and resting uterine tone every 15 minutes.
3. Monitor fetal heart rate every 15 minutes, and notify the OB if significant changes occur; use of an internal fetal scalp electrode may be prescribed.
4. Administered by IV infusion via an infusion monitoring device (most common route); prescribed additive solution is piggybacked at the port nearest the point of venous insertion (prescribed additive solution may be normal saline, lactated Ringer’s, or 5% dextrose in water).
5. Carefully monitor the dose being administered; do not leave the client unattended while the oxytocin is infusing.
6. Administer oxygen if prescribed.
7. Monitor for hypertonic contractions or a nonreassuring fetal heart rate and notify the OB if these occur (see Priority Nursing Actions).
8. Stop the medication if uterine hyperstimulation or a nonreassuring fetal heart rate occurs; turn the client on her side, increase the IV rate of the prescribed additive solution, and administer oxygen via face mask.
10. Have emergency equipment readily accessible.
11. Document the dose of the medication and the time the medication was started, increased, maintained, and discontinued; document the client’s response.
12. Keep the client and family informed of the client’s progress.
13. Calculating an oxytocin drip (Box 28-3)

**Priority Nursing Actions**

**Hypertonic Contractions or a Nonreassuring Fetal Heart Rate during Oxytocin Infusion**

1. Stop the oxytocin infusion.
2. Turn the client on her side, stay with the client, and ask another nurse to contact the obstetrician (OB).
3. Increase the flow rate of the intravenous (IV) solution that does not contain the oxytocin.
4. Administer oxygen, 8 to 10 L/minute, by snug face mask.
5. Assess maternal vital signs; fetal heart rate and patterns; and frequency, duration, and force of contractions.

**Reference**

Lowdermilk et al. (2016), p. 784.

VII. Medications Used to Manage Postpartum Hemorrhage (Box 28-4)

A. Ergot alkaloid

1. Description
   
a. Methylergonovine maleate is an ergot alkaloid.
   
b. Directly stimulates uterine muscle, increases the force and frequency of contractions, and produces a firm tetanic contraction of the uterus
   
c. Can produce arterial vasoconstriction and vasospasm of the coronary arteries
   
d. An ergot alkaloid is administered postpartum and is not administered before the birth of the placenta.

2. Uses
   
a. Postpartum hemorrhage
   
b. Postabortal hemorrhage resulting from atony or involution

3. Adverse effects and contraindications
   
a. Can cause nausea, uterine
cramping, bradycardia, dysrhythmias, myocardial infarction, and severe hypertension
b. High doses are associated with peripheral vasospasm or vasoconstriction, angina, miosis, confusion, respiratory depression, seizures, or unconsciousness; uterine tetany can occur.
c. Contraindicated during pregnancy and in clients with significant cardiovascular disease, peripheral vascular disease, or hypertension

4. Interventions

a. Monitor maternal vital signs, weight, intake and output, level of consciousness, and lung sounds.
b. Monitor the blood pressure closely; the medication produces vasoconstriction, and if an increase in blood pressure is noted, withhold the medication and notify the OB.
c. Monitor uterine contractions (frequency, strength, and duration).
d. Assess for chest pain, headache, shortness of breath, itching, pale or cold hands or feet, nausea, diarrhea, and dizziness.
e. Assess the extremities for color, warmth, movement, and pain.
f. Assess vaginal bleeding.
g. Notify the OB if chest pain or other adverse effects occur.
h. Administer analgesics as prescribed; they may be required because the medication produces painful uterine contractions.

Check the client’s blood pressure before administering methylergonovine maleate. This medication can cause severe hypertension and is contraindicated in a client with hypertension.

B. Prostaglandin F₂α: carboprost tromethamine
1. Description: Contracts the uterus
2. Uses: Postpartum hemorrhage
3. Adverse effects and contraindications
   a. Can cause headache, nausea, vomiting, diarrhea, fever, tachycardia, and hypertension
   b. Contraindicated if the client has asthma

4. Interventions
   a. Monitor vital signs.
   b. Monitor vaginal bleeding and uterine tone.

C. Oxytocin: See Section VI on uterine stimulants.

VIII. Rh(D) Immune Globulin

A. Description
   1. Prevention of anti-Rh(D) antibody formation is most successful if the medication is administered twice, at 28 weeks' gestation and again within 72 hours after delivery.
   2. Rh(D) immune globulin also should be administered within 72 hours after potential or actual exposure to Rh-positive blood and must be given with each subsequent exposure or potential exposure to Rh-positive blood.

B. Use: To prevent isoimmunization in Rh-negative clients who are negative for Rh antibodies and exposed or potentially exposed to Rh-positive red blood cells by amniocentesis, chorionic villus sampling, transfusion, termination of pregnancy, abdominal trauma, or bleeding during pregnancy or the birth process

C. Adverse effects and contraindications
   1. Elevated temperature
   2. Tenderness at the injection site
   3. Contraindicated for Rh-positive clients
   4. Contraindicated in clients with a history of systemic allergic reactions to preparations containing human immunoglobulins
   5. Note: Not administered to a newborn

D. Interventions
   1. Administer to the client by intramuscular injection at 28 weeks’ gestation and within 72 hours after delivery.
   2. Never administer by the IV route.

Rh(D) immune globulin is of no benefit when the client has developed a positive antibody titer to the Rh antigen.
IX. Rubella Vaccine

A. Given subcutaneously before hospital discharge to a nonimmune postpartum client
B. Administered if the rubella titer is less than 1:8
C. Adverse effects: Transient rash, hypersensitivity
D. Contraindicated in a client with a hypersensitivity to eggs (check with the OB regarding administration)
E. Interventions
   1. Assess for allergy to duck eggs and notify the OB before administration if an allergy exists.
   2. Question administration if the client or other family members are immunocompromised.

X. Lung Surfactants

A. Description
   1. Replenish surfactant and restore surface activity to the lungs to prevent and treat respiratory distress syndrome.
   2. Administered to the newborn by the intratracheal route.
B. Use: To prevent or treat respiratory distress syndrome in premature newborns
C. Adverse effects and contraindications
   1. Adverse effects include transient bradycardia and oxygen desaturation; pulmonary hemorrhage, mucus plugging, and endotracheal tube reflux can also occur.
   2. Surfactants are administered with caution in newborns at risk for circulatory overload.
D. Interventions
   1. Instill surfactant through the catheter inserted into the newborn’s endotracheal tube; avoid suctioning for at least 2 hours after administration.
   2. Monitor for bradycardia and decreased oxygen saturation during administration.
   3. Monitor respiratory status and lung sounds and for signs of adverse effects.

XI. Eye Prophylaxis for the Newborn

A. Description
   1. Preventive eye treatment against ophthalmia neonatorum in the newborn is required by law in the
United States.
2. Ophthalmic forms of erythromycin are prescribed because it is bacteriostatic and bactericidal and provides prophylaxis against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*.

**B. Use:** As a prophylactic measure to protect against *N. gonorrhoeae* and *C. trachomatis*

**C. Interventions**
1. Clean the newborn’s eyes before instilling the medication.
2. Do not flush the eyes after instillation.

**Instillation of eye medication can be delayed for 1 hour after birth to facilitate eye contact and parent-newborn attachment and bonding.**

**XII. Phytonadione**

**A. Description**
1. The newborn is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on phytonadione (also known as vitamin K), which is not synthesized until intestinal bacteria are present.
2. Newborns are deficient in phytonadione for the first 5 to 8 days of life because of the lack of intestinal bacteria.

**B. Use:** Prophylaxis and treatment of hemorrhagic disease of the newborn

**C. Adverse effect:** Can cause hyperbilirubinemia in the newborn (occurrence is rare)

**D. Interventions**
1. Protect the medication from light.
2. Administer during the early newborn period.
3. Administer by the intramuscular route in the lateral aspect of the middle third of the vastus lateralis muscle of the thigh.
4. Monitor for bruising at the injection site and for bleeding from the cord.
5. Monitor for jaundice and monitor the bilirubin level because, although rare, the medication can cause hyperbilirubinemia in the newborn.

**XIII. Hepatitis B Vaccine, Recombinant**

**A. Description:** Given intramuscularly to the newborn before discharge home

**B. Use:** Recommended for all newborns to prevent hepatitis B
C. Adverse effects: Rash, fever, erythema, and pain at injection site

D. Interventions

1. Parental consent must be obtained.
2. Administer intramuscularly in the lateral aspect of the middle third of the vastus lateralis muscle.
3. If the infant was born to a mother positive for hepatitis B surface antigen, hepatitis B immune globulin should be given within 12 hours of birth in addition to hepatitis B vaccine. Then follow the regularly scheduled hepatitis B vaccination schedule.
4. Document immunization administration on a vaccination card so that the parents have a record that the vaccine was administered.

XIV. Contraceptives

A. Description

1. These medications contain a combination of estrogen and a progestin or a progestin alone and come in several different forms, including oral and intramuscular preparations and implants.
2. Estrogen-progestin combinations suppress ovulation and change the cervical mucus, making it difficult for sperm to enter.
3. Medications that contain only progestins are less effective than the combined medications.
4. Contraceptives usually are taken for 21 consecutive days and stopped for 7 days; the administration cycle is then repeated.
5. Contraceptives provide reversible prevention of pregnancy.
6. Contraceptives are useful in controlling irregular or excessive menstrual cycles.
7. Risk factors associated with the development of complications related to the use of contraceptives include smoking, obesity, and hypertension.
8. Contraceptives are contraindicated in women with hypertension, thromboembolic disease, cerebrovascular or coronary artery disease, estrogen-dependent cancers, and pregnancy.
9. Contraceptives should be avoided with the use of hepatotoxic medications.
10. Contraceptives interfere with the activity of
bromocriptine mesylate and anticoagulants and increase the toxicity of tricyclic antidepressants.

11. Contraceptives may alter blood glucose levels.
12. Antibiotics may decrease the absorption and effectiveness of oral contraceptives.

B. Side and adverse effects
   1. Breakthrough bleeding
   2. Excessive cervical mucus formation
   3. Breast tenderness
   4. Hypertension
   5. Nausea, vomiting

C. Interventions
   1. Monitor vital signs and weight.
   2. Instruct the client in the administration of the medication (it may take up to 1 week for full contraceptive effect to occur when the medication is begun).
   3. Instruct the client with diabetes mellitus to monitor blood glucose levels carefully.
   4. Instruct the client to report signs of thromboembolic complications.
   5. Instruct the client to notify the OB if vaginal bleeding or menstrual irregularities occur or if pregnancy is suspected.
   6. Advise the client to use an alternative method of birth control when taking antibiotics because these may decrease absorption of the oral contraceptive.
   7. Instruct the client to perform breast self-examination regularly and about the importance of annual physical examinations.
   8. Contraceptive patches
      a. Designed to be worn for 3 weeks and removed for a 1-week period
      b. Applied on clean, dry, intact skin on the buttocks, abdomen, upper outer arm, or upper torso
      c. Instruct the client to peel away half of the backing on a patch, apply the sticky surface to the skin, remove the other half of the backing, and then press down on the patch with the palm for 10 seconds.
      d. Instruct the client to change the patch weekly, using a new location for each patch.
e. If the patch falls off and remains off for less than 24 hours (such as when the client is sleeping or is unaware that it has fallen off), it can be reapplied if still sticky, or it can be replaced with a new patch.

f. If the patch is off for more than 24 hours, a new 4-week cycle must be started immediately.

9. Vaginal ring
   a. Inserted into the vagina by the client, left in place for 3 weeks, and removed for 1 week
   b. The medication is absorbed through mucous membranes of the vagina.
   c. Removed rings should be wrapped in a foil pouch and discarded, not flushed down the toilet.

10. Implants and depot injections provide long-acting forms of birth control, from 3 months to 5 years in duration.

   If the client decides to discontinue the contraceptive to become pregnant, recommend that the client use an alternative form of birth control for 2 months after discontinuation to ensure more complete excretion of hormonal agents before conception.

XV. Fertility Medications (Box 28-5)
   A. Description
      1. Fertility medications act to stimulate follicle development and ovulation in functioning ovaries and are combined with human chorionic gonadotropin to maintain the follicles once ovulation has occurred.
      2. Fertility medications are contraindicated in the presence of primary ovarian dysfunction, thyroid or adrenal dysfunction, ovarian cysts, pregnancy, or idiopathic uterine bleeding.
      3. Fertility medications should be used with caution in clients with thromboembolic or respiratory disease.
   B. Side and adverse effects
1. Risk of multiple births and birth defects
2. Ovarian overstimulation (abdominal pain, distention, ascites, pleural effusion)
3. Headache, irritability
4. Fluid retention and bloating
5. Nausea, vomiting
6. Uterine bleeding
7. Ovarian enlargement
8. Gynecomastia
9. Rash
10. Orthostatic hypotension
11. Febrile reactions

C. Interventions

1. Instruct the client regarding administration of the medication.
2. Provide a calendar of treatment days and instructions on when intercourse should occur to increase therapeutic effectiveness of the medication.
3. Provide information about the risks and hazards of multiple births.
4. Instruct the client to notify the OB if signs of ovarian overstimulation occur.
5. Inform the client about the need for regular follow-up for evaluation.

Prostaglandins
Prostaglandin E₁: Misoprostol intravaginal tablet
Prostaglandin E₂: Dinoprostone vaginal gel, insert, or suppository

Box 28-2
Contraindications to the Use of Prostaglandins

- Active cardiac, hepatic, pulmonary, or kidney disease
- Acute pelvic inflammatory disease
- Clients in whom vaginal delivery is not indicated
- Fetal malpresentation
- History of cesarean section or major uterine surgery
- History of difficult labor or traumatic labor
- Hypersensitivity to prostaglandins
- Maternal fever or infection
- Nonreassuring fetal heart rate pattern
- Placenta previa or unexplained vaginal bleeding
- Regular progressive uterine contractions
- Significant cephalopelvic disproportion

Box 28-3
Calculating an Oxytocin Dose

Prescription: Oxytocin 2 milliunits (mU)/minute
Available: 20 units (U) in 1000 mL 5% dextrose in Water (D5W)

How many mL per hour?
Steps for calculating:

1. Do you need to convert? Yes, you need to change mU to U
2. What has been prescribed? Oxytocin 2 mU/minute
3. What do you have available? 1000 mL D5W containing 20 U oxytocin
4. Set up formula:

Convert:
How many mU are in 1 U? There are 1000 mU in 1 U.
If there are 1000 mU in 1 U, how many units in 2 mU?
**Answer:** 0.002 U in 2 mU

Now use the standard formula for calculation.

\[ \frac{\text{Prescribed / Available} \times \text{Volume}}{1000 \text{ mU}} = \frac{0.002 \text{ U}}{20 \text{ mU}} \times 1000 \text{ mL} = 0.1 \text{ mL} \]

Now, determine how many milliliters should be given in 1 hour if the prescription is for 0.1 mL/minute. 0.1 mL/minute × 60 minutes (1 hour) = 6 mL/hr

**Note:** Many electronic pumps allow for programming in units or milliunits per minute, eliminating the need to calculate the milliliters per hour, and this practice is recommended if available because medications are programmed in the pumps with dosage safeguards. If a dose that is too low or too high is programmed into the pump, the pump will flag or will not allow the nurse to proceed with administration.

**Box 28-4**

**Medications Used to Manage Postpartum Hemorrhage**

- Methylergonovine
- Oxytocin
- Prostaglandin F\(_{2\alpha}\): Carboprost tromethamine

**Box 28-5**
Fertility Medications

▪ Chorionic gonadotropin
▪ Clomiphene citrate
▪ Follitropin alfa
▪ Follitropin beta
▪ Menotropins
▪ Urofollitropin
▪ Cetrorelix
▪ Ganirelix

Practice Questions

284. The nurse is monitoring a client who is receiving oxytocin to induce labor. Which assessment findings should cause the nurse to immediately discontinue the oxytocin infusion? Select all that apply.

1. Fatigue
2. Drowsiness
3. Uterine hyperstimulation
4. Late decelerations of the fetal heart rate
5. Early decelerations of the fetal heart rate

285. A pregnant client is receiving magnesium sulfate for the management of pre eclampsia. The nurse determines that the client is experiencing toxicity from the medication if which findings are noted on assessment? Select all that apply.

1. Proteinuria of 3 +
2. Respirations of 10 breaths per minute
3. Presence of deep tendon reflexes
4. Urine output of 20 mL in an hour
5. Serum magnesium level of 4 mEq/L (2 mmol/L)

286. The nurse asks a nursing student to describe the procedure for administering erythromycin ointment to the eyes of a newborn. Which student statement indicates that further teaching is needed about administration of the eye medication?

1. “I will flush the eyes after instilling the ointment.”
2. “I will clean the newborn’s eyes before instilling ointment.”
3. “I need to administer the eye ointment within 1 hour after delivery.”
4. “I will instill the eye ointment into each of the newborn’s
conjunctival sacs.”

287. A client in preterm labor (31 weeks) who is dilated to 4 cm has been started on magnesium sulfate and contractions have stopped. If the client’s labor can be inhibited for the next 48 hours, the nurse anticipates a prescription for which medication?
   1. Nalbuphine
   2. Betamethasone
   3. Rh\(_o\)(D) immune globulin
   4. Dinoprostone vaginal insert

288. Methylergonovine is prescribed for a woman to treat postpartum hemorrhage. Before administration of methylergonovine, what is the priority assessment?
   1. Uterine tone
   2. Blood pressure
   3. Amount of lochia
   4. Deep tendon reflexes

289. The nurse is preparing to administer exogenous surfactant to a premature infant who has respiratory distress syndrome. The nurse prepares to administer the medication by which route?
   1. Intradermal
   2. Intratracheal
   3. Subcutaneous
   4. Intramuscular

290. An opioid analgesic is administered to a client in labor. The nurse assigned to care for the client ensures that which medication is readily accessible should respiratory depression occur?
   1. Naloxone
   2. Morphine sulfate
   3. Betamethasone
   4. Hydromorphone hydrochloride

291. Rh\(_o\)(D) immune globulin is prescribed for a client after delivery, and the nurse provides information to the client about the purpose of the medication. The nurse determines that the woman understands the purpose if the woman states that it will protect her next baby from which condition?
   1. Having Rh-positive blood
   2. Developing a rubella infection
   3. Developing physiological jaundice
   4. Being affected by Rh incompatibility

292. Methylergonovine is prescribed for a client with postpartum hemorrhage. Before administering the medication, the nurse should contact the obstetrician who prescribed the medication if which condition is documented in the client’s medical history?
   1. Hypotension
   2. Hypothyroidism
   3. Diabetes mellitus
   4. Peripheral vascular disease

293. The nurse is monitoring a client in preterm labor who is receiving intravenous magnesium sulfate. The nurse should monitor for which adverse
effects of this medication? Select all that apply.

☐ 1. Flushing
☐ 2. Hypertension
☐ 3. Increased urine output
☐ 4. Depressed respirations
☐ 5. Extreme muscle weakness
☐ 6. Hyperactive deep tendon reflexes

**Answers**

284. **Answer:** 3, 4

**Rationale:** Oxytocin stimulates uterine contractions and is a pharmacological method to induce labor. Late decelerations, a nonreassuring fetal heart rate pattern, is an ominous sign indicating fetal distress. Oxytocin infusion must be stopped when any signs of uterine hyperstimulation, late decelerations, or other adverse effects occur. Some obstetricians prescribe the administration of oxytocin in 10-minute pulsed infusions rather than as a continuous infusion. This pulsed method, which is more like endogenous secretion of oxytocin, is reported to be effective for labor induction and requires significantly less oxytocin use. Drowsiness and fatigue may be caused by the labor experience. Early decelerations of the fetal heart rate are a reassuring sign and do not indicate fetal distress.

**Test-Taking Strategy:** Note the strategic word, immediately. Focus on the subject, an adverse effect of oxytocin. Options 1 and 2 are comparable or alike and can be eliminated first. From the remaining options, recalling that early decelerations of the fetal heart rate are a reassuring sign will direct you to the correct options.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Implementation
**Content Area:** Pharmacology: Maternity/Newborn: Uterine Stimulants
**Health Problem:** Maternity: Fetal Distress/Demise
**Priority Concepts:** Perfusion; Reproduction
**References:** Lowdermilk et al. (2016), p. 784.

285. **Answer:** 2, 4

**Rationale:** Magnesium toxicity can occur from magnesium sulfate therapy. Signs of magnesium sulfate toxicity relate to the central nervous system depressant effects of the medication and include respiratory depression, loss of deep tendon reflexes, and a sudden decline in fetal heart rate and maternal heart rate and blood pressure. Respiratory rate below 12 breaths per minute is a sign of toxicity. Urine output should be at least 25 to 30 mL per hour. Proteinuria of 3+ is an expected finding in a client with preeclampsia. Presence of deep tendon reflexes is a normal and expected
finding. Therapeutic serum levels of magnesium are 4 to 7.5 mEq/L (2 to 3.75 mmol/L).

**Test-Taking Strategy:** Focus on the subject, magnesium toxicity. Eliminate option 3 first because it is a normal finding. Next, eliminate option 5, knowing that the therapeutic serum level of magnesium is 4 to 7.5 mEq/L (2 to 3.75 mmol/L). From the remaining options, recalling that proteinuria of 3+ would be noted and expected in a client with preeclampsia will direct you to the correct options.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology: Maternity/Newborn: Tocolytics

**Health Problem:** Maternity: Gestational hypertension/preeclampsia and eclampsia

**Priority Concepts:** Perfusion; Reproduction

**Reference:** McKinney et al. (2018), pp. 539, 544.

286. **Answer:** 1

**Rationale:** Eye prophylaxis protects the newborn against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*. The eyes are not flushed after instillation of the medication because the flush would wash away the administered medication. Options 2, 3, and 4 are correct statements regarding the procedure for administering eye medication to the newborn.

**Test-Taking Strategy:** Note the strategic words, further teaching is needed. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Eliminate options 3 and 4 first because they are comparable or alike and relate to instilling the eye medication. From the remaining options, visualize the effect of each. This will direct you to the correct option.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Pharmacology: Maternity/Newborn: Eye Prophylaxis for the newborn

**Health Problem:** Newborn: Infections

**Priority Concepts:** Health Promotion; Infection

287. **Answer:** 2

**Rationale:** Betamethasone, a glucocorticoid, is given to increase the production of surfactant to stimulate fetal lung maturation. It is administered to clients in preterm labor at 28 to 32 weeks of gestation if the labor can be inhibited for 48 hours. Nalbuphine is an opioid analgesic. Rh\(_o\)(D) immune globulin is given to Rh-negative clients to prevent sensitization. Dinoprostone vaginal insert is a prostaglandin given to ripen and soften the cervix and to stimulate uterine contractions.

**Test-Taking Strategy:** Focus on the subject, a client at 31 weeks’ gestation. Recall that the preterm infant is at risk for respiratory distress syndrome because of immaturity and the inability to produce surfactant. Next, recalling the actions of the
medications in the options and that betamethasone is used to increase the production of surfactant will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pharmacology: Maternity/Newborn: Lung Surfactant

**Health Problem:** Maternity: Preterm Labor

**Priority Concepts:** Gas Exchange; Perfusion

288. **Answer:** 2

**Rationale:** Methylergonovine, an ergot alkaloid, is used to prevent or control postpartum hemorrhage by contracting the uterus. Methylergonovine causes continuous uterine contractions and may elevate the blood pressure. A priority assessment before the administration of the medication is to check the blood pressure. The obstetrician needs to be notified if hypertension is present. Although options 1, 3, and 4 may be components of the postpartum assessment, blood pressure is related specifically to the administration of this medication.

**Test-Taking Strategy:** Note the *strategic word, priority.* Eliminate options 1 and 3 first because they are comparable or alike and related to one another. To choose from the remaining options, use the **ABCs—airway, breathing, and circulation.** Blood pressure is a method of assessing circulation.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology: Maternity/Newborn: Ergot alkaloids

**Health Problem:** Maternity: Postpartum uterine problems

**Priority Concepts:** Clotting; Reproduction

289. **Answer:** 2

**Rationale:** Respiratory distress syndrome is a serious lung disorder caused by immaturity and the inability to produce surfactant, resulting in hypoxia and acidosis. It is common in premature infants and may be due to lung immaturity as a result of surfactant deficiency. The mainstay of treatment is the administration of exogenous surfactant, which is administered by the intratracheal route. Options 1, 3, and 4 are not routes of administration for this medication.

**Test-Taking Strategy:** Focus on the **subject,** route of administration for exogenous surfactant. Note the relationship between the diagnosis, *respiratory distress syndrome,* and the correct option, **intratracheal.**

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pharmacology: Maternity/Newborn: Lung Surfactant

**Health Problem:** Newborn: Respiratory Problems
**Priority Concepts:** Development; Gas Exchange  
**References:** Lowdermilk et al. (2016), p. 826.

**290. Answer:** 1

**Rationale:** Opioid analgesics may be prescribed to relieve moderate to severe pain associated with labor. Opioid toxicity can occur and cause respiratory depression. Naloxone is an opioid antagonist, which reverses the effects of opioids and is given for respiratory depression. Morphine sulfate and hydromorphone hydrochloride are opioid analgesics. Betamethasone is a corticosteroid administered to enhance fetal lung maturity.

**Test-Taking Strategy:** Focus on the subject, the antidote for respiratory depression. Eliminate options 2 and 4 first because they are comparable or alike and are opioid analgesics. Next, eliminate option 3, knowing that this medication is a corticosteroid.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Pharmacology: Maternity/Newborn: Opioid analgesics  
**Health Problem:** N/A  
**Priority Concepts:** Gas Exchange; Safety  
**References:** Lowdermilk et al. (2016), p. 395.

**291. Answer:** 4

**Rationale:** Rh incompatibility can occur when an Rh-negative mother becomes sensitized to the Rh antigen. Sensitization may develop when an Rh-negative woman becomes pregnant with a fetus who is Rh positive. During pregnancy and at delivery, some of the fetus’s Rh-positive blood can enter the maternal circulation, causing the mother’s immune system to form antibodies against Rh-positive blood. Administration of Rh\(_o\)(D) immune globulin prevents the mother from developing antibodies against Rh-positive blood by providing passive antibody protection against the Rh antigen.

**Test-Taking Strategy:** Note the subject, the purpose of Rh\(_o\)(D) immune globulin. Noting the relationship between the name of the medication, Rh\(_o\)(D) immune globulin, and the word incompatibility in the correct option will direct you to this option.

**Level of Cognitive Ability:** Evaluating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Evaluation  
**Content Area:** Pharmacology: Maternity/Newborn: Rho (D) Immune Globulin  
**Health Problem:** Newborn: Erythroblastosis fetalis  
**Priority Concepts:** Health Promotion; Reproduction  
**Reference:** Lowdermilk et al. (2016), p. 494.

**292. Answer:** 4
**Rationale:** Methylergonovine is an ergot alkaloid used to treat postpartum hemorrhage. Ergot alkaloids are contraindicated in clients with significant cardiovascular disease, peripheral vascular disease, hypertension, preeclampsia, or eclampsia. These conditions are worsened by the vasoconstrictive effects of the ergot alkaloids. Options 1, 2, and 3 are not contraindications related to the use of ergot alkaloids.

**Test-Taking Strategy:** Focus on the subject, the purpose, action, and contraindications of methylergonovine. Recalling that ergot alkaloids produce vasoconstriction will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pharmacology: Maternity/Newborn: Ergot alkaloids

**Health Problem:** Maternity: Postpartum uterine problems

**Priority Concepts:** Collaboration; Safety

293. **Answer:** 1, 4, 5

**Rationale:** Magnesium sulfate is a central nervous system depressant and relaxes smooth muscle, including the uterus. It is used to halt preterm labor contractions and is used for preeclamptic clients to prevent seizures. Adverse effects include flushing, depressed respirations, depressed deep tendon reflexes, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.

**Test-Taking Strategy:** Focus on the subject, adverse effects of magnesium sulfate. Recalling that this medication is a central nervous system depressant and relaxes smooth muscle will assist you in choosing the correct options.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pharmacology: Maternity/Newborn: Tocolytics

**Health Problem:** Maternity: Gestational hypertension/preeclampsia and eclampsia

**Priority Concepts:** Perfusion; Reproduction

**References:** Lowdermilk et al. (2016), pp. 663-664.
Introduction

Pyramid to Success

Pyramid Points focus on growth and development, safety, and age-appropriate measures to ensure a safe and hazard-free environment for the child; on protection of the child and the prevention of accidents; and on acute health problems that can occur in children. Preventive pediatric health care and well-check schedules are a focus along with nutrition, specific feeding techniques, positioning techniques, and interventions that will provide and maintain adequate airway, breathing, and circulation patterns in the child. In addition, neglect and/or abuse of the child is a focus. On the NCLEX-RN® examination, be alert to the age of the child if the age is presented in a question. If an age is presented in the question, think about the specific growth and development characteristics of the age group to answer the question correctly.

Client Needs: Learning Objectives

Safe and Effective Care Environment

Communicating with interprofessional health care team members
Considering issues related to informed consent regarding minors
Delegating care safely
Ensuring environmental safety, including home safety and personal safety, related to the developmental age of the child
Establishing priorities
Instituting measures related to the spread and control of infectious agents, particularly communicable diseases
Maintaining confidentiality
Preventing errors and accidents
Protecting the child and other contacts to prevent illness
Providing continuity of care
Providing protective measures
Upholding parent and child rights

Health Promotion and Maintenance

Ensuring that immunization schedules are up to date
Focusing on developmental stages when planning care
Performing physical assessment techniques specific to the pediatric client
Preventing disease in the pediatric population
Providing health promotion programs for the pediatric client such as preventive pediatric health care programs and well-check schedules
Providing instructions to the child and parents regarding care at home

**Psychosocial Integrity**

Assessing the child for neglect and/or abuse
Communicating with the pediatric client
Considering concepts of family dynamics when planning care
Considering cultural, religious, and spiritual beliefs when planning care
Considering end-of-life issues and grief and loss in the pediatric population
Identifying family and support systems for the child
Providing play therapies

**Physiological Integrity**

Following medication administration procedures
Following nutritional guidelines for the pediatric population
Identifying comfort measures appropriate for the child
Maintaining sensitivity for intrusive procedures needed for the pediatric client
Managing childhood health problems
Monitoring elimination patterns
Monitoring for age-appropriate normal body structure and function
Monitoring for infectious diseases of the pediatric client
Monitoring for responses to treatments
Providing for consistent rest and sleep patterns
Responding to medical emergencies
CHAPTER 29

Integumentary Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Infection; Tissue Integrity

I. Eczema (Dermatitis)
   A. Description
      1. Superficial inflammatory process involving primarily the epidermis; there are many types, some of which include atopic dermatitis, contact dermatitis, and stasis dermatitis.
      2. Associated with family history of the disorder, allergies, asthma, or allergic rhinitis
      3. The major goals of management are to relieve pruritus, lubricate the skin, reduce inflammation, and prevent or control secondary infections.
   B. Forms of eczema (Box 29-1)
   C. Assessment
      1. Redness
      2. Scaliness
      3. Itching
      4. Minute papules (firm, elevated, circumscribed lesions < 1 cm in diameter) and vesicles (similar to papules but fluid-filled)
      5. Weeping, oozing, and crusting of lesions
      6. Lesions can occur on scalp and face (infants), creases of elbows and knees, neck, wrists, ankles, or creases between the buttocks and legs.
   D. Interventions
      1. Baths and moisturizers are important; bathing water should be tepid and bath should be limited to 5 to 10 minutes, and the skin should be moisturized immediately after the bath; a thick cream or ointment should be used, such as petroleum jelly.
      2. If topical medications are prescribed, they should be
applied within 3 minutes after the bath.
3. Antihistamines and topical corticosteroids may be prescribed; corticosteroids are applied in a thin layer and are rubbed into the area thoroughly.
4. Antibiotics may be prescribed if secondary infections occur.
5. Avoid exposure to skin irritants such as irritating soaps, detergents, fabric softeners, diaper wipes, and powder.
6. Cool, wet compresses applied for short periods may help soothe the skin and alleviate itching; pat skin dry between cooling treatments.
7. Prevent or minimize scratching; keep nails short and clean, and place gloves or cotton socks over the hands.
8. Eliminate conditions that increase itching, such as wet diapers, excessive bathing, ambient heat, woolen clothes or blankets, and rough fabrics or furry stuffed animals; exposure to latex should also be avoided.
9. Instruct parents to wash clothing in a mild detergent and rinse thoroughly; putting the clothes through a second complete wash cycle without detergent minimizes the residue remaining on the fabric.
10. Instruct parents about measures to prevent skin infections.
11. Instruct parents to monitor lesions for signs of infection (honey-colored crusts with surrounding erythema) and to seek immediate medical intervention if such signs are noted.

II. Impetigo
A. Description

1. Impetigo is a contagious bacterial infection of the skin caused by β-hemolytic streptococci or staphylococci or both; it occurs most commonly during hot, humid months.
2. Impetigo can occur because of poor hygiene; it can be a primary infection or occur secondarily at a site that has been injured or sustained an insect bite, or at a site that was originally a rash, such as atopic dermatitis or poison ivy or poison oak.
3. The most common sites of infection are on the face and around the mouth, and then on the hands, neck, and
extremities.

4. The lesions begin as vesicles or pustules surrounded by edema and redness (a pustule is similar to a vesicle except that its fluid content is purulent).

5. The lesions progress to an exudative and crusting stage; after the crusting of the lesions, the initially serous vesicular fluid becomes cloudy, and the vesicles rupture, leaving honey-colored crusts covering ulcerated bases.

B. Assessment (Fig. 29-1)
1. Blisters and crusts
2. Erythema
3. Pruritus
4. Burning
5. Secondary lymph node involvement can be present

C. Interventions
1. Institute contact isolation; also use standard precautions and implement agency-specific isolation procedures for the hospitalized child; strict hygiene practices are important, because impetigo is a highly contagious condition.
2. Apply topical antibiotic ointments with a clean/sterile cotton swab without touching the tube opening with fingers or skin, and instruct parents in the ointment and swab use; the infection is still communicable for 24 to 48 hours beyond initiation of antibiotic treatment.
3. Cover lesions with gauze bandages and tape to prevent the spread of infection.
4. Assist the child with daily bathing with antibacterial soap, as prescribed.
5. Apply warm water compresses to the lesions 2 or 3 times daily, followed by mild soap and water rinse to soften crusts for removal and to promote healing.
6. Oral antibiotics may be prescribed if there is no response to topical antibiotic treatment; it is extremely important to comply with the prescribed antibiotic regimen, because secondary infections such as glomerulonephritis may result if the infectious agent is of a streptococcal type that can affect the nephrons.
7. To prevent skin cracking, apply emollients and instruct parents in the use of emollients.
8. Instruct parents in the methods to prevent the spread of the infection, especially careful hand-
9. Inform parents that the child needs to use separate towels, linens, and eating utensils and dishes.

10. Inform parents that all linens and clothing used by the child should be washed with detergent in hot water separately from the linens and clothing of other household members.

III. Pediculosis capitis (Lice)
   A. Description
      1. *Pediculosis capitis* refers to an infestation of the hair and scalp with lice.
      2. The most common sites of involvement are the occipital area, behind the ears at the nape of the neck, and occasionally the eyebrows and eyelashes.
      3. The female louse lays her eggs (nits) on the hair shaft, close to the scalp; the incubation period is 7 to 10 days.
      4. Lice can survive for 48 hours away from the host; nits shed in the environment can hatch in 7 to 10 days.
      5. Head lice live and reproduce only on humans and are transmitted by direct and indirect contact, such as sharing of brushes, hats, towels, and bedding.
      6. All contacts of the infested child, especially siblings, should be examined for lice infestation and referred for treatment as appropriate.

   B. Assessment (*Box 29-2*)

   C. Interventions
      1. Use a pediculicide product as prescribed; follow package instructions for timing the application and for contraindications for use in children (most products used to treat pediculosis cannot be used on children younger than 6 months of age).
      2. Daily removal of nits with an extra-fine-tooth metal nit comb should be done as a control measure after use of the pediculicide product (gloves should be worn for removal of nits); hairbrushes or combs should be discarded or soaked in boiling water for 10 minutes.
      3. Instruct parents that siblings may also need treatment; grooming items should not be shared, and a single comb or brush should be used for each individual child.
      4. Instruct parents that bedding and clothing used by the child for the previous 2 days before diagnosis should...
be laundered in hot water with detergent and dried in a hot dryer for 20 minutes; bedding and clothing needs to be changed daily and laundered.
5. Instruct parents that nonessential bedding and clothing can be stored in a tightly sealed plastic bag for 2 weeks and then washed.
6. Instruct parents to seal toys that cannot be washed or dry-cleaned in a plastic bag for 2 weeks.
7. Instruct parents that furniture and carpets need to be vacuumed frequently and that the dust bag from the vacuum should be discarded after vacuuming.
8. Teach the child not to share clothing, headwear, brushes, and combs.
9. Lice on the eyelashes or eyebrows may need to be removed manually.

IV. Scabies

A. Description
1. Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite).
2. Scabies is endemic among schoolchildren and institutionalized populations as a result of close personal contact.
3. Incubation period
   a. The female mite burrows into the epidermis, lays eggs, and dies in the burrow after 4 to 5 weeks.
   b. The eggs hatch in 3 to 5 days, and larvae mature and complete their life cycle.
4. Infectious period: During the entire course of the infestation

B. Assessment

*Scabies is transmitted by close personal contact with an infected person.*
*Household members and contacts of an infected child need to be treated simultaneously.*

C. Interventions
1. Topical application of a scabicide is needed to kill the mites.
2. Various products are available, and a prescription is needed for the product.
3. One product known as lindane shampoo should not be used in children younger than 2 years because of the risk of neurotoxicity and seizures; all other products have contraindications regarding their use,
and it is critical to know these contraindications.

4. Instruct parents in the application of the scabicide, because each product has different application methods; the scabicide is not applied to the face or head, only from the neck down.

5. When permethrin is prescribed, it is applied to cool dry skin at least 30 minutes after bathing; the cream is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of the feet (avoid contact with the eyes), left on the skin for 8 to 14 hours, and then removed by bathing; a repeat treatment may be necessary.

6. Instruct the parents about the importance of frequent hand washing.

7. Instruct the parents that all clothing, bedding, and pillowcases used by the child need to be changed daily, washed in hot water with detergent, dried in a hot dryer, and ironed before reuse; this process should continue for at least 1 week.

8. Instruct parents that nonwashable toys and other items should be sealed in plastic bags for at least 4 days.

9. Anti-itch topical treatment may be necessary, and antibiotics may be prescribed if a secondary infection develops.

V. Burn Injuries (see Priority Nursing Actions)

Priority Nursing Actions

A Major Burn Injury in the Child

1. Stop the burning process.
2. Assess for a patent airway.
3. Begin resuscitation measures if necessary using CAB—compressions, airway, and breathing.
4. Remove burned clothing and jewelry.
5. Cover the wound(s) with a clean cloth at the site of injury (sterile dressings on arrival to the health care facility).
6. Keep the child warm.
7. Transport the child to the emergency department.

Reference

A. Pediatric considerations

1. Very young children who have been burned severely have a higher mortality rate than older children and
adults with comparable burns.
2. Lower burn temperatures and shorter exposure to heat can cause a more severe burn in a child than in an adult, because a child’s skin is thinner.
3. The degree of pain experienced by the child and the ability to communicate it are different than in an adult with the same exposure.
4. Severely burned children are at increased risk for fluid and heat loss, dehydration, and metabolic acidosis compared with adults.
5. The higher proportion of body fluid to body mass in children increases the risk of cardiovascular problems.
6. Burns involving more than 10% of the total body surface area require some form of fluid resuscitation.
7. Infants and children are at increased risk for protein and calorie deficiency because they have smaller muscle mass and less body fat than adults.
8. Scarring is more severe in a child; disturbed body image is a distinct issue for a child or adolescent, especially as growth continues.
9. An immature immune system presents an increased risk of infection for infants and young children.
10. A delay in growth may occur after a burn.

B. Extent of burn injury
1. The rule of nines, used for adults with burn injuries, gives an inaccurate estimate in children because of the difference in body proportions between children and adults.
2. In a pediatric client, the extent of the burn is expressed as a percentage of the total body surface area, using age-related charts (Fig. 29-3).

C. Fluid replacement therapy

To determine adequacy of fluid resuscitation, vital signs (especially heart rate), urine output, adequacy of capillary filling, and sensorium status are assessed.
1. Fluid replacement is necessary during the initial 24-hour period after burn injury because of the fluid shifts that occur as a result of the injury.
2. Several formulas are available to calculate the child’s fluid needs, and the formula used depends on the primary healthcare provider’s preference.
3. Crystalloid solutions are likely to be prescribed during the initial phase of therapy; colloid solutions such as
albumin, Plasma-Lyte (combined electrolyte solution), or fresh-frozen plasma are useful in maintaining plasma volume.

**Box 29-1**

**Forms of Eczema**

**Infantile:** Usually begins at 2 to 6 months of age and decreases in incidence with aging; spontaneous remission may occur by 3 years

**Childhood:** May follow the infantile form; occurs at 2 to 3 years of age

**Preadolescent and Adolescent:** Begins at about 12 years of age and may continue into the early adult years or indefinitely

**FIG. 29-1** Impetigo contagiosa. (From Weston, Lane, 2007.)
Box 29-2  
Assessment Findings: Pediculosis Capitis (Lice)

- Child scratches scalp excessively.
- Pruritus is caused by the crawling insect and insect saliva on the skin.
- Nits (white eggs) are observable on the hair shaft (it is important to differentiate nits from lint or dandruff, which flakes away easily).
- Adult lice are difficult to see and appear as small tan or grayish specks, which may crawl quickly.

Box 29-3  
Assessment Findings: Scabies

- Pruritic papular rash
- Burrows into the skin (fine grayish red lines that may be difficult to see)

**FIG. 29-2** Scabies rash on an infant. (From Calen et al., 1993. Courtesy Dr. Steve Estes.)
Practice Questions

294. The nurse is monitoring a child with burns during treatment. Which assessment provides the most accurate guide to determine the adequacy of fluid resuscitation?
   1. Skin turgor
   2. Level of edema at burn site
   3. Adequacy of capillary filling
   4. Amount of fluid tolerated in 24 hours

295. The mother of a 3-year-old child arrives at a clinic and tells the nurse that the child has been scratching the skin continuously and has developed a rash. The nurse assesses the child and suspects the presence of scabies. The nurse bases this suspicion on which finding noted on assessment of the child’s skin?
   1. Fine grayish red lines
   2. Purple-colored lesions
   3. Thick, honey-colored crusts
   4. Clusters of fluid-filled vesicles

296. Permethrin is prescribed for a child with a diagnosis of scabies. The nurse should give which instruction to the parents regarding the use of this treatment?
   1. Apply the lotion to areas of the rash only.
2. Apply the lotion and leave it on for 6 hours.
3. Avoid putting clothes on the child over the lotion.
4. Apply the lotion to cool, dry skin at least 30 minutes after bathing.

297. The school nurse has provided an instructional session about impetigo to parents of the children attending the school. Which statement, if made by a parent, indicates a need for further instruction?
   1. “It is extremely contagious.”
   2. “It is most common in humid weather.”
   3. “Lesions most often are located on the arms and chest.”
   4. “It might show up in an area of broken skin, such as an insect bite.”

298. The clinic nurse is reviewing the health care provider’s prescription for a child who has been diagnosed with scabies. Lindane has been prescribed for the child. The nurse questions the prescription if which is noted in the child’s record?
   1. The child is 18 months old.
   2. The child is being bottle-fed.
   3. A sibling is using lindane for the treatment of scabies.
   4. The child has a history of frequent respiratory infections.

299. A topical corticosteroid is prescribed by the health care provider for a child with contact dermatitis (eczema). Which instruction should the nurse give the parent about applying the cream?
   1. Apply the cream over the entire body.
   2. Apply a thick layer of cream to affected areas only.
   3. Avoid cleansing the area before application of the cream.
   4. Apply a thin layer of cream and rub it into the area thoroughly.

300. The school nurse is performing pediculosis capitis (head lice) assessments. Which assessment finding indicates that a child has a “positive” head check for lice?
   1. Maculopapular lesions behind the ears
   2. Lesions in the scalp that extend to the hairline or neck
   3. White flaky particles throughout the entire scalp region
   4. White sacs attached to the hair shafts in the occipital area

301. The nurse caring for a child who sustained a burn injury plans care based on which pediatric considerations associated with this injury? Select all that apply.
   1. Scarring is less severe in a child than in an adult.
   2. A delay in growth may occur after a burn injury.
   3. An immature immune system presents an increased risk of infection for infants and young children.
   4. Fluid resuscitation is unnecessary unless the burned area is more than 25% of the total body surface area.
   5. The lower proportion of body fluid to body mass in a child increases the risk of cardiovascular problems.
6. Infants and young children are at increased risk for protein and calorie deficiency, because they have smaller muscle mass and less body fat than adults.

Answers

294. Answer: 3

**Rationale:** Parameters such as vital signs (especially heart rate), urinary output volume, adequacy of capillary filling, and state of sensorium determine adequacy of fluid resuscitation. Although options 1, 2, and 4 may provide some information related to fluid volume, in a burn injury, and from the options provided, adequacy of capillary filling is most accurate.

**Test-Taking Strategy:** Note the **strategic word,** **most.** Use the **ABCs—airway, breathing, and circulation**—to assist in directing you to the correct option.

**Level of Cognitive Ability:** Evaluating
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Evaluation
**Content Area:** Pediatrics: Integumentary
**Health Problem:** Pediatric-Specific: Burns
**Priority Concepts:** Evidence; Fluids and Electrolytes

295. Answer: 1

**Rationale:** Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite). Scabies appears as burrows or fine, grayish red, thread-like lines. They may be difficult to see if they are obscured by excoriation and inflammation. Purple-colored lesions may indicate various disorders, including systemic conditions. Thick, honey-colored crusts are characteristic of impetigo or secondary infection in eczema. Clusters of fluid-filled vesicles are seen in herpesvirus infection.

**Test-Taking Strategy:** Focus on the **subject,** clinical manifestations of scabies. Think about the characteristic of this parasitic skin disorder. Recalling that scabies infestation produces burrows will assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Pediatrics: Integumentary
**Health Problem:** Pediatric-Specific: Skin Inflammation/Infection
**Priority Concepts:** Infection; Tissue Integrity

296. Answer: 4

**Rationale:** Permethrin is massaged thoroughly and gently into all skin surfaces
(not just the areas that have the rash) from the head to the soles of the feet. Care should be taken to avoid contact with the eyes. The lotion should not be applied until at least 30 minutes after bathing and should be applied only to cool, dry skin. The lotion should be kept on for 8 to 14 hours, and then the child should be given a bath. The child should be clothed during the 8 to 14 hours of treatment contact time.

**Test-Taking Strategy:** Option 3 can be eliminated because the child should be clothed. Eliminate option 1 next because of the closed-ended word, “only,” in this option. From the remaining options, recalling the procedure for the application of this lotion will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Integumentary

**Health Problem:** Pediatric-Specific: Skin Inflammation/Infection

**Priority Concepts:** Client Education; Tissue Integrity

297. **Answer:** 3

**Rationale:** Impetigo is a contagious bacterial infection of the skin caused by β-hemolytic streptococci or staphylococci, or both. Impetigo is most common during hot, humid summer months. Impetigo may begin in an area of broken skin, such as an insect bite or atopic dermatitis. Impetigo is extremely contagious. Lesions usually are located around the mouth and nose but may be present on the hands and extremities.

**Test-Taking Strategy:** Note the strategic words, need for further instruction. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Think about the pathophysiology associated with impetigo. Knowledge regarding the cause and manifestations of impetigo will direct you to the correct option.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Integumentary

**Health Problem:** Pediatric-Specific: Skin Inflammation/Infection

**Priority Concepts:** Client Education; Infection

298. **Answer:** 1

**Rationale:** Lindane is a pediculicide product that may be prescribed to treat scabies. It is contraindicated for children younger than 2 years because they have more permeable skin, and high systemic absorption may occur, placing the children at risk for central nervous system toxicity and seizures. Lindane also is used with caution in children between the ages of 2 and 10 years. Siblings and other household members should be treated simultaneously. Options 2 and 4 are unrelated to the use of lindane. Lindane is not recommended for use by a breast-feeding woman because
the medication is secreted into breast milk.

**Test-Taking Strategy:** Focus on the subject, contraindications of lindane. Recall the concepts related to the body surface area of children and an 18-month-old, and medication administration. These concepts will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Analysis  
**Content Area:** Pediatrics: Integumentary  
**Health Problem:** Pediatric-Specific: Skin Inflammation/ Infection  
**Priority Concepts:** Clinical Judgment; Safety  

299. **Answer:** 4

**Rationale:** Contact dermatitis is a superficial inflammatory process involving primarily the epidermis. A topical corticosteroid may be prescribed and should be applied sparingly (thin layer) and rubbed into the area thoroughly. The affected area should be cleaned gently before application. A topical corticosteroid should not be applied over extensive areas. Systemic absorption is more likely to occur with extensive application.

**Test-Taking Strategy:** Focus on the subject, application of a topical corticosteroid. Eliminate option 3 first because it does not make sense not to clean an affected area. Eliminate option 1 because medicated cream should be applied only to areas that are affected. Eliminate option 2 because of the word *thick.*

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Pediatrics: Integumentary  
**Health Problem:** Pediatric-Specific: Skin Inflammation/ Infection  
**Priority Concepts:** Client Education; Tissue Integrity  

300. **Answer:** 4

**Rationale:** Pediculosis capitis is an infestation of the hair and scalp with lice. The nits are visible and attached firmly to the hair shaft near the scalp. The occiput is an area in which nits can be seen. Maculopapular lesions behind the ears or lesions that extend to the hairline or neck are indicative of an infectious process, not pediculosis. White flaky particles are indicative of dandruff.

**Test-Taking Strategy:** Focus on the subject, the characteristics of pediculosis capitis. Option 3 can be eliminated first, because white flaky particles are indicative of dandruff. Recalling that in this infestation nit sacs attach to the hair shaft will direct you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Integumentary

902
Health Problem: Pediatric-Specific: Skin Inflammation/Infection
Priority Concepts: Clinical Judgment; Infection

301. Answer: 2, 3, 6

Rationale: Pediatric considerations in the care of a burn victim include the following: Scarring is more severe in a child than in an adult. A delay in growth may occur after a burn injury. An immature immune system presents an increased risk of infection for infants and young children. The higher proportion of body fluid to body mass in a child increases the risk of cardiovascular problems. Burns involving more than 10% of total body surface area require some form of fluid resuscitation. Infants and young children are at increased risk for protein and calorie deficiencies because they have smaller muscle mass and less body fat than adults.

Test-Taking Strategy: Focus on the subject, pediatric considerations in the care of a child who has sustained a burn injury. To answer correctly, read each option carefully and think about the physiology of a child related to body size.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Planning
Content Area: Pediatrics: Integumentary
Health Problem: Pediatric-Specific: Burns
Priority Concepts: Development; Tissue Integrity
I. Sickle Cell Anemia
   A. Description
   1. Sickle cell anemia constitutes a group of diseases termed hemoglobinopathies, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S.
   2. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain.
   3. Risk factors include having parents heterozygous for hemoglobin S or being of African American descent.
   4. For screening purposes, the sickle turbidity test (Sickledex) is frequently used because it can be performed on blood from a fingerstick and yields accurate results in 3 minutes. However, if the test result is positive, hemoglobin (Hgb) electrophoresis is necessary to distinguish between children with the trait and those with the disease.
   5. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell.
   6. Insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow (Fig. 30-1).
   7. The clinical manifestations occur primarily as a result of obstruction caused by sickled red blood cells and increased red blood cell destruction.
   8. Situations that precipitate sickling include fever, dehydration, and emotional or physical stress; any condition that increases the need for oxygen or alters the transport of oxygen can result in sickle cell crisis (acute exacerbation).
   9. Sickle cell crises are acute exacerbations of the disease,
which vary considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, hyperhemolytic crisis, and aplastic crisis.

10. The sickling response is reversible under conditions of adequate oxygenation and hydration; after repeated sickling, the cell becomes permanently sickled.

11. An interprofessional approach to care is needed, and care focuses on the prevention (preventing exposure to infection and maintaining normal hydration) and treatment (hydration, oxygen, pain management, and bed rest) of the crisis.

B. Assessment of the crisis (Box 30-1)

C. Interventions

1. Maintain adequate hydration and blood flow through oral and intravenously (IV) administered fluids. Electrolyte replacement is also provided as needed; without adequate hydration, pain will not be controlled.

2. Administer oxygen and blood transfusions as prescribed to increase tissue perfusion; exchange transfusions, which reduce the number of circulating sickle cells and the risk of complications, may also be prescribed.

3. Administer analgesics as prescribed (around the clock).

4. Assist the child to assume a comfortable position so that the child keeps the extremities extended to promote venous return; elevate the head of the bed no more than 30 degrees, avoid putting strain on painful joints, and do not raise the knee gatch of the bed.

5. Encourage consumption of a high-calorie, high-protein diet, with folic acid supplementation.

6. Administer antibiotics as prescribed to prevent infection.

7. Monitor for signs of complications, including increasing anemia, decreased perfusion, and shock (mental status changes, pallor, vital sign changes).

8. Instruct the child and parents about the early signs and symptoms of crisis and the measures to prevent crisis.

9. Ensure that the child receives pneumococcal and meningococcal vaccines and an annual influenza
vaccine, because of susceptibility to infection secondary to functional asplenia.

10. A splenectomy may be necessary for clients who experience recurrent splenic sequestration.

11. Inform parents of the hereditary aspects of the disorder.

Administration of meperidine for pain is avoided because of the risk of normeperidine-induced seizures.

II. Hemophilia
   A. Description
   1. Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins.
   2. Identifying the specific coagulation deficiency is important so that definitive treatment with the specific replacement agent can be implemented; aggressive replacement therapy is initiated to prevent the chronic crippling effects from joint bleeding.
   3. The most common types are factor VIII deficiency (hemophilia A or classic hemophilia) and factor IX deficiency (hemophilia B or Christmas disease).
   4. Hemophilia is transmitted as an X-linked recessive disorder (it may also occur as a result of a gene mutation).
   5. Carrier females pass on the defect to males; female offspring are rarely born with the disorder but may be if they inherit an affected gene from their mother and are offspring of a father with hemophilia.
   6. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain or corticosteroids, may be prescribed depending on the source of bleeding from the disorder.

B. Assessment
   1. Abnormal bleeding in response to trauma or surgery (sometimes is detected after circumcision)
   2. Epistaxis (nosebleeds)
   3. Joint bleeding causing pain, tenderness, swelling, and limited range of motion
   4. Tendency to bruise easily
   5. Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal.

C. Interventions
1. Monitor for bleeding and maintain bleeding precautions.
2. Prepare to administer factor VIII concentrates, either produced through genetic engineering (recombinant) or derived from pooled plasma, as prescribed.
3. DDAVP (1-deamino-8-D-arginine vasopressin), a synthetic form of vasopressin, increases plasma factor VIII and may be prescribed to treat mild hemophilia.
4. Monitor for joint pain; immobilize the affected extremity if joint pain occurs.
5. Assess neurological status (child is at risk for intracranial hemorrhage).
7. Control joint bleeding by immobilization, elevation, and application of ice; apply pressure (15 minutes) for superficial bleeding.
8. Instruct the child and parents about the signs of internal bleeding.
9. Instruct parents in how to control the bleeding.
10. Instruct parents regarding activities for the child, emphasizing the avoidance of contact sports and the need for protective devices while learning to walk; assist in developing an appropriate exercise plan.
11. Instruct the child to wear protective devices such as helmets and knee and elbow pads when participating in sports such as bicycling and skating.

III. von Willebrand’s Disease
A. Description
1. von Willebrand’s disease is a hereditary bleeding disorder that is characterized by a deficiency of or a defect in a protein termed von Willebrand factor.
2. The disorder causes platelets to adhere to damaged endothelium; the von Willebrand factor protein also serves as a carrier protein for factor VIII.
3. It is characterized by an increased tendency to bleed from mucous membranes.

B. Assessment
1. Epistaxis
2. Gum bleeding
3. Easy bruising
4. Excessive menstrual bleeding

C. Interventions

1. Treatment and care are similar to measures implemented for hemophilia, including administration of clotting factors.
2. Provide emotional support to the child and parents, especially if the child is experiencing an episode of bleeding.

A child with a bleeding disorder needs to wear a MedicAlert bracelet.

IV. β-Thalassemia Major

A. Description (Box 30-2)

1. β-Thalassemia major is an autosomal recessive disorder characterized by the reduced production of 1 of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β-thalassemia major).
2. The incidence is highest in individuals of Mediterranean descent, such as Italians, Greeks, Syrians, and their offspring.
3. Treatment is supportive; the goal of therapy is to maintain normal hemoglobin levels by the administration of blood transfusions.
4. Bone marrow transplantation may be offered as an alternative therapy.
5. A splenectomy may be performed in a child with severe splenomegaly who requires repeated transfusions (assists in relieving abdominal pressure and may increase the life span of supplemental red blood cells).

B. Assessment

1. Frontal bossing
2. Maxillary prominence
3. Wide-set eyes with a flattened nose
4. Greenish yellow skin tone
5. Hepatosplenomegaly
6. Severe anemia
7. Microcytic, hypochromic red blood cells

C. Interventions

1. Administer blood transfusions as prescribed; monitor for transfusion reactions.
2. Monitor for iron overload; chelation therapy with deferasirox or deferoxamine may be prescribed to
treat iron overload and to prevent organ damage from the elevated levels of iron caused by the multiple transfusion therapy.

3. If the child has had a splenectomy, instruct parents to report any signs of infection because of the risk of sepsis.

4. Ensure that parents understand the importance of the child receiving pneumococcal and meningococcal vaccines in addition to an annual influenza vaccine and the regularly scheduled vaccines.

5. Provide genetic counseling to parents.

V. Iron Deficiency Anemia

1. In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells; red blood cells are microcytic and hypochromic.

2. Refer to Chapter 44 for additional information

VI. Aplastic anemia

1. A deficiency of circulating erythrocytes and all other formed elements of blood, resulting from the arrested development of cells within the bone marrow; pancytopenia, a deficiency of erythrocytes, leukocytes, and thrombocytes occurs.

2. Refer to Chapter 44 for additional information

⚠️ Liquid iron preparation may be prescribed used to treat iron deficiency anemia. Teach the parents and child that liquid iron should be taken through a straw and that the teeth should be brushed after administration.
FIG. 30-1  Differences between effects of (A) normal red blood cells and (B) sickled red blood cells on circulation, with related complications.

Box 30-1  
Sickle Cell Crisis

Vaso-Occlusive Crisis

Caused by stasis of blood with clumping of cells in the microcirculation, ischemia, and infarction
Manifestations: Fever; painful swelling of hands, feet, and joints; and abdominal pain

Splenic Sequestration

Caused by pooling and clumping of blood in the spleen (hypersplenism)
Manifestations: Profound anemia, hypovolemia, and shock

Hyperhemolytic Crisis

An accelerated rate of red blood cell destruction
Manifestations: Anemia, jaundice, and reticulocytosis

Aplastic Crisis
Caused by diminished production and increased destruction of red blood cells, triggered by viral infection or depletion of folic acid

*Manifestations:* Profound anemia and pallor

**Box 30-2**

**Types of β-Thalassemia**

- **Thalassemia Minor:** Asymptomatic silent carrier case
- **Thalassemia Trait:** Produces mild microcytic anemia
- **Thalassemia Intermedia:** Manifested as splenomegaly and moderate to severe anemia
- **Thalassemia Major:** Results in severe anemia requiring transfusion support to sustain life (also known as Cooley’s anemia)

### Practice Questions

302. The nurse analyzes the laboratory results of a child with hemophilia. The nurse understands that which result will most likely be abnormal in this child?

1. Platelet count
2. Hematocrit level
3. Hemoglobin level
4. Partial thromboplastin time

303. The nurse is providing home care instructions to the parents of a 10-year-old child with hemophilia. Which sport activity should the nurse suggest for this child?

1. Soccer
2. Basketball
3. Swimming
4. Field hockey

304. The nursing student is presenting a clinical conference and discusses the cause of β-thalassemia. The nursing student informs the group that a child at greatest risk of developing this disorder is which of these?

1. A child of Mexican descent
2. A child of Mediterranean descent
3. A child whose intake of iron is extremely poor
4. A breast-fed child of a mother with chronic anemia

305. A child with β-thalassemia is receiving long-term blood transfusion therapy for the treatment of the disorder. Chelation therapy is prescribed as a result of too much iron from the transfusions. Which medication should the nurse anticipate being prescribed?

1. Fragmin
2. Meropenem
3. Metoprolol
4. Deferoxamine

306. The clinic nurse instructs parents of a child with sickle cell anemia about the precipitating factors related to sickle cell crisis. Which, if identified by the parents as a precipitating factor, indicates the need for further instruction?
   1. Stress
   2. Trauma
   3. Infection
   4. Fluid overload

307. A 10-year-old child with hemophilia A has slipped on the ice and bumped his knee. The nurse should prepare to administer which prescription?
   1. Injection of factor X
   2. Intravenous infusion of iron
   3. Intravenous infusion of factor VIII
   4. Intramuscular injection of iron using the Z-track method

308. The nurse is instructing the parents of a child with iron deficiency anemia regarding the administration of a liquid oral iron supplement. Which instruction should the nurse tell the parents?
   1. Administer the iron at mealtimes.
   2. Administer the iron through a straw.
   3. Mix the iron with cereal to administer.
   4. Add the iron to formula for easy administration.

309. Laboratory studies are performed for a child suspected to have iron deficiency anemia. The nurse reviews the laboratory results, knowing that which result indicates this type of anemia?
   1. Elevated hemoglobin level
   2. Decreased reticulocyte count
   3. Elevated red blood cell count
   4. Red blood cells that are microcytic and hypochromic

310. The nurse is reviewing a healthcare provider’s prescriptions for a child with sickle cell anemia who was admitted to the hospital for the treatment of vaso-occlusive crisis. Which prescriptions documented in the child’s record should the nurse question? Select all that apply.
   1. Restrict fluid intake.
   2. Position for comfort.
   3. Avoid strain on painful joints.
   4. Apply nasal oxygen at 2 L/minute.
   5. Provide a high-calorie, high-protein diet.
   6. Give meperidine, 25 mg intravenously, every 4 hours for pain.

311. The nurse is conducting staff in-service training on von Willebrand’s disease. Which should the nurse include as characteristics of von Willebrand’s disease? Select all that apply.
   1. Easy bruising occurs.
2. Gum bleeding occurs.
3. It is a hereditary bleeding disorder.
4. Treatment and care are similar to that for hemophilia.
5. It is characterized by extremely high creatinine levels.
6. The disorder causes platelets to adhere to damaged endothelium.

Answers

302. Answer: 4

**Rationale:** Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal. Abnormal laboratory results in hemophilia indicate a prolonged partial thromboplastin time. The platelet count, hemoglobin level, and hematocrit level are normal in hemophilia.

**Test-Taking Strategy:** Focus on the **subject**, laboratory tests used to monitor hemophilia, and note the **strategic words**, most likely. Recalling the pathophysiology associated with this disorder and recalling that it results from a deficiency of specific coagulation proteins will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Bleeding Disorders

**Priority Concepts:** Clinical Judgment; Clotting

303. Answer: 3

**Rationale:** Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Children with hemophilia need to avoid contact sports and to take precautions such as wearing elbow and knee pads and helmets with other sports. The safe activity for them is swimming.

**Test-Taking Strategy:** Focus on the **subject**, a safe activity. Recalling that bleeding is a major concern in this condition, eliminate options 1, 2, and 4, because these activities are **comparable or alike** in that they present the potential for injury.

**Level of Cognitive Ability:** Applying

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Bleeding Disorder
**Priority Concepts:** Clotting; Safety  

304. **Answer:** 2

**Rationale:** β-Thalassemia is an autosomal recessive disorder characterized by the reduced production of 1 of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β-thalassemia major). This disorder is found primarily in individuals of Mediterranean descent. Options 1, 3, and 4 are incorrect.

**Test-Taking Strategy:** Focus on the subject, the child at greatest risk for β-thalassemia major. Think about the pathophysiology of the disorder. Remember that this disorder occurs primarily in individuals of Mediterranean descent.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Pediatrics: Hematological  
**Health Problem:** Pediatric-Specific: Anemias  
**Priority Concepts:** Gas Exchange; Perfusion  

305. **Answer:** 4

**Rationale:** β-Thalassemia is an autosomal recessive disorder characterized by the reduced production of 1 of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β-thalassemia major). The major complication of long-term transfusion therapy is hemosiderosis. To prevent organ damage from too much iron, chelation therapy with either deferasirox or deferoxamine may be prescribed. Deferoxamine is classified as an antidote for acute iron toxicity. Dalteparin is an anticoagulant used as prophylaxis for postoperative deep vein thrombosis. Meropenem is an antibiotic. Metoprolol is a beta blocker used to treat hypertension.

**Test-Taking Strategy:** Focus on the subject, chelation therapy. Specific knowledge regarding the antidote for iron toxicity is needed to answer this question. One way to remember this is to look at the prefix in the generic name of the medication used to treat iron overdose. Remember to associate defer- and removal of iron.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Pediatrics: Hematological  
**Health Problem:** Pediatric-Specific: Anemias  
**Priority Concepts:** Clinical Judgment; Gas Exchange  

306. **Answer:** 4

**Rationale:** Sickle cell crises are acute exacerbations of the disease, which vary

914
considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, hyperhemolytic crisis, and aplastic crisis. Sickle cell crisis may be precipitated by infection, dehydration, hypoxia, trauma, or physical or emotional stress. The mother of a child with sickle cell disease should encourage fluid intake of 1.5 to 2 times the daily requirement to prevent dehydration.

**Test-Taking Strategy:** Note the strategic words, need for further instruction. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Recalling that fluids are a main component of treatment in sickle cell anemia to prevent crisis will direct you to the correct option. Remember that fluids are required to prevent dehydration.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Anemias

**Priority Concepts:** Client Education; Clotting

**References:** Hockenberry, Wilson, Rodgers (2017), pp. 791-792.

307. **Answer:** 3

**Rationale:** Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain, may be prescribed depending on the source of bleeding from the disorder. A child with hemophilia A is at risk for joint bleeding after a fall. Factor VIII would be prescribed intravenously to replace the missing clotting factor and minimize the bleeding. Factor X and iron are not used to treat children with hemophilia A.

**Test-Taking Strategy:** Focus on the child’s diagnosis. Eliminate options 2 and 4 because they are comparable or alike. Recalling that a child with hemophilia A is missing clotting factor VIII will direct you to the correct option from those remaining.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Bleeding Disorders

**Priority Concepts:** Clinical Judgment; Clotting

**Reference:** McKinney et al. (2018), pp. 1130, 1132.

308. **Answer:** 2

**Rationale:** In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. An oral iron supplement should be administered through a straw or medicine dropper placed at the back of the mouth, because the iron stains the teeth. The parents should be instructed to brush or wipe the child’s teeth or have the child brush the teeth after administration. Iron is administered between meals because absorption is decreased.
if there is food in the stomach. Iron requires an acid environment to facilitate its absorption in the duodenum. Iron is not added to formula or mixed with cereal or other food items.

**Test-Taking Strategy:** Eliminate options 3 and 4 first because they are comparable or alike and because medication should not be added to formula and food. Next, note the word *liquid* in the question. This should assist you in recalling that iron in liquid form stains teeth.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Anemias

**Priority Concepts:** Client Education; Health Promotion

309. **Answer:** 4

**Rationale:** In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. The results of a complete blood cell count in children with iron deficiency anemia show decreased hemoglobin levels and microcytic and hypochromic red blood cells. The red blood cell count is decreased. The reticulocyte count is usually normal or slightly elevated.

**Test-Taking Strategy:** Focus on the subject, laboratory findings. Eliminate options 1 and 3 first, knowing that the hemoglobin and red blood cell counts would be decreased. From the remaining options, select the correct option over option 2 because of the relationship between anemia and red blood cells.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Anemias

**Priority Concepts:** Cellular Regulation; Gas Exchange

310. **Answer:** 1, 6

**Rationale:** Sickle cell anemia is one of a group of diseases termed *hemoglobinopathies*, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell; insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow. Oral and intravenous fluids are an important part of treatment. Meperidine is not recommended for a child with sickle cell disease because of the risk for normeperidine-induced seizures. Normeperidine, a metabolite of meperidine, is a central nervous system stimulant that produces
anxiety, tremors, myoclonus, and generalized seizures when it accumulates with repetitive dosing. The nurse would question the prescription for restricted fluids and meperidine for pain control. Positioning for comfort, avoiding strain on painful joints, oxygen, and a high-calorie and high-protein diet are also important parts of the treatment plan.

**Test-Taking Strategy:** Focus on the subject, identifying the prescriptions that need to be questioned and on the pathophysiology that occurs in sickle cell disease. Recalling that fluids are an important component of the treatment plan will assist in identifying that a fluid restriction prescription would need to be questioned. Also, recalling the effects of meperidine will assist in identifying that this prescription needs to be questioned.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Anemias

**Priority Concepts:** Collaboration; Safety

**Reference:** McKinney et al. (2018), pp. 1125-1127.

311. **Answer:** 1, 2, 3, 4, 6

**Rationale:** von Willebrand’s disease is a hereditary bleeding disorder characterized by a deficiency of or a defect in a protein termed von Willebrand factor. The disorder causes platelets to adhere to damaged endothelium. It is characterized by an increased tendency to bleed from mucous membranes. Assessment findings include epistaxis, gum bleeding, easy bruising, and excessive menstrual bleeding. An elevated creatinine level is not associated with this disorder.

**Test-Taking Strategy:** Focus on the subject, assessment findings, and on the child’s diagnosis. Recalling that this disorder is characterized by an increased tendency to bleed from mucous membranes will direct you to the correct options.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pediatrics: Hematological

**Health Problem:** Pediatric-Specific: Bleeding Disorders

CHAPTER 31

Oncological Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Cellular Regulation; Safety

I. Leukemia
   A. Description
   1. Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow.

   2. In leukemia, proliferating immature white blood cells (WBCs) depress the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia).

   3. The cause is unknown; it seems to involve genetic damage of cells, leading to the transformation of cells from a normal state to a malignant state.

   4. Risk factors include genetic, viral, immunological, and environmental factors and exposure to radiation, chemicals, and medications.

   5. Acute lymphocytic leukemia is the most frequent type of cancer in children.

   6. Leukemia is more common in boys than girls after 1 year of age.

   7. Prognosis depends on various factors such as age at diagnosis, initial WBC count, type of cell involved, and sex of the child.

   8. Treatment involves chemotherapy and possibly radiation and hematopoietic stem cell transplantation.

   9. The phases of chemotherapy include induction, which achieves a complete remission or disappearance of leukemic cells; intensification or consolidation therapy, which decreases the tumor burden further; central nervous system prophylactic therapy, which prevents leukemic cells from invading the central nervous system; and maintenance, which serves to
maintain the remission phase.

B. Assessment

1. Infiltration of the bone marrow by malignant cells causes fever, pallor, fatigue, anorexia, hemorrhage (usually petechiae), and bone and joint pain; pathological fractures can occur as a result of bone marrow invasion with leukemic cells.
2. Signs of infection occur as a result of neutropenia.
3. The child experiences hepatosplenomegaly and lymphadenopathy.
4. The child has a normal, elevated, or low WBC count, depending on the presence of infection or of immature versus mature WBCs.
5. The child has decreased hemoglobin and hematocrit levels.
6. The child has a decreased platelet count.
7. A positive bone marrow biopsy specimen identifies leukemic blast (immature)–phase cells.
8. Signs of increased intracranial pressure (ICP) occur as a result of central nervous system involvement (Box 31-1).
9. The child shows signs of cranial nerve (cranial nerve VII, or the facial nerve, is most commonly affected) or spinal nerve involvement; clinical manifestations relate to the area involved.
10. Clinical manifestations indicate the invasion of leukemic cells to the kidneys, testes, prostate, ovaries, gastrointestinal tract, and lungs.

C. Infection (Box 31-2)

1. Infection can occur through self-contamination or cross-contamination.
2. The most common sites for infection are the skin (any break in the skin is a potential site for infection), respiratory tract, and gastrointestinal tract.

D. Bleeding (Box 31-3)

1. Platelet transfusions are generally reserved for active bleeding episodes that do not respond to local treatment and that may occur during induction or relapse therapy.
2. Packed red blood cells may be prescribed for a child with severe blood loss.
E. Fatigue and nutrition

1. Assist the parents and child in selecting a well-balanced diet.
2. Provide small meals that require little chewing and are not irritating to the oral mucosa.
3. If the child cannot take oral feedings, parenteral nutrition or enteral feedings may be prescribed.
4. Assist the child in self-care and mobility activities.
5. Allow adequate rest periods during care.
6. Do not perform nursing care activities unless they are essential.

F. Chemotherapy

1. Monitor for severe bone marrow suppression; during the period of greatest bone marrow suppression (the nadir), blood cell counts are extremely low.
2. Monitor for infection and bleeding.
3. Protect the child from life-threatening infections.
4. Monitor for nausea, vomiting, and alteration in bowel function.
5. Administer stool softeners as prescribed and if needed to prevent straining if constipation occurs.
6. Provide rectal hygiene gently as needed.
7. Administer antiemetics before beginning chemotherapy as prescribed.
8. Monitor for signs of dehydration.
9. Monitor for signs of hemorrhagic cystitis.
10. Monitor for signs of peripheral neuropathy.
11. Assess oral mucous membranes for mucositis; administer frequent mouth rinses per agency procedure and as prescribed to promote healing or prevent infection (local oral anesthetics may also be prescribed).
12. Instruct the parents and child in the signs and symptoms to watch for after chemotherapy and when to notify the primary health care provider (PHCP).
13. Inform the parents and child that hair loss may occur from chemotherapy (hair regrows in about 3 to 6 months and may be a slightly different color or texture).
14. Instruct the parents and child about the care of a central venous access device, as necessary (see Chapter 69).
15. Listen to the child and family, and encourage them to verbalize their feelings and express their concerns.
16. Introduce the family to other families of children with cancer, as appropriate.
17. Consult social services and chaplains as necessary.

Monitor a child receiving chemotherapy closely for signs of infection. Infection is a major cause of death in the immunosuppressed child.

II. Hodgkin’s Disease

A. Description
1. Hodgkin’s disease (a type of lymphoma) is a malignancy of the lymph nodes that originates in a single lymph node or a single chain of nodes (Fig. 31-1).
2. The disease predictably metastasizes to non-nodal or extralymphatic sites, especially the spleen, liver, bone marrow, lungs, and mediastinum.
3. Hodgkin’s disease is characterized by the presence of Reed-Sternberg cells noted in a lymph node biopsy specimen.
4. Peak incidence is in mid-adolescence.
5. Possible causes include viral infections and previous exposure to alkylating chemical agents.
6. The prognosis is excellent, with long-term survival rates depending on the stage of the disease.
7. The primary treatment modalities are radiation and chemotherapy; each may be used alone or in combination, depending on the clinical stage of the disease.

B. Assessment
1. Painless enlargement of lymph nodes
2. Enlarged, firm, nontender, movable nodes in the supraclavicular area; in children, the “sentinel” node located near the left clavicle may be the first enlarged node
3. Nonproductive cough as a result of mediastinal lymphadenopathy
4. Abdominal pain as a result of enlarged retroperitoneal nodes
5. Advanced lymph node and extralymphatic involvement that may cause systemic symptoms, such as a low-grade or intermittent fever, anorexia, nausea, weight loss, night sweats, and pruritus
6. Positive biopsy specimen of a lymph node (presence of Reed-Sternberg cells) and positive bone marrow biopsy specimen

7. Computed tomography scan of the liver, spleen, and bone marrow may be done to detect metastasis.

C. Interventions

1. For early stages without mediastinal node involvement, the treatment of choice is extensive external radiation of the involved lymph node regions.
2. With more extensive disease, radiation and multidrug chemotherapy are used.
3. Monitor for medication-induced pancytopenia and an abnormal depression of all cellular components of the blood, which increases the risk for infection, bleeding, and anemia.
4. Monitor for signs of infection and bleeding.
5. Protect the child from infection.
6. Monitor for adverse effects related to chemotherapy or radiation; the most common adverse effect of extensive irradiation is malaise, which can be difficult for older children and adolescents to tolerate physically and psychologically (Table 31-1).
7. Monitor for nausea and vomiting, and administer antiemetics as prescribed.

III. Nephroblastoma (Wilms’ Tumor)

A. Description

1. Wilms’ tumor is the most common intra-abdominal and kidney tumor of childhood; it may manifest unilaterally and localized or bilaterally, sometimes with metastasis to other organs.
2. The peak incidence is 3 years of age.
3. Occurrence is associated with a genetic inheritance and with several congenital anomalies.
4. Therapeutic management includes a combined treatment of surgery (partial to total nephrectomy) and chemotherapy with or without radiation, depending on the clinical stage and the histological pattern of the tumor.

B. Assessment

1. Swelling or mass within the abdomen (mass is characteristically firm, nontender, confined to 1 side, and deep within the flank)
2. Urinary retention or hematuria, or both
3. Anemia (caused by hemorrhage within the tumor)
4. Pallor, anorexia, and lethargy (resulting from anemia)
5. Hypertension (caused by secretion of excess amounts of renin by the tumor)
6. Weight loss and fever
7. Symptoms of lung involvement, such as dyspnea, shortness of breath, and pain in the chest, if metastasis has occurred

C. Preoperative interventions
   1. Monitor vital signs, particularly blood pressure.
   2. Avoid palpation of the abdomen; place a sign at bedside that reads, Do Not Palpate Abdomen.
   3. Measure abdominal girth at least once daily.

D. Postoperative interventions
   1. Monitor temperature and blood pressure closely.
   2. Monitor for signs of hemorrhage and infection.
   3. Monitor strict intake and urine output closely.
   4. Monitor for abdominal distention; monitor bowel sounds and other signs of gastrointestinal activity because of the risk for intestinal obstruction.

Avoid palpation of the abdomen in a child with Wilms’ tumor and be cautious when bathing, moving, or handling the child. It is important to keep the encapsulated tumor intact. Rupture of the tumor can cause the cancer cells to spread throughout the abdomen, lymph system, and bloodstream.

IV. Neuroblastoma
   A. Description
   1. Neuroblastoma is a tumor that originates from the embryonic neural crest cells that normally give rise to the adrenal medulla and the sympathetic ganglia.
   2. Most tumors develop in the adrenal gland or the retroperitoneal sympathetic chain; other sites may be within the head, neck, chest, or pelvis.
   3. Most children present with neuroblastoma before 10 years of age.
   4. Most presenting signs are caused by the tumor compressing adjacent normal tissue and organs.
   5. Diagnostic evaluation is aimed at locating the primary site of the tumor; analyzing the breakdown products excreted in the urine, namely vanillylmandelic acid, homovanillic acid, dopamine, and norepinephrine, permits detection of suspected tumor before and after
medical-surgical intervention.

6. The prognosis is poor because of the frequency of invasiveness of the tumor and because, in most cases, a diagnosis is not made until after metastasis has occurred; the younger the child at diagnosis, the better the survival rate.

7. Therapeutic management
   a. Surgery is performed to remove as much of the tumor as possible and to obtain biopsy specimens; in the early stages, complete surgical removal of the tumor is the treatment of choice.
   b. Surgery usually is limited to biopsy in the later stages because of extensive metastasis.
   c. Radiation is used commonly with later-stage disease and provides palliation for metastatic lesions in bones, lungs, liver, and brain.
   d. Chemotherapy is used for extensive local or disseminated disease.

B. Assessment
   1. Firm, nontender, irregular mass in the abdomen that crosses the midline
   2. Urinary frequency or retention from compression of the kidney, ureter, or bladder
   3. Lymphadenopathy, especially in the cervical and supraclavicular areas
   4. Bone pain if skeletal involvement
   5. Supraorbital ecchymosis, periorbital edema, and exophthalmos as a result of invasion of retrobulbar soft tissue
   6. Pallor, weakness, irritability, anorexia, weight loss
   7. Signs of respiratory impairment (thoracic lesion)
   8. Signs of neurological impairment (intracranial lesion)
   9. Paralysis from compression of the spinal cord

C. Preoperative interventions
   1. Monitor for signs and symptoms related to the location of the tumor.
   2. Provide emotional support to the child and parents.

D. Postoperative interventions
   1. Monitor for postoperative complications related to the location (organ) of the surgery.
   2. Monitor for complications related to chemotherapy or radiation if prescribed.
   3. Provide support to the parents and encourage them to express their feelings; many parents feel guilt for not
having recognized signs in the child earlier.

4. Refer parents to appropriate community services.

V. Osteosarcoma (Osteogenic Sarcoma)

A. Description

1. The most common bone cancer in children; it is also known as osteogenic sarcoma.
2. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur.
3. The peak age of incidence is between 10 and 25 years.
4. Symptoms in the earliest stage are almost always attributed to extremity injury or normal growing pains.
5. Treatment may include surgical resection (limb salvage procedure) to save a limb or remove affected tissue, or amputation.
6. Chemotherapy is used to treat the cancer and may be used before and after surgery.

B. Assessment

1. Localized pain at the affected site (may be severe or dull) that may be attributed to trauma or the vague complaint of “growing pains”; pain often is relieved by a flexed position.
2. Palpable mass
3. Limping if weight-bearing limb is affected
4. Progressive limited range of motion and the child’s curtailing of physical activity
5. Child may be unable to hold heavy objects because of their weight and resultant pain in the affected extremity.
6. Pathological fractures occur at the tumor site.

C. Interventions

1. Prepare the child and family for prescribed treatment modalities, which may include surgical resection by limb salvage to remove affected tissue, amputation, and chemotherapy.
2. Communicate honestly with the child and family and provide support.
3. Prepare for prosthetic fitting as necessary.
4. Assist the child in dealing with problems of self-image.
5. Instruct the child and parents about the potential development of phantom limb pain that may occur after amputation, characterized by tingling, itching,
and a painful sensation in the area where the limb was amputated.

VI. Brain Tumors
   A. Description
      1. An infratentorial (below the tentorium cerebelli) tumor, the most common brain tumor, is located in the posterior third of the brain (primarily in the cerebellum or brainstem) and accounts for the frequency of symptoms resulting from increased ICP.
      2. A supratentorial tumor is located within the anterior two-thirds of the brain—mainly the cerebrum.
      3. The signs and symptoms of a brain tumor depend on its anatomical location and size and, to some extent, on the age of the child; a number of tests may be used in the neurological evaluation, but the most common diagnostic procedure is magnetic resonance imaging (MRI), which determines the location and extent of the tumor.
      4. Therapeutic management includes surgery, radiation, and chemotherapy; the treatment of choice is total removal of the tumor without residual neurological damage.

   B. Assessment
      1. Headache that is worse on awakening and improves during the day
      2. Vomiting that is unrelated to feeding or eating
      3. Ataxia
      4. Seizures
      5. Behavioral changes
      6. Clumsiness; awkward gait or difficulty walking
      7. Diplopia
      8. Facial weakness

   C. Preoperative interventions
      1. Perform a neurological assessment at least every 4 hours.
      2. Institute seizure precautions and safety measures.
      3. Assess weight loss and nutritional status.
      4. Shave the child’s head as prescribed (provide a favorite cap or hat for the child); shaving the head
may also be done in the surgical suite.
5. Prepare the child as much as possible; tell the child that he or she will wake up with a large head dressing.

D. Postoperative interventions

1. Assess neurological and motor function and level of consciousness.
2. Monitor temperature closely, which may be elevated because of hypothalamus or brainstem involvement during surgery; maintain a cooling blanket by the bedside.
3. Monitor for signs of respiratory infection.
4. Monitor for signs of meningitis (opisthotonos, Kernig’s and Brudzinski’s signs).
5. Monitor for signs of increased ICP (see Box 31-1; see also Chapter 38).
6. Monitor for hemorrhage, checking the back of the head dressing for posterior pooling of blood; mark drainage edges with marker, reinforce dressing if needed, and do not change dressing without a specific prescription.
7. Assess pupillary response; sluggish, dilated, or unequal pupils are reported immediately because they may indicate increased ICP and potential brainstem herniation.
8. Monitor for colorless drainage on the dressing or from the ears or nose, which indicates cerebrospinal fluid and should be reported immediately; assess for the presence of glucose in the drainage (dipstick).
9. Assess the surgeon’s prescription for positioning, including the degree of neck flexion (Box 31-4).
10. Monitor intravenous fluids closely.
11. Promote measures that prevent vomiting (vomiting increases ICP and the risk for incisional rupture).
12. Provide a quiet environment.
13. Administer analgesics as prescribed.
14. Provide emotional support to the child and parents, and promote optimal growth and development.

Box 31-1

Manifestations of Increased Intracranial Pressure in Infants and Children

Infants
- Tense, bulging fontanel
- Separated cranial sutures
- Macewen’s sign (cracked-pot sound on percussion)
- Irritability
- High-pitched cry
- Increased head circumference
- Distended scalp veins
- Poor feeding
- Crying when disturbed
- Setting sun sign (eyes appear downward, with the sclera seen over the iris, part of the lower pupil may be covered by the lower eyelid)

**Children**

- Headache
- Nausea
- Forceful vomiting
- Diplopia; blurred vision
- Seizures

**Personality and Behavior Signs**

- Irritability, restlessness
- Indifference, drowsiness
- Decline in school performance
- Diminished physical activity and motor performance
- Increased sleeping
- Inability to follow simple commands
- Lethargy

**Late Signs**

- Bradycardia
- Decreased motor response to command
- Decreased sensory response to painful stimuli
- Alterations in pupil size and reaction
- Decerebrate (extension) or decorticate (flexion) posturing
- Cheyne-Stokes respirations
- Papilledema
- Decreased consciousness
- Coma
Box 31-2

Protecting the Child from Infection

- Initiate protective isolation procedures.
- Maintain frequent and thorough hand washing.
- Maintain the child in a private room with high-efficiency particulate air filtration or laminar air flow system if possible.
- Ensure that the child’s room is cleaned daily.
- Use strict aseptic technique for all nursing procedures.
- Limit the number of caregivers entering the child’s room, and ensure that anyone entering the child’s room wears a mask.
- Keep supplies for the child separate from supplies for other children.
- Reduce exposure to environmental organisms by eliminating raw fruits and vegetables from the diet, by not allowing fresh flowers in the child’s room, and by not leaving standing water in the child’s room.
- Assist the child with daily bathing, using antimicrobial soap.
- Assist the child to perform oral hygiene frequently.
- Assess for signs and symptoms of infection.
- Monitor temperature, pulse, and blood pressure.
- Change wound dressings daily, and inspect wounds for redness, swelling, or drainage.
- Assess urine for color and cloudiness.
- Assess the skin and oral mucous membranes for signs of infection.
- Auscultate lung sounds.
- Encourage the child to cough and deep-breathe.
- Monitor white blood cell and neutrophil counts.
- Notify the primary health care provider if signs of infection are present, and prepare to obtain specimens for culture of open lesions, urine, and sputum.
- Initiate a bowel program to prevent constipation and rectal trauma.
- Avoid invasive procedures such as injections, rectal temperatures, and urinary catheterization.
- Administer antibiotic, antifungal, and antiviral medications as prescribed.
- Administer granulocyte colony-stimulating factor as prescribed.
- Instruct parents to keep the child away from crowds and individuals with infections.
- Instruct parents that the child should not receive immunization with a live virus (measles, mumps, rubella, polio), because if the immune system is depressed, the attenuated virus can result in a life-threatening infection; also, the child
should not receive the varicella vaccine.

- The Salk (inactivated) vaccine for poliomyelitis may be administered.
- Instruct parents to inform the teacher that they should be notified immediately if a case of a communicable disease occurs in another child at school.

**Box 31-3**

**Protecting the Child from Bleeding**

- Examine the child for signs and symptoms of bleeding.
- Handle the child gently.
- Measure abdominal girth; an increase can indicate internal hemorrhage.
- Instruct the child to use a soft toothbrush and avoid dental floss.
- Provide soft foods that are cool to warm in temperature.
- Avoid injections, if possible, to prevent trauma to the skin and bleeding.
- Apply firm and gentle pressure to a needle-stick site for at least 10 minutes.
- Pad side rails and sharp corners of the bed and furniture.
- Discourage the child from engaging in activities involving the use of objects that can cause injury.
- Instruct the child to avoid constrictive or tight clothing.
- Use caution when taking the blood pressure to prevent skin injury.
- Instruct the child to avoid blowing his or her nose.
- Avoid the use of rectal suppositories, enemas, and rectal thermometers.
- Examine all body fluids and excrement for the presence of blood.
- Count the number of pads or tampons used if the adolescent girl is menstruating.
- Instruct the child about the signs and symptoms of bleeding.
- Instruct parents to avoid administering nonsteroidal anti-inflammatory drugs and products that contain aspirin to the child.
FIG. 31-1  Main areas of lymphadenopathy and organ involvement in Hodgkin’s disease.

Table 31-1

Adverse Effects of Radiation Therapy and Nursing Interventions
Positioning After Craniotomy

- Assess the surgeon’s prescription for positioning, including the degree of neck flexion.
- If a large tumor has been removed, the child is not placed on the operative side, because the brain may shift suddenly to that cavity.
- In an infratentorial procedure, the child usually is positioned flat and on either side.
- In a supratentorial procedure, the head usually is elevated above the heart level to facilitate cerebrospinal fluid drainage and to decrease excessive blood flow to the brain to prevent hemorrhage.
Never place the child in Trendelenburg’s position because it increases intracranial pressure and the risk of hemorrhage.

Practice Questions

312. The nurse is monitoring a child for bleeding after surgery for removal of a brain tumor. The nurse checks the head dressing for the presence of blood and notes a colorless drainage on the back of the dressing. Which action should the nurse perform immediately?
   1. Notify the surgeon.
   2. Reinforce the dressing.
   3. Document the findings and continue to monitor.
   4. Circle the area of drainage and continue to monitor.

313. A child undergoes surgical removal of a brain tumor. During the postoperative period, the nurse notes that the child is restless, the pulse rate is elevated, and the blood pressure has decreased significantly from the baseline value. The nurse suspects that the child is in shock. Which is the most appropriate nursing action?
   1. Place the child in a supine position.
   2. Place the child in Trendelenburg’s position.
   3. Increase the flow rate of the intravenous fluids.
   4. Notify the primary health care provider (PHCP).

314. The mother of a 4-year-old child tells the pediatric nurse that the child’s abdomen seems to be swollen. During further assessment, the mother tells the nurse that the child is eating well and that the activity level of the child is unchanged. The nurse, suspecting the possibility of Wilms’ tumor, should avoid which during the physical assessment?
   1. Palpating the abdomen for a mass
   2. Assessing the urine for the presence of hematuria
   3. Monitoring the temperature for the presence of fever
   4. Monitoring the blood pressure for the presence of hypertension

315. The nurse provides a teaching session to the nursing staff regarding osteosarcoma. Which statement by a member of the nursing staff indicates a need for information?
   1. “The femur is the most common site of this sarcoma.”
   2. “The child does not experience pain at the primary tumor site.”
   3. “Limping, if a weight-bearing limb is affected, is a clinical manifestation.”
   4. “The symptoms of the disease in the early stage are almost always attributed to normal growing pains.”

316. The nurse analyzes the laboratory values of a child with leukemia who is receiving chemotherapy. The nurse notes that the platelet count is 19,500 mm$^3$ ($19.5 \times 10^9$/L). On the basis of this laboratory result, which intervention should the nurse include in the plan of care?
   1. Initiate bleeding precautions.
   2. Monitor closely for signs of infection.
   3. Monitor the temperature every 4 hours.
4. Initiate protective isolation precautions.

317. The nurse is monitoring a 3-year-old child for signs and symptoms of increased intracranial pressure (ICP) after a craniotomy. The nurse plans to monitor for which **early** sign or symptom of increased ICP?
1. Vomiting
2. Bulging anterior fontanel
3. Increasing head circumference
4. Complaints of a frontal headache

318. A 4-year-old child is admitted to the hospital for abdominal pain. The mother reports that the child has been pale and excessively tired and is bruising easily. On physical examination, lymphadenopathy and hepatosplenomegaly are noted. Diagnostic studies are being performed because acute lymphocytic leukemia is suspected. The nurse determines that which laboratory result confirms the diagnosis?
1. Lumbar puncture showing no blast cells
2. Bone marrow biopsy showing blast cells
3. Platelet count of 350,000 mm$^3$ (350 × 10$^9$/L)
4. White blood cell count 4500 mm$^3$ (4.5 × 10$^9$/L)

319. A 6-year-old child with leukemia is hospitalized and is receiving combination chemotherapy. Laboratory results indicate that the child is neutropenic, and protective isolation procedures are initiated. The grandmother of the child visits and brings a fresh bouquet of flowers picked from her garden and asks the nurse for a vase for the flowers. Which response should the nurse provide to the grandmother?
1. “I have a vase in the utility room, and I will get it for you.”
2. “I will get the vase and wash it well before you put the flowers in it.”
3. “The flowers from your garden are beautiful, but should not be placed in the child’s room at this time.”
4. “When you bring the flowers into the room, place them on the bedside stand as far away from the child as possible.”

320. A diagnosis of Hodgkin’s disease is suspected in a 12-year-old child. Several diagnostic studies are performed to determine the presence of this disease. Which diagnostic test result will confirm the diagnosis of Hodgkin’s disease?
1. Elevated vanillylmandelic acid urinary levels
2. The presence of blast cells in the bone marrow
3. The presence of Epstein-Barr virus in the blood
4. The presence of Reed-Sternberg cells in the lymph nodes

321. Which specific nursing interventions are implemented in the care of a child with leukemia who is at risk for infection? **Select all that apply.**

- [ ] 1. Maintain the child in a semiprivate room.
- [ ] 2. Reduce exposure to environmental organisms.
- [ ] 3. Use strict aseptic technique for all procedures.
- [ ] 4. Ensure that anyone entering the child’s room wears a mask.
- [ ] 5. Apply firm pressure to a needle-stick area for at least 10
The nurse is performing an assessment on a 10-year-old child suspected to have Hodgkin’s disease. Which assessment findings are specifically characteristic of this disease? Select all that apply.

1. Abdominal pain
2. Fever and malaise
3. Anorexia and weight loss
4. Painful, enlarged inguinal lymph nodes
5. Painless, firm, and movable adenopathy in the cervical area

**Answers**

312. **Answer:** 1

**Rationale:** Colorless drainage on the dressing in a child after craniotomy indicates the presence of cerebrospinal fluid and should be reported to the surgeon immediately. Options 2, 3, and 4 are not the immediate nursing action because they do not address the need for immediate intervention to prevent complications.

**Test-Taking Strategy:** Note the **strategic word**, *immediately*. Eliminate options 3 and 4 because they are **comparable or alike** and delay necessary intervention. Also, note the words *colorless drainage*. This should alert you quickly to the possibility of the presence of cerebrospinal fluid and direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pediatrics: Oncological

**Health Problem:** Complex Care: Emergency Situations/Management

**Priority Concepts:** Clinical Judgment; Intracranial Regulation

313. **Answer:** 4

**Rationale:** In the event of shock, the PHCP is notified immediately before the nurse changes the child’s position or increases intravenous fluids. After craniotomy, a child is never placed in the supine or Trendelenburg’s position because it increases intracranial pressure (ICP) and the risk of bleeding. The head of the bed should be elevated. Increasing intravenous fluids can cause an increase in ICP.

**Test-Taking Strategy:** Focus on the **subject**, care for the child following craniotomy, and note the **strategic words**, *most appropriate*. Eliminate options 1 and 2 because these positions could increase ICP. Eliminate option 3 because increasing the flow rate could also increase ICP. In addition, the nurse should not increase intravenous fluids without a PHCP’s prescription.

**Level of Cognitive Ability:** Synthesizing

314. Answer: 1

Rationale: Wilms’ tumor is the most common intra-abdominal and kidney tumor of childhood. If Wilms’ tumor is suspected, the tumor mass should not be palpated by the nurse. Excessive manipulation can cause seeding of the tumor and spread of the cancerous cells. Hematuria, fever, and hypertension are clinical manifestations associated with Wilms’ tumor.

Test-Taking Strategy: Focus on the subject, the action to avoid. Knowledge that this tumor is an intra-abdominal and kidney tumor will assist in eliminating options 2 and 4 because of the relationship of these options to renal function. Next, thinking about the effect of palpating the tumor will direct you to the correct answer from the remaining options.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Cellular Regulation; Safety

315. Answer: 2

Rationale: Osteosarcoma is the most common bone cancer in children. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur. Osteosarcoma is manifested clinically by progressive, insidious, and intermittent pain at the tumor site. By the time these children receive medical attention, they may be in considerable pain from the tumor. Options 1, 3, and 4 are accurate regarding osteosarcoma.

Test-Taking Strategy: Note the strategic words, need for information. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Knowledge that osteosarcoma is a malignant tumor of the bone will direct you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Cellular Regulation; Clinical Judgment
Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). If a child has a low platelet count usually less than 50,000 mm$^3$ ($50.0 \times 10^9$/L), bleeding precautions need to be initiated because of the increased risk of bleeding or hemorrhage. Precautions include limiting activity that could result in head injury, using soft toothbrushes, checking urine and stools for blood, and administering stool softeners to prevent straining with constipation. In addition, suppositories, enemas, and rectal temperatures are avoided. Options 2, 3, and 4 are related to the prevention of infection rather than bleeding.

Test-Taking Strategy: Note that the platelet count is low and recall that a low platelet count places the child at risk for bleeding. In addition, note that options 2, 3, and 4 are comparable or alike because they relate to prevention of and monitoring for infection.

Level of Cognitive Ability: Analyzing
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Planning
Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Cellular Regulation; Clotting

Rationale: The brain, although well protected by the solid bony cranium, is highly susceptible to pressure that may accumulate within the enclosure. Volume and pressure must remain constant within the brain. A change in the size of the brain, such as occurs with edema or increased volume of intracranial blood or cerebrospinal fluid without a compensatory change, leads to an increase in ICP, which may be life-threatening. Vomiting, an early sign of increased ICP, can become excessive as pressure builds up and stimulates the medulla in the brainstem, which houses the vomiting center. Children with open fontanels (posterior fontanel closes at 2 to 3 months; anterior fontanel closes at 12 to 18 months) compensate for ICP changes by skull expansion and subsequent bulging fontanels. When the fontanels have closed, nausea, excessive vomiting, diplopia, and headaches become pronounced, with headaches becoming more prevalent in older children.

Test-Taking Strategy: Note the strategic word, early; focus on the age of the child, and use age as the key to principles of growth and development. Knowing when the fontanels close and focusing on the child’s age as 3 years eliminates options 2 and 3. The subjective symptom of headache in option 4 is unreliable in a 3 year old, so eliminate this option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. The confirmatory test for leukemia is microscopic examination of bone marrow obtained by bone marrow aspirate and biopsy, which is considered positive if blast cells are present. An altered platelet count occurs as a result of the disease but also may occur as a result of chemotherapy and does not confirm the diagnosis. The white blood cell count may be normal, high, or low in leukemia. A lumbar puncture may be done to look for blast cells in the spinal fluid that indicate central nervous system disease.

Test-Taking Strategy: Focus on the subject, bone marrow biopsy and leukemia, and note the word confirms in the question. This word and knowledge that the bone marrow is affected in leukemia will direct you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity

Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Cellular Regulation; Clinical Judgment

319. Answer: 3

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). For a hospitalized neutropenic child, flowers or plants should not be kept in the room, because standing water and damp soil harbor Aspergillus and Pseudomonas aeruginosa, to which the child is susceptible. In addition, fresh fruits and vegetables harbor molds and should be avoided until the white blood cell count increases.

Test-Taking Strategy: Note that options 1 and 2 are comparable or alike and should be eliminated first; these options indicate that it is acceptable to place the flowers in the child’s room. From the remaining options, select the correct option over option 4 because this response maintains the protective isolation procedures required.

Level of Cognitive Ability: Applying
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Infection; Safety
Rationale: Hodgkin’s disease (a type of lymphoma) is a malignancy of the lymph nodes. The presence of giant, multinucleated cells (Reed-Sternberg cells) is the classic characteristic of this disease. Elevated levels of vanillylmandelic acid in the urine may be found in children with neuroblastoma. The presence of blast cells in the bone marrow indicates leukemia. Epstein-Barr virus is associated with infectious mononucleosis.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Cellular Regulation; Clinical Judgment

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). A common complication of treatment for leukemia is overwhelming infection secondary to neutropenia. Measures to prevent infection include the use of a private room, strict aseptic technique, restriction of visitors and health care personnel with active infection, strict hand washing, ensuring that anyone entering the child’s room wears a mask, and reducing exposure to environmental organisms by eliminating raw fruits and vegetables from the diet and fresh flowers from the child’s room and by not leaving standing water in the child’s room. Applying firm pressure to a needle-stick area for at least 10 minutes is a measure to prevent bleeding.

Test-Taking Strategy: Focus on the subject, preventing infection. Reading each intervention carefully and keeping this subject in mind will assist in answering the question. A semiprivate room places the child at risk for infection. Applying firm pressure to a needle-stick area is related to preventing bleeding.

Level of Cognitive Ability: Analyzing
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Oncological
Health Problem: Pediatric-Specific: Cancers
Priority Concepts: Infection; Safety
Rationale: Hodgkin’s disease (a type of lymphoma) is a malignancy of the lymph nodes. Specific clinical manifestations associated with Hodgkin’s disease include painless, firm, and movable adenopathy in the cervical and supraclavicular areas and abdominal pain as a result of enlarged retroperitoneal nodes. Hepatosplenomegaly also is noted. Although fever, malaise, anorexia, and weight loss are associated with Hodgkin’s disease, these manifestations are seen in many disorders.

Test-Taking Strategy: Note the words specifically characteristic in the question. Eliminate options 2 and 3 first because these symptoms are comparable or alike in that they are general and vague. Recalling that painless adenopathy is associated with Hodgkin’s disease and abdominal pain will direct you to the correct options.

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Content Area: Pediatrics: Oncological

Health Problem: Pediatric-Specific: Cancers

Priority Concepts: Cellular Regulation; Clinical Judgment

I. Fever

A. Description
1. Fever is an abnormal body temperature elevation.
2. A child’s temperature can vary depending on activity, emotional stress, disease processes, medications, type of clothing the child is wearing, and temperature of the environment.
3. A fever in an infant less than 1 month old is considered an emergency, and the pediatric specialist should be contacted immediately if this occurs.
4. Assessment findings associated with the fever provide important indications of the seriousness of the fever.

B. Assessment
1. Temperature elevation: Normal temperature range for a child is 36.4°C to 37.0°C (97.5°F to 98.6°F); 38.0°C (100.4°F) is considered to be fever.
2. Flushed skin, warm to touch
3. Diaphoresis
4. Chills
5. Restlessness or lethargy

C. Interventions
1. Monitor vital signs; take the temperature via the electronic route or per agency procedures.
2. Remove excess clothing and blankets, reduce the room temperature, and increase the air circulation; use other cooling measures such as the application of a cool compress to the forehead if appropriate.
3. Administer a sponge bath with tepid water for 20 to 30 minutes and gently squeeze water from a facecloth over the back and chest. Recheck the temperature 30 minutes after the bath. Do not use alcohol because it can cause peripheral vasoconstriction.
4. Administer antipyretics such as ibuprofen as prescribed.
5. Aspirin should not be administered, unless specifically prescribed, because of the risk of Reye’s syndrome.

6. Retake the temperature 30 to 60 minutes after the antipyretic is administered.

7. Provide adequate fluid intake as tolerated and as prescribed.

8. Monitor for signs and symptoms that indicate dehydration and electrolyte imbalances; monitor laboratory values.

9. Instruct the parents in how to take the temperature, how to medicate the child safely, and when it is necessary to call the primary health care provider (PHCP).

II. Dehydration

A. Description

1. Dehydration is a common fluid and electrolyte imbalance in infants and children.

2. In infants and children, the organs that conserve water are immature, placing them at risk for fluid volume deficit.

3. Causes can include decreased fluid intake, diaphoresis, vomiting, diarrhea, diabetic ketoacidosis, and extensive burns or other serious injuries.

B. Assessment (Table 32-1)

C. Interventions

1. Treat and eliminate the cause of the dehydration.

2. Monitor vital signs.

3. Monitor weight and monitor for changes, including fluid gains and losses.

4. Monitor intake and output and urine for specific gravity.

5. Monitor level of consciousness.

Infants and children are more vulnerable to fluid volume deficit because more of their body water is in the extracellular fluid compartment.
7. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte or a similar rehydration solution as prescribed; avoid carbonated beverages because they are gas-producing, and fluids that contain high amounts of sugar, such as apple juice.

8. For severe dehydration, maintain NPO (nothing by mouth) status to place the bowel at rest and provide fluid and electrolyte replacement by the intravenous (IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and has adequate renal function.

9. Reintroduce a normal diet when rehydration is achieved.

10. Provide instructions to the parents about the types and amounts of fluid to encourage, signs of dehydration, and indications of the need to notify the PHCP.

III. Phenylketonuria

A. Description

1. Phenylketonuria is a genetic disorder (autosomal recessive disorder) that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood.

2. It is characterized by blood phenylalanine levels greater than 20 mg/dL (1210 mcmol/L); normal level is 0 to 2 mg/dL (0 to 121 mcmol/L).

3. All 50 states require routine screening of all newborns for phenylketonuria.

B. Assessment

1. In all children
   a. Digestive problems and vomiting
   b. Seizures
   c. Musty odor of the urine
   d. Mental retardation

2. In older children
   a. Eczema
   b. Hypertonia
   c. Hypopigmentation of the hair, skin, and irises
   d. Hyperactive behavior

C. Interventions

1. Screening of newborn infants for phenylketonuria: The infant should have begun formula or breast milk feeding before specimen collection.

2. If initial screening is positive, a repeat test is
performed, and further diagnostic evaluation is required to verify the diagnosis.

3. Rescreen newborns by 14 days of age if the initial screening was done before 48 hours of age.

4. If phenylketonuria is diagnosed, prepare to implement the following:
   a. Restrict phenylalanine intake; high-protein foods (meats and dairy products) and aspartame are avoided because they contain large amounts of phenylalanine.
   b. Monitor physical, neurological, and intellectual development.
   c. Stress the importance of follow-up treatment.
   d. Encourage the parents to express their feelings about the diagnosis and discuss the risk of phenylketonuria in future children.
   e. Educate the parents about the use of special preparation formulas and about the foods that contain phenylalanine.
   f. Consult with social care services to assist the parents with the financial burdens of purchasing special prepared formulas.

IV. Childhood Obesity
   A. Description
      1. A condition where excess body fat negatively impacts the health and well-being of the child.
      2. Body mass index (BMI) is a screening tool that can be used to measure obesity.
      3. BMI is defined as a person’s body weight in kilograms divided by the square of a person’s height in meters.
      4. As recommended by the Centers for Disease Control and Prevention (CDC), health professionals should use the BMI percentile when measuring children and adolescents aged 2 to 20 years.
      5. Overweight is defined as being above the 85th percentile but less than the 95th percentile. Obesity is defined as having a BMI greater than the 95th percentile.
   B. Effects of Obesity
      1. Obesity can lead to problems later in life if diagnosed in childhood, such as physical, social, and emotional health problems.
      2. Asthma, sleep apnea, bone and joint problems, type 2
diabetes, and risk factors leading to heart disease, such as hyperlipidemia, can occur.

3. A child who is obese is more likely to be obese as an adult, which results in the comorbidities associated with obesity later in life, such as type 2 diabetes, heart disease, metabolic syndrome, and cancer.

V. Diabetes Mellitus

A. Description (Fig. 32-1)

1. Type 1 diabetes mellitus is characterized by the destruction of the pancreatic beta cells, which produce insulin; this results in absolute insulin deficiency.

2. Type 2 diabetes mellitus usually arises because of insulin resistance, in which the body fails to use insulin properly, combined with relative (rather than absolute) insulin deficiency.

3. The rate of children and teens being diagnosed with prediabetes and type 2 diabetes is increasing. The number one risk factor for developing type 2 diabetes in childhood is being overweight. See Box 32-1 on prevention strategies for type 2 diabetes in childhood.

4. Insulin deficiency requires the use of exogenous insulin to promote appropriate glucose use and to prevent complications related to elevated blood glucose levels, such as hyperglycemia, diabetic ketoacidosis, and death.

5. Diagnosis is based on the presence of classic symptoms and an elevated blood glucose level (normal blood glucose level is 70 to 99 mg/dL [4 to 6 mmol/L]; based on PHCP preference, normal level may be a lower range).

6. Children may need to be admitted directly to the pediatric intensive care unit because of the manifestations of diabetic ketoacidosis, which may be the initial occurrence leading to diagnosis of diabetes mellitus.

B. Assessment

1. Polyuria, polydipsia, polyphagia
2. Hyperglycemia
3. Weight loss
4. Unexplained fatigue or lethargy
5. Headaches
6. Occasional enuresis in a previously toilet-trained child
7. Vaginitis in adolescent girls (caused by Candida, which thrives in hyperglycemic tissues)
8. Fruity odor to breath  
9. Dehydration  
10. Blurred vision  
11. Slow wound healing  
12. Changes in level of consciousness  

C. Long-term effects  
1. Failure to grow at a normal rate  
2. Delayed maturation  
3. Recurrent infections  
4. Neuropathy  
5. Cardiovascular disease  
6. Retinal microvascular disease  
7. Renal microvascular disease  

D. Complications  
1. Hypoglycemia  
2. Hyperglycemia  
3. Diabetic ketoacidosis  
4. Coma  
5. Hypokalemia  
6. Hyperkalemia  
7. Microvascular changes  
8. Cardiovascular changes  

For a child with diabetes mellitus, plan to initiate a consultation with the diabetic specialist to plan the child’s care.  

E. Diet  
1. Normal healthy nutrition is encouraged, and the total number of calories is individualized based on the child’s age and growth expectations. For type 2 diabetes, the American Diabetes Association recommendations can be found at http://main.diabetes.org/dorg/PDFs/Type-2-Diabetes-in-Youth/Type-2-Diabetes-in-Youth_14-18.pdf.  
2. As prescribed by the PHCP, children with diabetes need no special types of foods or supplements. They need sufficient calories to balance daily expenditure for energy and to satisfy the requirement for growth and development.  
3. Dietary intake should include 3 well-balanced meals per day, eaten at regular intervals, plus a mid-afternoon snack and a bedtime snack; a consistent intake of the prescribed protein, fats, and carbohydrates at each meal and snack is needed (concentrated sweets are discouraged; fat is reduced to 30% or less of the total caloric requirement).
4. Instruct children and parents to carry a source of glucose, such as glucose tablets, with them at all times to treat hypoglycemia if it occurs.
5. Incorporate the diet into the individual child’s needs, likes and dislikes, lifestyle, and cultural and socioeconomic patterns.
6. Allow the child to participate in making food choices to provide a sense of control.

F. Exercise
1. Instruct the child in dietary adjustments when exercising.
2. Extra food needs to be consumed for increased activity, usually 10 to 15 g of carbohydrates for every 30 to 45 minutes of activity.
3. Instruct the child to monitor the blood glucose level before exercising.
4. Plan an appropriate exercise regimen with the child, taking the developmental stage into account.

G. Insulin
1. Diluted insulin may be required for some infants to provide small enough doses to avoid hypoglycemia; diluted insulin should be labeled clearly to avoid dosage errors.
2. Laboratory evaluation of glycosylated hemoglobin (HgbA1c) should be performed every 3 months. Reference interval for HgbA1c is less than 6%.
3. Illness, infection, and stress increase the need for insulin, and insulin should not be withheld during illness, infection, or stress, because hyperglycemia and ketoacidosis can result.
4. When the child is not receiving anything by mouth for a special procedure, verify with the PHCP the need to withhold the morning insulin, and when food, fluids, and insulin are to be resumed.
5. Instruct the child and parents in the administration of insulin.
6. Instruct the child and parents to recognize symptoms of hypoglycemia and hyperglycemia.
7. Instruct the parents in the administration of glucagon intramuscularly or subcutaneously if the child has a hypoglycemic reaction and is unable to consume anything orally (if semiconscious or unconscious).
8. Instruct the child and parents always to have a spare bottle of insulin available.
9. Advise the parents to obtain a MedicAlert bracelet.
indicating the type and daily insulin dosage prescribed for the child.

10. See Chapter 47 for information on insulin types, administration sites, and administration procedure.

H. Blood glucose monitoring

1. Results provide information needed to maintain good glycemic control.
2. Blood glucose monitoring is more accurate than urine testing.
3. Monitoring requires that the child prick himself or herself several times a day as prescribed (Box 32-2).
4. Instruct the child and parents about the proper procedure for obtaining the blood glucose level.
5. Inform the child and parents that the procedure must be done precisely to obtain accurate results.
6. Stress the importance of hand washing before and after performing the procedure to prevent infection.
7. Stress the importance of following the manufacturer’s instructions for the blood glucose monitoring device.
8. Instruct the child and parents to calibrate the monitor as instructed by the manufacturer.
9. Instruct the child and parents to check the expiration date on the test strips used for blood glucose monitoring.
10. Instruct the child and parents that if the blood glucose results do not seem reasonable, they should reread the instructions, reassess technique, check the expiration date of the test strips, and perform the procedure again to verify results.

I. Urine testing

1. Instruct the parents and child in the procedure for testing urine for ketones and glucose.
2. Teach the child that the second voided urine specimen is most accurate.
3. The presence of ketones may indicate impending ketoacidosis.

Urine glucose testing is an unreliable method of monitoring the glucose level; however, the urine should be tested for ketones when the child is ill or when the blood glucose level is consistently greater than 200 mg/dL (greater than 11.4 mmol/L) or as specified by the PHCP.

J. Hypoglycemia

1. Description
a. Hypoglycemia is a blood glucose level less than 70 mg/dL (4 mmol/L) (or as specified by the PHCP).
b. Hypoglycemia results from too much insulin, not enough food, or excessive activity.

2. Signs include headache, nausea, sweating, tremors, lethargy, hunger, confusion, slurred speech, tingling around the mouth, and anxiety.

3. Interventions (Boxes 32-3 and 32-4; see also Priority Nursing Actions)

K. Hyperglycemia

1. Description: Elevated blood glucose level (> 200 mg/dL [11.4 mmol/L], or as specified by the PHCP)
2. Signs include polydipsia, polyuria, polyphagia, blurred vision, weakness, weight loss, and syncope.
3. Interventions (Box 32-5)

4. Sick day rules (Box 32-6)

L. Diabetic ketoacidosis

1. Description
   a. Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs.
   b. Diabetic ketoacidosis is a life-threatening condition.
   c. Hyperglycemia that progresses to metabolic acidosis occurs.
   d. Diabetic ketoacidosis develops over several hours to days.
   e. The blood glucose level is greater than 300 mg/dL (greater than 17.14 mmol/L), and urine and serum ketone tests are positive.

   Manifestations of diabetic ketoacidosis include signs of hyperglycemia, Kussmaul’s respirations, acetone (fruity) breath odor, increasing lethargy, and decreasing level of consciousness.

2. Interventions
a. Restore circulating blood volume, and protect against cerebral, coronary, or renal hypoperfusion.
b. Correct dehydration with IV infusions of 0.9% or 0.45% saline as prescribed.
c. Correct hyperglycemia with IV regular insulin administration as prescribed.
d. Monitor vital signs, urine output, and mental status closely.
e. Correct acidosis and electrolyte imbalances as prescribed.
f. Administer oxygen as prescribed.
g. Monitor blood glucose level frequently.
h. Monitor potassium level closely, because when the child receives insulin to reduce the blood glucose level, the serum potassium level changes; if the potassium level decreases, potassium replacement may be required.
i. The child should be voiding adequately before administering potassium; if the child does not have an adequate output, hyperkalemia may result.
j. Monitor the child closely for signs of fluid overload.
k. IV dextrose is added as prescribed when the blood glucose reaches an appropriate level.
l. Treat the cause of hyperglycemia.

Priority Nursing Actions

Hypoglycemia in a Hospitalized Child with Diabetes Mellitus

1. Check the child’s blood glucose level.
2. Give the child ½ cup of fruit juice or other acceptable item.
3. Take the child’s vital signs.
4. Retest the blood glucose level.
5. Give the child a small snack of carbohydrate and protein.
6. Document the child’s signs and symptoms, actions taken, and outcome.

Insulin deficiency

→ Impaired metabolism of fats, proteins, carbohydrates

→ Hyperglycemia
  Fatigue
  Hunger
  Weight loss

→ Polyuria, cellular starvation

→ Ketones, produced in response to cellular starvation, cannot nourish cell because of absence of insulin.

→ Ketoacidosis

**FIG. 32-1** Insulin deficiency leading to ketoacidosis.
## Box 32-1

### Preventing Type 2 Diabetes Mellitus in Childhood

#### Eating Healthy to Lose Weight

- Drink water instead of sugared beverages, such as sodas, juices, and sports drinks.
- Eat more fruits and vegetables—fresh is the best, but frozen and canned in water (not syrup) is acceptable.
- Limit fast food.
- Make healthy snacks, such as grapes, carrots, or plain popcorn.

#### Increasing Physical Activity to Lose Weight

- Children and adolescents should have 60 minutes a day of physical activity.
- Dancing, walking, bike riding, taking the stairs, playing interactive video games.
- Limiting screen time (using computers, tablets, or phones) to 60 minutes per day.

#### Noticing Warning Signs

- Increased thirst
- Increased night-time urination
- Blurry vision
- Unusual fatigue

## Box 32-2

### Lessening the Pain of Blood Glucose Monitoring

Hold the finger under warm water for a few seconds before puncture (enhances blood flow to the finger).

Use the ring finger or thumb to obtain a blood sample, because blood flows more easily to these areas; puncture the finger just to the side of the finger pad, because there are more blood vessels in this area and fewer nerve endings.
Press the lancet device lightly against the skin to prevent a deep puncture. Use glucose monitors that require very small blood samples for measurement.

---

**Box 32-3**

**Interventions for Hypoglycemia**

- If possible, confirm hypoglycemia with a blood glucose reading.
- Administer glucose immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker.
- Give an extra snack if the next meal is not planned for more than 30 minutes or if activity is planned.
- If the child becomes unconscious, squeeze cake frosting or glucose paste onto the gums and retest the blood glucose level in 15 minutes (monitor the child closely); if the reading remains low, administer additional glucose.
- If the child remains unconscious, the administration of glucagon may be necessary.
- In the hospital, prepare to administer dextrose intravenously if the child is unable to consume an oral glucose product.

---

**Box 32-4**

**Food Items to Treat Hypoglycemia**

- ½ cup of orange juice or sugar-sweetened carbonated beverage
- 8 oz of milk
- 1 small box of raisins
- 3 or 4 hard candies
- 4 sugar cubes (1 Tbsp of sugar)
- 3 or 4 Life Savers candies
- 1 candy bar
- 1 tsp honey
- 2 or 3 glucose tablets

---

**Box 32-5**

**Interventions for Hyperglycemia**
Instruct the parents to notify the primary health care provider when the following occur:

- Blood glucose results remain elevated (usually > 200 mg/dL (> 11.4 mmol/L)
- Moderate or high ketonuria is present
- Child is unable to take food or fluids
- Child vomits more than once
- Illness persists

**Box 32-6**

**Sick Day Rules for a Diabetic Child**

- Always give insulin, even if the child does not have an appetite, or contact the primary health care provider (PHCP) for specific instructions.
- Test blood glucose levels at least every 4 hours.
- Test for urinary ketones with each voiding.
- Notify the PHCP if moderate or large amounts of urinary ketones are present.
- Follow the child’s usual meal plan.
- Encourage liquids to aid in clearing ketones.
- Encourage rest, especially if urinary ketones are present.
- Notify the PHCP if vomiting, fruity odor to the breath, deep rapid respirations, decreasing level of consciousness, or persistent hyperglycemia occurs.

Adapted from Hockenberry M, Wilson D: *Nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.

**Practice Questions**

323. A school-age child with type 1 diabetes mellitus has soccer practice and the school nurse provides instructions regarding how to prevent hypoglycemia during practice. Which should the school nurse tell the child to do?

1. Eat twice the amount normally eaten at lunchtime.
2. Take half the amount of prescribed insulin on practice days.
3. Take the prescribed insulin at noontime rather than in the morning.
4. Eat a small box of raisins or drink a cup of orange juice before soccer practice.

324. The mother of a 6-year-old child who has type 1 diabetes mellitus calls a clinic nurse and tells the nurse that the child has been sick. The mother reports that she checked the child’s urine and it was positive for ketones. The nurse should instruct the mother to take which action?

1. Hold the next dose of insulin.
2. Come to the clinic immediately.
3. Encourage the child to drink liquids.
4. Administer an additional dose of regular insulin.

325. A pediatrician prescribes an intravenous (IV) solution of 5% dextrose and half-normal saline (0.45%) with 40 mEq of potassium chloride for a child with hypotonic dehydration. The nurse performs which priority assessment before administering this IV prescription?
1. Obtains a weight
2. Takes the temperature
3. Takes the blood pressure
4. Checks the amount of urine output

326. An adolescent client with type 1 diabetes mellitus is admitted to the emergency department for treatment of diabetic ketoacidosis. Which assessment findings should the nurse expect to note?
1. Sweating and tremors
2. Hunger and hypertension
3. Cold, clammy skin and irritability
4. Fruity breath odor and decreasing level of consciousness

327. A mother brings her 2-week-old infant to a clinic for a phenylketonuria rescreening blood test. The test indicates a serum phenylalanine level of 1 mg/dL (60.5 mcmol/L). The nurse reviews this result and makes which interpretation?
1. It is positive.
2. It is negative.
3. It is inconclusive.
4. It requires rescreening at age 6 weeks.

328. A child with type 1 diabetes mellitus is brought to the emergency department by the mother, who states that the child has been complaining of abdominal pain and has been lethargic. Diabetic ketoacidosis is diagnosed. Anticipating the plan of care, the nurse prepares to administer which type of intravenous (IV) infusion?
1. Potassium infusion
2. NPH insulin infusion
3. 5% dextrose infusion
4. Normal saline infusion

329. The nurse has just administered ibuprofen to a child with a temperature of 102° F (38.8° C). The nurse should also take which action?
1. Withhold oral fluids for 8 hours.
2. Sponge the child with cold water.
3. Plan to administer salicylate in 4 hours.
4. Remove excess clothing and blankets from the child.

330. A child has fluid volume deficit. The nurse performs an assessment and determines that the child is improving and the deficit is resolving if which finding is noted?
1. The child has no tears.
2. Urine specific gravity is 1.035.
3. Capillary refill is less than 2 seconds.
4. Urine output is less than 1 mL/kg/hr.
331. The nurse should implement which interventions for a child older than 2 years with type 1 diabetes mellitus who has a blood glucose level of 60 mg/dL (3.4 mmol/L)? **Select all that apply.**

- 1. Administer regular insulin.
- 2. Encourage the child to ambulate.
- 3. Give the child a teaspoon of honey.
- 4. Provide electrolyte replacement therapy intravenously.
- 5. Wait 30 minutes and confirm the blood glucose reading.
- 6. Prepare to administer glucagon subcutaneously if unconsciousness occurs.

**Answers**

323. **Answer:** 4

**Rationale:** Hypoglycemia is a blood glucose level less than 70 mg/dL (4 mmol/L) and results from too much insulin, not enough food, or excessive activity. An extra snack of 15 to 30 g of carbohydrates eaten before activities such as soccer practice would prevent hypoglycemia. A small box of raisins or a cup of orange juice provides 15 to 30 g of carbohydrates. The child or parents should not be instructed to adjust the amount or time of insulin administration. Meal amounts should not be doubled.

**Test-Taking Strategy:** Use general medication guidelines to eliminate options 2 and 3 first, noting that they are **comparable or alike** and indicate changing the amount of insulin or time of administration. From the remaining options, recalling the definition of hypoglycemia and its manifestations and associated treatment will direct you to the correct option.

**Health Problem:** Pediatric-Specific: Diabetes mellitus

**Priority Concepts:** Glucose Regulation; Health Promotion

324. **Answer:** 3

**Rationale:** When the child is sick, the mother should test for urinary ketones with each voiding. If ketones are present, liquids are essential to aid in clearing the ketones. The child should be encouraged to drink liquids. Bringing the child to the clinic immediately is unnecessary. Insulin doses should not be adjusted or changed.

**Test-Taking Strategy:** Use general medication guidelines. Eliminate options 1 and 4, noting that they are **comparable or alike**. Recall that insulin doses should not be
adjusted or changed. From the remaining options, note the words *positive for ketones* in the question. Recalling that liquids are essential to aid in clearing the ketones will direct you to the correct option.

325. **Answer:** 4

**Rationale:** In hypotonic dehydration, electrolyte loss exceeds water loss. The priority assessment before administering potassium chloride intravenously would be to assess the status of the urine output. Potassium chloride should never be administered in the presence of oliguria or anuria. If the urine output is less than 1 to 2 mL/kg/hr, potassium chloride should not be administered. Although options 1, 2, and 3 are appropriate assessments for a child with dehydration, these assessments are not related specifically to the IV administration of potassium chloride.

**Test-Taking Strategy:** Note the **strategic word**, *priority*. Focus on the IV prescription. Recalling that the kidneys play a key role in the excretion and reabsorption of potassium will direct you to the correct option.

**Content Area:** Pediatrics: Metabolic/Endocrine  
**Health Problem:** Pediatric-Specific: Dehydration  
**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes  

326. **Answer:** 4

**Rationale:** Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Signs of hyperglycemia include fruity breath odor and a decreasing level of consciousness. Hunger can be a sign of hypoglycemia or hyperglycemia, but hypertension is not a sign of diabetic ketoacidosis. Hypotension occurs because of a decrease in blood volume related to the dehydrated state that occurs during diabetic ketoacidosis. Cold clammy skin, irritability, sweating, and tremors all are signs of hypoglycemia.

**Test-Taking Strategy:** Focus on the **subject**, the signs of diabetic ketoacidosis, and recall that in this condition the blood glucose level is elevated. Eliminate options 1, 2, and 3 because these signs do not occur with hyperglycemia. Recall that fruity breath odor and a change in the level of consciousness can occur during diabetic ketoacidosis.

**Reference:** McKinney et al. (2018), pp. 1268, 1271-1272.

327. **Answer:** 2

**Rationale:** Phenylketonuria is a genetic (autosomal recessive) disorder that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood. It is characterized by blood phenylalanine levels greater than 20 mg/dL (1210 mcmol/L); normal level is 0 to 2 mg/dL (0 to 121 mcmol/L). A result of 1 mg/dL is a negative test result.

**Test-Taking Strategy:** Eliminate options 3 and 4 first because they are comparable or alike, indicating no definitive finding. Note that the level identified in the question is a low level; this should assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity

**Content Area:** Pediatrics: Metabolic/Endocrine  
**Health Problem:** Pediatric-Specific: Phenylketonuria  
**Priority Concepts:** Clinical Judgment; Health Promotion  

328. **Answer:** 4

**Rationale:** Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Rehydration is the initial step in resolving diabetic ketoacidosis. Normal saline is the initial IV rehydration fluid. NPH insulin is never administered by the IV route. Dextrose solutions are added to the treatment when the blood glucose level decreases to an acceptable level. Intravenously administered potassium may be required, depending on the potassium level, but would not be part of the initial treatment.

**Test-Taking Strategy:** Focus on the subject, treatment for diabetic ketoacidosis. Eliminate option 3, knowing that dextrose would not be administered in a hyperglycemic state. Eliminate option 2 next, knowing that NPH insulin is not administered by the IV route. Recalling that hydration is the initial treatment in diabetic ketoacidosis will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Reference:** McKinney et al. (2018), pp. 1271-1272.
Rationale: After administering ibuprofen, excess clothing and blankets should be removed. The child can be sponged with tepid water but not cold water, because the cold water can cause shivering, which increases metabolic requirements above those already caused by the fever. Aspirin (a salicylate) is not administered to a child with fever because of the risk of Reye’s syndrome. Fluids should be encouraged to prevent dehydration, so oral fluids should not be withheld.

Test-Taking Strategy: Focus on the subject, interventions for an elevated temperature. Remember that cooling measures such as removing excess clothing and blankets should be done when a child has a fever. Options 1, 2, and 3 are not interventions for a child with a fever.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Metabolic/Endocrine
Health Problem: Pediatric-Specific: Fever
Priority Concepts: Clinical Judgment; Thermoregulation

Rationale: Indicators that fluid volume deficit is resolving would be capillary refill less than 2 seconds, specific gravity of 1.003 to 1.030, urine output of at least 1 mL/kg/hr, and adequate tear production. A capillary refill time less than 2 seconds is the only indicator that the child is improving. Urine output of less than 1 mL/kg/hr, a specific gravity of 1.035, and no tears would indicate that the deficit is not resolving.

Test-Taking Strategy: Focus on the subject, assessment findings indicating that fluid volume deficit is resolving. Recall the parameters that indicate adequate hydration status. The only option that indicates an improving fluid balance is option 3. The other options indicate fluid imbalance.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Evaluation
Content Area: Pediatrics: Metabolic/Endocrine
Health Problem: Pediatric-Specific: Dehydration
Priority Concepts: Evidence; Fluids and Electrolytes

Rationale: Hypoglycemia is defined as a blood glucose level less than 70 mg/dL (4 mmol/L). Hypoglycemia occurs as a result of too much insulin, not enough food, or excessive activity. If possible, the nurse should confirm hypoglycemia with a blood glucose reading. Glucose is administered orally immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker. An extra snack is given if the next meal is not planned for
more than 30 minutes or if activity is planned. If the child becomes unconscious, cake frosting or glucose paste is squeezed onto the gums, and the blood glucose level is retested in 15 minutes; if the reading remains low, additional glucose is administered. If the child remains unconscious, administration of glucagon may be necessary, and the nurse should be prepared for this intervention. Encouraging the child to ambulate and administering regular insulin would result in a lowered blood glucose level. Providing electrolyte replacement therapy intravenously is an intervention to treat diabetic ketoacidosis. Waiting 30 minutes to confirm the blood glucose level delays necessary intervention.

**Test-Taking Strategy:** Focus on the subject, a low blood glucose level, and on the information in the question. Think about the pathophysiology associated with hypoglycemia and how it is treated. Recalling that a blood glucose level of 60 mg/dL (3.4 mmol/L) indicates hypoglycemia will assist in determining the correct interventions.

CHAPTER 33

Gastrointestinal Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Elimination; Nutrition

I. Vomiting
   A. Description
      1. The major concerns when a child is vomiting are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic alkalosis.
      2. Additional concerns include aspiration and the development of atelectasis or pneumonia.
      3. Causes of vomiting include acute infectious diseases, increased intracranial pressure, toxic ingestions, food intolerance, mechanical obstruction of the gastrointestinal tract, metabolic disorders, and psychogenic disorders.
   B. Assessment
      1. Character of vomitus
      2. Signs of aspiration
      3. Presence of pain and abdominal cramping
      4. Signs of dehydration and fluid and electrolyte imbalances
      5. Signs of metabolic alkalosis
   C. Interventions
      1. Maintain a patent airway.
      2. Position the child on the side to prevent aspiration.
      3. Monitor the character, amount, and frequency of vomiting.
      4. Assess the force of the vomiting; projectile vomiting may indicate pyloric stenosis or increased intracranial pressure.
      5. Monitor strict intake and output.
      6. Monitor for signs and symptoms of dehydration, such
as a sunken fontanel (age-appropriate), nonelastic skin turgor, dry mucous membranes, decreased tear production, vital sign changes, and oliguria.

7. Monitor electrolyte levels.
8. Provide oral rehydration therapy as tolerated and as prescribed; begin feeding slowly, with small amounts of fluid at frequent intervals.
9. Administer antiemetics as prescribed.
10. Assess for abdominal pain or diarrhea.
11. Advise the parents to inform the primary health care provider (PHCP) if signs of dehydration, blood in the vomitus, forceful vomiting, or abdominal pain are present.

II. Diarrhea

A. Description

1. Acute diarrhea is a cause of dehydration, particularly in children younger than 5 years.
2. Causes of acute diarrhea include acute infectious disorders of the gastrointestinal tract, antibiotic therapy, rotavirus, and parasitic infestation.
3. Causes of chronic diarrhea include malabsorption syndromes, inflammatory bowel disease, immunodeficiencies, food intolerances, and nonspecific factors.
4. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months old; children younger than 3 months have some protection because of maternally acquired antibodies.

Many conditions can cause vomiting or diarrhea, such as but not limited to viral gastroenteritis, group B hemolytic streptococcal pharyngitis, food allergies, and food-borne illnesses.

B. Assessment

1. Character of stools
2. Presence of pain and abdominal cramping
3. Signs of dehydration and fluid and electrolyte imbalances
4. Signs of metabolic acidosis

C. Interventions

1. Monitor character, amount, and frequency of diarrhea.
2. Provide enteric isolation as required; instruct the parents in effective handwashing technique (children should be taught this technique also).
3. Monitor skin integrity.
4. Monitor strict intake and output.
5. Monitor electrolyte levels.
7. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte or a similar rehydration solution as prescribed; avoid carbonated beverages because they are gas-producing, and fluids that contain high amounts of sugar, such as apple juice.
8. For severe dehydration, maintain NPO (nothing by mouth) status to place the bowel at rest and provide fluid and electrolyte replacement by the intravenous (IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and has adequate renal function.
9. Reintroduce a normal diet when rehydration is achieved.

The major concerns when a child is having diarrhea are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic acidosis. Orthostatic vital signs are helpful in assessing hydration status.

III. Cleft Lip and Cleft Palate
A. Description
1. Cleft lip and cleft palate are congenital anomalies that occur as a result of failure of soft tissue or bony structure to fuse during embryonic development.
2. The defects involve abnormal openings in the lip and palate that may occur unilaterally or bilaterally and are readily apparent at birth.
3. Causes include hereditary and environmental factors—exposure to radiation or rubella virus, chromosome abnormalities, family history, maternal smoking, and teratogenic factors such as medications taken during pregnancy.
4. Prenatal dietary supplementation of folic acid is important to decrease the risk of cleft lip and palate.
5. Closure of a cleft lip defect precedes closure of the cleft palate and is usually performed by age 3 to 6 months.
6. Cleft palate repair is usually performed around 1 year of age, following the successful repair of cleft lip if present, and to allow for the palatal changes that occur with normal growth; a cleft palate is closed as early as possible to facilitate speech development.
7. A child with cleft palate is at risk for developing frequent otitis media; this can result in hearing loss.
8. An interprofessional team approach, including audiologists, orthodontists, plastic surgeons, and occupational and speech therapists, is taken to address the many needs of the child.

B. Assessment (Fig. 33-1)
   1. Cleft lip can range from a slight notch to a complete separation from the floor of the nose.
   2. Cleft palate can include nasal distortion, midline or bilateral cleft, and variable extension from the uvula and soft and hard palate.

C. Interventions
   1. Assess the ability to suck, swallow, handle normal secretions, and breathe without distress.
   2. Assess fluid and calorie intake daily.
   3. Monitor daily weight.
   4. Modify feeding techniques; plan to use specialized feeding techniques, obturators, and special nipples and feeders.
   5. Hold the infant in an upright position and direct the formula to the side and back of the mouth to prevent aspiration.
   6. Feed small amounts gradually and burp frequently.
   7. Keep suction equipment and a bulb syringe at the bedside.
   8. Teach the parents special feeding or suctioning techniques.
   9. Teach the parents the ESSR method of feeding — enlarge the nipple, stimulate the sucking reflex, swallow, rest to allow the infant to finish swallowing what has been placed in the mouth.
   10. Encourage parents to express their feelings about the disorder.
   11. Encourage parental bonding with the infant, including holding the infant and calling the infant by name.

D. Postoperative interventions
   1. Cleft lip repair
      a. Provide lip protection; a metal appliance or adhesive strips may be taped securely to the cheeks to prevent trauma to the suture line.
      b. Avoid positioning the infant on the side of the repair or in the prone position because these positions can
cause rubbing of the surgical site on the mattress (position on the back upright and position to prevent airway obstruction by secretions, blood, or the tongue).

c. Keep the surgical site clean and dry; after feeding, gently cleanse the suture line of formula or serosanguineous drainage with a solution such as normal saline or as designated by agency procedure.

d. Apply antibiotic ointment to the site as prescribed.

e. Elbow restraints should be used to prevent the infant from injuring or traumatizing the surgical site.

f. Monitor for signs and symptoms of infection at the surgical site.

2. Cleft palate repair

a. Feedings are resumed by bottle, breast, or cup per surgeon preference; some surgeons prescribe the use of an Asepto syringe for feeding or a soft cup such as a sippy cup.

b. Oral packing may be secured to the palate (usually removed in 2 to 3 days).

c. Instruct the parents to avoid placing anything in the child's mouth that is harsh and could cause disruption of the surgical site.

3. Soft elbow or jacket restraints may be used (check agency policies and procedures) to keep the child from touching the repair site; remove restraints at least every 1 to 2 hours (or per agency procedure) to assess skin integrity and circulation and to allow for exercising the arms.

4. Avoid the use of oral suction or placing objects in the mouth such as a tongue depressor, thermometer, straws, spoons, forks, or pacifiers.

5. Provide analgesics for pain as prescribed.

6. Instruct the parents in feeding techniques and in the care of the surgical site.

7. Instruct the parents to monitor for signs of infection at the surgical site, such as redness, swelling, or
Encourage the parents to hold the child.

9. Initiate appropriate referrals such as a dental referral and speech therapy referral.

IV. Esophageal Atresia and Tracheoesophageal Fistula (Fig. 33-2)

A. Description

1. The esophagus terminates before it reaches the stomach, ending in a blind pouch, or a fistula is present that forms an unnatural connection with the trachea.

2. The condition causes oral intake to enter the lungs or a large amount of air to enter the stomach, presenting a risk of coughing and choking; severe abdominal distention can occur.

3. Aspiration pneumonia and severe respiratory distress may develop, and death is likely to occur without surgical intervention.

4. Treatment includes maintenance of a patent airway, prevention of aspiration pneumonia, gastric or blind pouch decompression, supportive therapy, and surgical repair.

B. Assessment

1. Frothy saliva in the mouth and nose and excessive drooling

2. The “3 Cs”—coughing and choking during feedings and unexplained cyanosis

3. Regurgitation and vomiting

4. Abdominal distention

5. Increased respiratory distress during and after feeding

C. Preoperative interventions

1. The infant may be placed in a radiant warmer in which humidified oxygen is administered (intubation and mechanical ventilation may be necessary if respiratory distress occurs).

3. Maintain IV fluids as prescribed.

4. Monitor respiratory status closely.

5. Suction accumulated secretions from the mouth and pharynx.

6. Maintain in a supine upright position (at least 30 degrees upright) to facilitate drainage and prevent aspiration of gastric secretions.

7. Keep the blind pouch empty of secretions by intermittent or continuous suction as prescribed; monitor its patency closely, because clogging from
mucus can occur easily.
8. If a gastrostomy tube is inserted, it may be left open so that air entering the stomach through the fistula can escape, minimizing the risk of regurgitation of gastric contents into the trachea.
9. Broad-spectrum antibiotics may be prescribed because of the high risk for aspiration pneumonia.

D. Postoperative interventions

1. Monitor vital signs and respiratory status.
2. Maintain IV fluids, antibiotics, and parenteral nutrition as prescribed.
3. Monitor strict intake and output.
4. Monitor daily weight; assess for dehydration and possible fluid overload.
5. Assess for signs of pain.
6. Maintain chest tube if present.
7. Inspect the surgical site for signs and symptoms of infection.
8. Monitor for anastomotic leaks as evidenced by purulent drainage from the chest tube, increased temperature, and increased white blood cell count.
9. If a gastrostomy tube is present, it is usually attached to gravity drainage until the infant can tolerate feedings and the anastomosis is healed (usually postoperative day 5 to 7); then feedings are prescribed.
10. Before oral feedings and removal of the chest tube, prepare for an esophagogram as prescribed to check the integrity of the esophageal anastomosis.
11. Before feeding, elevate the gastrostomy tube and secure it above the level of the stomach to allow gastric secretions to pass to the duodenum and swallowed air to escape through the open gastrostomy tube.
12. Administer oral feedings with sterile water, followed by frequent small feedings of formula as prescribed.
13. Assess the cervical esophagostomy site, if present, for redness, breakdown, or exudate; remove accumulated drainage frequently, and apply protective ointment, barrier dressing, or a collection device as prescribed.
14. Provide nonnutritive sucking, using a pacifier for infants who remain NPO for extended periods (a pacifier should not be used if the infant is unable to handle secretions).
15. Instruct the parents in the techniques of suctioning, gastrostomy tube care and feedings, and skin site care as appropriate.
16. Instruct the parents to identify behaviors that indicate the need for suctioning, signs of respiratory distress, and signs of a constricted esophagus (e.g., poor feeding, dysphagia, drooling, coughing during feedings, regurgitated undigested food).

V. Gastroesophageal Reflux Disease
A. Description

1. Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter.
2. Most infants with gastroesophageal reflux have a mild problem that improves in about 1 year and requires medical therapy only.
3. Gastroesophageal reflux disease occurs when gastric contents reflux into the esophagus or oropharynx and produce symptoms.

B. Assessment

1. Passive regurgitation or emesis
2. Poor weight gain
3. Irritability
4. Hematemesis
5. Heartburn (in older children)
6. Anemia from blood loss

C. Interventions

1. Assess amount and characteristics of emesis.
2. Assess the relationship of vomiting to the times of feedings and infant activity.
3. Monitor breath sounds before and after feedings.
4. Assess for signs of aspiration, such as drooling, coughing, or dyspnea, after feeding.
5. Place suction equipment at the bedside.
6. Monitor intake and output.
7. Monitor for signs and symptoms of dehydration.
8. Maintain IV fluids as prescribed.

Complications of gastroesophageal reflux disease include esophagitis, esophageal strictures, aspiration of gastric contents, and aspiration pneumonia.

D. Positioning
1. The infant is placed in the supine position during sleep (to reduce the incidence of sudden infant death syndrome) unless the risk of death from aspiration or other serious complications of gastroesophageal reflux disease greatly outweighs the risks associated with the prone position (check the PHCP’s prescription); otherwise, the prone position is acceptable only while the infant is awake and can be monitored.

2. In children older than 1 year, position with the head of the bed elevated.

E. Diet

1. Provide small, frequent feedings with predigested formula to decrease the amount of regurgitation.
2. Nutrition via nasogastric tube feedings may be prescribed if severe regurgitation and poor growth are present.
3. For infants, formula may be thickened by adding rice cereal to the formula (follow agency procedure); cross-cut the nipple.
4. Breast-feeding may continue, and the mother may provide more frequent feeding times or express milk for thickening with rice cereal.
5. Burp the infant frequently when feeding and handle the infant minimally after feedings; monitor for coughing during feeding and other signs of aspiration.
6. For toddlers, feed solids first, followed by liquids.
7. Instruct the parents to avoid feeding the child fatty foods, chocolate, tomato products, carbonated liquids, fruit juices, citrus products, and spicy foods.
8. Instruct the parents that the child should avoid vigorous play after feeding and avoid feeding just before bedtime.

F. Medications

1. Antacids for symptom relief
2. Proton pump inhibitors and histamine H$_2$-receptor antagonists to decrease gastric acid secretion

VI. Hypertrophic Pyloric Stenosis (Fig. 33-3)

A. Description

1. Hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum.
2. The stenosis usually develops in the first few weeks of life, causing projectile vomiting, dehydration, metabolic alkalosis, and failure to thrive.
B. Assessment

1. Vomiting that progresses from mild regurgitation to forceful and projectile vomiting; it usually occurs after a feeding.
2. Vomitus contains gastric contents such as milk or formula, may contain mucus, may be blood-tinged, and does not usually contain bile.
3. The child exhibits hunger and irritability.
4. Peristaltic waves are visible from left to right across the epigastrium during or immediately after a feeding.
5. An olive-shaped mass is in the epigastrium just right of the umbilicus.
6. Signs of dehydration and malnutrition
7. Signs of electrolyte imbalances
8. Metabolic alkalosis

C. Interventions

1. Monitor strict intake and output.
2. Monitor vomiting episodes and stools.
3. Obtain daily weights.
4. Monitor for signs of dehydration and electrolyte imbalances.
5. Prepare the child and parents for pyloromyotomy if prescribed.

D. Pyloromyotomy

1. Description: An incision through the muscle fibers of the pylorus; may be performed by laparoscopy
2. Preoperative interventions
   a. Monitor hydration status by daily weights, intake and output, and urine for specific gravity.
   b. Correct fluid and electrolyte imbalances; administer fluids intravenously as prescribed for rehydration.
   c. Maintain NPO status as prescribed.
   d. Monitor the number and character of stools.
   e. Maintain patency of the nasogastric tube placed for stomach decompression.
3. Postoperative interventions
   a. Monitor intake and output.
b. Begin small, frequent feedings postoperatively as prescribed.
c. Gradually increase amount and interval between feedings until a full feeding schedule has been reinstated.
d. Feed the infant slowly, burping frequently, and handle the infant minimally after feedings.
e. Monitor for abdominal distention.
f. Monitor the surgical wound and for signs of infection.
g. Instruct the parents about wound care and feeding.

VII. Lactose Intolerance

A. Description: Inability to tolerate lactose as a result of an absence or deficiency of lactase, an enzyme found in the secretions of the small intestine that is required for the digestion of lactose

B. Assessment

1. Symptoms occur after the ingestion of milk or other dairy products.
2. Abdominal distention
3. Crampy, abdominal pain; colic
4. Diarrhea and excessive flatus

C. Interventions

1. Eliminate the offending dairy product, or administer an enzyme tablet replacement.
2. Provide information to the parents about enzyme tablets that predigest the lactose in dairy products or supplement the body’s own lactase.
3. Substitute soy-based formulas for cow’s milk formula or human milk.
4. Allow milk consumption as tolerated.
5. Instruct the child and family that the child should drink milk with other foods rather than by itself.
6. Encourage consumption of hard cheese, cottage cheese, and yogurt, which contain the inactive lactase enzyme.
7. Encourage consumption of small amounts of dairy foods daily to help colonic bacteria adapt to ingested lactose.
8. Instruct the parents about the foods that contain lactose, including hidden sources.

A child with lactose intolerance can develop calcium and
vitamin D deficiency. Instruct the parents about the importance of
providing these supplements.

VIII. Celiac Disease
A. Description
1. Celiac disease is also known as gluten enteropathy or
   celiac sprue.
2. Intolerance to gluten, the protein component of
   wheat, barley, rye, and oats, is characteristic.
3. Celiac disease results in the accumulation of the amino
   acid glutamine, which is toxic to intestinal mucosal
   cells.
4. Intestinal villous atrophy occurs, which affects
   absorption of ingested nutrients.
5. Symptoms of the disorder occur most often between
   the ages of 1 and 5 years.
6. There is usually an interval of 3 to 6 months between
   the introduction of gluten in the diet and the onset of
   symptoms.
7. Strict dietary avoidance of gluten minimizes the risk of
   developing malignant lymphoma of the small
   intestine and other gastrointestinal malignancies.
B. Assessment
1. Acute or insidious diarrhea
2. Steatorrhea
3. Anorexia
4. Abdominal pain and distention
5. Muscle wasting, particularly in the buttocks and
   extremities
6. Vomiting
7. Anemia
8. Irritability
C. Celiac crisis
1. Precipitated by fasting, infection, or ingestion of
   gluten
2. Causes profuse watery diarrhea and vomiting
3. Can lead to rapid dehydration, electrolyte imbalance,
   and severe acidosis
D. Interventions
1. Maintain a gluten-free diet, substituting corn,
   rice, and millet as grain sources.
2. Instruct the parents and child about lifelong
   elimination of gluten sources such as wheat, rye, oats,
   and barley.
3. Administer mineral and vitamin supplements, including iron, folic acid, and fat-soluble vitamins A, D, E, and K.

4. Teach the child and parents about a gluten-free diet and about reading food labels carefully for hidden sources of gluten (Box 33-1).

5. Instruct the parents in measures to prevent celiac crisis.

6. Inform the parents about the Celiac Sprue Association.

IX. Appendicitis

A. Description
1. Inflammation of the appendix
2. When the appendix becomes inflamed or infected, perforation may occur within a matter of hours, leading to peritonitis, sepsis, septic shock, and potentially death.
3. Treatment is surgical removal of the appendix before perforation occurs.

B. Assessment
1. Pain in periumbilical area that descends to the right lower quadrant
2. Abdominal pain that is most intense at McBurney’s point
3. Referred pain indicating the presence of peritoneal irritation
4. Rebound tenderness and abdominal rigidity
5. Elevated white blood cell count
6. Side-lying position with abdominal guarding (legs flexed) to relieve pain
7. Difficulty walking and pain in the right hip
8. Low-grade fever
9. Anorexia, nausea, and vomiting after pain develops
10. Diarrhea

C. Peritonitis
1. Description: Results from a perforated appendix
2. Assessment
   a. Increased fever
   b. Progressive abdominal distention
   c. Tachycardia and tachypnea
   d. Pallor
   e. Chills
   f. Restlessness and irritability

An indication of a perforated appendix is
the sudden relief of pain and then a subsequent increase in pain accompanied by right guarding of the abdomen.

D. Appendectomy

1. Description: Surgical removal of the appendix

2. Interventions preoperatively
   a. Maintain NPO status.
   b. Administer IV fluids and electrolytes as prescribed to prevent dehydration and correct electrolyte imbalances.
   c. Monitor for changes in the level of pain.
   d. Monitor for signs of a ruptured appendix and peritonitis.
   e. Avoid the use of pain medications so as not to mask pain changes associated with perforation.
   f. Administer antibiotics as prescribed.
   g. Monitor bowel sounds.
   h. Position in a right side-lying or low to semi-Fowler’s position to promote comfort.
   i. Apply ice packs to the abdomen for 20 to 30 minutes every hour if prescribed.
   j. Avoid the application of heat to the abdomen.
   k. Avoid laxatives or enemas.

3. Postoperative interventions
   a. Monitor vital signs, particularly temperature.
   b. Maintain NPO status until bowel function has returned, advancing the diet gradually as tolerated and as prescribed when bowel sounds return.
   c. Assess the incision for signs of infection such as redness, swelling, drainage, and pain.
   d. Monitor drainage from the drain, which may be inserted if perforation occurred.
   e. Position the child in a right side-lying or low to semi-Fowler’s position with the legs slightly flexed to facilitate drainage.
f. Change the dressing as prescribed, and record the type and amount of drainage.
g. Perform wound irrigations if prescribed.
h. Maintain nasogastric tube suction and patency of the tube if present.
i. Administer antibiotics and analgesics as prescribed.

X. Hirschsprung’s Disease (Fig. 33-4)

A. Description

1. Hirschsprung’s disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon.
2. The disease occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine.
3. Mechanical obstruction results because of inadequate motility in an intestinal segment.
4. The disease may be a familial congenital defect or may be associated with other anomalies, such as Down’s syndrome and genitourinary abnormalities.
5. A rectal biopsy specimen shows histological evidence of the absence of ganglionic cells.
6. The most serious complication is enterocolitis; signs include fever, severe prostration, gastrointestinal bleeding, and explosive watery diarrhea.
7. Treatment for mild or moderate disease is based on relieving the chronic constipation with stool softeners and rectal irrigations; however, many children require surgery.
8. Treatment for moderate to severe disease involves a 2-step surgical procedure.
   a. Initially, in the neonatal period, a temporary colostomy is created to relieve obstruction and allow the normally innervated, dilated bowel to return to its normal size.
   b. When the bowel returns to its normal size, a complete surgical repair is performed via a pull-through procedure to excise portions of the bowel; at this time, the colostomy is closed.
B. Assessment

1. Newborns
   a. Failure to pass meconium stool
   b. Refusal to suck
   c. Abdominal distention
   d. Bile-stained vomitus

2. Children
   a. Failure to gain weight and delayed growth
   b. Abdominal distention
   c. Vomiting
   d. Constipation alternating with diarrhea
   e. Ribbon-like and foul-smelling stools

C. Interventions: Medical management

1. Maintain a low-fiber, high-calorie, high-protein diet; parenteral nutrition may be necessary in extreme situations.
2. Administer stool softeners as prescribed.
3. Administer daily rectal irrigations with normal saline to promote adequate elimination and prevent obstruction as prescribed.

D. Surgical management: Preoperative interventions

1. Assess bowel function.
2. Administer bowel preparation as prescribed.
4. Monitor hydration and fluid and electrolyte status; provide fluids intravenously as prescribed for hydration.
5. Administer antibiotics or colonic irrigations with an antibiotic solution as prescribed to clear the bowel of bacteria.
6. Monitor strict intake and output.
7. Obtain daily weight.
8. Measure abdominal girth daily.
9. Avoid taking the temperature rectally.

E. Surgical management: Postoperative interventions

1. Monitor vital signs, avoiding taking the temperature rectally.
2. Measure abdominal girth daily and PRN (as needed).
3. Assess the surgical site for redness, swelling, and drainage.
4. Assess the stoma if present for bleeding or skin
breakdown (stoma should be red and moist).
5. Assess the anal area for the presence of stool, redness, or discharge.
6. Maintain NPO status as prescribed and until bowel sounds return or flatus is passed, usually within 48 to 72 hours.
7. Maintain nasogastric tube to allow intermittent suction until peristalsis returns.
8. Maintain IV fluids until the child tolerates appropriate oral intake, advancing the diet from clear liquids to regular as tolerated and as prescribed.
9. Assess for dehydration and fluid overload.
10. Monitor strict intake and output.
11. Obtain daily weight.
12. Assess for pain and provide comfort measures as required.
13. Provide the parents with instructions regarding colostomy care and skin care.
14. Teach the parents about the appropriate diet and the need for adequate fluid intake.

XI. Intussusception (Fig. 33-5)
A. Description
1. Telescoping of one portion of the bowel into another portion
2. The condition results in obstruction to the passage of intestinal contents.

B. Assessment
1. Colicky abdominal pain that causes the child to scream and draw the knees to the abdomen, similar to the fetal position
2. Vomiting of gastric contents
3. Bile-stained fecal emesis
4. Currant jelly–like stools containing blood and mucus
5. Hypoactive or hyperactive bowel sounds
6. Tender distended abdomen, possibly with a palpable sausage-shaped mass in the upper right quadrant

C. Interventions
1. Monitor for signs of perforation and shock as evidenced by fever, increased heart rate, changes in level of consciousness or blood pressure, and respiratory distress, and report immediately.
2. Antibiotics, IV fluids, and decompression via nasogastric tube may be prescribed.
3. Monitor for the passage of normal, brown stool, which indicates that the intussusception has reduced itself.

4. Prepare for hydrostatic reduction as prescribed, if no signs of perforation or shock occur (in hydrostatic reduction, air or fluid is used to exert pressure on area involved to lessen, diminish, or resolve the prolapse).

5. Posthydrostatic reduction
   a. Monitor for the return of normal bowel sounds, for the passage of barium, and the characteristics of stool.
   b. Administer clear fluids, and advance the diet gradually as prescribed.

6. If surgery is required, postoperative care is similar to care after any abdominal surgery; procedure may be done via laparoscope.

XII. Abdominal Wall Defects
   A. Omphalocele

   1. Omphalocele refers to herniation of the abdominal contents through the umbilical ring, usually with an intact peritoneal sac.

   2. The protrusion is covered by a translucent sac that may contain bowel or other abdominal organs.

   3. Rupture of the sac results in evisceration of the abdominal contents.

   4. Immediately after birth, the sac is covered with sterile gauze soaked in normal saline to prevent drying of abdominal contents; a layer of plastic wrap is placed over the gauze to provide additional protection against moisture loss.

   5. Monitor vital signs frequently (every 2 to 4 hours), particularly temperature, because the infant can lose heat through the sac.

   6. Preoperatively: Maintain NPO status, administer IV fluids as prescribed to maintain hydration and electrolyte balance, monitor for signs of infection, and handle the infant carefully to prevent rupture of the sac.

   7. Postoperatively: Control pain, prevent infection, maintain fluid and electrolyte balance, and ensure adequate nutrition.

   B. Gastroschisis

   1. Gastroschisis occurs when the herniation of the
intestine is lateral to the umbilical ring.

2. No membrane covers the exposed bowel.

3. The exposed bowel is covered loosely in saline-soaked pads, and the abdomen is loosely wrapped in a plastic drape or an agency approved drape; wrapping directly around the exposed bowel is contraindicated, because if the exposed bowel expands, wrapping could cause pressure and necrosis.

4. Preoperatively: Care is similar to that for omphalocele; surgery is performed within several hours after birth because no membrane is covering the sac.

5. Postoperatively: Most infants develop prolonged ileus, require mechanical ventilation, and need parenteral nutrition; otherwise, care is similar to that for omphalocele.

XIII. Umbilical and Inguinal Hernia and Hydrocele

A. Description

1. An umbilical hernia is a protrusion of the bowel through an abnormal opening in the abdominal wall.

2. In children, hernias most commonly occur at the umbilicus and also through the inguinal canal.

3. A hydrocele is the presence of abdominal fluid in the scrotal sac.

B. Assessment

1. Umbilical hernia: Soft swelling or protrusion around the umbilicus that is usually reducible with a finger

2. Inguinal hernia

   a. Inguinal hernia refers to a painless inguinal swelling that is reducible.

   b. Swelling may disappear during periods of rest and is most noticeable when the infant cries or coughs.

3. Incarcerated hernia

   a. Incarcerated hernia occurs when the descended portion of the bowel becomes tightly caught in the hernial sac, compromising blood supply.

   b. This represents a medical emergency requiring surgical repair.

   c. Assessment findings include irritability, tenderness at site, anorexia, abdominal distention, and difficulty defecating.

   d. The protrusion cannot be reduced, and
complete intestinal obstruction and gangrene may occur.

4. Noncommunicating hydrocele
   a. Noncommunicating hydrocele occurs when residual peritoneal fluid is trapped in the scrotum with no communication to the peritoneal cavity.
   b. Hydrocele usually disappears by age 1 year as the fluid is reabsorbed.

5. Communicating hydrocele
   a. Communicating hydrocele is associated with a hernia that remains open from the scrotum to the abdominal cavity.
   b. Assessment includes a bulge in the inguinal area or the scrotum that increases with crying or straining and decreases when the infant is at rest. Parents may also report the bulge is smaller in the morning but increases in size throughout the day.

C. Postoperative interventions (hernia)
   1. Monitor vital signs.
   2. Assess for wound infection.
   3. Monitor for redness or drainage.
   4. Monitor input and output and hydration status.
   5. Advance the diet as tolerated.
   6. Administer analgesics as prescribed.

D. Postoperative interventions (hydrocele)
   1. Provide ice bags and a scrotal support to relieve pain and swelling.
   2. Instruct the parents that tub bathing needs to be avoided until the incision heals.
   3. Instruct the parents that strenuous physical activities need to be avoided.
   4. Advise parent that the scrotum may not immediately return to normal size.

XIV. Constipation and Encopresis
   A. Description
   1. Constipation is the infrequent and difficult passage of dry, hard stools.
   2. Encopresis is constipation with fecal incontinence; children often complain that soiling is involuntary and occurs without warning.
   3. If the child does not have a neurological or anatomical disorder, encopresis is usually the result of fecal impaction and an enlarged rectum caused by chronic constipation.
B. Assessment

1. Constipation
   a. Abdominal pain and cramping without distention
   b. Palpable movable fecal masses
   c. Normal or decreased bowel sounds
   d. Malaise and headache
   e. Anorexia, nausea, and vomiting

2. Encopresis
   a. Evidence of soiling of clothing
   b. Scratching or rubbing of the anal area
   c. Fecal odor
   d. Social withdrawal

C. Interventions

1. Maintain a diet high in fiber and fluids to promote bowel elimination (Box 33-2).
2. Monitor treatment regimen for severe encopresis for 3 to 6 months.
3. Decrease sugar and milk intake.
4. Administer enemas as prescribed until impaction is cleared.
5. Monitor for hypernatremia or hyperphosphatemia when administering repeated enemas.
   a. Signs of hypernatremia include increased thirst; dry, sticky mucous membranes; flushed skin; increased temperature; nausea and vomiting; oliguria; and lethargy.
   b. Signs of hyperphosphatemia include tetany, muscle weakness, dysrhythmias, and hypotension.
6. Administer stool softeners or laxatives as prescribed.
7. Encourage the child to sit on the toilet for 5 to 10 minutes approximately 20 to 30 minutes after breakfast and dinner to assist with defecation.

XV. Irritable Bowel Syndrome

A. Description

1. Irritable bowel syndrome results from increased motility, which can lead to spasm and pain.
2. The diagnosis is based on the elimination of pathological conditions.
3. The syndrome is a self-limiting, intermittent problem with no definitive treatment.
4. Stress and emotional factors may contribute to its occurrence.
B. Assessment

1. Diffuse abdominal pain unrelated to meals or activity
2. Alternating constipation and diarrhea with the presence of undigested food and mucus in the stool

C. Interventions

1. Reassure the parents and child that the problem is self-limiting and intermittent and will resolve.
2. Anticholinergics may be prescribed (antidepressants may be needed in severe cases).
3. Encourage the maintenance of a healthy, well-balanced, moderate-fiber, and low-fat diet.
4. Encourage health promotion activities such as exercise and school activities.
5. Inform the parents of psychosocial resources if required.

XVI. Imperforate Anus

A. Description: Incomplete development or absence of the anus in its normal position in the perineum

B. Types

1. A membrane is noted over the anal opening, with a normal anus just above the membrane.
2. There is complete absence of the anus (anal agenesis) with a rectal pouch ending some distance above.
3. Rectum ends blindly or has a fistula connection to the perineum, urethra, bladder, or vagina.

C. Assessment (Box 33-3)

D. Preoperative interventions

1. Determine presence of an anal opening.
2. Monitor for the presence of stool in the urine and vagina (indicates a fistula) and report immediately.
3. Administer IV fluids as prescribed.
4. Prepare the child and parents for the surgical procedures, including the potential for colostomy.

E. Postoperative interventions

1. Monitor the skin for signs of infection.
2. The preferred position is a side-lying prone position with the hips elevated or a supine position with the legs suspended at a 90-degree angle to the trunk to reduce edema and pressure on the surgical site.
3. Keep the anal surgical incision clean and dry, and monitor for redness, swelling, or drainage.

983
4. Maintain NPO status and nasogastric tube if in place.
5. Maintain IV fluids until gastrointestinal motility returns.
6. Provide care for colostomy, if present, as prescribed.
7. A new colostomy stoma may be red and edematous, but the edema should decrease with time.
8. Instruct the parents to perform anal dilation if prescribed to achieve and maintain bowel patency.
9. Instruct the parents to use only anal dilators supplied by the PHCP and a water-soluble lubricant and to insert the dilator no more than 1 to 2 cm into the anus to prevent damage to the mucosa.

XVII. Hepatitis

A. This section contains specific information regarding hepatitis as it relates to infants and children; see also Chapters 22 and 48.
B. Description: An acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process
C. Hepatitis A (HAV)
   1. Highest incidence of HAV infection occurs among preschool or school-age children younger than 15 years.
   2. Many infected children are asymptomatic, but mild nausea, vomiting, and diarrhea may occur.
   3. Infected children who are asymptomatic still can spread HAV to others.
D. Hepatitis B (HBV)
   1. Most HBV infection in children is acquired perinatally.
   2. Newborns are at risk if the mother is infected with HBV or was a carrier of HBV during pregnancy.
   3. Possible routes of maternal-fetal (newborn) transmission include leakage of the virus across the placenta late in pregnancy or during labor, ingestion of amniotic fluid or maternal blood, and breastfeeding, especially if the mother has cracked nipples.
   4. The severity in the infant varies from no liver disease to fulminant (severe acute course) or chronic active disease.
   5. In children and adolescents, HBV occurs in specific high-risk groups, including children with hemophilia or other disorders requiring multiple blood transfusions, children or adolescents involved in IV drug abuse, institutionalized children, preschool children in endemic areas, and children who have had heterosexual activity or sexual activity with
homosexual men.
6. Infection with HBV can cause a carrier state and lead to eventual cirrhosis or hepatocellular carcinoma in adulthood.

E. Hepatitis C (HCV)
1. Transmission of HCV is primarily by the parenteral route.
2. Some children may be asymptomatic, but HCV often becomes a chronic condition and can cause cirrhosis and hepatocellular carcinoma.

F. Hepatitis D
1. Infection occurs in children already infected with HBV.
2. Acute and chronic forms tend to be more severe than HBV and can lead to cirrhosis.
3. Children with hemophilia are more likely to be infected, as are those who are IV drug users.

G. Hepatitis E
1. Infection is uncommon in children.
2. Infection is not a chronic condition, does not cause chronic liver disease, and has no carrier state.

H. Assessment (Box 33-4)

I. Laboratory diagnostic evaluation: See Chapters 10 and 48.

J. Prevention
1. Immunoglobulin provides passive immunity and may be effective for preexposure prophylaxis to prevent HAV infection.
2. Hepatitis B immunoglobulin provides passive immunity and may be effective in preventing infection after a 1-time exposure (should be given immediately after exposure), such as an accidental needle puncture or other contact of contaminated material with mucous membranes; immunoglobulin should also be given to newborns whose mothers are positive for hepatitis B surface antigen.
3. Hepatitis A vaccine and hepatitis B vaccine: See Chapters 18 and 40.

K. Interventions
1. Strict hand washing is required.
2. Hospitalization is required in the event of coagulopathy or fulminant hepatitis.
3. Standard precautions and enteric precautions are followed during hospitalization.
4. Provide enteric precautions for at least 1 week after the onset of jaundice with HAV.
5. The hospitalized child usually is not isolated in a separate room unless he or she is fecally incontinent and items are likely to become contaminated with feces.
6. Children are discouraged from sharing toys.
7. Instruct the child and parents in effective hand washing techniques.
8. Instruct the parents to disinfect diaper-changing surfaces thoroughly with a solution of ¼ cup (60 mL) bleach in 1 gallon (3.8 L) of water.
9. Maintain comfort and provide adequate rest and sleep.
11. Inform the parents that because HAV is not infectious 1 week after the onset of jaundice, the child may return to school at that time if he or she feels well enough.
12. Inform the parents that jaundice may appear worse before it resolves.
13. Caution the parents about administering any medications to the child; explain the role of the liver in detoxification and excretion of medications in understandable terms.
14. Instruct the parents about the signs of the child’s condition worsening, such as changes in neurological status, bleeding, and fluid retention.

XVIII. Ingestion of Poisons (see Priority Nursing Actions)
A. Lead poisoning
   1. Description: Excessive accumulation of lead in the blood
   2. Causes
      a. The pathway for exposure may be food, air, or water.
      b. Dust and soil contaminated with lead may be a source of exposure.
      c. Lead enters the child’s body through ingestion or inhalation or through placental transmission to an unborn child when the mother is exposed; the most common route is hand to mouth lead-containing from contaminated
objects, such as loose paint chips, pottery, or ceramic ware coupled with the inhalation of lead dust in the environment.

d. When lead enters the body, it affects the erythrocytes, bones and teeth, and organs and tissues, including the brain and nervous system; the most serious consequences are the effects on the central nervous system.

3. **Universal screening**
   
a. Screening is recommended for children 1 to 2 years old; children at high risk should be screened earlier.
   
b. Any child between the ages of 3 and 6 years who has not been screened should be tested.

4. **Targeted screening**
   
a. Targeted screening is acceptable in low-risk areas.
   
b. A child at the age of 1 to 2 years (or a child between the ages of 3 and 6 years who has not been screened) may be targeted for screening if determined to be at risk.

5. **Blood lead level test**: Used for screening and diagnosis ([Table 33-1](#))

6. **Erythrocyte protoporphyrin test**
   
a. Indicator of anemia
   
b. Normal value for a child: 35 mcg/100 mL of whole blood or lower

7. **Chelation therapy**
   
a. Chelation therapy removes lead from the circulating blood and from some organs and tissues.
   
b. Therapy does not counteract any effects of the lead.
   
c. Medications include calcium disodium edetate, and succimer, an oral preparation; British anti-Lewisite is used in conjunction with ethylenediamine tetraacetic acid (EDTA).
   
d. British anti-Lewisite is administered via the IV route or the deep intramuscular
route and is contraindicated in children with an allergy to peanuts because the medication is prepared in a peanut oil solution; it is also contraindicated in children with glucose-6-phosphate dehydrogenase (G6PD) deficiency and should not be given with iron.
e. The function of the renal, hepatic, and hematological systems must be monitored closely.
f. Ensure adequate urinary output before administering the medication, and monitor the output and pH of the urine closely during and after therapy.
g. Provide adequate hydration and monitor kidney function for nephrotoxicity when the medication is given, because the medication is excreted via the kidneys.
h. Follow-up of lead levels needs to be done to monitor progress.
i. Provide instructions to parents about safety from lead hazards, medication administration, and the need for follow-up.
j. Confirm that the child will be discharged to a home without lead hazards.

B. Acetaminophen

1. Description
a. Seriousness of ingestion is determined by the amount ingested and the length of time before intervention.
b. Toxic dose is 150 mg/kg or higher in children.

2. Assessment
a. First 2 to 4 hours: Malaise, nausea, vomiting, sweating, pallor, weakness
b. Latent period: 24 to 36 hours; child improves
c. Hepatic involvement: May last 7 days and may be permanent; right upper quadrant pain, jaundice, confusion, stupor, elevated liver enzyme and bilirubin levels, prolonged prothrombin time
3. Interventions

   b. Dilute antidote in juice or soda because of its offensive odor.
   c. Loading dose is followed by maintenance doses.
   d. In an unconscious child, prepare to administer gastric lavage with activated charcoal to decrease the absorption of acetaminophen.
   e. If using activated charcoal with lavage, do not also use N-acetylcysteine because activated charcoal inactivates the antidote.

C. Acetylsalicylic acid (aspirin)

1. Description

   a. Overdose may be caused by acute ingestion or chronic ingestion.
   b. Acute: Severe toxicity with 300 to 500 mg/kg
   c. Chronic: Ingestion of more than 100 mg/kg per day for 2 days or more, which can be more serious than acute ingestion

2. Assessment

   a. Gastrointestinal effects: Nausea, vomiting, and thirst from dehydration
   b. Central nervous system effects: Hyperpnea, confusion, tinnitus, seizures, coma, respiratory failure, circulatory collapse
   c. Renal effects: Oliguria
   d. Hematopoietic effects: Bleeding tendencies
   e. Metabolic effects: Diaphoresis, fever, hyponatremia, hypokalemia, dehydration, hypoglycemia, metabolic acidosis

3. Interventions

   a. Prepare to administer activated charcoal to decrease absorption of salicylate.
   b. Emesis or cathartic measures may be prescribed.
c. Administer IV fluids; sodium bicarbonate may be prescribed to correct metabolic acidosis.
d. Other interventions include external cooling, anticonvulsants, vitamin K (if bleeding), and oxygen.
e. Prepare the child for dialysis as prescribed if the child is unresponsive to the therapy.

D. Corrosives

1. Description
   a. Items that can cause poisoning include household cleaners, detergents, bleach, paint or paint thinners, and batteries.
   b. Liquid corrosives can cause more damage to the victim than other types of corrosives, such as granular.

2. Assessment
   a. Severe burning in the mouth, throat, or stomach
   b. Edema of the mucous membranes, lips, tongue, and pharynx
   c. Vomiting
   d. Drooling and inability to clear secretions

3. Interventions
   a. Dilute corrosive with water or milk as prescribed (usually no more than 4 oz [120 mL])
   b. Inducing vomiting is contraindicated because vomiting redamages the mucous membranes.
   c. Neutralization of the ingested corrosive is not done because it can cause a reaction producing heat and burns.

! **Educate parents to call the Poison Control Center immediately in the event of poisoning. The parents need to post the Poison Control Center telephone number near each phone in the house and have it in their mobile phones.**

XIX. Intestinal Parasites

A. Description: Common infections in children are giardiasis and pinworm infestation.

1. Giardiasis is caused by protozoa and is prevalent among children in crowded environments, such as
classrooms or day care centers.

2. Pinworms (enterobiasis) are universally present in temperate climate zones and are easily transmitted in crowded environments.

B. Assessment

1. Giardiasis
   a. Diarrhea and vomiting
   b. Anorexia
   c. Failure to thrive
   d. Abdominal cramps with intermittent loose stools and constipation
   e. Steatorrhea
   f. Stool specimens from 3 or more collections are used for diagnosis.

2. Pinworms
   a. Intense perianal itching
   b. Irritability, restlessness
   c. Poor sleeping
   d. Bed wetting

C. Interventions

1. Giardiasis
   a. Medications that kill the parasites may be prescribed; medications are not usually prescribed for children younger than 2 years.
   b. Caregivers should wash hands meticulously.
   c. Provide education to family and caregivers regarding sanitary practices.

2. Pinworms
   a. Perform a visual inspection of the anus with a flashlight 2 to 3 hours after sleep.
   b. The tape test is the most common diagnostic test.
   c. Educate the family and caregivers regarding the tape test. A loop of transparent tape is placed firmly against the child’s perianal area; it is removed in the morning and placed in a glass jar or plastic bag and transported to the laboratory for analysis.
   d. Medications that kill the parasites may be prescribed; medications are not usually prescribed for children younger than 2 years.
e. The medication regimen may be repeated in 2 weeks to prevent reinfection.
f. All members of the family are treated for the infection.
g. Teach the family and caregivers about the importance of meticulous hand washing and about washing all clothes and bed linens in hot water.
**FIG. 33-1** Variations in clefts of lip and palate at birth. **A,** Notch in vermilion border. **B,** Unilateral cleft lip and palate. **C,** Bilateral cleft lip and palate. **D,** Cleft palate.

**FIG. 33-2** Congenital atresia of esophagus and tracheoesophageal fistula. **A,** Upper and lower segments of esophagus end in blind sac (occurring in 5% to 8% of such infants). **B,** Upper segment of esophagus ends in atresia and connects to trachea by fistulous tract (occurring rarely). **C,** Upper segment of esophagus ends in blind pouch; lower segment connects with trachea by small fistulous tract (occurring in 80% to 95% of such infants). **D,** Both segments of esophagus connect by fistulous tracts to trachea (occurring in less than 1% of such infants). Infant may aspirate with first feeding. **E,** Esophagus is continuous but connects by fistulous tract to trachea (known as *H*-type).
FIG. 33-3  Hypertrophic pyloric stenosis. A, Enlarged muscular area nearly obliterates pyloric channel. B, Longitudinal surgical division of muscle down to submucosa establishes adequate passageway.

Box 33-1
Basics of a Gluten-Free Diet

Foods Allowed
Meat such as beef, pork, poultry, and fish; eggs; milk and some dairy products; vegetables, fruits, rice, corn, gluten-free flour, puffed rice, cornflakes, cornmeal, and precooked gluten-free cereals are allowed.

Foods Prohibited
Commercially prepared ice cream; malted milk; prepared puddings; and grains, including anything made from wheat, rye, oats, or barley, such as breads, rolls, cookies, cakes, crackers, cereal, spaghetti, macaroni noodles, beer, and ale, are prohibited.
Box 33-2

High-Fiber Foods

Bread and Grains

- Whole-grain bread or rolls
- Whole-grain cereals
- Bran
- Pancakes, waffles, and muffins with fruit or bran
• Unrefined (brown) rice

**Vegetables**

• Raw vegetables, especially broccoli, cabbage, carrots, cauliflower, celery, lettuce, and spinach
• Cooked vegetables, including those listed above and asparagus, beans, Brussels sprouts, corn, potatoes, rhubarb, squash, string beans, and turnips

**Fruits**

• Prunes, raisins, or other dried fruits
• Raw fruits, especially those with skins or seeds, other than ripe banana or avocado

**Miscellaneous**

• Legumes (beans), popcorn, nuts, and seeds
• High-fiber snack bars

---

**Box 33-3**

**Assessment Findings: Imperforate Anus**

• Failure to pass meconium stool
• Absence or stenosis of the anal rectal canal
• Presence of an anal membrane
• External fistula to the perineum

**Box 33-4**

**Assessment Findings: Hepatitis**

**Prodromal or Anicteric Phase**

• Lasts 5 to 7 days
• Absence of jaundice
• Anorexia, malaise, lethargy, easy fatigability
• Fever (especially in adolescents)
- Nausea and vomiting
- Epigastric or right upper quadrant abdominal pain
- Arthralgia and rashes (more likely with hepatitis B virus)
- Hepatomegaly

**Icteric Phase**

- Jaundice, which is best assessed in the sclera, nail beds, and mucous membranes
- Dark urine and pale stools
- Pruritus

### Table 33-1

**Blood Lead Level Test Results and Interventions**

<table>
<thead>
<tr>
<th>Level (mcg/dL)</th>
<th>Intervention</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 5</td>
<td>Reassess or rescreen in 1 yr or sooner if exposure status changes</td>

### Priority Nursing Actions

**Poisoning Treatment in the Emergency Department**

1. Assess the child.
2. Terminate exposure to the poison.
3. Identify the poison.
4. Take measures to prevent absorption of the poison.
5. Document the occurrence, assessment findings, poison ingested, treatment measures, and the child’s response.
Practice Questions

332. The clinic nurse reviews the record of an infant and notes that the primary health care provider (PHCP) has documented a diagnosis of suspected Hirschsprung’s disease. The nurse reviews the assessment findings documented in the record, knowing that which sign most likely led the mother to seek health care for the infant?
   1. Diarrhea
   2. Projectile vomiting
   3. Regurgitation of feedings
   4. Foul-smelling ribbon-like stools

333. An infant has just returned to the nursing unit after surgical repair of a cleft lip on the right side. The nurse should place the infant in which best position at this time?
   1. Prone position
   2. On the stomach
   3. Left lateral position
   4. Right lateral position

334. The nurse reviews the record of a newborn infant and notes that a diagnosis of esophageal atresia with tracheoesophageal fistula is suspected. The nurse expects to note which most likely sign of this condition documented in the record?
   1. Incessant crying
   2. Coughing at nighttime
   3. Choking with feedings
   4. Severe projectile vomiting

335. The nurse provides feeding instructions to a parent of an infant diagnosed with gastroesophageal reflux disease. Which instruction should the nurse give to the parent to assist in reducing the episodes of emesis?
   1. Provide less frequent, larger feedings.
   2. Burp the infant less frequently during feedings.
   3. Thin the feedings by adding water to the formula.
   4. Thicken the feedings by adding rice cereal to the formula.

336. A child is hospitalized because of persistent vomiting. The nurse should monitor the child closely for which problem?
   1. Diarrhea
   2. Metabolic acidosis
   3. Metabolic alkalosis
   4. Hyperactive bowel sounds

337. The nurse is caring for a newborn with a suspected diagnosis of imperforate anus. The nurse monitors the infant, knowing that which is a clinical manifestation associated with this disorder?
   1. Bile-stained fecal emesis
2. The passage of currant jelly–like stools
3. Failure to pass meconium stool in the first 24 hours after birth
4. Sausage-shaped mass palpated in the upper right abdominal quadrant

338. The nurse admits a child to the hospital with a diagnosis of pyloric stenosis. On assessment, which data would the nurse expect to obtain when asking the parent about the child’s symptoms?
   1. Watery diarrhea
   2. Projectile vomiting
   3. Increased urine output
   4. Vomiting large amounts of bile

339. The nurse provides home care instructions to the parents of a child with celiac disease. The nurse should teach the parents to include which food item in the child’s diet?
   1. Rice
   2. Oatmeal
   3. Rye toast
   4. Wheat bread

340. The nurse is preparing to care for a child with a diagnosis of intussusception. The nurse reviews the child’s record and expects to note which sign of this disorder documented?
   1. Watery diarrhea
   2. Ribbon-like stools
   3. Profuse projectile vomiting
   4. Bright red blood and mucus in the stools

341. Which interventions should the nurse include when creating a care plan for a child with hepatitis? Select all that apply.
   1. Providing a low-fat, well-balanced diet.
   2. Teaching the child effective hand-washing techniques.
   3. Scheduling playtime in the playroom with other children.
   4. Notifying the primary health care provider (PHCP) if jaundice is present.
   5. Instructing the parents to avoid administering medications unless prescribed.
   6. Arranging for indefinite home schooling because the child will not be able to return to school.

**Answers**

332. **Answer:** 4

**Rationale:** Hirschsprung’s disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon. It occurs as the result of an absence
of ganglion cells in the rectum and other areas of the affected intestine. Chronic constipation beginning in the first month of life and resulting in pellet-like or ribbon-like stools that are foul-smelling is a clinical manifestation of this disorder. Delayed passage or absence of meconium stool in the neonatal period is also a sign. Bowel obstruction, especially in the neonatal period; abdominal pain and distention; and failure to thrive are also clinical manifestations. Options 1, 2, and 3 are not associated specifically with this disorder.

Test-Taking Strategy: Note the strategic words, most likely. Use knowledge regarding the pathophysiology associated with Hirschsprung’s disease to direct you to the correct option. Remember that chronic constipation beginning in the first month of life and resulting in pellet-like or ribbon-like, foul-smelling stools is a clinical manifestation of this disorder.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Gastrointestinal
Health Problem: Pediatric-Specific: Gastrointestinal and Rectal Problems
Priority Concepts: Clinical Judgment; Elimination

333. Answer: 3

Rationale: A cleft lip is a congenital anomaly that occurs as a result of failure of soft tissue or bony structure to fuse during embryonic development. After cleft lip repair, the nurse avoids positioning an infant on the side of the repair or in the prone position, because these positions can cause rubbing of the surgical site on the mattress. The nurse positions the infant on the side lateral to the repair or on the back upright and positions the infant to prevent airway obstruction by secretions, blood, or the tongue. From the options provided, placing the infant on the left side immediately after surgery is best to prevent the risk of aspiration if the infant vomits.

Test-Taking Strategy: Note the strategic word, best. Eliminate options 1 and 2 because they are comparable or alike positions. Consider the anatomical location of the surgical site and note the words right side in the question to direct you to the correct option from those remaining.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Gastrointestinal
Health Problem: Pediatric-Specific: Disorders of Prenatal Development
Priority Concepts: Safety; Tissue Integrity

334. Answer: 3

Rationale: In esophageal atresia and tracheoesophageal fistula, the esophagus terminates before it reaches the stomach, ending in a blind pouch, and a fistula is
present that forms an unnatural connection with the trachea. Any child who exhibits the “3 Cs”—coughing and choking with feedings and unexplained cyanosis—should be suspected to have tracheoesophageal fistula. Options 1, 2, and 4 are not specifically associated with tracheoesophageal fistula.

**Test-Taking Strategy:** Note the strategic words, **most likely.** Focus on the diagnosis and think about the pathophysiology of the disorder. Recalling the “3 Cs” associated with this disorder will assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Gastrointestinal  
**Health Problem:** Pediatric-Specific: Disorders of Prenatal Development  
**Priority Concepts:** Clinical Judgment; Tissue Integrity  

335. **Answer:** 4

**Rationale:** Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter. Small, more frequent feedings with frequent burping often are prescribed in the treatment of gastroesophageal reflux. Feedings thickened with rice cereal may reduce episodes of emesis. If thickened formula is used, cross-cutting of the nipple may be required.

**Test-Taking Strategy:** Note the subject, gastroesophageal reflux disease. Use basic principles related to feeding an infant to assist in eliminating options 1 and 2. Noting the words reducing the episodes of emesis in the question will assist in directing you to select the correct option over option 3.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Pediatrics: Gastrointestinal  
**Health Problem:** Pediatric-Specific: Gastroesophageal Reflux Disease  
**Priority Concepts:** Client Education; Nutrition  

336. **Answer:** 3

**Rationale:** Vomiting causes the loss of hydrochloric acid and subsequent metabolic alkalosis. Metabolic acidosis would occur in a child experiencing diarrhea because of the loss of bicarbonate. Diarrhea might or might not accompany vomiting. Hyperactive bowel sounds are not associated with vomiting.

**Test-Taking Strategy:** Focus on the subject, complications related to vomiting. Recalling that gastric fluids are acidic and that the loss of these fluids leads to alkalosis will assist you in answering the question. No data in the question support options 1 and 4.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Gastrointestinal  
**Health Problem:** Pediatric-Specific: Dehydration  
**Priority Concepts:** Acid-Base Balance; Fluids and Electrolytes  

337. **Answer:** 3

**Rationale:** Imperforate anus is the incomplete development or absence of the anus in its normal position in the perineum. During the newborn assessment, this defect should be identified easily on sight. However, a rectal thermometer or tube may be necessary to determine patency if meconium is not passed in the first 24 hours after birth. Other assessment findings include absence or stenosis of the anal rectal canal, presence of an anal membrane, and an external fistula to the perineum. Options 1, 2, and 4 are findings noted in intussusception.

**Test-Taking Strategy:** Note the subject, manifestations of imperforate anus. Use the definition of the word *imperforate* to assist in answering this question. This should direct you to the correct option.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Gastrointestinal  
**Health Problem:** Pediatric-Specific: Gastrointestinal and Rectal Problems  
**Priority Concepts:** Clinical Judgment; Elimination  
**Reference:** McKinney et al. (2018), pp. 968-969.

338. **Answer:** 2

**Rationale:** In pyloric stenosis, hypertrophy of the circular muscles of the pyloric canal between the stomach and the duodenum. Clinical manifestations of pyloric stenosis include projectile vomiting, irritability, hunger and crying, constipation, and signs of dehydration, including a decrease in urine output.

**Test-Taking Strategy:** Focus on the subject, the manifestations of pyloric stenosis. Considering the anatomical location of this disorder and its potential effects will assist in eliminating options 1 and 3. Thinking about the pathophysiology of the disorder and recalling that a major clinical manifestation is projectile vomiting will assist in directing you to the correct option from those remaining.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Gastrointestinal  
**Health Problem:** Pediatric-Specific: Disorder of Prenatal Development  
**Priority Concepts:** Clinical Judgment; Fluids and Electrolytes  

339. **Answer:** 1
**Rationale:** Celiac disease also is known as *gluten enteropathy* or *celiac sprue* and refers to intolerance to gluten, the protein component of wheat, barley, rye, and oats. The important factor to remember is that all wheat, rye, barley, and oats should be eliminated from the diet and replaced with corn, rice, or millet. Vitamin supplements—especially the fat-soluble vitamins, iron, and folic acid—may be needed to correct deficiencies. Dietary restrictions are likely to be lifelong.

**Test-Taking Strategy:** Focus on the subject, home care instructions for the child with celiac disease. Recalling that corn, rice, and millet are substitute food replacements in this disease will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Health Promotion and Maintenance

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Gastrointestinal

**Health Problem:** Pediatric-Specific: Nutrition Problems

**Priority Concepts:** Client Education; Nutrition

340. **Answer:** 4

**Rationale:** Intussusception is a telescoping of 1 portion of the bowel into another. The condition results in an obstruction to the passage of intestinal contents. A child with intussusception typically has severe abdominal pain that is crampy and intermittent, causing the child to draw in the knees to the chest. Vomiting may be present, but is not projectile. Bright red blood and mucus are passed through the rectum and commonly are described as currant jelly–like stools. Watery diarrhea and ribbon-like stools are not manifestations of this disorder.

**Test-Taking Strategy:** Focus on the subject, the manifestations of intussusception. Think about the pathophysiology associated with this condition. Recalling that a classic manifestation is currant jelly–like stools will assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pediatrics: Gastrointestinal

**Health Problem:** Pediatric-Specific: Gastrointestinal and Rectal Problems

**Priority Concepts:** Clinical Judgment; Elimination

341. **Answer:** 1, 2, 5

**Rationale:** Hepatitis is an acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process. Because hepatitis can be viral, standard precautions should be instituted in the hospital. The child should be discouraged from sharing toys, so playtime in the playroom with other children is not part of the plan of care. The child will be allowed to return to school 1 week after the onset of jaundice, so indefinite home schooling would not need to be arranged. Jaundice is an expected finding with hepatitis and would not
warrant notification of the PHCP. Provision of a low-fat, well-balanced diet is recommended. Parents are cautioned about administering any medication to the child, because normal doses of many medications may become dangerous owing to the liver’s inability to detoxify and excrete them. Hand washing is the most effective measure for control of hepatitis in any setting, and effective hand washing can prevent the immunocompromised child from contracting an opportunistic type of infection.

**Test-Taking Strategy:** Focus on the *subject*, care for a child with hepatitis. Thinking about the pathophysiology associated with hepatitis and the method of transmission will assist you in answering the question. Because the infection can be transmitted to others, playing with other children in the playroom is not an appropriate intervention. Since jaundice is an expected finding, notifying the PHCP is unnecessary. Planning for an indefinite period of home schooling is not necessary.

**Level of Cognitive Ability:** Creating

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pediatrics: Gastrointestinal

**Health Problem:** Pediatric-Specific: Hepatitis

**Priority Concepts:** Clinical Judgment; Infection

CHAPTER 34

Eye, Ear, and Throat Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Safety; Sensory Perception

I. Strabismus
   A. Description
      1. Called “squint” or “cross-eye”
      2. Condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles
      3. Most often results from muscle imbalance or paralysis of extraocular muscles, but also may result from a congenital defect
      4. Amblyopia (reduced visual acuity) may occur if not treated early, because the brain receives two messages as a result of the nonparallel visual axes.
      5. Permanent loss of vision can occur if not treated early.
      6. This condition, considered a normal finding in a young infant, should not be present after about age 4 months.
      7. Treatment of the condition depends on the cause.
   B. Assessment
      1. Crossed eyes
      2. Squinting; tilts the head or closes one eye to see
      3. Loss of binocular vision
      4. Impairment of depth perception
      5. Frequent headaches
      6. Diplopia; photophobia
   C. Interventions
      1. Corrective lenses may be indicated.
      2. Instruct the parents regarding patching (occlusion therapy) of the “good” eye to strengthen the weak eye.
      3. Prepare for surgery to realign the weak muscles as prescribed if nonsurgical interventions are unsuccessful.
4. Instruct the parents about the need for follow-up visits.

II. Conjunctivitis
   A. Description
      1. Also known as “pink eye”; an inflammation of the conjunctiva
      2. Conjunctivitis usually is caused by allergy, infection, or trauma.
      3. Types include viral, bacterial, or allergic; bacterial or viral conjunctivitis is extremely contagious.
   B. Assessment
      1. Itching, burning, or scratchy eyelids
      2. Redness
      3. Edema
      4. Discharge

   Chlamydial conjunctivitis is rare in older children; if diagnosed in a child who is not sexually active, the child should be assessed for possible sexual abuse.

   C. Interventions
      1. Viral conjunctivitis.
         a. The infection will usually resolve in 7 to 14 days; in some cases it can take 2 to 3 weeks or more to resolve.
         b. Antiviral medication may be prescribed to treat more serious forms of conjunctivitis, such as those caused by herpes simplex virus or varicella zoster virus; antibiotics are not effective against viruses.
      2. Bacterial conjunctivitis
         a. Mild cases may improve without antibiotic treatment.
         b. An antibiotic, usually prescribed topically as eye drops or ointment, may be prescribed to shorten the length of infection, reduce complications, and reduce the spread to others.
      3. Allergic conjunctivitis
         a. Removing the allergen from the environment often improves the condition.
         b. Allergy medications and eye drops such as topical antihistamine and
vasoconstrictors may be prescribed.

4. General interventions
   a. The primary health care provider (PHCP) needs to be consulted regarding going to school and contact with others.
   b. Instruct the child and parents about the administration of the prescribed medications.
   c. Instruct in infection control measures such as good hand washing and not sharing towels and washcloths.
   d. Instruct the child to avoid rubbing the eye to prevent injury.
   e. Instruct a child who is wearing contact lenses to discontinue wearing them and to obtain new lenses to eliminate the chance of reinfection that can occur from use of the old lenses.
   f. Instruct an adolescent that eye makeup should be discarded and replaced.
   g. For additional information, refer to Centers for Disease Control and prevention at https://www.cdc.gov/conjunctivitis/index.html

III. Otitis Media
   A. Description
      1. An inflammatory disorder usually caused by an infection of the middle ear occurring as a result of a blocked eustachian tube, which prevents normal drainage; can be acute or chronic.
      2. Otitis media is a common complication of an acute respiratory infection (most commonly from respiratory syncytial virus, influenza, or group A streptococcus).
      3. Infants and children have eustachian tubes that are shorter, wider, and straighter, which makes them more prone to otitis media.

   B. Prevention
      1. Feed infants in an upright position, to prevent reflux.
      3. Encourage breast-feeding for at least the first 6 months of life.
      4. Avoid exposure to tobacco smoke and allergens.

   C. Assessment
      1. Fever
      2. Acute onset of ear pain
3. Crying, irritability, lethargy
4. Loss of appetite
5. Rolling of head from side to side
6. Pulling on or rubbing the ear
7. Purulent ear drainage may be present
8. Red, opaque, bulging, immobile tympanic membrane on otoscopic examination
9. Signs of hearing loss (indicative of chronic otitis media)

D. Interventions
1. Encourage fluid intake (may be difficult if the child is in pain).
2. Instruct the child to avoid chewing as much as possible during the acute period, because chewing increases pain.
3. Provide local heat or cold as prescribed to relieve discomfort, and have the child lie with the affected ear down.
4. Instruct the parents in the appropriate procedure to clean drainage from the external ear canal with sterile swabs or gauze; frequent cleansing and the application of moisture barriers may be prescribed to prevent ear excoriation from the drainage.
5. Instruct the parents in the administration of analgesics or antipyretics such as acetaminophen or ibuprofen as prescribed to decrease fever and pain.
6. Instruct the parents in the administration of antibiotics if prescribed, emphasizing that the prescribed period of administration is necessary to eliminate infective organisms.
7. In healthy infants older than 6 months and children, careful use of antibiotics is recommended because of concerns about medication-resistant *Streptococcus pneumoniae*; usually, waiting up to 72 hours for spontaneous resolution is a safe and appropriate management of acute otitis media.
8. Instruct the parents that screening for hearing loss may be necessary.
9. Instruct the parents about the procedure for administering ear medications such as topical pain-relief drops, if prescribed.

E. Otitis Externa
1. Description: Inflammation of the external auditory canal, which can occur with or without infection; also known as “swimmer’s ear.”
2. Assessment
   a. Rapid onset of symptoms within 48
hours, symptoms include otalgia, pruritis, fullness, drainage, and impaired hearing.
b. A low-grade fever may be present.
c. Tenderness on manipulation of the pinna and tragus is noted on physical exam.
d. May have regional lymphadenopathy.

3. Interventions: Treatment is indicated with topical antibiotics and may include neomycin with or without polymyxin B or a fluoroquinolone preparation.

To administer ear medications in a child younger than 3 years, pull the earlobe down and back. In a child older than 3 years, pull the pinna up and back.

F. Myringotomy

1. Description
   a. A surgical incision into the tympanic membrane to provide drainage of the purulent middle ear fluid; may be done by a laser-assisted procedure
   b. Tympanoplasty tubes, which are small cylinder-shaped tubes, may be inserted into the middle ear to allow continued drainage and to equalize pressure and allow ventilation of the middle ear.

2. Postoperative interventions
   a. Instruct the parents and child to keep the ears dry.
   b. The child should wear earplugs while bathing, shampooing, and swimming (diving and submerging under water are not allowed).
   c. Parents can administer an analgesic such as acetaminophen or ibuprofen to relieve discomfort after insertion of tympanoplasty tubes.
   d. Parents should be taught that the child should not blow her or his nose for 7 to 10 days after surgery.
   e. Instruct the parents that if the tubes fall out, it is not an emergency, but the PHCP should be notified; inform the parents of the appearance
of the tubes (tiny, white, spool-shaped tubes).

IV. Tonsillitis and Adenoiditis
A. Description
1. Tonsillitis refers to inflammation and infection of the tonsils, which is lymphoid tissue located in the pharynx (Fig. 34-1).
2. Adenoiditis refers to inflammation and infection of the adenoids (pharyngeal tonsils), located on the posterior wall of the nasopharynx.
3. Enlarged tonsils and adenoids may lead to an obstructive sleep apnea in children, manifested by snoring and periods of sudden waking and fragmented sleep; a polysomnography and referral to ear, nose and throat specialist may be needed.
4. Can be the result of a viral, bacterial, or fungal infection. Group A streptococcus ("strep throat") is a common bacterial infection of the oropharynx, particularly in children, which can result in streptococcal toxic shock syndrome. Mononucleosis is another possible cause of tonsillitis and adenoiditis.
5. Tonsillectomy (surgical removal of the tonsils) and adenoidectomy (surgical removal of the adenoids) may be necessary depending on the number of infections per year as well as signs of obstructive respiratory disturbance.

B. Assessment
1. Persistent or recurrent sore throat
2. Enlarged, bright red tonsils that may be covered with white exudate
3. Difficulty in swallowing
4. Mouth breathing and an unpleasant mouth odor
5. Fever
6. Cough
7. Enlarged adenoids may cause nasal quality of speech, mouth breathing, hearing difficulty, snoring, or obstructive sleep apnea.

C. Preoperative interventions
1. Assess for signs of active infection.
2. Assess bleeding and clotting studies, because the throat is vascular.
3. Assess for any loose teeth to decrease the risk of aspiration during surgery.
4. Prepare the child for a sore throat postoperatively, and inform the child that she or he will need to drink liquids.

D. Interventions postoperatively

1011
1. Position the child prone or side-lying to facilitate drainage.

2. Have suction equipment available but do not suction unless there is an airway obstruction.

3. Monitor for signs of bleeding (frequent swallowing may indicate bleeding); if bleeding occurs, turn the child to the side and notify the PHCP.

4. Discourage coughing, clearing the throat, or nose blowing to prevent bleeding.

5. Provide an ice collar or analgesics (rectally or intravenously) for discomfort.

6. Administer antiemetics to prevent vomiting if prescribed.

7. Provide clear, cool, noncitrus and noncarbonated fluids (crushed ice, ice pops).

8. Avoid red, purple, or brown liquids, which simulate the appearance of blood if the child vomits.

9. Avoid milk products such as milk, ice cream, and pudding initially because they coat the throat, causing the child to cough to clear the throat.

10. Soft foods may be prescribed 1 to 2 days postoperatively.

11. Do not give the child any straws, forks, or sharp objects that can be put into the mouth.

12. Mouth odor, slight ear pain, and a low-grade fever may occur for a few days postoperatively, but the parents should be instructed to notify the PHCP if bleeding, persistent earache, or fever occurs.

13. Instruct the parents to keep the child away from crowds until healing has occurred; usually the child is able to resume normal activities 1 to 2 weeks postoperatively.

V. Epistaxis (Nosebleed)
   A. Description

   1. The nose, especially the septum, is a highly vascular structure, and bleeding usually results from direct trauma, foreign bodies, and nose picking or from mucosal inflammation.

   2. Recurrent epistaxis and severe bleeding may indicate an underlying disease.

   B. Interventions
1. See Priority Nursing Actions.

**Priority Nursing Actions**

**Nosebleed in a Child**

1. Remain calm and keep the child calm and quiet.
2. Have the child sit up and lean forward (not lie down).
3. Apply continuous pressure to the nose with the thumb and forefinger for at least 10 minutes.
4. Insert cotton or wadded tissue into each nostril, and apply ice or a cold cloth to the bridge of the nose if bleeding persists.

**Reference**

2. If bleeding cannot be controlled, packing or cauterization of the bleeding vessel may be prescribed.

VI. Allergic Rhinitis

A. Description: a condition in which children are sensitized to environmental allergens

B. Assessment

1. Itchy and watery eyes, runny nose, itchy throat
2. May be a family history of atopic disease
3. Dark circles under the eyes, cobblestoning of the conjunctiva, pale nasal mucosa, clear nasal drainage, nasal polyps, fluid in the middle ear, cobblestoning of the posterior pharynx, wheezes, rhonchi, eczema, hives, angioedema

A. Interventions

1. Children with allergic rhinitis should be tested for environmental allergies, food allergies, atopic dermatitis, and asthma.
2. Avoidance of triggers; administration of prescribed antihistamines, nasal corticosteroids, inhalers.
Practice Questions

342. After a tonsillectomy, a child begins to vomit bright red blood. The nurse should take which initial action?
   1. Turn the child to the side.
   2. Administer the prescribed antiemetic.
   4. Notify the primary health care provider (PHCP).

343. The mother of a 6-year-old child arrives at a clinic because the child has been experiencing itchy, red, and swollen eyes. The nurse notes a discharge from the eyes and sends a culture to the laboratory for analysis. Chlamydial conjunctivitis is diagnosed. On the basis of this diagnosis, the nurse determines that which requires further investigation?
   1. Possible trauma
   2. Possible sexual abuse
   3. Presence of an allergy
   4. Presence of a respiratory infection

344. The nurse prepares a teaching plan for the mother of a child diagnosed with bacterial conjunctivitis. Which, if stated by the mother, indicates a need for further teaching?
   1. “I need to wash my hands frequently.”
2. “I need to clean the eye as prescribed.”
3. “It is okay to share towels and washcloths.”
4. “I need to give the eye drops as prescribed.”

345. The nurse is reviewing the laboratory results for a child scheduled for a tonsillectomy. The nurse determines that which laboratory value is most significant to review?
   1. Creatinine level
   2. Prothrombin time
   3. Sedimentation rate
   4. Blood urea nitrogen level

346. The nurse is preparing to care for a child after a tonsillectomy. The nurse documents on the plan of care to place the child in which position?
   1. Supine
   2. Side-lying
   3. High-Fowler’s
   4. Trendelenburg’s

347. After a tonsillectomy, the nurse reviews the surgeon’s postoperative prescriptions. Which prescription should the nurse question?
   1. Monitor for bleeding.
   2. Suction every 2 hours.
   3. Give no milk or milk products.
   4. Give clear, cool liquids when awake and alert.

348. The nurse is caring for a child after a tonsillectomy. The nurse monitors the child, knowing that which finding indicates the child is bleeding?
   1. Frequent swallowing
   2. A decreased pulse rate
   3. Complaints of discomfort
   4. An elevation in blood pressure

349. Antibiotics are prescribed for a child with otitis media who underwent a myringotomy with insertion of tympanostomy tubes. The nurse provides discharge instructions to the parents regarding the administration of the antibiotics. Which statement, if made by the parents, indicates understanding of the instructions provided?
   1. “Administer the antibiotics until they are gone.”
   2. “Administer the antibiotics if the child has a fever.”
   3. “Administer the antibiotics until the child feels better.”
   4. “Begin to taper the antibiotics after 3 days of a full course.”

350. The day care nurse is observing a 2-year-old child and suspects that the child may have strabismus. Which observation made by the nurse indicates the presence of this condition?
   1. The child has difficulty hearing.
   2. The child consistently tilts the head to see.
   3. The child does not respond when spoken to.
   4. The child consistently turns the head to hear.

351. A child has been diagnosed with acute otitis media of the right ear. Which interventions should the nurse include in the plan of care? Select all that apply.
1. Provide a soft diet.
2. Position the child on the left side.
3. Administer an antihistamine twice daily.
4. Irrigate the right ear with normal saline every 8 hours.
5. Administer ibuprofen for fever every 4 hours as prescribed and as needed.
6. Instruct the parents about the need to administer the prescribed antibiotics for the full course of therapy.

Answers

342. Answer: 1

Rationale: After tonsillectomy, if bleeding occurs, the nurse immediately turns the child to the side to prevent aspiration and then notifies the PHCP. NPO status would be maintained, and an antiemetic may be prescribed; however, the initial nursing action would be to turn the child to the side.

Test-Taking Strategy: Note the strategic word, initial. Although all of the options may be appropriate to maintain physiological integrity, the initial action is to turn the child to the side to prevent aspiration.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Throat/Respiratory
Health Problem: Pediatric-Specific: Tonsillitis and Adenoiditis
Priority Concepts: Clinical Judgment; Safety

343. Answer: 2

Rationale: Conjunctivitis is an inflammation of the conjunctiva. A diagnosis of chlamydial conjunctivitis in a child who is not sexually active should signal the health care provider to assess the child for possible sexual abuse. Trauma, allergy, and infection can cause conjunctivitis, but the causative organism is not likely to be Chlamydia.

Test-Taking Strategy: Note the age of the child and the organism that is identified in the question. Also note that options 1, 3, and 4 are comparable or alike in that they can be recognized as the common causes of conjunctivitis and they relate to a physiological problem.

Level of Cognitive Ability: Analyzing
Client Needs: Psychosocial Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Infectious and Communicable Diseases
Health Problem: Pediatric-Specific: Conjunctivitis
Priority Concepts: Clinical Judgment; Infection

344. Answer: 3

Rationale: Conjunctivitis is an inflammation of the conjunctiva. Bacterial conjunctivitis is highly contagious, and the nurse should teach infection control measures. These include good hand washing and not sharing towels and washcloths. Options 1, 2, and 4 are correct treatment measures.

Test-Taking Strategy: Note the strategic words, need for further teaching. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 can be eliminated by recalling that bacterial conjunctivitis is highly contagious.

Level of Cognitive Ability: Evaluating
Client Needs: Safe and Effective Care Environment
Integrated Process: Teaching and Learning
Content Area: Pediatrics: Infectious and Communicable Diseases
Health Problem: Pediatric-Specific: Conjunctivitis
Priority Concepts: Client Education; Infection

345. Answer: 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. Because the tonsillar area is so vascular, postoperative bleeding is a concern. Prothrombin time, partial thromboplastin time, platelet count, hemoglobin and hematocrit, white blood cell count, and urinalysis are performed preoperatively. The prothrombin time results would identify a potential for bleeding. Creatinine level, sedimentation rate, and blood urea nitrogen would not determine the potential for bleeding.

Test-Taking Strategy: Note the strategic word, most. Focus on the surgical procedure and the subject of the question. The subject of the question relates to the potential for bleeding. Options 1 and 4 can be eliminated because they relate to kidney function. Option 3 can be eliminated because it is unrelated to the subject of the question.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Throat/Respiratory
Health Problem: Pediatric-Specific: Tonsillitis and Adenoiditis
Priority Concepts: Clinical Judgment; Clotting

346. Answer: 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. The child should be placed in a prone or side-lying position after the surgical procedure to facilitate
drainage. Options 1, 3, and 4 would not achieve this goal.

**Test-Taking Strategy:** Focus on the subject, positioning after tonsillectomy. Focus on the surgical procedure and visualize each of the positions described in the options. Keeping in mind that the goal is to facilitate drainage will direct you to the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pediatrics: Throat/Respiratory

**Health Problem:** Pediatric-Specific: Tonsillitis and Adenoiditis

**Priority Concepts:** Caregiving; Safety

347. **Answer:** 2

**Rationale:** A tonsillectomy is the surgical removal of the tonsils. After tonsillectomy, suction equipment should be available, but suctioning is not performed unless there is an airway obstruction because of the risk of trauma to the surgical site. Monitoring for bleeding is an important nursing intervention after any type of surgery. Milk and milk products are avoided initially because they coat the throat, cause the child to clear the throat, and increase the risk of bleeding. Clear, cool liquids are encouraged.

**Test-Taking Strategy:** Focus on the subject, the prescription that the nurse questions. Option 1 can be eliminated first because this is a nursing action, not a medical prescription. From the remaining options, consider the anatomical location of the surgery. This should direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Safe and Effective Care Environment

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pediatrics: Throat/Respiratory

**Health Problem:** Pediatric-Specific: Tonsillitis and Adenoiditis

**Priority Concepts:** Collaboration; Safety

348. **Answer:** 1

**Rationale:** A tonsillectomy is the surgical removal of the tonsils. Frequent swallowing, restlessness, a fast and thready pulse, and vomiting bright red blood are signs of bleeding. An elevated blood pressure and complaints of discomfort are not indications of bleeding.

**Test-Taking Strategy:** Focus on the subject, a sign of bleeding, and use the concepts related to the signs of shock. These concepts should assist in eliminating options 2 and 4. From the remaining options, recalling that discomfort is expected and does not indicate bleeding will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

1018
Content Area: Pediatrics: Throat/Respiratory
Health Problem: Pediatric-Specific: Tonsillitis and Adenoiditis
Priority Concepts: Clinical Judgment; Clotting

349. Answer: 1

Rationale: A myringotomy is the insertion of tympanoplasty tubes into the middle ear to promote drainage of purulent middle ear fluid, equalize pressure, and keep the ear aerated. The nurse must instruct parents regarding the administration of antibiotics. Antibiotics need to be taken as prescribed, and the full course needs to be completed. Options 2, 3, and 4 are incorrect. Antibiotics are not tapered but are administered for the full course of therapy.

Test-Taking Strategy: Focus on the subject, understanding of the instructions about antibiotics. Recall that antibiotics must be taken for the full course, regardless of whether the child is feeling better. This will assist in directing you to the correct option.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Evaluation
Content Area: Pediatrics: Eye/Ear
Health Problem: Pediatric-Specific: Acute and Chronic Otitis
Priority Concepts: Client Education; Safety

350. Answer: 2

Rationale: Strabismus is a condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles. The nurse may suspect strabismus in a child when the child complains of frequent headaches, squints, or tilts the head to see. Other manifestations include crossed eyes, closing one eye to see, diplopia, photophobia, loss of binocular vision, or impairment of depth perception. Options 1, 3, and 4 are not indicative of this condition.

Test-Taking Strategy: Eliminate options 1 and 4 first because they are comparable or alike and relate to hearing. To select from the remaining options, recall that this is a condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Eye/Ear
Health Problem: Pediatric-Specific: Eye Focus and Alignment Disorders
Priority Concepts: Clinical Judgment; Sensory Perception

351. Answer: 1, 5, 6
**Rationale:** Acute otitis media is an inflammatory disorder caused by an infection of the middle ear. The child often has fever, pain, loss of appetite, and possible ear drainage. The child also is irritable and lethargic and may roll the head or pull on or rub the affected ear. Otoscopic examination may reveal a red, opaque, bulging, and immobile tympanic membrane. Hearing loss may be noted, particularly in chronic otitis media. The child’s fever should be treated with ibuprofen. The child is positioned on her or his affected side to facilitate drainage. A soft diet is recommended during the acute stage to avoid pain that can occur with chewing. Antibiotics are prescribed to treat the bacterial infection and should be administered for the full prescribed course. The ear should not be irrigated with normal saline because it can exacerbate the inflammation further. Antihistamines are not usually recommended as a part of therapy.

**Test-Taking Strategy:** Focus on the subject, care for the child with acute otitis media, and on the child’s diagnosis and note the words *acute* and *right ear*. Think about the pathophysiology associated with the disorder and the associated manifestations to select the correct options.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pediatrics: Eye/Ear

**Health Problem:** Pediatric-Specific: Acute and Chronic Otitis

**Priority Concepts:** Clinical Judgment; Infection

I. Epiglottitis
   A. Description
      1. Bacterial form of croup
      2. Inflammation of the epiglottis occurs, which may be caused by *Haemophilus influenzae* type b or *Streptococcus pneumoniae*; children immunized with *H. influenzae* type b (Hib vaccine) are at less risk for epiglottitis.
      3. Occurs most frequently in children 2 to 8 years old, but can occur from infancy to adulthood
      4. Onset is abrupt, and the condition occurs most often in winter.
      5. Considered an emergency situation because it can progress rapidly to severe respiratory distress.
   B. Assessment
      1. High fever
      2. Sore, red, and inflamed throat (large, cherry red, edematous epiglottis) and pain on swallowing (Fig. 35-1)
      3. Absence of spontaneous cough
      4. Dysphonia (muffled voice), dysphagia, dyspnea, and drooling
      5. Agitation
      6. **Retractions** as the child struggles to breathe
      7. Inspiratory **stridor** aggravated by the supine position
      8. Tachycardia
      9. Tachypnea progressing to more severe respiratory distress (hypoxia, hypercapnia, respiratory acidosis, decreased level of consciousness)
10. Tripod positioning: While supporting the body with the hands, the child leans forward, thrusts the chin forward, and opens the mouth in an attempt to widen the airway.

11. A fiberoptic nasal laryngectomy may be necessary to assist in diagnosis.

C. Interventions

1. Maintain a patent airway.

2. Assess respiratory status and breath sounds, noting **nasal flaring**, the use of accessory muscles, retractions, and the presence of stridor (Fig. 35-2).

3. Do not measure the temperature by the oral route.

5. Prepare the child for lateral neck films to confirm the diagnosis (accompany the child to the radiology department).

6. Do not leave the child unattended.

7. Avoid placing the child in a supine position, because this position would affect the respiratory status further.

8. Maintain NPO (nothing by mouth) status.

9. Do not restrain the child or take any other measure that may agitate the child.

10. Administer intravenous (IV) fluids as prescribed; insertion of an IV line may need to be delayed until an adequate airway is established because this procedure may agitate the child.

11. Administer IV antibiotics as prescribed; these are usually followed by oral antibiotics (blood cultures before initiation of antibiotics may be necessary to identify the organism).

12. Administer analgesics and antipyretics (acetaminophen or ibuprofen) to reduce fever and throat pain as prescribed.

13. Administer corticosteroids to decrease inflammation and reduce throat edema as prescribed.

14. Heliox (mixture of helium and oxygen) may be prescribed; this medication reduces the work of breathing, reduces airway turbulence, and helps relieve airway obstruction.
15. Provide cool mist oxygen therapy as prescribed; high humidification cools the airway and decreases swelling.

16. Have resuscitation equipment available, and prepare for endotracheal intubation or tracheotomy for severe respiratory distress.

17. Ensure that the child is up to date with immunizations, including Hib conjugate vaccine (see Chapter 18).

If epiglottitis is suspected, no attempts should be made to visualize the posterior pharynx, obtain a throat culture, or take an oral temperature. Otherwise, spasm of the epiglottis can occur, leading to complete airway occlusion.

II. Laryngotracheobronchitis (Croup)

A. Description

1. Inflammation of the larynx, trachea, and bronchi.
2. Most common type of croup; may be viral or bacterial and most frequently occurs in children younger than 5 years.
3. Common causative organisms include parainfluenza virus types 2 and 3, respiratory syncytial virus (RSV), Mycoplasma pneumoniae, and influenza A and B.
4. Characterized by gradual onset that may be preceded by an upper respiratory infection.

B. Assessment (Box 35-1)

C. Interventions

1. Maintain a patent airway.
2. Assess respiratory status and monitor pulse oximetry; monitor for nasal flaring, sternal retraction, and inspiratory stridor (see Fig. 35-2).
3. Monitor for adequate respiratory exchange; monitor for pallor or cyanosis.
4. Elevate the head of the bed and provide rest.
5. Provide humidified oxygen via a cool air or mist tent as prescribed for a hospitalized child (Table 35-1).
6. Instruct the parents to use a cool air vaporizer at home; other measures include having the child breathe in the cool night air or the air from an open freezer or taking the child to a cool basement or garage.
7. Provide and encourage fluid intake; IV fluids may be prescribed to maintain hydration status if the child is unable to take fluids orally.
8. Administer analgesics as prescribed to reduce fever.

9. Teach the parents to avoid administering cough syrups or cold medicines, which may dry and thicken secretions.

10. Administer corticosteroids if prescribed to reduce inflammation and edema.

11. Administer antibiotics as prescribed, noting that they are not indicated unless a bacterial infection is present.

12. Heliox (mixture of helium and oxygen) may be prescribed.

13. Have resuscitation equipment available.

14. Provide appropriate reassurance and education to the parents or caregivers.

Isolation precautions should be implemented for a hospitalized child with an upper respiratory infection until the cause of the infection is known.

III. Bronchitis

A. Description

1. Inflammation of the trachea and bronchi; may be referred to as tracheobronchitis

2. Usually occurs in association with an upper respiratory infection

3. Is usually a mild disorder; causative agent is most often viral

B. Assessment

1. Fever

2. Dry, hacking, and nonproductive cough that is worse at night and becomes productive in 2 to 3 days

C. Interventions

1. Treat symptoms as necessary.

2. Monitor for respiratory distress.

3. Provide cool, humidified air to the child.

4. Encourage increased fluid intake; child may drink beverages that he or she likes as long as the respiratory status is stable.

5. Administer antipyretics for fever as prescribed.

6. A cough suppressant may be prescribed to promote rest.

IV. Bronchiolitis and Respiratory Syncytial Virus (RSV)

A. Description

1. Bronchiolitis is an inflammation of the bronchioles that causes production of thick mucus that occludes
bronchiole tubes and small bronchi.

2. RSV causes an acute viral infection and is a common cause of bronchiolitis (other organisms that cause bronchiolitis include adenoviruses, parainfluenza viruses, and human metapneumovirus).

3. RSV is highly communicable and is usually transferred via droplets or by direct contact with respiratory secretions.

4. RSV occurs primarily in the fall, winter, and spring.

5. RSV is rarer in children older than 2 years, with a peak incidence at approximately 6 months of age.

6. At-risk children include children who have a chronic or disabling condition and those who are immunocompromised.

7. Identification of the virus is done via testing of nasal or nasopharyngeal secretions.

8. Prevention measures include encouraging breastfeeding; avoiding tobacco smoke exposure; using good hand-washing techniques.

B. Assessment (Box 35-2)

C. Interventions

1. For a child with bronchiolitis, interventions are aimed at treating symptoms and include airway maintenance, cool humidified air and oxygen, adequate fluid intake, and medications.

2. For a hospitalized child with RSV, place the child in a single room to prevent transmission of the virus.

3. Ensure that nurses caring for a child with RSV do not care for other high-risk children.

4. Use contact, droplet, and standard precautions during care; using good hand-washing techniques is necessary.

5. Monitor airway status and maintain a patent airway.
6. For most effective airway maintenance, position the child at a 30- to 40-degree angle with the neck slightly extended to maintain an open airway and decrease pressure on the diaphragm.

7. Provide cool, humidified oxygen as prescribed.

8. Monitor pulse oximetry levels.

9. Encourage fluids; fluids administered intravenously may be necessary until the acute stage has passed.

10. Periodic suctioning may be necessary if nasal secretions are copious; use of a bulb syringe for suctioning infants may be effective. Suctioning should be done before feeding to promote comfort and adequate intake.

11. Antiviral medication may be prescribed.

Cough suppressants are administered with caution because they can interfere with the clearance of respiratory secretions.

V. Pneumonia

A. Description

1. Inflammation of the pulmonary parenchyma or alveoli or both, caused by a virus, mycoplasmal agents, bacteria, or aspiration of foreign substances.

2. The causative agent usually is introduced into the lungs through inhalation or from the bloodstream.

3. Viral pneumonia occurs more frequently than bacterial pneumonia, is seen in children of all ages, and often is associated with a viral upper respiratory infection.

4. Primary atypical pneumonia, usually caused by Mycoplasma pneumoniae or Chlamydia pneumoniae, occurs most often in the fall and winter months and is more common in crowded living conditions; it is most often seen in children 5 to 12 years old.

5. Bacterial pneumonia is often a serious infection requiring hospitalization when pleural effusion or empyema accompanies the disease; hospitalization is also necessary for children with staphylococcal pneumonia (Streptococcus pneumoniae is a common cause).

6. Aspiration pneumonia occurs when food, secretions, liquids, or other materials enter the lung and cause inflammation and a chemical pneumonitis. Classic symptoms include an increasing cough or fever with foul-smelling sputum, deteriorating results on chest x-rays, and other signs of airway involvement.
7. Prevention of viral and bacterial pneumonia includes immunization of infants and children with heptavalent pneumococcal conjugate vaccine (see Chapter 18).

B. Viral pneumonia

1. Assessment
   a. Acute or insidious onset
   b. Symptoms range from mild fever, slight cough, and malaise to high fever, severe cough, and diaphoresis.
   c. Nonproductive or productive cough of small amounts of whitish sputum
   d. Wheezes or fine crackles

2. Interventions
   a. Treatment is symptomatic.
   b. Administer oxygen with cool humidified air as prescribed.
   c. Increase fluid intake.
   d. Administer antipyretics for fever as prescribed.
   e. Administer chest physiotherapy and postural drainage as prescribed.

C. Primary atypical pneumonia

1. Assessment
   a. Acute or insidious onset
   b. Fever (lasting several days to 2 weeks), chills, anorexia, headache, malaise, and myalgia (muscle pain)
   c. Rhinitis; sore throat; and dry, hacking cough
   d. Nonproductive cough initially, progressing to production of seromucoid sputum that becomes mucopurulent or blood-streaked

2. Interventions
   a. Treatment is symptomatic.
   b. Recovery generally occurs in 7 to 10 days.

D. Bacterial pneumonia

1. Assessment
   a. Acute onset
   b. Infant: Irritability, lethargy, poor feeding; abrupt fever (may be accompanied by seizures); respiratory
distress (air hunger, tachypnea, and circumoral cyanosis)
c. Older child: Headache, chills, abdominal pain, chest pain, meningeal symptoms (meningism)
d. Hacking, nonproductive cough
e. Diminished breath sounds or scattered crackles
f. With consolidation, decreased breath sounds are more pronounced.
g. As the infection resolves, the cough becomes productive and the child expectorates purulent sputum; coarse crackles and **wheezing** are noted.

2. Interventions

a. Blood cultures are taken and antibiotic therapy is initiated as soon as the diagnosis is suspected; in a hospitalized infant or child, IV antibiotics are usually prescribed.
b. Administer oxygen for respiratory distress as prescribed, and monitor oxygen saturation via pulse oximetry.
c. Place the child in a cool mist tent as prescribed; cool humidification moistens the airways and assists in temperature reduction.
d. Suction mucus from the infant, using a bulb syringe, to maintain a patent airway if the infant is unable to handle secretions.
e. Administer chest physiotherapy and postural drainage every 4 hours as prescribed.
f. Promote bed rest to conserve energy.
g. Encourage the child to lie on the affected side (if pneumonia is unilateral) to splint the chest and reduce the discomfort caused by pleural rubbing.
h. Encourage fluid intake (administer cautiously to prevent aspiration); intravenously administered fluids may be necessary.
i. Administer antipyretics for fever and bronchodilators as prescribed.
j. Monitor temperature frequently because...
of the risk for febrile seizures.
k. Institute isolation precautions with pneumococcal or staphylococcal pneumonia (according to agency policy).
l. Administer cough suppressant if prescribed before rest times and meals if the cough is disturbing (administered with caution because they can interfere with the clearance of respiratory secretions).
m. Continuous closed chest drainage may be necessary if purulent fluid is present (usually noted in *Staphylococcus* infections).
n. Fluid accumulation in the pleural cavity may be removed by thoracentesis; thoracentesis also provides a means for obtaining fluid for culture and for instilling antibiotics directly into the pleural cavity.

Children with a respiratory disorder should be monitored for weight loss and for signs of dehydration. Signs of dehydration include a sunken fontanel (infants), nonelastic skin turgor, decreased and concentrated urinary output, dry mucous membranes, and decreased tear production.

VI. Asthma

A. Description

1. Asthma is a chronic inflammatory disease of the airways (see Chapter 50).
2. Asthma is classified on the basis of disease severity; management includes medications, environmental control of allergens, and child and family education.
3. The allergic reaction in the airways caused by the precipitant can result in an immediate reaction with obstruction occurring, and it can result in a late bronchial obstructive reaction several hours after the initial exposure to the precipitant.
4. Mast cell release of histamine leads to a bronchoconstrictive process, bronchospasm, and obstruction.
5. Diagnosis is made on the basis of the child’s symptoms, history and physical examination, chest radiograph, and laboratory tests (Box 35-3). See Table 35-2 for a classification system for asthma severity.
6. Precipitants may trigger an asthma attack (Box 35-4).

7. Status asthmaticus is the most severe form of an asthma attack that is unresponsive to repeated courses of beta-agonist therapy; this is a medical emergency that can result in respiratory failure and death if not recognized and vigorously treated.

B. Assessment

1. Child has episodes of dyspnea, wheezing, breathlessness, chest tightness, and cough, particularly at night or in the early morning or both.

2. Acute asthma attacks
   a. Episodes include progressively worsening shortness of breath, cough, wheezing, chest tightness, decreases in expiratory airflow secondary to bronchospasm, mucosal edema, and mucus plugging; air is trapped behind occluded or narrow airways, and hypoxemia can occur.
   b. The attack begins with irritability, restlessness, headache, feeling tired, or chest tightness; just before the attack, the child may present with itching localized at the front of the neck or over the upper part of the back.
   c. Respiratory symptoms include a hacking, irritable, nonproductive cough caused by bronchial edema.
   d. Accumulated secretions stimulate the cough; the cough becomes rattling, and there is production of frothy, clear, gelatinous sputum.
   e. The child experiences retractions.
   f. Hyperresonance on percussion of the chest is noted.
   g. Breath sounds become coarse and loud, with crackles, coarse rhonchi, and inspiratory and expiratory wheezing; expiration is prolonged.
   h. Child may be pale or flushed, and the lips may have a deep, dark-red color that may progress to cyanosis (also observed in the nail beds and skin,
especially around the mouth).
i. Restlessness, apprehension, and **diaphoresis** occur.
j. Child speaks in short, broken phrases.
k. Younger children assume the tripod sitting position; older children sit upright, with the shoulders in a hunched-over position, the hands on the bed or a chair, and the arms braced to facilitate the use of the accessory muscles of breathing (child avoids a lying-down position).
l. Exercise-induced attack: Cough, shortness of breath, chest pain or tightness, wheezing, and endurance problems occur during exercise.
m. Severe spasm or obstruction: Breath sounds and wheezing cannot be heard (silent chest), and cough is ineffective (represents a lack of air movement).
n. Ventilatory failure and asphyxia: Shortness of breath, with air movement in the chest restricted to the point of absent breath sounds, is noted; this is accompanied by a sudden increase in the respiratory rate.

C. Interventions: Acute episode (see **Priority Nursing Actions**)

**Priority Nursing Actions**

**Acute Asthma Attack**

1. Assess airway patency and respiratory status.
2. Administer humidified oxygen by nasal cannula or face mask.
3. Administer quick-relief (rescue) medications.
4. Initiate an intravenous (IV) line.
5. Prepare the child for a chest radiograph and fiberoptic nasal laryngectomy if prescribed.
6. Prepare to obtain a blood sample for determining arterial blood gas levels if prescribed.

**Reference**

D. Medications

1. Quick-relief medications (rescue medications): Used to treat symptoms and exacerbations (**Box 35-5**)
2. Long-term control medications (preventer medications): Used to achieve and maintain control of
Certain long-term control medications, such as long-acting beta-adrenergic agonists (LABAs), should not be given without an inhaled corticosteroid because of the risk for rebound bronchoconstriction.

3. Nebulizer, metered-dose inhaler (MDI): May be used to administer medications; if the child has difficulty using the MDI, medication can be administered by nebulization (medication is mixed with saline and then nebulized with compressed air by a machine).

4. If an MDI is used to administer a corticosteroid, a spacer should be used to prevent yeast infections in the child’s mouth; the spacer prevents the medication being sprayed directly into the mouth, which can lead to irritation and possibly infection (thrush) in the mouth.

5. The child’s growth patterns need to be monitored when corticosteroids are prescribed.

E. Chest physiotherapy
   1. Includes breathing exercises and physical training.
   2. Chest physiotherapy strengthens the respiratory musculature and produces more efficient breathing patterns.
   3. Chest physiotherapy is not recommended during an acute exacerbation.

F. Allergen control
   1. Testing may be done to identify allergens.
   2. Teach the child and parents about measures to prevent and reduce exposure to allergens (see Box 35-4).

G. Home care measures
   1. Instruct the family in measures to eliminate environmental allergens.
   2. Avoid extremes of environmental temperature; in cold temperatures, instruct the child to breathe through the nose, not the mouth, and to cover the nose and mouth with a scarf.
   3. Avoid exposure to individuals with a respiratory infection.
   4. Instruct the child and family in how to recognize early symptoms of an asthma attack.
   5. Teach the child and family about medications and how to use a nebulizer, MDI, or peak expiratory flowmeter (PEF).
   6. The PEF measures how fast air comes out of the lungs
after exhaling forcefully after inhaling fully.

7. Instruct the child and family about the importance of home monitoring of the peak expiratory flow rate; a decrease in the expiratory flow rate may indicate impending infection or exacerbation.

8. Instruct the child in the cleaning of devices used for inhaled medications (yeast infections can occur with the use of aerosolized corticosteroids).

9. Encourage adequate rest, sleep, and a well-balanced diet.

10. Instruct the child in the importance of adequate fluid intake to liquefy secretions.

11. Assist in developing an exercise program.

12. Instruct the child in the procedure for respiratory treatments and exercises as prescribed.

13. Encourage the child to cough effectively.

14. Encourage the parents to keep immunizations up to date; annual influenza vaccinations are recommended for children 6 months of age and older.

15. Inform other health care providers and school personnel of the asthma condition.

16. Allow the child to take control of self-care measures, based on age appropriateness.

VII. Cystic Fibrosis

A. Description (Fig. 35-3)

1. A chronic multisystem disorder (autosomal recessive trait disorder) characterized by exocrine gland dysfunction

2. The mucus produced by the exocrine glands is abnormally thick, tenacious, and copious, causing obstruction of the small passageways of the affected organs, particularly in the respiratory, gastrointestinal, and reproductive systems.

3. Common symptoms are associated with pancreatic enzyme deficiency and pancreatic fibrosis caused by duct blockage, progressive chronic lung disease as a result of infection, and sweat gland dysfunction resulting in increased sodium and chloride sweat concentrations.

4. An increase in sodium and chloride in sweat and saliva forms the basis for one diagnostic test, the sweat chloride test (Box 35-7).

5. Cystic fibrosis is a progressive and incurable disorder, and respiratory failure is a common cause of death; organ transplantations may be an option to increase survival rates.
B. Respiratory system

1. Symptoms are produced by the stagnation of mucus in the airway, leading to bacterial colonization and destruction of lung tissue.
2. Emphysema and atelectasis occur as the airways become increasingly obstructed.
3. Chronic hypoxemia causes contraction and hypertrophy of the muscle fibers in pulmonary arteries and arterioles, leading to pulmonary hypertension and eventual cor pulmonale.
4. Pneumothorax from ruptured bullae and hemoptysis from erosion of the bronchial wall occur as the disease progresses.
5. Other respiratory symptoms
   a. Wheezing and cough
   b. Dyspnea
   c. Cyanosis
   d. Clubbing of the fingers and toes
   e. Barrel chest
   f. Repeated episodes of bronchitis and pneumonia

C. Gastrointestinal system

1. Meconium ileus in the newborn is the earliest manifestation.
2. Intestinal obstruction (distal intestinal obstructive syndrome) caused by thick intestinal secretions can occur; signs include pain, abdominal distention, nausea, and vomiting.
3. Stools are frothy and foul-smelling.
4. Deficiency of the fat-soluble vitamins A, D, E, and K, which can result in easy bruising, bleeding, and anemia, occurs.
5. Malnutrition and failure to thrive is a concern.
6. Demonstration of hypoalbuminemia can occur from diminished absorption of protein, resulting in generalized edema.
7. Rectal prolapse can result from the large, bulky stools and increased intra-abdominal pressure.
8. Pancreatic fibrosis can occur and places the child at risk for diabetes mellitus.

D. Integumentary system

1. Abnormally high concentrations of sodium and chloride in sweat are noted.
2. Parents report that the infant tastes “salty” when
kissed.

3. Dehydration and electrolyte imbalances can occur, especially during hyperthermic conditions.

E. Reproductive system

1. Cystic fibrosis can delay \textbf{puberty} in girls.
2. Fertility can be inhibited by the highly viscous cervical secretions, which act as a plug and block sperm entry.
3. Males are usually sterile (but not impotent), caused by the blockage of the vas deferens by abnormal secretions or by failure of normal development of duct structures.

F. Diagnostic tests

1. Quantitative sweat chloride test is positive (see Box 35-7).
2. Newborn screening may be done in some states and may consist of immunoreactive trypsinogen analysis and direct DNA analysis for mutant genes.
4. Pulmonary function tests provide evidence of abnormal small airway function.
5. Stool, fat, enzyme analysis: A 72-hour stool sample is collected to check the fat or enzyme (trypsin) content, or both (food intake is recorded during the collection).

G. Interventions: Respiratory system

1. Goals of treatment include preventing and treating pulmonary infection by improving aeration, removing secretions, and administering antibiotic medications as prescribed.
2. Monitor respiratory status, including lung sounds and the presence and characteristics of a cough.
3. Chest physiotherapy (percussion and postural drainage) on awakening and in the evening (more frequently during pulmonary infection) needs to be done every day to maintain pulmonary hygiene; chest physiotherapy should not be performed before or immediately after a meal.
4. A Flutter mucus clearance device (a small, handheld plastic pipe with a stainless-steel ball on the inside) facilitates the removal of mucus and may be prescribed (store away from small children, because if the device separates, the steel ball poses a choking hazard).
5. Handheld percussors or a special vest device that provides high-frequency chest wall oscillation may be prescribed to help loosen secretions.
6. A positive expiratory pressure mask may be prescribed; use of this mask forces secretion to the upper airway for expectoration.
7. The child should be taught the forced expiratory technique (huffing) to mobilize secretions for expectoration.
8. Bronchodilator medication by aerosol may be prescribed; the medication opens the bronchi for easier expectoration (administered before chest physiotherapy when the child has reactive airway disease or is wheezing). Medications that decrease the viscosity of mucus may also be prescribed.
9. A physical exercise program with the aim of stimulating mucus expectoration and establishing an effective breathing pattern should be instituted.
10. Aerosolized or IV antibiotics may be prescribed; IV antibiotics may be administered at home through a central venous access device.
11. Oxygen may be prescribed during acute episodes; monitor closely for oxygen narcosis (signs include nausea and vomiting, malaise, fatigue, numbness and tingling of extremities, substernal distress), because a child with cystic fibrosis may have chronic carbon dioxide retention.
12. Lung transplantation may be an option.

H. Interventions: Gastrointestinal system

1. A child with cystic fibrosis requires a high-calorie, high-protein, and well-balanced diet to meet energy and growth needs; multivitamins and vitamins A, D, E, and K are also administered; for those with severe lung disease, energy requirements may be as high as 20% to 50% or more of the recommended daily allowance.
2. Monitor weight and for failure to thrive.
3. Monitor stool patterns and for signs of intestinal obstruction.
4. The goal of treatment for pancreatic insufficiency is to replace pancreatic enzymes; pancreatic enzymes are administered within 30 minutes of eating and administered with all meals and all snacks (enzymes should not be given if the child is NPO).
5. The amount of pancreatic enzymes administered depends on the primary health care provider’s (PHCP’s) preference and usually is adjusted to
achieve normal growth and a decrease in the number of stools to 2 or 3 daily (additional enzymes are needed if the child is consuming high-fat foods).

6. Enteric-coated pancreatic enzymes should not be crushed or chewed; capsules can be taken apart, and the contents can be sprinkled on a small amount of food for administration.

7. Monitor for constipation, intestinal obstruction, and rectal prolapse.

8. Monitor for signs of gastroesophageal reflux; place the infant in an upright position after eating, and teach the child to sit upright after eating.

I. Additional interventions

1. Monitor blood glucose levels and for signs of diabetes mellitus.

2. Ensure adequate salt intake and fluids that provide an adequate supply of electrolytes during extremely hot weather and when the child has a fever.

4. Monitor for signs of retinopathy or nephropathy.

5. Provide emotional support to the parents, particularly when the child is diagnosed; parents will be fearful and uncertain about the disorder and the care involved.

6. Provide support to the child as he or she transitions through the stages of growth.

7. Teach the child and parents about the care involved and encourage independence in the child for self-care as age appropriate.

J. Home care

1. Home care involves educating the parents and the child about all aspects of care for the disorder.

2. Inform the parents and child about the signs of complications and actions to take and that the importance of follow-up care is crucial.

3. Instruct the parents to ensure that the child receives the recommended immunizations on schedule; in addition, annual influenza vaccinations are recommended for children 6 months of age and older.

4. Inform the child and parents about the Cystic Fibrosis Foundation.

An alteration in respiratory status can be a frightening experience for the child and parents. A calm and reassuring nursing approach assists in reducing fear.
VIII. Sudden Infant Death Syndrome (SIDS)

A. Description

1. SIDS refers to unexpected death of an apparently healthy infant younger than 1 year for whom an investigation of the death and a thorough autopsy fail to show an adequate cause of death.
2. Several theories are proposed regarding the cause of SIDS, but the exact cause is unknown.
3. SIDS most frequently occurs during winter months.
4. Death usually occurs during sleep periods, but not necessarily at night.
5. SIDS most frequently affects infants 2 to 3 months of age.
6. Incidence is higher in boys.
7. Incidence is higher in Native Americans, African Americans, and Hispanics and in lower socioeconomic groups.
8. Incidence has been found to be lower in breast-fed infants and infants sleeping with a pacifier.
9. High-risk conditions for SIDS:
   a. Prone position
   b. Use of soft bedding, sleeping in a noninfant bed such as a sofa
   c. Overheating (thermal stress)
   d. Cosleeping
   e. Mother who smoked cigarettes or abused substances during pregnancy
   f. Exposure to tobacco smoke after birth

B. Assessment

1. Infant is apneic, blue, and lifeless.
2. Frothy blood-tinged fluid is in the nose and mouth.
3. Infant may be found in any position, but typically is found in a disheveled bed, with blankets over the head, and huddled in a corner.
4. Infants may appear to have been clutching bedding.
5. Diaper may be wet and full of stool.

C. Prevention and interventions

1. Infants should be placed in the supine position for sleep.
2. Mother needs to be taught about the risk factors: cigarette smoking and substance abuse during pregnancy; use of soft bedding, sleeping in a noninfant bed such as a sofa; overheating (thermal stress); cosleeping; exposure to tobacco smoke after birth. Stuffed animals or other toys should be
removed from the crib while the infant is sleeping.
3. Teach the parents to monitor for positional
plagiocephaly caused by the supine sleeping position;
signs include flattened posterior occiput and
development of a bald spot in the posterior occiput
area.
4. To assist in preventing positional plagiocephaly, teach
the parents to alter head position during sleep, avoid
excessive time in infant seats and bouncers, and place
the infant in a prone position while awake (monitor
the infant when in the prone position).
5. If SIDS occurs, the parents need a great deal of support
as they grieve and mourn, especially because the
event was sudden, unexpected, and unexplained.

IX. Foreign Body Aspiration
A. Description (Fig. 35-4)
1. Swallowing and aspiration of a foreign body into the
air passages
2. Most inhaled foreign bodies lodge in the main stem or
lobar bronchus.
3. Most common offending foods are round in
shape and include items such as hot dogs, candy,
peanuts, popcorn, or grapes.

B. Assessment
1. Initially, choking, gagging, coughing, and retractions
are general findings.
2. If the condition worsens, cyanosis may occur.
3. Laryngotraheal obstruction leads to dyspnea, stridor,
cough, and hoarseness.
4. Bronchial obstruction produces paroxysmal cough,
wheezing, asymmetrical breath sounds, and dyspnea.
5. If any obstruction progresses, unconsciousness and
asphyxiation may occur.
6. Partial obstructions may occur without symptoms.
7. Distressed child cannot speak, becomes cyanotic, and
collapses.

C. Interventions: Abdominal thrust maneuver is used for the
removal of a foreign body (or relief of choking) in a child; refer to
the American Heart Association document at
https://hinman.org/Clinicians/Handouts/2017/Th113-Th114-Fr141-
Fr142.pdf.
1. Emergency care
2. After instituting emergency care measures, removal by
endoscopy may be necessary.
a. After endoscopy, the child receives high-humidity air.
b. Observe for signs and symptoms of airway edema.

3. Prevention
a. Keep small objects, including rubber balloons, out of reach of small children.
b. Avoid giving small children small, round food items.

4. Parent, day care provider, and babysitter education
a. Teach about the hazards of aspiration.
b. Discuss potential situations in which small items may be aspirated.
c. Teach about the symptoms of aspiration.
d. Teach how to perform emergency care measures.

X. Tuberculosis

A. Description
1. Tuberculosis is a contagious disease caused by *Mycobacterium tuberculosis*, an acid-fast bacillus (see Chapter 50).
2. Multidrug-resistant strains of *M. tuberculosis* occur because of child or family noncompliance with therapeutic regimens.
3. The route of transmission of *M. tuberculosis* is through inhalation of droplets from an individual with active tuberculosis.
4. There is an increased incidence in urban low-income areas, nonwhite racial or ethnic groups, and first-generation immigrants from endemic countries.
5. Most children are infected by a family member or by another individual with whom they have frequent contact, such as a babysitter.

B. Assessment
1. Child may be asymptomatic or develop symptoms such as malaise, fever, cough, weight loss, anorexia, and lymphadenopathy.
2. Specific symptoms related to the site of infection, such as the lungs, brain, or bone, may be present.
3. With increased time, asymmetrical expansion of the lungs, decreased breath sounds, crackles, and dullness to percussion develop.

C. Tuberculin skin test (TST) or Mantoux test (Box 35-8)
1. The test produces a positive reaction 2 to 10 weeks after the initial infection.
2. The test determines whether a child has been infected and has developed a sensitivity to the protein of the tubercle bacillus; a positive reaction does not confirm the presence of active disease (exposure versus presence).
3. After a child reacts positively, the child will always react positively; a positive reaction in a previously negative child indicates that the child has been infected since the last test.
4. Tuberculosis testing should not be done at the same time as measles immunization (viral interference from the measles vaccine may cause a false-negative result).

D. Sputum culture
1. A definitive diagnosis is made by showing the presence of mycobacteria in a culture.
2. Chest x-rays are supplemental to sputum cultures and are not definitive alone.
3. Because an infant or young child often swallows sputum rather than expectorates it, gastric washings (aspiration of lavaged contents from the fasting stomach) may be done to obtain a specimen; the specimen is obtained in the early morning before breakfast.

E. Interventions
1. Medications
   a. A 9-month course of isoniazid may be prescribed to prevent a latent infection from progressing to clinically active tuberculosis and to prevent initial infection in children in high-risk situations; a 12-month course may be prescribed for a child infected with human immunodeficiency virus (HIV).
   b. Recommendation for a child with clinically active tuberculosis may include combination administration of isoniazid, rifampin, and pyrazinamide daily for 2 months, and then isoniazid and rifampin twice weekly for 4 months.
   c. Inform the parents and child that bodily fluids, including urine, may turn an
orange-red color with some tuberculosis medications.
d. Directly observed therapy may be necessary for some children.

2. Place children with active disease who are contagious on respiratory isolation until medications have been initiated, sputum cultures show a diminished number of organisms, and cough is improving; this includes use of a personally fitted air-purifying N95 or N100 respirator (mask) by the nurse caring for the child.

3. Stress the importance of adequate rest and adequate diet.

4. Instruct the child and family about measures to prevent the transmission of tuberculosis.

5. Case finding and follow-up with known contacts is crucial to decrease the number of cases of individuals with active tuberculosis.

**FIG. 35-1** A, Normal larynx. B, Obstruction and narrowing resulting from edema of croup.
Box 35-1
Progression of Symptoms in Laryngotraceobronchitis

Stage I

- Low-grade fever
- Hoarseness
- Seal bark and brassy cough (croup cough)
- Inspiratory stridor
- Fear
- Irritability and restlessness

Stage II

- Continuous respiratory stridor
- Retractions
- Use of accessory muscles
- Crackles and wheezing
- Labored respirations
Stage III

- Continued restlessness
- Anxiety
- Pallor
- Diaphoresis
- Tachypnea
- Signs of anoxia and hypercapnia

Stage IV

- Intermittent cyanosis progressing to consistent cyanosis
- Apneic episodes progressing to cessation of breathing

Table 35-1

### Oxygen Delivery Systems: Advantages and Disadvantages

<table>
<thead>
<tr>
<th>System</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>

Data from Hockenberry M, Wilson D: Wong’s nursing care of infants and children, ed 9, St. Louis, 2011, Mosby.

Box 35-2

**Assessment: Respiratory Syncytial Virus**
Initial Manifestations

- Rhinorrhea
- Eye or ear drainage
- Pharyngitis
- Coughing
- Sneezing
- Wheezing
- Intermittent fever

Manifestations as Disease Progresses

- Increased coughing and wheezing
- Signs of air hunger
- Tachypnea and retractions
- Periods of cyanosis

Manifestations in Severe Illness

- Tachypnea more than 70 breaths per minute
- Decreased breath sounds and poor air exchange
- Listlessness
- Apneic episodes

Box 35-3

Laboratory Tests to Assist in Diagnosing Asthma

**Pulmonary Function Tests:** Spirometry testing assesses the presence and degree of disease and can determine the response to treatment.

**Peak Expiratory Flow Rate Measurement:** Measures maximum flow of air that can be forcefully exhaled in 1 second; child uses a peak expiratory flowmeter to determine a “personal best” value that can be used for comparison at other times, such as during and after an asthma attack.

**Bronchoprovocation Testing:** Testing that is done to identify inhaled allergens; mucous membranes are directly exposed to suspected allergen in increasing amounts.

**Skin Testing:** Done to identify specific allergens.

**Exercise Challenges:** Exercise is used to identify the occurrence of exercise-induced bronchospasm.
Radioallergosorbent Test: Blood test used to identify a specific allergen. Chest Radiograph: May show hyperexpansion of the airways.

Note: Some tests place the child at risk for an asthma attack; testing should be done under close supervision.

<tr>
<td></td>
<td>*FEV1 60%-80% predicted, PFT &gt; 30%</td>
<td></td>
</tr>
<tr>
<td>Severe persistent</td>
<td>Continuous daily symptoms</td>
<td>Inhaled SABA as needed</td>
</tr>
<tr>
<td></td>
<td>Frequent nighttime symptoms</td>
<td>Multiple daily controller meds, high-dose inhaled corticosteroid, *LABA, cromolyn/nedocromil, leukotriene modifiers, may need long-term corticosteroids</td>
</tr>
<tr>
<td></td>
<td>Physical activity limited by asthma</td>
<td></td>
</tr>
<tr>
<td></td>
<td>*FEV1 less than or equal to 60% predicted, PFT variability &gt; 30%</td>
<td></td>
</tr>
</tbody>
</table>

FEV1, Forced expiratory volume in 1 second; LABA, long-acting beta-adrenergic agonists; PFT, pulmonary function tests; SABA, short-acting beta-adrenergic agonists.

Box 35-4

Examples of Precipitants Triggering an Asthma Attack

Allergens

Outdoor: Trees, shrubs, weeds, grasses, molds, pollen, air pollution, sand dust, spores

Indoor: Dust, dust mites, mold, cockroach antigen

Irritants: Tobacco smoke, wood smoke, odors, sprays

Exposure to Occupational Irritants
Exercise
Cold Air
Changes in Weather or Temperature
Environmental Change: Moving to a new home, starting a new school
Colds and Infections
Animals: Cats, dogs, rodents, horses
Medications: Aspirin, nonsteroidal antiinflammatory drugs, antibiotics, beta blockers
Strong Emotions: Fear, anger, laughing, crying
Conditions: Gastroesophageal reflux disease, tracheoesophageal fistula
Food Additives: Sulfite preservatives
Foods: Nuts, milk, other dairy products
Endocrine Factors: Menses, pregnancy, thyroid disease

Box 35-5
Quick-Relief Medications (Rescue Medications)

- Short-acting $\beta_2$ agonists (for bronchodilation)
- Anticholinergics (for relief of acute bronchospasm)
- Systemic corticosteroids (for antiinflammatory action to treat reversible airflow obstruction)

Box 35-6
Long-Term Control (Medications to Prevent Attacks)

- Inhaled corticosteroids (for antiinflammatory action)
- Antiallergy medications (to prevent an adverse response on exposure to an allergen)
- Nonsteroidal antiinflammatory drugs (for antiinflammatory action)
- Long-acting $\beta_2$ agonists (for long-acting bronchodilation)
- Leukotriene modifiers (to prevent bronchospasm and inflammatory cell infiltration)
- Monoclonal antibody (blocks binding of immunoglobulin E [IgE] to mast cells to inhibit inflammation)
Box 35-7

**Quantitative Sweat Chloride Test**

- Production of sweat is stimulated (pilocarpine iontophoresis), sweat is collected, and sweat electrolytes are measured (more than 75 mg of sweat is needed).
- Normally, the sweat chloride concentration is less than 40 mEq/L (40 mmol/L).
- Chloride concentration greater than 60 mEq/L (60 mmol/L) is a positive test result (higher than 40 mEq/L (40 mmol/L) is diagnostic in infants younger than 3 months of age.
- Chloride concentrations of 40 to 60 mEq/L (40 to 60 mmol/L) are highly suggestive of cystic fibrosis and require a repeat test.
Box 35-8

Tuberculin Skin Test or Mantoux Test Interpretation

- Induration measuring 15 mm or more is considered to be a positive reaction in children 4 years or older who do not have any risk factors.
- Induration measuring 10 mm or more is considered to be a positive reaction in children younger than 4 years and in children with chronic illness or at high risk for exposure to tuberculosis.
- Induration measuring 5 mm or more is considered to be positive for the highest-risk groups, such as children with immunosuppressive conditions or human immunodeficiency virus (HIV) infection.

Practice Questions

352. A 10-year-old child with asthma is treated for acute exacerbation in the emergency department. The nurse caring for the child should monitor for which sign, knowing that it indicates a worsening of the condition?
   1. Warm, dry skin
   2. Decreased wheezing
   3. Pulse rate of 90 beats per minute
   4. Respirations of 18 breaths per minute

353. The mother of an 8-year-old child being treated for right lower lobe pneumonia at home calls the clinic nurse. The mother tells the nurse that the child complains of discomfort on the right side and that ibuprofen is not effective. Which instruction should the nurse provide to the mother?
   1. Increase the dose of ibuprofen.
   2. Increase the frequency of ibuprofen.

FIG. 35-4 Mechanisms of airway obstruction by a foreign body (FB).
3. Encourage the child to lie on the left side.
4. Encourage the child to lie on the right side.

354. A new parent expresses concern to the nurse regarding sudden infant death syndrome (SIDS). She asks the nurse how to position her new infant for sleep. In which position should the nurse tell the parent to place the infant?
1. Side or prone
2. Back or prone
3. Stomach with the face turned
4. Back rather than on the stomach

355. The clinic nurse is providing instructions to a parent of a child with cystic fibrosis regarding the immunization schedule for the child. Which statement should the nurse make to the parent?
1. “The immunization schedule will need to be altered.”
2. “The child should not receive any hepatitis vaccines.”
3. “The child will receive all of the immunizations except for the polio series.”
4. “The child will receive the recommended basic series of immunizations along with a yearly influenza vaccination.”

356. The emergency department nurse is caring for a child diagnosed with epiglottitis. In assessing the child, the nurse should monitor for which indication that the child may be experiencing airway obstruction?
1. The child exhibits nasal flaring and bradycardia.
2. The child is leaning forward, with the chin thrust out.
3. The child has a low-grade fever and complains of a sore throat.
4. The child is leaning backward, supporting herself or himself with the hands and arms.

357. A child with laryngotracheobronchitis (croup) is placed in a cool mist tent. The mother becomes concerned because the child is frightened, consistently crying, and trying to climb out of the tent. Which is the most appropriate nursing action?
1. Tell the mother that the child must stay in the tent.
2. Place a toy in the tent to make the child feel more comfortable.
3. Call the pediatrician and obtain a prescription for a mild sedative.
4. Let the mother hold the child and direct the cool mist over the child’s face.

358. The clinic nurse reads the results of a tuberculin skin test (TST) on a 3-year-old child. The results indicate an area of induration measuring 10 mm. The nurse should interpret these results as which finding?
1. Positive
2. Negative
3. Inconclusive
4. Definitive and requiring a repeat test

359. The mother of a hospitalized 2-year-old child with viral laryngotracheobronchitis (croup) asks the nurse why the pediatrician did not prescribe antibiotics. Which response should the nurse make?
1. “The child may be allergic to antibiotics.”
2. “The child is too young to receive antibiotics.”
3. “Antibiotics are not indicated unless a bacterial infection is
360. The nurse is caring for an infant with bronchiolitis, and diagnostic tests have confirmed respiratory syncytial virus (RSV). On the basis of this finding, which is the most appropriate nursing action?

1. Initiate strict enteric precautions.
2. Move the infant to a private room.
3. Leave the infant in the present room, because RSV is not contagious.
4. Inform the staff that using standard precautions is all that is necessary when caring for the child.

361. The nurse is preparing for the admission of an infant with a diagnosis of bronchiolitis caused by respiratory syncytial virus (RSV). Which interventions should the nurse include in the plan of care? Select all that apply.

1. Place the infant in a private room.
2. Ensure that the infant’s head is in a flexed position.
3. Wear a mask, gown, and gloves when in contact with the infant.
4. Place the infant in a tent that delivers warm humidified air.
5. Position the infant on the side, with the head lower than the chest.
6. Ensure that nurses caring for the infant with RSV do not care for other high-risk children.

Answers

352. Answer: 2

Rationale: Asthma is a chronic inflammatory disease of the airways. Decreased wheezing in a child with asthma may be interpreted incorrectly as a positive sign when it may actually signal an inability to move air. A “silent chest” is an ominous sign during an asthma episode. With treatment, increased wheezing actually may signal that the child’s condition is improving. Warm, dry skin indicates an improvement in the child’s condition, because the child is normally diaphoretic during exacerbation. The normal pulse rate in a 10-year-old is 70 to 110 beats per minute. The normal respiratory rate in a 10-year-old is 16 to 20 breaths per minute.

Test-Taking Strategy: Note the word worsening in the question. Options 3 and 4 can be eliminated because they are comparable or alike in that they are normal vital signs. From the remaining options, recall that a “silent chest” is an ominous sign during an asthma episode and indicates severe bronchial spasm or obstruction.

Level of Cognitive Ability: Analyzing
Rationale: Pneumonia is an inflammation of the pulmonary parenchyma or alveoli, or both, caused by a virus, mycoplasmal agents, bacteria, or aspiration of foreign substances. Splinting of the affected side by lying on that side may decrease discomfort. It would be inappropriate to advise the mother to increase the dose or frequency of the ibuprofen. Lying on the left side would not be helpful in alleviating discomfort.

Test-Taking Strategy: Options 1 and 2 can be eliminated because they are comparable or alike. Recall that the nurse does not adjust the dose or frequency of medications. Recalling the principles related to splinting an incision in the postoperative client will assist in directing you to the correct option, because these principles can be applied in this situation.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Throat/Respiratory
Health Problem: Pediatric-Specific: Pneumonia
Priority Concepts: Client Education; Pain
355. **Answer:** 4

**Rationale:** Cystic fibrosis is a chronic multisystem disorder (autosomal recessive trait disorder) characterized by exocrine gland dysfunction. The mucus produced by the exocrine glands is abnormally thick, tenacious, and copious, causing obstruction of the small passageways of the affected organs, particularly in the respiratory, gastrointestinal, and reproductive systems. Adequately protecting children with cystic fibrosis from communicable diseases by immunization is essential. In addition to the basic series of immunizations, a yearly influenza immunization is recommended for children with cystic fibrosis. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Eliminate options 1, 2, and 3 because they are comparable or alike, indicating that the immunization schedule will be adjusted in some way. Recalling the importance of protection from communicable diseases, particularly in children with a disorder such as cystic fibrosis, will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying

**Health Problem:** Pediatric-Specific: Cystic fibrosis  
**Priority Concepts:** Client Education; Health Promotion  
https://www.cdc.gov/vaccines/schedules/hcp/child-adolescent.html

356. **Answer:** 2

**Rationale:** Epiglottitis is a bacterial form of croup. A primary concern is that it can progress to acute respiratory distress. Clinical manifestations suggestive of airway obstruction include tripod positioning (leaning forward while supported by arms, chin thrust out, mouth open), nasal flaring, the use of accessory muscles for breathing, and the presence of stridor. Option 4 is an incorrect position. Options 1 and 3 are incorrect because epiglottitis causes tachycardia and a high fever.

**Test-Taking Strategy:** Focus on the subject, manifestations of airway obstruction in a child with epiglottitis. Eliminate option 1 first, because tachycardia rather than bradycardia would occur in a child experiencing respiratory distress. Eliminate option 3 next, knowing that a high fever occurs with epiglottitis. From the remaining options, visualize the descriptions in each and determine which position would best assist a child experiencing respiratory distress.

**Level of Cognitive Ability:** Analyzing

**Health Problem:** Pediatric-Specific: Croup  
**Priority Concepts:** Clinical Judgment; Gas Exchange  
**Reference:** McKinney et al. (2018), pp. 1046-1047

357. **Answer:** 4
**Rationale:** Laryngotracheobronchitis (croup) is the inflammation of the larynx, trachea, and bronchi and is the most common type of croup. Cool mist therapy may be prescribed to liquefy secretions and to assist in breathing. If the use of a tent or hood is causing distress, treatment may be more effective if the child is held by the parent and a cool mist is directed toward the child’s face (blow-by). A mild sedative would not be administered to the child. Crying would increase hypoxia and aggravate laryngospasm, which may cause airway obstruction. Options 1 and 2 would not alleviate the child’s fear.

**Test-Taking Strategy:** Note the strategic words, most appropriate. Focus on the subject, the child’s fear. Options 1, 2, and 3 are comparable or alike in that they do not address the fear. The correct option is the one that addresses the subject of the question.

**Level of Cognitive Ability:** Applying

**Client Needs:** Psychosocial Integrity

**Integrated Process:** Caring

**Content Area:** Pediatrics: Throat/Respiratory

**Health Problem:** Pediatric-Specific: Croup

**Priority Concepts:** Caregiving; Clinical Judgment

358. **Answer:** 1

**Rationale:** Induration measuring 10 mm or more is considered to be a positive result in children younger than 4 years of age and in children with chronic illness or at high risk for exposure to tuberculosis. A reaction of 5 mm or more is considered to be a positive result for the highest risk groups, such as a child with an immunosuppressive condition or a child with human immunodeficiency virus (HIV) infection. A reaction of 15 mm or more is positive in children 4 years or older without any risk factors.

**Test-Taking Strategy:** Options 3 and 4 are comparable or alike and can be eliminated first. From the remaining options, focus on the data in the question and note the child’s age to assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pediatrics: Throat/Respiratory

**Health Problem:** Pediatric-Specific: Tuberculosis

**Priority Concepts:** Evidence; Infection

359. **Answer:** 3

**Rationale:** Laryngotracheobronchitis (croup) is the inflammation of the larynx, trachea, and bronchi and is the most common type of croup. It can be viral or bacterial. Antibiotics are not indicated in the treatment of croup unless a bacterial infection is present. Options 1, 2, and 4 are incorrect. In addition, no supporting data in the question indicate that the child may be allergic to antibiotics.
Test-Taking Strategy: Focus on the subject, indications for the use of antibiotics. Eliminate option 1 because there are no supporting data in the question regarding the potential for allergies. Noting the word viral in the question and noting the age of the child will assist in eliminating options 2 and 4.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Pediatrics: Throat/Respiratory
Health Problem: Pediatric-Specific: Croup
Priority Concepts: Immunity; Inflammation

360. Answer: 2

Rationale: RSV is a highly communicable disorder and is transmitted via droplets and direct contact with respiratory secretions. Use of contact, droplet, and standard precautions during care is necessary. Using good hand-washing technique and wearing gloves, gown, and a mask should be done to prevent transmission. An infant with RSV should be placed in a private room. Enteric precautions are unnecessary.

Test-Taking Strategy: Note the strategic words, most appropriate. Focus on the subject, the method of transmission of RSV. Remember that the virus is transmitted via droplets and direct contact with respiratory secretions. An infant with RSV is contagious and should be placed in a private room.

Level of Cognitive Ability: Applying
Client Needs: Safe and Effective Care Environment
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Throat/Respiratory
Health Problem: Pediatric-Specific: Bronchiolitis/respiratory syncytial virus
Priority Concepts: Infection; Safety

361. Answer: 1, 3, 6

Rationale: RSV is a highly communicable disorder and is transmitted via droplets or contact with respiratory secretions. Use of contact, droplet, and standard precautions during care (wearing gloves, mask, and a gown) reduces nosocomial transmission of RSV. In addition, it is important to ensure that nurses caring for a child with RSV do not care for other high-risk children to prevent the transmission of the infection. An infant with RSV should be placed in a private room. The infant should be positioned with the head and chest at a 30- to 40-degree angle and the neck slightly extended to maintain an open airway and decrease pressure on the diaphragm. Cool humidified oxygen is delivered to relieve dyspnea, hypoxemia, and insensible water loss from tachypnea.

Test-Taking Strategy: Focus on the subject, care of the child with bronchiolitis and RSV. Recalling the mode of transmission of RSV will assist in answering correctly.
Remember that RSV is highly communicable and is transmitted via droplets or direct contact with respiratory secretions.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Pediatrics: Throat/Respiratory  
**Health Problem:** Pediatric-Specific: Bronchitis/bronchiolitis/respiratory syncytial virus  

**Priority Concepts:** Care Coordination; Safety  
CHAPTER 36

Cardiovascular Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Gas Exchange; Perfusion

I. Hyperlipidemia
   A. Description
      1. A condition in which there are high levels of lipids circulating in the blood, which can predispose a child to heart disease.
      2. Laboratory values for lipids for individuals aged 2 to 19 years are as follows:
         a. Total cholesterol: less than 170 mg/dL (4.25 mmol/L) is acceptable, 170 to 199 mg/dL (4.25 to 4.9 mmol/L) is borderline, 200 mg/dL (5 mmol/L) or greater is high.
         b. Low-density lipoprotein cholesterol: less than 110 mg/dL (2.75 mmol/L) is acceptable, 110 to 129 mg/dL (2.75 to 3.22 mmol/L) is borderline, 130 mg/dL (3.25 mmol/L) or greater is high.
         c. High-density lipoprotein cholesterol: greater than 45 mg/dL (1.12 mmol/L) is acceptable, 40 to 45 mg/dL (1.0 to 1.12 mmol/L) is borderline, less than 40 mg/dL (1.0 mmol/L) is low.
         d. Triglycerides: less than 100 mg/dL (1.14 mmol/L) for 9 years and younger is acceptable; less than 130 mg/dL (1.48 mmol/L) for 10 years and older is acceptable.
         e. Any person with hyperlipidemia as a child is likely to have the condition later in life, and it predisposes them to cardiac events.
         f. Referral to a specialist (cardiology) should be made if there is an elevation in any of the above values.
g. Treatment focuses on lifestyle modifications and behavior changes. See Box 32-1 for recommended dietary and physical activity changes for preventing diabetes mellitus, which also applies with the treatment focus for hyperlipidemia.

II. Heart Failure (HF)
   A. Description
      1. HF (Box 36-1) is the inability of the heart to pump a sufficient amount of blood to meet the metabolic and oxygen needs of the body.
      2. In infants and children, inadequate cardiac output most commonly is caused by congenital heart defects (shunt, obstruction, or a combination of both) that produce an excessive volume or pressure load on the myocardium.
      3. In infants and children, a combination of left-sided and right-sided HF is usually present.
      4. The goals of treatment are to improve cardiac function, remove accumulated fluid and sodium, decrease cardiac demands, improve tissue oxygenation, and decrease oxygen consumption; depending on the cause, surgery may be required.

   B. Assessment of early signs
      1. Tachycardia, especially during rest and slight exertion
      2. Tachypnea
      3. Profuse scalp diaphoresis, especially in infants
      4. Fatigue and irritability
      5. Sudden weight gain
      6. Respiratory distress

   C. Interventions
      1. Monitor for early signs of HF.
      2. Monitor for respiratory distress (count respirations for 1 minute).
      3. Monitor apical pulse (count apical pulse for 1 minute), and monitor for dysrhythmias.
      4. Monitor temperature for hyperthermia and for other signs of infection, particularly respiratory infection.
      5. Monitor strict intake and output; weigh diapers as appropriate for most accurate output.
      6. Monitor daily weight to assess for fluid retention; a weight gain of 0.5 kg (1 lb) in 1 day is caused by the accumulation of fluid.
7. Monitor for facial or peripheral dependent edema, auscultate lung sounds, and report abnormal findings indicating excessive fluid in the body.
8. Elevate the head of the bed in a semi-Fowler’s position.
9. Maintain a neutral thermal environment to prevent cold stress in infants.
10. Provide rest and decrease environmental stimuli.
11. Administer cool humidified oxygen as prescribed, using an oxygen hood for young infants and a nasal cannula or face mask for older infants and children.
12. Organize nursing activities to allow for uninterrupted sleep.
14. Feed when hungry and soon after awakening, conserving energy and oxygen supply.
15. Provide small, frequent feedings, conserving energy and oxygen supply.
16. Administer medications as prescribed, which may include digoxin, diuretics, and afterload reducers such as angiotensin-converting enzyme (ACE) inhibitors.

17. Administer digoxin as prescribed.
   a. Assess apical heart rate for 1 minute before administration.
   b. Withhold digoxin if the apical pulse is less than 90 to 110 beats per minute in infants and young children and less than 70 beats per minute in older children, as prescribed.
   c. Check the prescribed dose carefully to ensure it is a safe, age-appropriate dose; follow agency policy and question any unclear prescription.
18. Monitor digoxin levels and for signs of digoxin toxicity, including anorexia, poor feeding, nausea, vomiting, bradycardia, and dysrhythmias.
19. The optimal therapeutic digoxin level range is 0.8 to 2 ng/mL (1.02 to 2.55 nmol/L; toxicity is usually seen at > 2 ng/mL (2.55 nmol/L) level.
20. Administer angiotensin-converting enzyme inhibitors as prescribed.
   a. Monitor for hypotension, renal dysfunction, and cough when ACE inhibitors are administered.
   b. Assess blood pressure; serum protein, albumin, blood urea nitrogen, and
creatinine levels; white blood cell count; urine output; urinary specific gravity; and urinary protein level.

21. Administer diuretics such as furosemide as prescribed.
   a. Monitor for signs and symptoms of hypokalemia (serum potassium level < 3.5 mEq/L [3.5 mmol/L]), including muscle weakness and cramping, confusion, irritability, restlessness, and inverted T waves or prominent U waves on the electrocardiogram.
   b. If signs and symptoms of hypokalemia are present and the child is also being administered digoxin, monitor closely for digoxin toxicity, because hypokalemia potentiates digoxin toxicity.

22. Administer potassium supplements and provide dietary sources of potassium as prescribed.
   a. Supplemental potassium should be given only if indicated by serum potassium levels and if adequate renal function is evident and is usually necessary when administering a potassium-losing diuretic such as furosemide.
   b. Encourage foods that the child will eat that are high in potassium, as appropriate, such as bananas, baked potato skins, and peanut butter.

23. Monitor serum electrolyte levels, particularly the potassium level (normal level is 3.5 to 5.0 mEq/L [3.5 to 5.0 mmol/L]).

24. Limit fluid intake as prescribed in the acute stage.

25. Monitor for signs and symptoms of dehydration, including sunken fontanel (infant), nonelastic skin turgor, dry mucous membranes, decreased tear production, decreased urine output, and concentrated urine.

26. Monitor sodium levels as prescribed.
   a. Normal level is 135 to 145 mEq/L (135 to 145 mmol/L).
   b. Many infant formulas have slightly more sodium than breast milk.

27. Instruct the parents regarding administration
of digoxin (Box 36-2).

28. Instruct the parents in cardiopulmonary resuscitation (CPR). The guidelines for CPR for the child older than 1 year of age are the same as for an adult. For American Heart Association current CPR guidelines, refer to https://eccguidelines.heart.org/wp-content/uploads/2017/11/2017-Focused-Updates_Highlights.pdf.

III. Defects with Increased Pulmonary Blood Flow

A. Description

1. Intracardiac communication along the septum or an abnormal connection between the great arteries allows blood to flow from the high-pressure left side of the heart to the low-pressure right side of the heart.

2. The infant typically shows signs and symptoms of HF.

B. Atrial septal defect (ASD)

1. ASD is an abnormal opening between the atria that causes an increased flow of oxygenated blood into the right side of the heart.

2. Right atrial and ventricular enlargement occurs.

3. Infant may be asymptomatic or may develop HF.

4. Signs and symptoms of decreased cardiac output may be present (Box 36-3).

5. Types

   a. ASD 1 (ostium primum): Opening is at the lower end of the septum.

   b. ASD 2 (ostium secundum): Opening is near the center of the septum.

   c. ASD 3 (sinus venosus defect): Opening is near the junction of the superior vena cava and the right atrium.

6. Management

   a. Defect may be closed during a cardiac catheterization.

   b. Open repair with cardiopulmonary bypass may be performed and usually is performed before school age.

C. Atrioventricular canal defect

1. The defect results from incomplete fusion of the endocardial cushions.

2. The defect is the most common cardiac defect in
Down’s syndrome.
3. A characteristic murmur is present.
4. The infant usually has mild to moderate HF, with cyanosis increasing with crying.
5. Signs and symptoms of decreased cardiac output may be present.
6. Management can include pulmonary artery banding for infants with severe symptoms (palliative) or complete repair via cardiopulmonary bypass.

D. Patent ductus arteriosus
1. Patent ductus arteriosus is failure of the fetal ductus arteriosus (shunt connecting the aorta and the pulmonary artery) to close within the first weeks of life.
2. A characteristic machinery-like murmur is present.
3. An infant may be asymptomatic or may show signs of HF.
4. A widened pulse pressure and bounding pulses are present.
5. Signs and symptoms of decreased cardiac output may be present.
6. Management
   a. Indomethacin, a prostaglandin inhibitor, may be administered to close a patent ductus in premature infants and some newborns.
   b. The defect may be closed during cardiac catheterization, or the defect may require surgical management.

E. Ventricular septal defect (VSD)
1. VSD is an abnormal opening between the right and left ventricles.
2. Many VSDs close spontaneously during the first year of life in children with small or moderate defects.
3. A characteristic murmur is present.
4. Signs and symptoms of HF are commonly present.
5. Signs and symptoms of decreased cardiac output may be present.
6. Management
   a. Closure during cardiac catheterization may be possible.
   b. Open repair may be done with cardiopulmonary bypass.
IV. Obstructive Defects
   A. Description
      1. Blood exiting a portion of the heart meets an area of anatomical narrowing (stenosis), causing obstruction to blood flow.
      2. The location of narrowing is usually near the valve of the obstructive defect.
      3. Infants and children exhibit signs of HF.
      4. Children with mild obstruction may be asymptomatic.
   B. Aortic stenosis
      1. Aortic stenosis is a narrowing or stricture of the aortic valve, causing resistance to blood flow from the left ventricle into the aorta, resulting in decreased cardiac output, left ventricular hypertrophy, and pulmonary vascular congestion.
      2. Valvular stenosis is the most common type and usually is caused by malformed cusps, resulting in a bicuspid rather than a tricuspid valve, or fusion of the cusps.
      3. A characteristic murmur is present.
      4. Infants with severe defects show signs of decreased cardiac output.
      5. Children show signs of activity intolerance, chest pain, and dizziness when standing for long periods.
      6. Management
         a. Dilation of the narrowed valve may be done during cardiac catheterization.
         b. Surgical aortic valvotomy (palliative) may be done; a valve replacement may be required at a second procedure.
   C. Coarctation of the aorta
      1. Coarctation of the aorta is localized narrowing near the insertion of the ductus arteriosus.
      2. Blood pressure is higher in the upper extremities than in the lower extremities; bounding pulses in the arms, weak or absent femoral pulses, and cool lower extremities may be present.
      3. Signs of HF may occur in infants.
      4. Signs and symptoms of decreased cardiac output may be present.
      5. Children may experience headaches, dizziness, fainting, and epistaxis resulting from hypertension.
6. Management of the defect may be done via balloon angioplasty in children; restenosis can occur.

7. Surgical management
   a. Mechanical ventilation and medications to improve cardiac output are often necessary before surgery.
   b. Resection of the coarcted portion with end-to-end anastomosis of the aorta or enlargement of the constricted section, using a graft, may be required.
   c. Because the defect is outside the heart, cardiopulmonary bypass is not required, and a thoracotomy incision is used.

With coarctation of the aorta, the blood pressure is higher in the upper extremities than in the lower extremities. In addition, bounding pulses in the arms, weak or absent femoral pulses, and cool lower extremities may be present.

D. Pulmonary stenosis
   1. Pulmonary stenosis is narrowing at the entrance to the pulmonary artery.
   2. Resistance to blood flow causes right ventricular hypertrophy and decreased pulmonary blood flow; the right ventricle may be hypoplastic.
   3. Pulmonary atresia is the extreme form of pulmonary stenosis in that there is total fusion of the commissures and no blood flow to the lungs.
   4. A characteristic murmur is present.
   5. Infants or children may be asymptomatic.
   6. Newborns with severe narrowing are cyanotic.
   7. If pulmonary stenosis is severe, HF occurs.
   8. Signs and symptoms of decreased cardiac output may occur.
   9. Management: Dilation of the narrowed valve may be done during cardiac catheterization.
   10. Surgical management:
       a. In infants: Transventricular (closed) valvotomy procedure
       b. In children: Pulmonary valvotomy with cardiopulmonary bypass

V. Defects with Decreased Pulmonary Blood Flow
   A. Description
1. Obstructed pulmonary blood flow and an anatomical defect (ASD or VSD) between the right and left sides of the heart are present.
2. Pressure on the right side of the heart increases, exceeding pressure on the left side, which allows desaturated blood to shunt right to left, causing desaturation in the left side of the heart and in the systemic circulation.
3. Typically hypoxemia and cyanosis appear.

B. Tetralogy of Fallot

1. Tetralogy of Fallot includes 4 defects—VSD, pulmonary stenosis, overriding aorta, and right ventricular hypertrophy.
2. If pulmonary vascular resistance is higher than systemic resistance, the shunt is from right to left; if systemic resistance is higher than pulmonary resistance, the shunt is from left to right.
3. Infants
   a. An infant may be acutely cyanotic at birth or may have mild cyanosis that progresses over the first year of life as the pulmonic stenosis worsens.
   b. A characteristic murmur is present.
   c. Acute episodes of cyanosis and hypoxia (hypercyanotic spells), called blue spells or tet spells, occur when the infant’s oxygen requirements exceed the blood supply, such as during periods of crying, feeding, or defecating (see Priority Nursing Actions).

**Priority Nursing Actions**

Hypercyanotic Spell Occurring in an Infant

1. Place the infant in a knee-chest position.
2. Administer 100% oxygen.
3. Administer morphine sulfate.
4. Administer fluids intravenously.

**Reference**

4. Children: With increasing cyanosis, squatting, clubbing of the fingers, and poor growth may occur.
   a. Squatting is a compensatory mechanism to facilitate increased return of blood flow to the heart for oxygenation.
   b. Clubbing is an abnormal enlargement in the distal phalanges, seen in the fingers.

5. Surgical management: Palliative shunt
   a. The shunt increases pulmonary blood flow and increases oxygen saturation in infants who cannot undergo primary repair.
   b. The shunt provides blood flow to the pulmonary arteries from the left or right subclavian artery.

6. Surgical management: Complete repair
   a. Complete repair usually is performed in the first year of life.
   b. The repair requires a median sternotomy and cardiopulmonary bypass.

C. Tricuspid atresia

1. Tricuspid atresia is failure of the tricuspid valve to develop.

2. No communication exists from the right atrium to the right ventricle.

3. Blood flows through an ASD or a patent foramen ovale to the left side of the heart and through a VSD to the right ventricle and out to the lungs.

4. The defect often is associated with pulmonic stenosis and transposition of the great arteries.

5. The defect results in complete mixing of unoxygenated and oxygenated blood in the left side of the heart, resulting in systemic desaturation, pulmonary obstruction, and decreased pulmonary blood flow.

6. Cyanosis, tachycardia, and dyspnea are seen in the newborn.

7. Older children exhibit signs of chronic hypoxemia and clubbing.

8. Management: If the ASD is small, the defect may be closed during cardiac catheterization; otherwise, surgery is needed.
Clubbing is symptomatic of chronic hypoxia. Peripheral circulation is diminished, and oxygenation of vital organs and tissues is compromised.

VI. Mixed Defects

A. Description
1. Fully saturated systemic blood flow mixes with the desaturated blood flow, causing desaturation of the systemic blood flow.
2. Pulmonary congestion occurs and cardiac output decreases.
3. Signs of HF are present; symptoms vary with the degree of desaturation.

B. Hypoplastic left heart syndrome
1. Underdevelopment of the left side of the heart occurs, resulting in a hypoplastic left ventricle and aortic atresia.
2. Mild cyanosis and signs of HF occur until the ductus arteriosus closes; then progressive deterioration with cyanosis and decreased cardiac output are seen, leading to cardiovascular collapse.
3. The defect is fatal in the first few months of life without intervention.
4. Surgical treatment
   a. Surgical treatment is necessary; transplantation in the newborn period may be considered.
   b. In the preoperative period, the newborn requires mechanical ventilation and a continuous infusion of prostaglandin E₁ to maintain ductal patency, ensuring adequate systemic blood flow.

C. Transposition of the great arteries or transposition of the great vessels
1. The pulmonary artery leaves the left ventricle, and the aorta exits from the right ventricle.
2. No communication exists between the systemic and pulmonary circulation.
3. Infants with minimal communication are severely cyanotic at birth.
4. Infants with large septal defects or a patent ductus arteriosus may be less severely cyanotic but
may have symptoms of HF.
5. Cardiomegaly is evident a few weeks after birth.
6. Nonsurgical management
   a. Prostaglandin E\textsubscript{1} may be initiated to keep the ductus arteriosus open and to improve blood mixing temporarily.
   b. Balloon atrial septostomy during cardiac catheterization may be performed to increase mixing from both sides of the heart and to maintain cardiac output over a longer period.
7. Surgical management: The arterial switch procedure reestablishes normal circulation with the left ventricle acting as the systemic pump and creation of a new aorta.

D. Total anomalous pulmonary venous connection
1. The defect is a failure of the pulmonary veins to join the left atrium.
2. The defect results in mixed blood being returned to the right atrium and shunted from the right to the left through an ASD.
3. The right side of the heart hypertrophies, whereas the left side of the heart may remain small.
   4. Signs and symptoms of HF develop.
   5. Cyanosis worsens with pulmonary vein obstruction; when obstruction occurs, the infant’s condition deteriorates rapidly.
6. Surgical management
   a. Corrective repair is performed in early infancy.
   b. The pulmonary vein is anastomosed to the left atrium, the ASD is closed, and the anomalous pulmonary venous connection is ligated.

E. Truncus arteriosus
1. Truncus arteriosus is failure of normal septation and division of the embryonic bulbar trunk into the pulmonary artery and the aorta, resulting in a single vessel that overrides both ventricles.
2. Blood from both ventricles mixes in the common great artery, causing desaturation and hypoxemia.
   3. A characteristic murmur is present.
   4. The infant exhibits moderate to severe HF and
variable cyanosis, poor growth, and activity intolerance.
5. Surgical management: Corrective surgical repair is performed in the first few months of life.

VII. Interventions: Cardiovascular Defects (Box 36-4)

VIII. Cardiac Catheterization
A. Description
1. Invasive diagnostic procedure to determine cardiac defects.
2. Provides information about oxygen saturation of blood in great vessels and heart chambers.
3. May be done for diagnostic, interventional, or electrophysiological reasons.
4. May be carried out on an outpatient basis.
5. Risks include hemorrhage from the entry site, clot formation and subsequent blockage distally, and transient dysrhythmias.
6. General anesthesia is usually unnecessary.
7. See Chapter 52 for additional information about this procedure.

B. Preprocedure nursing interventions
1. Assess accurate height and weight, because this helps with the selection of the correct catheter size.
2. Obtain a history of the presence of allergic reactions to iodine.
3. Assess for symptoms of infection, including a diaper rash.
4. Assess and mark bilateral pulses, such as the dorsalis pedis and posterior tibial.
5. Assess baseline oxygen saturation.
6. Familiarize the parents and child with hospital procedures and equipment.
7. Educate the child, if age appropriate, and the parents about the procedure.
8. Allow the parents and child to verbalize feelings and concerns regarding the procedure and the disorder.

C. Postprocedure nursing interventions
1. Monitor findings on the cardiac monitor and oxygen saturation for 4 hours after procedure.
2. Assess pulses below the catheter site for presence, equality and symmetry.
3. Assess the temperature and color of the affected extremity and report coolness, which may indicate
arterial obstruction.
4. Monitor vital signs frequently, usually every 15 minutes 4 times, every half-hour 4 times, and then every hour 4 times.
5. Assess the pressure dressing for intactness and signs of hemorrhage.
6. Check the bed sheets under the extremity for blood, which indicates bleeding from the entry site.
7. If bleeding is present, apply continuous, direct pressure at the cardiac catheter entry site and report it immediately.
8. Immobilize the affected extremity in a flat position for at least 4 to 6 hours for venous entry site and 6 to 8 hours for arterial entry site as prescribed.
9. Hydrate the child via the oral or intravenous route or both routes as prescribed.
10. Administer acetaminophen or ibuprofen for pain or discomfort as prescribed.
11. Prepare the parents and child, if appropriate, for surgery.

D. Discharge teaching for the child and parents
1. Remove the dressing on the day after the procedure and cover it with a bandage for 2 or 3 days as prescribed.
2. Keep the site clean and dry.
3. Avoid tub baths for 2 to 3 days.
4. Observe for redness, edema, drainage, bleeding, and fever, and report any of these signs immediately.
5. Avoid strenuous activity, if applicable.
6. The child may return to school, if appropriate.
7. Provide a diet as tolerated.
8. Administer acetaminophen or ibuprofen for pain, discomfort, or fever.
9. Keep follow-up appointment with the pediatrician.

IX. Cardiac Surgery
A. Postoperative interventions
1. Monitor vital signs frequently, especially temperature, and notify the surgeon if fever occurs.
2. Monitor for signs of sepsis such as fever, chills, diaphoresis, lethargy, and altered levels of consciousness.
3. Maintain strict aseptic technique.
4. Monitor lines, tubes, or catheters that are in place, and monitor for signs and symptoms of infection.
5. Assess for signs of discomfort such as irritability, restlessness, changes in heart rate, respiratory rate, and blood pressure.
6. Administer pain medications as prescribed.
7. Administer antibiotics and antipyretics as prescribed.
8. Promote rest and sleep periods.
9. Facilitate parent-child contact as soon as possible.

B. Postoperative home care (Box 36-5)

X. Rheumatic Fever

A. Description

1. Rheumatic fever is an inflammatory autoimmune disease that affects the connective tissues of the heart, joints, skin (subcutaneous tissues), blood vessels, and central nervous system.
2. The most serious complication is rheumatic heart disease, which affects the cardiac valves, particularly the mitral valve.
3. Rheumatic fever manifests 2 to 6 weeks after an untreated or partially treated group A beta-hemolytic streptococcal infection of the upper respiratory tract.
4. Jones criteria are used to help determine the diagnosis (Box 36-6).

B. Assessment (Fig. 36-1)

1. Fever: Low-grade fever that spikes in the late afternoon
2. Elevated anti–streptolysin O titer
3. Elevated erythrocyte sedimentation rate
4. Elevated C-reactive protein level
5. Aschoff bodies (lesions): Found in the heart, blood vessels, brain, and serous surfaces of the joints and pleura

Assessment of a child with suspected rheumatic fever includes inquiring about a recent sore throat, because rheumatic fever manifests 2 to 6 weeks after an untreated or partially treated group A beta-hemolytic streptococcal infection of the upper respiratory tract.

C. Interventions

1. Assess vital signs.
2. Control joint pain and inflammation with massage and alternating hot and cold applications as prescribed.
3. Provide bed rest during the acute febrile phase.
4. Limit physical exercise in a child with carditis.
5. Administer antibiotics as prescribed.
6. Administer salicylates and antiinflammatory agents as
prescribed; these medications should not be administered before the diagnosis is confirmed, because the medications mask the polyarthritis.

7. Initiate seizure precautions if the child is experiencing chorea.

8. Instruct the parents about the importance of follow-up and the need for antibiotic prophylaxis for dental work, infection, and invasive procedures.

9. Advise the child to inform the parents if anyone in school develops a streptococcal throat infection.

XI. Kawasaki Disease

A. Description

1. Kawasaki disease, also known as mucocutaneous lymph node syndrome, is an acute systemic inflammatory illness.

2. The cause is unknown, but may be associated with an infection from an organism or toxin.

3. Cardiac involvement is the most serious complication; aneurysms can develop.

B. Assessment

1. Acute stage
   a. Fever
   b. Conjunctival hyperemia
   c. Red throat
   d. Swollen hands, rash, and enlargement of cervical lymph nodes

2. Subacute stage
   a. Cracking lips and fissures
   b. Desquamation of the skin on the tips of the fingers and toes
   c. Joint pain
   d. Cardiac manifestations
   e. Thrombocytosis

3. Convalescent stage: Child appears normal, but signs of inflammation may be present.

C. Interventions

1. Monitor temperature frequently.
2. Assess heart sounds and heart rate and rhythm.
3. Assess extremities for edema, redness, and desquamation.
4. Examine eyes for conjunctivitis.
5. Monitor mucous membranes for inflammation.
6. Monitor strict intake and output.
7. Administer soft foods and liquids that are neither too hot nor too cold.
8. Weigh child daily.
9. Provide passive range-of-motion exercises to facilitate joint movement.
10. Administer acetylsalicylic acid as prescribed for its antipyretic and antiplatelet effects (additional anticoagulation may be necessary if aneurysms are present).
11. Administer immunoglobulin intravenously as prescribed to reduce the duration of the fever and the incidence of coronary artery lesions and aneurysms; intravenous immunoglobulin is a blood product, so blood precautions when administering it are warranted.
12. Parent education (Box 36-7)

**Box 36-1**

**Signs and Symptoms of Heart Failure**

**Left-Sided Failure**

- Crackles and wheezes
- Cough
- Dyspnea
- Grunting (infants)
- Head bobbing (infants)
- Nasal flaring
- Orthopnea
- Periods of cyanosis
- Retractions
- Tachypnea

**Right-Sided Failure**

- Ascites
- Hepatosplenomegaly
- Jugular vein distention
- Oliguria
- Peripheral edema, especially dependent edema, and periorbital edema
- Weight gain
Home Care Instructions for Administering Digoxin

- Administer as prescribed.
- Use an accurate measuring device as provided by the pharmacist.
- Administer 1 hour before or 2 hours after feedings.
- Use a calendar to mark off the dose administered.
- Do not mix medication with foods or fluid.
- If a dose is missed and more than 4 hours has elapsed, withhold the dose and give the next dose at the scheduled time; if less than 4 hours has elapsed, administer the missed dose.
- If the child vomits, do not administer a second dose. (Follow the pediatrician’s prescription.)
- If more than 2 consecutive doses have been missed, notify the pediatrician; do not increase or double the dose for missed doses.
- If the child has teeth, give water after the medication; if possible, brush the teeth to prevent tooth decay from the sweetened liquid.
- Monitor for signs of toxicity, such as poor feeding or vomiting.
- If the child becomes ill, notify the pediatrician.
- Keep the medication in a locked cabinet.
- Call the Poison Control Center immediately if accidental overdose occurs.

Signs and Symptoms of Decreased Cardiac Output

- Decreased peripheral pulses
- Activity intolerance
- Feeding difficulties
- Hypotension
- Irritability, restlessness, lethargy
- Oliguria
- Pale, cool extremities
- Tachycardia

Interventions for Cardiovascular Defects
Monitor for signs of a defect in the infant or child.
Monitor vital signs closely.
Monitor respiratory status for the presence of *nasal flaring*, use of accessory muscles, and for signs of impending respiratory distress, and notify the pediatrician if any changes occur.
Auscultate breath sounds for crackles, rhonchi, or wheezes.
If respiratory effort is increased, place the child in a reverse Trendelenburg’s position, elevating the head and upper body, to decrease the work of breathing.
Administer humidified oxygen as prescribed.
Provide endotracheal tube and ventilator care if necessary as prescribed.
Monitor for hypcyanotic spells and intervene immediately if they occur.
Assess for signs of HF, such as periorbital edema or dependent edema in the hands and feet.
Assess peripheral pulses.
Maintain fluid restriction if prescribed.
Monitor intake and output, and notify the pediatrician if a decrease in urine output occurs.
Obtain daily weight.
Provide adequate nutrition (high calorie requirements) as prescribed.
Administer medications as prescribed.
Plan interventions to allow maximal rest for the child; keep the child as stress-free as possible.
Prepare the child and parents for cardiac catheterization, if appropriate.

**Box 36-5**

**Home Care after Cardiac Surgery**

- Omit play outside for several weeks as prescribed.
- Avoid activities in which the child could fall and be injured, such as bike riding, for 2 to 4 weeks.
- Avoid crowds for 2 weeks after discharge.
- Follow a no-added-salt diet, if prescribed.
- Do not add any new foods to the infant’s diet (if an allergy exists to the new food, the manifestations may be interpreted as a postoperative complication).
- Do not place creams, lotions, or powders on the incision until completely healed.
- The child may return to school usually the third week after discharge, starting with half-days.
- The child should not participate in physical education for 2 months.
- Discipline the child normally.
- The 2-week follow-up is important.
- Avoid immunizations, invasive procedures, and dental visits for 2 months;
following this time period, the immunization schedule and dental visits need to be resumed.

- The child should have a dental visit every 6 months after age 3 years and inform the dentist of the cardiac problem so that antibiotics can be prescribed if necessary.
- Call the pediatrician if coughing, tachypnea, cyanosis, vomiting, diarrhea, anorexia, pain, or fever occur, or any swelling, redness, or drainage occurs at the site of the incision.

**Box 36-6**

**Jones Criteria for Diagnosis of Rheumatic Fever**

**Major Criteria**

- Carditis
- Arthralgia
- Chorea
- Erythema marginatum
- Subcutaneous nodules

**Minor Criteria**

- Fever
- Arthralgia
- Elevated erythrocyte sedimentation rate or positive C-reactive protein level
- Prolonged PR interval on electrocardiogram

*Note:* For making a diagnosis, 2 major or 1 major and 2 minor manifestations must be accompanied by supporting evidence of a preceding streptococcal infection (positive throat culture for group A *Streptococcus* and an elevated or increasing anti-streptolysin O titer).
Chorea
Involuntary movements of extremities and face; affects speech

Fever
With history of sore throat

Carditis
Inflammation of all parts of the heart, primarily the mitral valves

Erythema marginatum
Red skin lesions starting on the trunk and spreading peripherally

Abdominal pain
Occurs in some cases

Subcutaneous nodules
Small, nontender swellings often over the joints

Polyarthritis
Tender, painful joints (elbows, knees, ankles, wrists)
Box 36-7

Parent Education for Kawasaki Disease

- Follow-up care is essential to recovery.
- Signs and symptoms of Kawasaki disease include the following:
  - Irritability that may last for 2 months after the onset of symptoms
  - Peeling of the hands and feet
  - Pain in the joints that may persist for several weeks
  - Stiffness in the morning, after naps, and in cold temperatures
- Record the temperature (because fever is expected) until the child has been afebrile for several days.
- Notify the pediatrician if the temperature is 101°F (38.3°C) or higher.
- Salicylates such as acetylsalicylic acid (aspirin) may be prescribed.
- Signs of aspirin toxicity include tinnitus, headache, vertigo, and bruising; do not administer aspirin or aspirin-containing products if the child has been exposed to chickenpox or the flu.
- Signs and symptoms of bleeding include epistaxis (nosebleeds), hemoptysis (coughing up blood), hematemesis (vomiting up blood), hematuria (blood in urine), melena (blood in stool), and bruises on the body.
- Signs and symptoms of cardiac complications include chest pain or tightness (older children), cool and pale extremities, abdominal pain, nausea and vomiting, irritability, restlessness, and uncontrollable crying.
- The child should avoid contact sports, if age appropriate, if taking aspirin or anticoagulants.
- Avoid administration of measles, mumps, and rubella (MMR) or varicella vaccine to the child for 11 months after intravenous immunoglobulin therapy, if appropriate.

Practice Questions

362. The nurse is monitoring an infant with congenital heart disease closely for signs of heart failure (HF). The nurse should assess the infant for which early sign of HF?
   1. Pallor
   2. Cough
   3. Tachycardia
   4. Slow and shallow breathing

363. The nurse reviews the laboratory results for a child with a suspected
diagnosis of rheumatic fever, knowing that which laboratory study would assist in confirming the diagnosis?

1. Immunoglobulin
2. Red blood cell count
3. White blood cell count
4. Anti–streptolysin O titer

364. On assessment of a child admitted with a diagnosis of acute-stage Kawasaki disease, the nurse expects to note which clinical manifestation of the acute stage of the disease?

1. Cracked lips
2. Normal appearance
3. Conjunctival hyperemia
4. Desquamation of the skin

365. The nurse provides home care instructions to the parents of a child with heart failure regarding the procedure for administration of digoxin. Which statement made by the parent indicates the need for further instruction?

1. “I will not mix the medication with food.”
2. “If more than 1 dose is missed, I will call the pediatrician.”
3. “I will take my child’s pulse before administering the medication.”
4. “If my child vomits after medication administration, I will repeat the dose.”

366. The nurse is closely monitoring the intake and output of an infant with heart failure who is receiving diuretic therapy. The nurse should use which most appropriate method to assess the urine output?

1. Weighing the diapers
2. Inserting a urinary catheter
3. Comparing intake with output
4. Measuring the amount of water added to formula

367. The clinic nurse reviews the record of a child just seen by the pediatrician and diagnosed with suspected aortic stenosis. The nurse expects to note documentation of which clinical manifestation specifically found in this disorder?

1. Pallor
2. Hyperactivity
3. Activity intolerance
4. Gastrointestinal disturbances

368. The nurse has provided home care instructions to the parents of a child who is being discharged after cardiac surgery. Which statement made by the parents indicates a need for further instruction?

1. “A balance of rest and activity is important.”
2. “I can apply lotion or powder to the incision if it is itchy.”
3. “Activities in which my child could fall need to be avoided for 2 to 4 weeks.”
4. “Large crowds of people need to be avoided for at least 2 weeks after surgery.”

369. A child with rheumatic fever will be arriving to the nursing unit for admission. On admission assessment, the nurse should ask the parents
which question to elicit assessment information specific to the development of rheumatic fever?

1. “Has the child complained of back pain?”
2. “Has the child complained of headaches?”
3. “Has the child had any nausea or vomiting?”
4. “Did the child have a sore throat or fever within the last 2 months?”

370. A pediatrician has prescribed oxygen as needed for an infant with heart failure. In which situation should the nurse administer the oxygen to the infant?

1. During sleep
2. When changing the infant’s diapers
3. When the mother is holding the infant
4. When drawing blood for electrolyte level testing

371. Assessment findings of an infant admitted to the hospital reveal a machinery-like murmur on auscultation of the heart and signs of heart failure. The nurse reviews congenital cardiac anomalies and identifies the infant’s condition as which disorder? Refer to figure (the circled area) to determine the condition.
1. Aortic stenosis
2. Atrial septal defect
3. Patent ductus arteriosus
4. Ventricular septal defect

**Answers**

362. **Answer:** 3

**Rationale:** HF is the inability of the heart to pump a sufficient amount of blood to meet the oxygen and metabolic needs of the body. The early signs of HF include tachycardia, tachypnea, profuse scalp sweating, fatigue and irritability, sudden weight gain, and respiratory distress. A cough may occur in HF as a result of mucosal swelling and irritation, but is not an early sign. Pallor may be noted in an infant with HF but is not an early sign.

**Test-Taking Strategy:** Note the **strategic word**, *early*. Think about the physiology and the effects on the heart when fluid overload occurs. These concepts will assist in directing you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pediatrics: Cardiovascular

**Health Problem:** Pediatric-Specific: Congestive Heart Failure

**Priority Concepts:** Clinical Judgment; Perfusion

363. **Answer:** 4

**Rationale:** Rheumatic fever is an inflammatory autoimmune disease that affects the connective tissues of the heart, joints, skin (subcutaneous tissues), blood vessels, and central nervous system. A diagnosis of rheumatic fever is confirmed by the presence of 2 major manifestations or 1 major and 2 minor manifestations from the Jones criteria. In addition, evidence of a recent streptococcal infection is confirmed by a positive anti-streptolysin O titer, Streptozyme assay, or anti-DNase B assay. Options 1, 2, and 3 would not help confirm the diagnosis of rheumatic fever.

**Test-Taking Strategy:** Focus on the **subject**, definitive diagnosis of rheumatic fever. Recalling that rheumatic fever characteristically is associated with streptococcal infection will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Analysis

**Content Area:** Pediatrics: Cardiovascular

**Health Problem:** Pediatric-Specific: Rheumatic Fever

**Priority Concepts:** Clinical Judgment; Inflammation

**Reference:** Hockenberry, Wilson, Rodgers (2017), pp. 767-768.
Rationale: Kawasaki disease, also known as mucocutaneous lymph node syndrome, is an acute systemic inflammatory illness. In the acute stage, the child has a fever, conjunctival hyperemia, red throat, swollen hands, rash, and enlargement of the cervical lymph nodes. In the subacute stage, cracking lips and fissures, desquamation of the skin on the tips of the fingers and toes, joint pain, cardiac manifestations, and thrombocytosis occur. In the convalescent stage, the child appears normal, but signs of inflammation may be present.

Test-Taking Strategy: Focus on the subject, the acute stage of Kawasaki disease. Option 2 can be eliminated first, because a normal appearance is not likely in the acute stage. From the remaining options, focusing on the words acute stage in the question will assist in directing you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Cardiovascular
Health Problem: Pediatric-Specific: Kawasaki Disease
Priority Concepts: Clinical Judgment; Inflammation

365. Answer: 4

Rationale: Digoxin is a cardiac glycoside. The parents need to be instructed that if the child vomits after digoxin is administered, they are not to repeat the dose. Options 1, 2, and 3 are accurate instructions regarding the administration of this medication. In addition, the parents should be instructed that if a dose is missed and is not identified until 4 hours later, the dose should not be administered.

Test-Taking Strategy: Note the strategic words, need for further instruction. These words indicate a negative event query and ask you to select an option that is an incorrect statement. General knowledge regarding digoxin administration will assist in eliminating option 2. Principles related to administering medications to children will assist in eliminating option 1. From the remaining options, select the correct option because if the child vomits, it would be difficult to determine whether the medication also was vomited or was absorbed by the body.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Pediatrics: Cardiovascular
Health Problem: Pediatric-Specific: Congestive Heart Failure
Priority Concepts: Client Education; Safety

366. Answer: 1

Rationale: Heart failure is the inability of the heart to pump a sufficient amount of blood to meet the oxygen and metabolic needs of the body. The most appropriate
method for assessing urine output in an infant receiving diuretic therapy is to weigh the diapers. Comparing intake with output would not provide an accurate measure of urine output. Measuring the amount of water added to formula is unrelated to the amount of output. Although urinary catheter drainage is most accurate in determining output, it is not the most appropriate method in an infant and places the infant at risk for infection.

**Test-Taking Strategy:** Note the **strategic words**, *most appropriate*. Eliminate options 3 and 4 first because they are **comparable or alike** and will not provide an indication of urine output. Noting the **strategic words** will direct you to the correct option from the remaining options.

**Level of Cognitive Ability:** Applying
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Pediatrics: Cardiovascular
**Health Problem:** Pediatric-Specific: Congestive Heart Failure
**Priority Concepts:** Clinical Judgment; Perfusion

367. **Answer:** 3

**Rationale:** Aortic stenosis is a narrowing or stricture of the aortic valve, causing resistance to blood flow in the left ventricle, decreased cardiac output, left ventricular hypertrophy, and pulmonary vascular congestion. A child with aortic stenosis shows signs of activity intolerance, chest pain, and dizziness when standing for long periods. Pallor may be noted but is not specific to this type of disorder alone. Options 2 and 4 are not related to this disorder.

**Test-Taking Strategy:** Focus on the **subject**, the characteristics of aortic stenosis. Options 2 and 4 can be eliminated first, because they are not associated with a cardiac disorder. From the remaining options, noting the word *specifically* in the question will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Pediatrics: Cardiovascular
**Health Problem:** Pediatric-Specific: Congenital Cardiac Defects
**Priority Concepts:** Elimination; Perfusion

368. **Answer:** 2

**Rationale:** The mother should be instructed that lotions and powders should not be applied to the incision site after cardiac surgery. Lotions and powders can irritate the surrounding skin, which could lead to skin breakdown and subsequent infection of the incision site. Options 1, 3, and 4 are accurate instructions regarding home care after cardiac surgery.

**Test-Taking Strategy:** Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and ask you to select an option that is an
incorrect statement. Using general principles related to postoperative incisional site
care will direct you to the correct option.

**Level of Cognitive Ability**: Evaluating

**Client Needs**: Physiological Integrity

**Integrated Process**: Teaching and Learning

**Content Area**: Pediatrics: Cardiovascular

**Health Problem**: Pediatric-Specific: Congenital Cardiac Defects

**Priority Concepts**: Client Education; Health Promotion

369. **Answer**: 4

**Rationale**: Rheumatic fever is an inflammatory autoimmune disease that affects
the connective tissues of the heart, joints, skin (subcutaneous tissues), blood vessels,
and central nervous system. Rheumatic fever characteristically manifests 2 to 6
weeks after an untreated or partially treated group A beta-hemolytic streptococcal
infection of the upper respiratory tract. Initially, the nurse determines whether the
child had a sore throat or an unexplained fever within the past 2 months. Options 1,
2, and 3 are unrelated to rheumatic fever.

**Test-Taking Strategy**: Focus on the **subject**, the pathophysiology and etiology
associated with rheumatic fever. Also, note the similarity between the words
rheumatic fever in the question and the word fever in the correct option.

**Level of Cognitive Ability**: Analyzing

**Client Needs**: Physiological Integrity

**Integrated Process**: Nursing Process—Assessment

**Content Area**: Pediatrics: Cardiovascular

**Health Problem**: Pediatric-Specific: Rheumatic Fever

**Priority Concepts**: Clinical Judgment; Inflammation

370. **Answer**: 4

**Rationale**: Heart failure (HF) is the inability of the heart to pump a sufficient
amount of blood to meet the oxygen and metabolic needs of the body. Crying
exhausts the limited energy supply, increases the workload of the heart, and
increases the oxygen demands. Oxygen administration may be prescribed for
stressful periods, especially during bouts of crying or invasive procedures. Options
1, 2, and 3 are not likely to produce crying in the infant.

**Test-Taking Strategy**: Focus on the **subject**, the need to administer oxygen to the
infant with HF, and recall the situations that would place stress and an increased
workload on the heart; this should direct you to the correct option. Drawing blood is
an invasive procedure, which would likely cause the infant to cry.

**Level of Cognitive Ability**: Analyzing

**Client Needs**: Physiological Integrity

**Integrated Process**: Nursing Process—Implementation

**Content Area**: Pediatrics: Cardiovascular

**Health Problem**: Pediatric-Specific: Congestive Heart Failure

1084
**Rationale:** A patent ductus arteriosus is failure of the fetal ductus arteriosus (artery connecting the aorta and the pulmonary artery) to close. A characteristic machinery-like murmur is present, and the infant may show signs of heart failure. Aortic stenosis is a narrowing or stricture of the aortic valve. Atrial septal defect is an abnormal opening between the atria. Ventricular septal defect is an abnormal opening between the right and left ventricles.

**Test-Taking Strategy:** Focus on the subject, the congenital cardiac anomaly and the location of the defect. Recalling the anatomical locations in the heart will direct you to the correct option.

**Level of Cognitive Ability:** Analyzing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Assessment

**Content Area:** Pediatrics: Cardiovascular

**Health Problem:** Pediatric-Specific: Congenital Cardiac Defects

**Priority Concepts:** Clinical Judgment; Perfusion
I. Urinary Tract Infection (UTI)
   A. Bacterial invasion of the urinary tract from flora from the skin or gastrointestinal tract
   B. Uncircumcised infants are more likely to develop a UTI than a circumcised infant; see: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1477524/
   C. Hygiene (wiping from front to back) is important in children to prevent this problem
   D. Children may experience asymptomatic bacteruria, so if there is a suspicion of infection in the urinary tract, they should be screened and treated accordingly.
   E. See Chapter 54 for additional information.

II. Glomerulonephritis
   A. Description
      1. Glomerulonephritis refers to a group of kidney disorders characterized by inflammatory injury in the glomerulus, most of which are caused by an immunological reaction.
      2. The disorder results in proliferative and inflammatory changes within the glomerular structure.
      3. Destruction, inflammation, and sclerosis of the glomeruli of the kidneys occur.
      4. Inflammation of the glomeruli results from an antigen-antibody reaction produced by an infection elsewhere in the body.
      5. Loss of kidney function develops.
   B. Causes
      1. Immunological diseases
      2. Autoimmune diseases
      3. Antecedent group A β-hemolytic streptococcal infection of the pharynx or skin
4. History of pharyngitis or tonsillitis 2 to 3 weeks before symptoms

C. Types
1. Acute: Occurs 2 to 3 weeks after a streptococcal infection
2. Chronic: May occur after the acute phase or slowly over time

D. Complications
1. Kidney failure
2. Hypertensive encephalopathy
3. Pulmonary edema
4. Heart failure
5. Seizures

E. Assessment (Box 37-1)

F. Interventions (see Priority Nursing Actions)

Priority Nursing Actions

Fluid Volume Overload in a Child with Glomerulonephritis
1. Assess airway patency, vital signs, and weight.
2. Assess for dyspnea, bounding rapid pulse, dysrhythmias, and hypertension.
3. Assess for distended hand and neck veins.
4. Assess level of generalized edema (anasarca) and check amount of urinary output.
5. Notify the primary health care provider and carry out prescriptions, including water and sodium restriction and administration of diuretics.

Reference

1. Monitor vital signs, intake and output, and characteristics of urine.

2. Measure daily weights at the same time of day, using the same scale, and wearing the same clothing.

3. Limit activity; provide safety measures.

4. Diet restrictions of sodium depend on the stage and severity of the disease, especially the extent of the edema; in addition, potassium may be restricted during periods of oliguria.

5. Monitor for complications (e.g., kidney failure, hypertensive encephalopathy, seizures, pulmonary
edema, heart failure).
6. Administer diuretics (if significant edema and fluid overload are present), antihypertensives (for hypertension), and antibiotics (to a child with evidence of persistent streptococcal infections) as prescribed.
7. Initiate seizure precautions and administer anticonvulsants as prescribed for seizures associated with hypertensive encephalopathy.
8. Instruct parents to report signs of bloody urine, headache, or edema.
9. Instruct parents that the child needs to obtain appropriate and immediate treatment for infections, specifically for sore throats, upper respiratory infections, and skin infections.

Measuring the daily weight and assessing for changes is the most useful and effective measure for determining fluid balance.

III. Nephrotic Syndrome
   A. Description
      1. Nephrotic syndrome is a kidney disorder characterized by massive proteinuria, hypoalbuminemia (hypoproteinemia), and edema (Fig. 37-1).
      2. The primary objectives of therapeutic management are to reduce the excretion of urinary protein, maintain protein-free urine, reduce edema, prevent infection, and minimize complications.

   B. Assessment (Box 37-2)

   The classic manifestations of nephrotic syndrome are massive proteinuria, hypoalbuminemia, and edema.

   C. Interventions
      1. Monitor vital signs, intake and output, and daily weights.
      3. Monitor for edema.
      4. Nutrition: A regular diet without added salt may be prescribed if the child is in remission; sodium is restricted during periods of massive edema (fluids
5. Corticosteroid therapy is prescribed as soon as the diagnosis has been determined; monitor the child closely for signs of infection and other adverse effects of corticosteroids (see Chapter 47).
6. Immunosuppressant therapy may be prescribed to reduce the relapse rate and induce long-term remission, or, if the child is unresponsive to corticosteroid therapy, immunosuppressant therapy may be administered along with the corticosteroid.
7. Diuretics may be prescribed to reduce edema.
8. Plasma expanders such as salt-poor human albumin may be prescribed for a severely edematous child.
9. Instruct parents about testing the urine for protein, medication administration, side effects of medications, and general care of the child.
10. Instruct parents on the signs of infection and the need to avoid contact with other children who may be infectious.

IV. Hemolytic-Uremic Syndrome
   A. Description
      1. Hemolytic-uremic syndrome is thought to be associated with bacterial toxins, chemicals, and viruses that cause acute kidney injury in children.
      2. It occurs primarily in infants and small children 6 months to 5 years old.
      3. Clinical features include acquired hemolytic anemia, thrombocytopenia, kidney injury, and central nervous system symptoms.
   B. Assessment
      1. Triad of anemia, thrombocytopenia, and kidney failure (Box 37-3)
      2. Proteinuria, hematuria, and presence of urinary casts
      3. Blood urea nitrogen and serum creatinine levels elevated; hemoglobin and hematocrit levels decreased
   C. Interventions
      1. Hemodialysis or peritoneal dialysis may be prescribed if a child is anuric (dialysate solution is prescribed to meet the child’s electrolyte needs).
      2. Strict monitoring of fluid balance is necessary; fluid restrictions may be prescribed if the child is anuric.
      3. Institute measures to prevent infection.
      4. Provide adequate nutrition.
5. Other treatments include medications to treat manifestations and the administration of blood products to treat severe anemia (administered with caution to prevent fluid overload).

V. Enuresis

A. Description

1. *Enuresis* refers to a condition in which a child is unable to control bladder function, even though the child has reached an age at which control of voiding is expected or the child has successfully completed a bladder control program.

2. A child does not have control over this condition.

B. Primary enuresis: Wetting that occurs in a child that has not fully mastered toilet training.

C. Nighttime (nocturnal) enuresis

1. Nighttime (nocturnal) enuresis is bedwetting in a child who has never been dry for extended periods.

2. The condition is common in children, and most children eventually outgrow bedwetting without therapeutic intervention.

3. The child is unable to sense a full bladder and does not awaken to void.

4. The child may have delayed maturation of the central nervous system.

5. The child should be evaluated for any pathological causes before the diagnosis of nighttime (nocturnal) enuresis is made.

D. Daytime (diurnal) enuresis: Wetting that occurs during the day.

E. Secondary enuresis

1. The onset of wetting occurs after a period of established urinary continence.

2. If the child complains of dysuria, urgency, or frequency the child should be assessed for urinary tract infections.

F. Assessment: A child older than 5 years wets their bed or their clothes 2 times a week or more, for at least 3 months.

G. Interventions

1. Perform urinalysis and urine culture as prescribed to rule out infection or an existing disorder.

2. Assist the family with identifying a treatment plan that best fits the needs of the child.

3. Limit fluid intake at night, and encourage the child to void just before going to bed.

4. Involve the child in caring for the wet sheets and changing the bed to assist the child to take ownership of the problem.

5. Provide reward systems as appropriate for the child.

6. Incorporate behavioral conditioning techniques.
7. Desmopressin may reduce urine production at night; anticholinergics may reduce bladder contractions and increase bladder capacity.
8. Encourage follow-up to determine the effectiveness of the treatment.

VI. Cryptorchidism
A. Description: Cryptorchidism is a condition in which one or both testes fail to descend through the inguinal canal into the scrotal sac.

B. Assessment: Testes are not palpable or easily guided into the scrotum.

C. Interventions
1. Monitor during the first 6 months of life to determine whether spontaneous descent occurs.
2. Surgical correction is commonly done at 6 months of age and before 12 months, depending on the pediatric surgeon’s preference.
3. Monitor for bleeding and infection postoperatively.
4. Instruct parents in postoperative home care measures, including preventing infection, pain control, and activity restrictions.
5. Provide an opportunity for parental counseling if the parents are concerned about the future fertility of the child.

VII. Epispadias and Hypospadias (Fig. 37-2)
A. Description
1. Epispadias and hypospadias are congenital defects involving abnormal placement of the urethral orifice of the penis.
2. These anatomical defects can lead to the easy entry of bacteria into the urine.

B. Assessment
1. Epispadias: The urethral orifice is located on the dorsal surface of the penis; the condition often occurs with exstrophy of the bladder.
2. Hypospadias: Urethral orifice is located below the glans penis along the ventral surface.

C. Surgical interventions: Surgery is done before the age of toilet training, between 6 and 12 months of age, depending on the pediatric surgeon’s preference.
Circumcision may not be performed on a newborn with epispadias or hypospadias. Although there are other surgical techniques used to repair these defects, the pediatric surgeon may prefer using the foreskin for surgical reconstruction.

D. Postoperative interventions

1. The child has a pressure dressing and may have some type of urinary diversion or a urinary stent (used to maintain patency of the urethral opening) while the meatus is healing.
2. Monitor vital signs.
3. Encourage fluid intake to maintain adequate urine output and maintain patency of the stent if a stent was placed.
4. Monitor intake and output and the urine for cloudiness or a foul odor.
5. Notify the pediatric surgeon if there is no urinary output for 1 hour, because this may indicate kinks in the urinary diversion or stent or obstruction by sediment.
6. Provide pain medication or medication to relieve bladder spasms (anticholinergic) as prescribed.
7. Administer antibiotics as prescribed.
8. Instruct parents in the care of the child who has a urinary diversion or stent.
9. Instruct parents to avoid giving the child a tub bath until the stent, if present, is removed.
10. Instruct parents about fluid intake, medication administration, signs and symptoms of infection, and need for follow-up for dressing removal after surgery as prescribed.

VIII. Bladder Exstrophy

A. Description

1. Bladder exstrophy is a congenital anomaly characterized by extrusion of the urinary bladder to the outside of the body through a defect in the lower abdominal wall.
2. The cause is unknown; it is possibly a combination of genetic and environmental risk factors during pregnancy.
3. The condition can include specific defects of the abdominal wall, bladder, genitals, pelvic bones, rectum, and anus.
4. Children with bladder exstrophy will also experience vesicoureteral reflux, in which urine flows back up into the ureters to the kidneys; epispadias is also noted.
5. These defects are treated through surgical procedures
that repair the affected organs, muscles, and bones.

6. Initial surgery for closure of the abdominal defect should occur within the first few days of life.

7. The goal of subsequent surgeries is to reconstruct the bladder and genitalia and enable the child to achieve urinary continence.

B. Assessment

1. Exposed bladder mucosa and epispadius in males
2. Defects of the abdominal wall
3. Vesicoureteral reflux
4. Defects of the rectum and anus

C. Interventions

1. Monitor urinary output.
2. Monitor for signs of urinary tract or wound infection.
3. Maintain the integrity of the exposed bladder mucosa.
4. Prevent the bladder tissue from drying, while allowing the drainage of urine, until surgical closure is performed. Immediately after birth, as prescribed, the exposed bladder is covered with a sterile, nonadherent dressing to protect it until closure can be performed.
5. Monitor laboratory values and urinalysis to assess renal function.
6. Administer antibiotics as prescribed.
7. Provide emotional support to the parents, and encourage verbalization of their fears and concerns.

Applying petroleum jelly to the bladder mucosa is avoided because it tends to dry out, adhere to the bladder mucosa, and damage the delicate tissues when the dressing is removed.

IX. Sexually Transmitted Infections (STIs)

A. Screening for certain STIs should be done for certain children and adolescents. See http://pediatrics.aappublications.org/content/early/2014/06/25/peds1024 for specific recommendations.

B. Refer to Chapters 21 and 22 for more detailed information on STIs.

Box 37-1

Assessment Findings in Glomerulonephritis

- Periorbital and facial edema that is more prominent in the morning
- Anorexia
- Decreased urinary output
- Cloudy, smoky, brown-colored urine (hematuria)
- Pallor, irritability, lethargy
- In an older child: Headaches, abdominal or flank pain, dysuria
- Hypertension
- Proteinuria that produces a persistent and excessive foam in the urine
- Azotemia
- Increased blood urea nitrogen and creatinine levels
- Increased anti–streptolysin O titer (used to diagnose disorders caused by streptococcal infections)
FIG. 37-1 Sequence of events in nephrotic syndrome. ADH, Antidiuretic hormone; Na⁺, sodium.

Box 37-2
Assessment Findings in Nephrotic Syndrome

- Child gains weight
- Periorbital and facial edema most prominent in the morning
- Leg, ankle, labial, or scrotal edema
- Urine output decreases; urine dark and frothy
- Ascites (fluid in abdominal cavity)
- Blood pressure normal or slightly decreased
- Lethargy, anorexia, and pallor
- Massive proteinuria
- Decreased serum protein (hypoproteinemia) and elevated serum lipid levels

Epispadias and hypospadias are genital anomalies in which the urethral opening is above or below its normal location on the glans of the penis.

FIG. 37-2  Epispadias and hypospadias are genital anomalies in which the urethral opening is above or below its normal location on the glans of the penis.
372. The nurse reviews the record of a child who is suspected to have glomerulonephritis. Which statement by the child’s parent should the nurse expect that is associated with this diagnosis?

1. “His pediatrician said his kidneys are working well.”
2. “I noticed his urine was the color of cola lately.”
3. “I’m so glad they didn’t find any protein in his urine.”
4. “The nurse who admitted my child said his blood pressure was low.”

373. The nurse performing an admission assessment on a 2-year-old child who has been diagnosed with nephrotic syndrome notes that which most common characteristic is associated with this syndrome?

1. Hypertension
2. Generalized edema
3. Increased urinary output
4. Frank, bright red blood in the urine

374. The nurse is planning care for a child with hemolytic-uremic syndrome who has been anuric and will be receiving peritoneal dialysis treatment. The nurse should plan to implement which measure?

1. Restrict fluids as prescribed.
2. Care for the arteriovenous fistula.
3. Encourage foods high in potassium.
4. Administer analgesics as prescribed.

375. A 7-year-old child is seen in a clinic, and the pediatrician documents a diagnosis of nighttime (nocturnal) enuresis. The nurse should provide which information to the parents?

1. Nighttime (nocturnal) enuresis does not respond to treatment.
2. Nighttime (nocturnal) enuresis is caused by a psychiatric problem.
3. Nighttime (nocturnal) enuresis requires surgical intervention to improve the problem.
4. Nighttime (nocturnal) enuresis is usually outgrown without therapeutic intervention.

376. The nurse provided discharge instructions to the parents of a 2-year-old child who had an orchiopexy to correct cryptorchidism. Which statement by the parents indicates the need for further instruction?

1. “I’ll check his temperature.”
2. “I’ll give him medication so he’ll be comfortable.”
3. “I’ll check his voiding to be sure there’s no problem.”
4. “I’ll let him decide when to return to his play activities.”

377. The nurse is reviewing a treatment plan with the parents of a newborn with hypospadias. Which statement by the parents indicates their understanding of the plan?

1. “Caution should be used when straddling my infant on a hip.”
2. “Vital signs should be taken daily to check for bladder infection.”
3. “Catheterization will be necessary when my infant does not void.”
4. “Circumcision has been delayed to save tissue for surgical repair.”
378. The nurse is caring for an infant with a diagnosis of bladder extrophy. To protect the exposed bladder tissue, the nurse should plan which intervention?
1. Cover the bladder with petroleum jelly gauze.
2. Cover the bladder with a nonadhering plastic wrap.
3. Apply sterile distilled water dressings over the bladder mucosa.
4. Keep the bladder tissue dry by covering it with dry sterile gauze.

379. Which question should the nurse ask the parents of a child suspected of having glomerulonephritis?
1. “Did your child fall off a bike onto the handlebars?”
2. “Has the child had persistent nausea and vomiting?”
3. “Has the child been itching or had a rash anytime in the last week?”
4. “Has the child had a sore throat or a throat infection in the last few weeks?”

380. The nurse collects a urine specimen preoperatively from a child with epispadias who is scheduled for surgical repair. When analyzing the results of the urinalysis, which should the nurse most likely expect to note?
1. Hematuria
2. Proteinuria
3. Bacteriuria
4. Glucosuria

381. The nurse is performing an assessment on a child admitted to the hospital with a probable diagnosis of nephrotic syndrome. Which assessment findings should the nurse expect to observe? Select all that apply.
1. Pallor
2. Edema
3. Anorexia
4. Proteinuria
5. Weight loss
6. Decreased serum lipids

Answers

372. Answer: 2

Rationale: Glomerulonephritis refers to a group of kidney disorders characterized by inflammatory injury in the glomerulus. Gross hematuria, resulting in dark, smoky, cola-colored or brown-colored urine, is a classic symptom of glomerulonephritis. Blood urea nitrogen levels and serum creatinine levels may be elevated, indicating that kidney function is compromised. A mild to moderate elevation in protein in the urine is associated with glomerulonephritis. Hypertension is also common because of fluid volume overload secondary to the kidneys not
working properly.

Test-Taking Strategy: Focus on the subject, the manifestations of glomerulonephritis. Eliminate options 1 and 3 first, because hypertension from fluid volume overload and proteinuria are most likely to occur in this kidney disorder. Recalling that this is a renal disorder and that blood urea nitrogen levels and serum creatinine levels increase in these type of disorders will assist in directing you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Renal and Urinary
Health Problem: Pediatric-Specific: Glomerulonephritis
Priority Concepts: Clinical Judgment; Elimination

373. Answer: 2

Rationale: Nephrotic syndrome is defined as massive proteinuria, hypoalbuminemia, hyperlipemia, and edema. Other manifestations include weight gain; periorbital and facial edema that is most prominent in the morning; leg, ankle, labial, or scrotal edema; decreased urine output and urine that is dark and frothy; abdominal swelling; and blood pressure that is normal or slightly decreased.

Test-Taking Strategy: Note the strategic word, most. Recall the pathophysiology associated with nephrotic syndrome. Associate edema with nephrotic syndrome. This will help you answer questions similar to this one.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Assessment
Content Area: Pediatrics: Renal and Urinary
Health Problem: Pediatric-Specific: Nephrotic Syndrome
Priority Concepts: Clinical Judgment; Elimination

374. Answer: 1

Rationale: Hemolytic-uremic syndrome is thought to be associated with bacterial toxins, chemicals, and viruses that result in acute kidney injury in children. Clinical manifestations of the disease include acquired hemolytic anemia, thrombocytopenia, renal injury, and central nervous system symptoms. A child with hemolytic-uremic syndrome undergoing peritoneal dialysis because of anuria would be on fluid restriction. Pain is not associated with hemolytic-uremic syndrome, and potassium would be restricted, not encouraged, if the child is anuric. Peritoneal dialysis does not require an arteriovenous fistula (only hemodialysis).

Test-Taking Strategy: Note the subject, anuria. Focus on the child’s diagnosis and recall knowledge about the care of a client with acute kidney injury. Also focus on the data in the question. Noting the word peritoneal will assist in eliminating option 2. From the remaining options, remember that because the child is anuric, fluids will
be restricted.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Planning
Content Area: Pediatrics: Renal and Urinary
Health Problem: Pediatric-Specific: Hemolytic Uremic Syndrome
Priority Concepts: Elimination; Fluids and Electrolytes

375. Answer: 4

Rationale: Nighttime (nocturnal) enuresis occurs in a child who has never been dry at night for extended periods. The condition is common in children, and most children eventually outgrow bedwetting without therapeutic intervention. The child is unable to sense a full bladder and does not awaken to void. The child may have delayed maturation of the central nervous system. The condition is not caused by a psychiatric problem.

Test-Taking Strategy: Focus on the subject, the characteristics of nighttime (nocturnal) enuresis. Recall that the word \textit{enuresis} refers to urinating, and the word \textit{nocturnal} refers to nighttime.

Level of Cognitive Ability: Applying
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Implementation
Content Area: Pediatrics: Renal and Urinary
Health Problem: Pediatric-Specific: Enuresis
Priority Concepts: Development; Elimination

376. Answer: 4

Rationale: Cryptorchidism is a condition in which 1 or both testes fail to descend through the inguinal canal into the scrotal sac. Surgical correction may be necessary. All vigorous activities should be restricted for 2 weeks after surgery to promote healing and prevent injury. This prevents dislodging of the suture, which is internal. Normally, 2-year-olds want to be active; allowing the child to decide when to return to his play activities may prevent healing and cause injury. The parents should be taught to monitor the temperature, provide analgesics as needed, and monitor the urine output.

Test-Taking Strategy: Note the \textbf{strategic words}, \textit{need for further instruction}. These words indicate a \textbf{negative event query} and ask you to select an option that is an incorrect statement. Option 1 is an important action to recognize signs of infection. Option 2 is appropriate to keep pain to a minimum. Option 3 monitors voiding pattern, which is also important after this type of surgery.

Level of Cognitive Ability: Evaluating
Client Needs: Physiological Integrity
Integrated Process: Teaching and Learning
Content Area: Pediatrics: Renal and Urinary
**Health Problem:** Pediatric-Specific: Urologic Structural Abnormalities  
**Priority Concepts:** Client Education; Safety  

377. **Answer:** 4

**Rationale:** Hypospadias is a congenital defect involving abnormal placement of the urethral orifice of the penis. In hypospadias, the urethral orifice is located below the glans penis along the ventral surface. The infant should not be circumcised, because the dorsal foreskin tissue will be used for surgical repair of the hypospadias. Options 1, 2, and 3 are unrelated to this disorder.

**Test-Taking Strategy:** Focus on the subject, treatment for hypospadias. Note the words *indicates their understanding*. Recalling that hypospadias is a congenital defect involving abnormal placement of the urethral orifice of the penis will direct you to the correct option.

**Level of Cognitive Ability:** Evaluating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Evaluation  
**Content Area:** Pediatrics: Renal and Urinary  
**Health Problem:** Pediatric-Specific: Urologic Structural Abnormalities  
**Priority Concepts:** Client Education; Elimination  

378. **Answer:** 2

**Rationale:** In bladder extrophy, the bladder is exposed and external to the body. In this disorder, one must take care to protect the exposed bladder tissue from drying, while allowing the drainage of urine. This is accomplished best by covering the bladder with a nonadhering plastic wrap. The use of petroleum jelly gauze should be avoided, because this type of dressing can dry out, adhere to the mucosa, and damage the delicate tissue when removed. Dry sterile dressings and dressings soaked in solutions (that can dry out) also damage the mucosa when removed.

**Test-Taking Strategy:** Focus on the subject, treatment for bladder extrophy, and visualize this disorder. Noting the word *nonadhering* in the correct option will direct you to select this one.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Pediatrics: Renal and Urinary  
**Health Problem:** Pediatric-Specific: Urologic Structural Abnormalities  
**Priority Concepts:** Safety; Tissue Integrity  

379. **Answer:** 4

**Rationale:** Glomerulonephritis refers to a group of kidney disorders characterized by inflammatory injury in the glomerulus. Group A β-hemolytic streptococcal
infection is a cause of glomerulonephritis. Often, a child becomes ill with streptococcal infection of the upper respiratory tract and then develops symptoms of acute poststreptococcal glomerulonephritis after an interval of 1 to 2 weeks. The assessment data in options 1, 2, and 3 are unrelated to a diagnosis of glomerulonephritis.

**Test-Taking Strategy:** Note the subject, a question that will elicit information specific to the diagnosis of glomerulonephritis. Option 1 relates to a kidney injury, not an infectious process. From the remaining options, recalling that a streptococcal infection 1 to 2 weeks before the development of glomerulonephritis is the classic assessment finding will assist in directing you to the correct option.

**Level of Cognitive Ability:** Applying
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Pediatrics: Renal and Urinary
**Health Problem:** Pediatric-Specific: Glomerulonephritis
**Priority Concepts:** Clinical Judgment; Infection

380. **Answer:** 3

**Rationale:** Epispadias is a congenital defect involving abnormal placement of the urethral orifice of the penis. The urethral opening is located anywhere on the dorsum of the penis. This anatomical characteristic facilitates entry of bacteria into the urine. Options 1, 2, and 4 are not characteristically noted in this condition.

**Test-Taking Strategy:** Note the strategic words, most likely. Visualize the anatomical characteristics of epispadias to answer the question. Options 1, 2, and 4 do not relate to the potential for infection, which can be associated with epispadias.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
**Content Area:** Pediatrics: Renal and Urinary
**Health Problem:** Pediatric-Specific: Urologic Structural Abnormalities
**Priority Concepts:** Clinical Judgment; Elimination

381. **Answer:** 1, 2, 3, 4

**Rationale:** Nephrotic syndrome is a kidney disorder characterized by massive proteinuria, hypoalbuminemia, edema, elevated serum lipids, anorexia, and pallor. The child gains weight.

**Test-Taking Strategy:** Focus on the subject, the characteristics of nephrotic syndrome. Thinking about the pathophysiology associated with this disorder and recalling the assessment findings for nephrotic syndrome will direct you to the correct options.

**Level of Cognitive Ability:** Analyzing
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Assessment
Content Area: Pediatrics: Renal and Urinary
Health Problem: Pediatric-Specific: Nephrotic Syndrome
Priority Concepts: Clinical Judgment; Elimination
CHAPTER 38

Neurological and Cognitive Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts

Intracranial Regulation; Safety

I. Cerebral Palsy
   A. Description
      1. Disorder characterized by impaired movement and posture resulting from an abnormality in the extrapyramidal or pyramidal motor system
      2. The most common clinical type is spastic cerebral palsy, which represents an upper motor neuron type of muscle weakness.
      3. Less common types of cerebral palsy are athetoid, ataxic, and mixed.
   B. Assessment
      1. Extreme irritability and crying
      2. Feeding difficulties
      3. Abnormal motor performance
      4. Alterations of muscle tone; stiff and rigid arms or legs
      5. Delayed developmental milestones
      6. Persistence of primitive infantile reflexes (Moro, tonic neck) after 6 months (most primitive reflexes disappear by 3 to 4 months of age)
      7. Abnormal posturing, such as opisthotonos (exaggerated arching of the back) (Fig. 38-1)
      8. Seizures may occur.
   C. Interventions
      1. The goal of management is early recognition and interventions to maximize the child’s abilities.
      2. An interprofessional team approach is implemented to meet the many needs of the child.
      3. Therapeutic management includes physical therapy, occupational therapy, speech therapy, education, and recreation.
      4. Assess the child’s developmental level and
intelligence.
5. Encourage early intervention and participation in school programs.
6. Prepare for using mobilizing devices to help prevent or reduce deformities.
7. Encourage communication and interaction with the child on her or his developmental level, rather than chronological age level.
8. Provide a safe environment by removing sharp objects, using a protective helmet if the child falls frequently, and implementing seizure precautions if necessary.
9. Provide safe, appropriate toys for the child’s age and developmental level.
10. Position the child upright after meals.
11. Medications may be prescribed to relieve muscle spasms, which cause intense pain; antiseizure medications may also be prescribed.
12. Provide the parents with information about the disorder and treatment plan; encourage support groups for parents.

II. Head Injury
   A. Description
      1. Head injury is the pathological result of any mechanical force to the skull, scalp, meninges, or brain (Fig. 38-2).
         a. Open head injury occurs when there is a fracture of the skull or penetration of the skull by an object.
         b. Closed head injury is the result of blunt trauma (this is more serious than an open head injury because of the chance of increased intracranial pressure [ICP] in a “closed” vault); this type of injury can also be caused by shaken baby syndrome.
      2. Manifestations depend on the type of injury and the subsequent amount of increased ICP.

   B. Assessment: Increased ICP
      a. Slight change in vital signs

The child’s level of consciousness provides the earliest indication of an improvement or deterioration of the neurological condition.

   1. Early signs
      a. Slight change in vital signs

1106
b. Slight change in level of consciousness
c. Infant: Irritability, high-pitched cry, bulging fontanel, increased head circumference, dilated scalp veins, Macewen’s sign (cracked-pot sound on percussion of the head), setting sun sign (sclera visible above the iris)
d. Child: Headache, nausea, vomiting, visual disturbances (diplopia), seizures

2. Late signs
a. Significant decrease in level of consciousness
b. Bradycardia
c. Decreased motor and sensory responses
d. Alteration in pupil size and reactivity
e. Decorticate (flexion) posturing: Adduction of the arms at the shoulders; arms are flexed on the chest with the wrists flexed and the hands fisted, and the lower extremities are extended and adducted; seen with severe dysfunction of cerebral cortex (Fig. 38-3)
f. Decerebrate (extension) posturing: Rigid extension and pronation of the arms and the legs; sign of dysfunction at the level of the midbrain (see Fig. 38-3)
g. Cheyne-Stokes respirations
h. Coma

![Immobilize the neck and spine after a head injury if a cervical or other spinal injury is suspected. When a spinal cord injury is ruled out, elevate the head of the bed 15 to 30 degrees, if not contraindicated and as prescribed, to facilitate venous drainage.]

C. Interventions
1. Monitor the airway; administer oxygen as prescribed.
2. Assess injuries. (See Chapter 58 for information on spinal cord injuries.)
3. Position the client so that the head is maintained midline to avoid jugular vein compression, which can increase ICP.
4. Monitor vital signs and neurological function (assess level of consciousness closely).
5. Notify the primary health care provider (PHCP) if
signs of increased ICP occur.
6. Keep stimuli to a minimum; attempt to minimize crying in an infant.
7. Withhold sedating medications during the acute phase of the injury so that changes in levels of consciousness can be assessed.
8. Initiate seizure precautions (Box 38-1).
9. Monitor for decreased responsiveness to pain (a significant sign of altered level of consciousness).
10. Maintain NPO (nothing by mouth) status or provide clear liquids, if prescribed, until it is determined that vomiting will not occur.
11. Monitor prescribed intravenous fluids carefully to avoid increasing any cerebral edema and to minimize the possibility of overhydration.
12. Monitor for a fluid or electrolyte alteration (could indicate injury to the hypothalamus or posterior pituitary).
13. Assess wounds and dressings for the presence of drainage, and monitor for nose or ear drainage, which could indicate leakage of cerebrospinal fluid (CSF).
14. Administer tepid sponge baths or place the child on a hypothermia blanket as prescribed if hyperthermia occurs.
15. Avoid suctioning through the nares because of the possibility of the catheter entering the brain through a fracture, which places the child at high risk for a secondary infection.
16. As prescribed, administer acetaminophen for headache, anticonvulsants for seizures, and antibiotics if a laceration is present; prepare to administer prophylactic tetanus toxoid.
17. A corticosteroid or osmotic diuretic may be prescribed to reduce cerebral edema.
18. Monitor for signs of brainstem involvement (Box 38-2).
19. Monitor for signs of epidural hematoma:
   Asymmetrical pupils (one dilated, nonreactive pupil) may indicate a neurosurgical emergency that requires evacuation of the hematoma.

**Drainage from the nose or ear needs to be tested for the presence of glucose. Drainage that is positive for glucose (as tested with reagent strips) indicates leakage of CSF. The PHCP must be notified immediately if the drainage tests positive for glucose.**

III. Hydrocephalus
   A. Description
   1. An imbalance of CSF absorption or production caused
by malformations, tumors, hemorrhage, infections, or trauma

2. Results in head enlargement and increased ICP

B. Types

1. Communicating
   a. Hydrocephalus occurs as a result of impaired absorption within the subarachnoid space.
   b. Obstruction of the cerebrospinal fluid flow in the ventricular system does not occur.

2. Noncommunicating: Obstruction of cerebrospinal fluid flow in the ventricular system does occur.

C. Assessment

1. Infant
   a. Increased head circumference
   b. Thin, widely separated bones of the head that produce a cracked-pot sound (Macewen’s sign) on percussion
   c. Anterior fontanel tense, bulging, and nonpulsating; sutures will separate prior to fontanel bulging
   d. Dilated scalp veins
   e. Frontal bossing
   f. “Setting sun” eyes

2. Child
   a. Behavior changes, such as irritability and lethargy
   b. Headache on awakening
   c. Nausea and vomiting
   d. Ataxia
   e. Nystagmus

3. Late signs: High, shrill cry and seizures

D. Surgical interventions

1. The goal of surgical treatment is to prevent further CSF accumulation by bypassing the blockage and draining the fluid from the ventricles to a location where it may be reabsorbed.

2. In a ventriculoperitoneal shunt, the CSF drains into the peritoneal cavity from the lateral ventricle (Fig. 38-4).

3. In a ventriculoatrial shunt, CSF drains into the right atrium of the heart from the lateral ventricle, bypassing the obstruction (used in older children and in children with pathological conditions of the
abdomen).
4. Shunt revision may be necessary as the child grows.
5. An alternative to shunt placement is endoscopic third ventriculostomy, in which a small opening in the floor of the third ventricle is made that allows CSF to bypass the fourth ventricle and return to the circulation to be absorbed; this treatment may not be appropriate for some types of hydrocephalus.

E. Preoperative interventions
1. Monitor intake and output; give small, frequent feedings as tolerated until preoperative NPO status is prescribed.
2. Reposition the head frequently and use special devices such as an egg crate mattress under the head to prevent pressure sores.
3. Prepare the child and family for diagnostic procedures and surgery.

F. Postoperative interventions
1. Monitor vital signs and neurological signs.
2. Position the child on the unoperated side to prevent pressure on the shunt valve.
3. Keep the child flat if prescribed to avoid rapid reduction of intracranial fluid.
4. Observe for increased ICP; if increased ICP occurs, elevate the head of the bed to 15 to 30 degrees to enhance gravity flow through the shunt.
5. Measure head circumference.
7. Monitor intake and output.
8. Provide comfort measures and administer medications as prescribed.
9. Instruct parents on how to recognize shunt infection or malfunction.
10. In an infant, irritability, a high, shrill cry, lethargy, and feeding poorly may indicate shunt malfunction or infection.
11. In a toddler, headache and a lack of appetite are the earliest common signs of shunt malfunction.
12. In older children, an indicator of shunt malfunction is an alteration in the child’s level of consciousness.

IV. Meningitis

A high, shrill cry in an infant can be a sign of increased ICP.
A. Description

1. Meningitis is an infectious process of the central nervous system caused by bacteria or viruses that may be acquired as a primary disease or as a result of complications of neurosurgery, trauma, infection of the sinuses or ears, or systemic infections.

2. Diagnosis of bacterial meningitis is made by testing CSF obtained by lumbar puncture; the fluid is cloudy with increased pressure, increased white blood cell count, elevated protein, and decreased glucose levels.

3. Bacterial meningitis can be caused by various organisms, most commonly *Haemophilus influenzae* type b, *Streptococcus pneumoniae*, or *Neisseria meningitidis*; meningococcal meningitis occurs in epidemic form and can be transmitted by droplets from nasopharyngeal secretions.

4. Viral meningitis is associated with viruses such as mumps, paramyxovirus, herpesvirus, and enterovirus.

B. Assessment

1. Signs and symptoms vary, depending on the type, the age of the child, and the duration of the preceding illness.
2. Fever, chills, headache
3. Vomiting, diarrhea
4. Poor feeding or anorexia
5. Nuchal rigidity
6. Poor or high, shrill cry
7. Altered level of consciousness, such as lethargy or irritability
8. Bulging anterior fontanel in an infant
9. Positive Kernig’s sign (inability to extend the leg when the thigh is flexed anteriorly at the hip) and Brudzinski’s sign (neck flexion causes adduction and flexion movements of the lower extremities) in children and adolescents
10. Muscle or joint pain (meningococcal infection and *H. influenzae* infection)
11. Petechial or purpuric rashes (meningococcal infection)
12. Ear that chronically drains (pneumococcal meningitis)

C. Interventions

1. Provide respiratory isolation precautions and maintain it for at least 24 hours after antibiotics are initiated.
2. Administer antibiotics and antipyretics as prescribed (administer antibiotics as soon as they are prescribed after lumbar puncture); antiseizure medications may also be prescribed.

3. Perform neurological assessment and monitor for seizures; assess for the complication of inappropriate antidiuretic hormone secretion, causing fluid retention (cerebral edema) and dilutional hyponatremia.

4. Assess for changes in level of consciousness and irritability.

5. Monitor for a purpuric or petechial rash and for signs of thromboemboli.

6. Assess nutritional status; monitor intake and output.

7. Monitor for hearing loss.

8. Determine close contacts of the child with meningitis, because the contacts need prophylactic treatment.

9. Pneumococcal conjugate vaccine is recommended for all children beginning at age 2 months to protect against meningitis; streptococcal pneumococci can cause many bacterial infections, including meningitis (see Chapter 18 for information on vaccines).

V. Submersion Injury

A. Description

1. Survival of at least 24 hours after submersion in a fluid medium

2. Hypoxia/asphyxiaton is the primary problem because it results in extensive cell damage; cerebral cells sustain irreversible damage after 4 to 6 minutes of submersion.

3. Additional problems include aspiration and hypothermia.

4. Outcome is predicted on the basis of the length of submersion in nonicy water; outcome may be good if submersion was for less than 5 minutes and the child exhibits neurological responsiveness, reactive pupils, and a normal cardiac rhythm.

5. A child who was submerged for more than 10 minutes and does not respond to cardiopulmonary life support measures within 25 minutes has an extremely poor prognosis (severe neurological impairment or death).

B. Interventions

1. Provide ventilatory and circulatory support; if the child has had a severe cerebral insult, endotracheal
intubation and mechanical ventilation may be required.

2. Monitor respiratory status, because respiratory compromise and cerebral edema may occur 24 hours after the incident.

4. Monitor neurological status closely; if spontaneous purposeful movement and normal brainstem function are not apparent 24 hours after the event, the child most likely has sustained severe neurological deficits.

5. Teach parents to provide adequate supervision of infants and small children around water to prevent accidents.

VI. Reye’s Syndrome

A. Description

1. Reye’s syndrome is an acute encephalopathy that follows a viral illness and is characterized pathologically by cerebral edema and fatty changes in the liver; diagnosis is made by laboratory studies and liver biopsy.

2. The exact cause is unclear; it most commonly follows a viral illness such as influenza or varicella.

3. Administration of aspirin and aspirin-containing products is not recommended for children with a febrile illness or children with varicella or influenza because of its association with Reye’s syndrome.

4. Acetaminophen or ibuprofen are considered the medications of choice.

5. Early diagnosis and aggressive treatment are important; the goal of treatment is to maintain effective cerebral perfusion and control increasing ICP.

B. Assessment

1. History of systemic viral illness 4 to 7 days before the onset of symptoms

2. Fever

3. Nausea and vomiting

4. Signs of altered hepatic function such as lethargy

5. Progressive neurological deterioration

6. Increased blood ammonia levels

C. Interventions
1. Provide rest and decrease stimulation in the environment.
2. Assess neurological status.
3. Monitor for altered level of consciousness and signs of increased ICP.
4. Monitor for signs of altered hepatic function and results of liver function studies.
5. Monitor intake and output.
6. Monitor for signs of bleeding and signs of impaired coagulation, such as a prolonged bleeding time.

VII. Seizure Disorders
   A. Description (see Chapter 58 for additional information on seizures)
      1. Excessive and unorganized neuronal discharges in the brain that activate associated motor and sensory organs
      2. Classified as generalized, partial, or unclassified, depending on the area of the brain involved
      3. Types of generalized seizures include tonic-clonic, absence, myoclonic, and atonic.
      4. Partial seizures arise from a specific area in the brain and cause limited symptoms; types include simple partial and complex partial.

   B. Assessment
      1. Obtain information from the parents about the time of onset, precipitating events, and behavior before and after the seizure.
      2. Determine the child’s history related to seizures.
      3. Ask the child about the presence of an aura (a warning sign of impending seizure).
      4. Monitor for apnea and cyanosis.
      5. Postseizure (postictal state): The child is disoriented and sleepy.

   C. Seizure precautions (see Box 38-1)
   D. Interventions (Box 38-3)
   E. Antiseizure medications (see Chapter 59 for information on medications)

   Never place anything, including an airway device, into the mouth of a child during a seizure.

VIII. Neural Tube Defects
   A. Description
1. This central nervous system defect results from failure of the neural tube to close during embryonic development.
2. Folic acid is recommended during childbearing years and pregnancy to reduce the occurrence of these conditions.
3. Associated deficits include sensorimotor disturbance, dislocated hips, talipes equinovarus (clubfoot), and hydrocephalus.
4. Defect closure is performed soon after birth.

B. Types

1. Spina bifida occulta
   a. Posterior vertebral arches fail to close in the lumbosacral area.
   b. Spinal cord remains intact and usually is not visible.
   c. Meninges are not exposed on the skin surface.
   d. Neurological deficits are not usually present.

2. Closed neural tube defect
   a. This type consists of a diverse group of defects; the spinal cord is marked by malformations of fat, bone, or meninges.
   b. Usually there are few or no symptoms; in some situations the malformation causes incomplete paralysis with urinary and bowel dysfunction.

3. Meningocele
   a. Protrusion involves meninges and a sac-like cyst that contains CSF in the midline of the back, usually in the lumbosacral area.
   b. The spinal cord is not involved.
   c. Neurological deficits are usually not present.

4. Myelomeningocele
   a. Protrusion of the meninges, CSF, nerve roots, and a portion of the spinal cord occurs.
   b. The sac (defect) is covered by a thin membrane prone to leakage or rupture.
c. Neurological deficits are evident.

C. Assessment

1. Depends on the spinal cord involvement
2. Visible spinal defect
3. Flaccid paralysis of the legs
4. Altered bladder and bowel function
5. Hip and joint deformities
6. Hydrocephalus

D. Interventions

1. Evaluate the sac and measure the lesion.
2. Perform neurological assessment.
3. Monitor for increased ICP, which might indicate developing hydrocephalus.
4. Measure head circumference; assess anterior fontanel for bulging.
5. Protect the sac; as prescribed, cover with a sterile, moist (normal saline), nonadherent dressing to maintain the moisture of the sac and contents.
6. Change the dressing covering the sac on a regular schedule or whenever it becomes soiled because of the risk of infection; diapering may be contraindicated until the defect has been repaired.
7. Use aseptic technique to prevent infection.
8. Assess the sac for redness, clear or purulent drainage, abrasions, irritation, and signs of infection.
9. Early signs of infection include elevated temperature (axillary), irritability, lethargy, and nuchal rigidity.
10. Place in a prone position to minimize tension on the sac and the risk of trauma; the head is turned to 1 side for feeding.
11. Assess for physical impairments such as hip and joint deformities.
12. Prepare the child and family for surgery.
13. Administer antibiotics preoperatively and postoperatively, as prescribed, to prevent infection.
14. Teach the parents and eventually the child about long-term home care.

   a. Positioning, feeding, skin care, and range-of-motion exercises
   b. Instituting a bladder elimination program and performing clean intermittent catheterization technique if necessary
   c. Administering antispasmodics (that act
on the smooth muscle of the bladder) as prescribed to increase bladder capacity and improve continence
d. Implement a bowel program, including a high-fiber diet, increased fluids, and suppositories as needed.
e. The child is at high risk for allergy to latex and rubber products because of the frequent exposure to latex during implementation of care measures.

IX. Attention-Deficit Hyperactivity Disorder
A. Description

1. Behavior disorder characterized by developmentally inappropriate degrees of inattention, overactivity, and impulsivity
2. Childhood problems include lowered intellectual development, some minor physical abnormalities, sleeping disturbances, behavioral or emotional disorders, and difficulty in social relationships.
3. Early diagnosis is important to prevent impaired emotional and psychological development.
4. Diagnosis is established on the basis of self-reports, parent and teacher reports, and use of assessment tools.

B. Assessment

1. Fidgets with hands or feet or squirms in the seat
2. Easily distracted with external or internal stimuli
3. Difficulty with following through on instructions
4. Poor attention span
5. Shifts from 1 uncompleted activity to another
6. Talks excessively
7. Interrupts or intrudes on others
8. Engages in physically dangerous activities without considering the possible consequences

C. Interventions

1. Provide parents with information about the disorder and treatment plan; encourage support groups for parents.
2. Treatment includes behavioral therapy, medication, maintaining a consistent environment, and appropriate classroom placement.
3. Behavioral therapy focuses on preventing undesirable behavior.
4. Maintain a consistent home and classroom
environment, and provide environmental and physical safety measures.

6. Stimulant medications may be prescribed; possible side effects include appetite suppression and weight loss, nervousness, tics, insomnia, and increased blood pressure.

7. Instruct the child and parents about medication administration and the need for regular follow-up.

X. Autism Spectrum Disorders
   A. Description
      1. Autism spectrum disorders (ASDs) are complex neurodevelopmental disorders of unknown etiology composed of qualitative alterations in social interaction and verbal impairment with repetitive, restricted, and stereotype behavioral patterns.
      2. Autism spectrum disorder impairments range from mild to severe; types include autism, Asperger’s syndrome, Rett’s syndrome.
      3. Symptoms are usually noticed by the parents by 3 years of age.
      4. The cause of the disorder is not specifically known; however, it has been linked to a wide range of antepartum, intrapartum, and newborn conditions and exposure to hazardous chemicals; genetic predisposition is also linked to the disorder.
      5. The disorder is accompanied by intellectual and social behavioral deficits, and the child exhibits peculiar and bizarre characteristics with social interactions, communication, and behaviors.
      6. Despite their relatively moderate to severe disability, some children with autism (known as savants) excel in particular areas, such as art, music, memory, mathematics, or perceptual skills such as puzzle building.
      7. Diagnosis is established on the basis of symptoms and the use of several screening tools.

B. Assessment
   1. Social
      a. Abnormal or lack of comfort-seeking behaviors
      b. Abnormal or lack of social play
      c. Impairment in peer relationships
      d. Lack of awareness of the existence or feelings of others
      e. Abnormal imitation of others
   2. Communication
a. Lack of, impaired, or abnormal speech, such as producing a monotone voice or echolalia
b. Abnormal nonverbal communication (does not use gestures to communicate)

3. Behavior
a. Lack of imaginative play
b. Persistent preoccupation or attachment to objects; range of interests restricted
c. Self-injurious behaviors
d. Must maintain routine; any environmental change produces marked distress
e. Produces repetitive body movements such as rocking or head banging

C. Interventions
1. Determine the child’s routines, habits, and preferences and maintain consistency as much as possible.
2. Determine the specific ways in which the child communicates and use these methods.
3. Avoid placing demands on the child.
4. Implement safety precautions as necessary for self-injurious behaviors such as head banging.
5. Initiate referrals to special programs as required.
6. Provide support to parents.
7. The Modified Checklist for Autism in Toddlers—Revised (MCHAT-R) is used to screen toddlers for this disorder. For a copy of the tool, see https://www.autismspeaks.org/sites/default/files/docs/sciencedocs/m-chat/m-chat-r_f.pdf?v=1

Ensuring a safe environment for a child with autism is a priority.

XI. Intellectual Disability
A. Description
1. In intellectual disability, a child manifests subaverage intellectual functioning along with deficits in adaptive skills.
2. Down’s syndrome is a congenital condition that results in moderate to severe intellectual disabilities and has been linked to an extra group G chromosome, chromosome 21 (trisomy 21).
B. Assessment

1. Deficits in cognitive skills and level of adaptive functioning
2. Delays in fine and gross motor skills
3. Speech delays
4. Decreased spontaneous activity
5. Nonresponsiveness
6. Irritability
7. Poor eye contact during feeding

C. Interventions

1. Medical strategies are focused on correcting structural deformities and treating associated behaviors.
2. Implement community and educational services, using a multidisciplinary approach.
3. Promote care skills as much as possible.
4. Assist with communication and socialization skills.
5. Facilitate appropriate play time.
6. Initiate safety precautions as necessary.
7. Assist the family with decisions regarding care.
8. Provide information regarding support services and community agencies.

FIG. 38-1 Abnormal posturing: opisthotonos.
FIG. 38-2  Mechanical distortion of cranium during closed head injury.

FIG. 38-3  A, Decorticate (flexion) posturing. B, Decerebrate (extension) posturing.

Box 38-1
Seizure Precautions
• Raise side rails when child is sleeping or resting.
• Pad side rails and other hard objects.
• Place waterproof mattress or pad on bed or crib.
• Instruct child to wear or carry medical identification.
• Instruct child in precautions to take during potentially hazardous activities.
• Instruct child to swim with a companion.
• Instruct child to use a protective helmet and padding when engaged in bicycle riding, skateboarding, and in-line skating.
• Alert caregivers to need for any special precautions.

**Box 38-2**

**Signs of Brainstem Involvement**

- Deep, rapid, or intermittent and gasping respirations
- Wide fluctuations or noticeable slowing of pulse
- Widening pulse pressure or extreme fluctuations in blood pressure
- Sluggish, dilated, or unequal pupils

Notify the primary health care provider immediately if these signs develop!

**FIG. 38-4** Ventriculoperitoneal shunt.

**Box 38-3**

**Interventions for Seizures**

• Ensure airway patency.
• Have suction equipment and oxygen available.
• Time the seizure episode.
• If the child is standing or sitting, ease the child down to the floor and place the child in a side-lying position.
• Place a pillow or folded blanket under the child’s head; if no bedding is available, place your own hands under the child’s head or place the child’s head in your own lap.
• Loosen restrictive clothing.
• Remove eyeglasses from the child if present.
• Clear the area of any hazards or hard objects.
• Allow the seizure to proceed and end without interference.
• If vomiting occurs, turn the child to one side as a unit.
• Do not restrain the child, place anything in the child’s mouth, or give any food or liquids to the child.
• Prepare to administer medications as prescribed.
• Remain with the child until the child recovers fully.
• Observe for incontinence, which may have occurred during the seizure.
• Document the occurrence.

Practice Questions

382. The parents of a child recently diagnosed with cerebral palsy ask the nurse about the limitations of the disorder. The nurse responds by explaining that the limitations occur as a result of which pathophysiological process?
   1. An infectious disease of the central nervous system
   2. An inflammation of the brain as a result of a viral illness
   3. A chronic disability characterized by impaired muscle movement and posture
   4. A congenital condition that results in moderate to severe intellectual disabilities

383. The nurse notes documentation that a child is exhibiting an inability to flex the leg when the thigh is flexed anteriorly at the hip. Which condition does the nurse suspect?
   1. Meningitis
   2. Spinal cord injury
   3. Intracranial bleeding
   4. Decreased cerebral blood flow

384. A mother arrives at the emergency department with her 5-year-old child and states that the child fell off a bunk bed. A head injury is suspected. The nurse checks the child’s airway status and assesses the child for early and late signs of increased intracranial pressure (ICP). Which is a late sign of increased ICP?
   1. Nausea
   2. Irritability
   3. Headache

1123
4. Bradycardia

385. The nurse is assigned to care for an 8-year-old child with a diagnosis of a basilar skull fracture. The nurse reviews the pediatrician’s prescriptions and should contact the pediatrician to question which prescription?

1. Obtain daily weight.
2. Provide clear liquid intake.
3. Nasotracheal suction as needed.
4. Maintain a patent intravenous line.

386. The nurse is reviewing the record of a child with increased intracranial pressure and notes that the child has exhibited signs of decerebrate posturing. On assessment of the child, the nurse expects to note which characteristic of this type of posturing?

1. Flaccid paralysis of all extremities
2. Adduction of the arms at the shoulders
3. Rigid extension and pronation of the arms and legs
4. Abnormal flexion of the upper extremities and extension and adduction of the lower extremities

387. A child is diagnosed with Reye’s syndrome. The nurse creates a nursing care plan for the child and should include which intervention in the plan?

1. Assessing hearing loss
2. Monitoring urine output
3. Changing body position every 2 hours
4. Providing a quiet atmosphere with dimmed lighting

388. The nurse creates a plan of care for a child at risk for tonic-clonic seizures. In the plan of care, the nurse identifies seizure precautions and documents that which item(s) need to be placed at the child’s bedside?

1. Emergency cart
2. Tracheotomy set
3. Padded tongue blade
4. Suctioning equipment and oxygen

389. A lumbar puncture is performed on a child suspected to have bacterial meningitis, and cerebrospinal fluid (CSF) is obtained for analysis. The nurse reviews the results of the CSF analysis and determines that which results would verify the diagnosis?

1. Clear CSF, decreased pressure, and elevated protein level
2. Clear CSF, elevated protein, and decreased glucose levels
3. Cloudy CSF, elevated protein, and decreased glucose levels
4. Cloudy CSF, decreased protein, and decreased glucose levels

390. The nurse is planning care for a child with acute bacterial meningitis. Based on the mode of transmission of this infection, which precautionary intervention should be included in the plan of care?

1. Maintain enteric precautions.
3. No precautions are required as long as antibiotics have been started.
4. Maintain respiratory isolation precautions for at least 24 hours after the initiation of antibiotics.

391. An infant with a diagnosis of hydrocephalus is scheduled for surgery. Which
is the **priority** nursing intervention in the preoperative period?
1. Test the urine for protein.
2. Reposition the infant frequently.
3. Provide a stimulating environment.
4. Assess blood pressure every 15 minutes.

**392.** The nurse is creating a plan of care for a child who is at risk for seizures. Which interventions apply if the child has a seizure? **Select all that apply.**

- [ ] 1. Time the seizure.
- [ ] 2. Restrain the child.
- [ ] 3. Stay with the child.
- [ ] 4. Place the child in a prone position.
- [ ] 5. Move furniture away from the child.
- [ ] 6. Insert a padded tongue blade in the child’s mouth.

**Answers**

**382. Answer:** 3

**Rationale:** Cerebral palsy is a chronic disability characterized by impaired movement and posture resulting from an abnormality in the extrapyramidal or pyramidal motor system. Meningitis is an infectious process of the central nervous system. Encephalitis is an inflammation of the brain that occurs as a result of viral illness or central nervous system infection. Down’s syndrome is an example of a congenital condition that results in moderate to severe intellectual disabilities.

**Test-Taking Strategy:** Eliminate options 1 and 2 first, noting that they are **comparable or alike.** Next, note the relationship between the words *palsy* in the question and *impaired muscle movement* in the correct option.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Neurological

**Health Problem:** Pediatric-Specific: Cerebral Palsy

**Priority Concepts:** Intracranial Regulation; Mobility

**383. Answer:** 1

**Rationale:** Meningitis is an infectious process of the central nervous system caused by bacteria and viruses. The inability to extend the leg when the thigh is flexed anteriorly at the hip is a positive Kernig’s sign, noted in meningitis. Kernig’s sign is not seen specifically with spinal cord injury, intracranial bleeding, or decreased cerebral blood flow.

**Test-Taking Strategy:** Note the **data in the question** and the **subject,** the
characteristics of Kernig’s sign. Knowledge regarding this sign is needed to answer correctly. Think about the neurological exam and physical assessment findings to answer correctly.

**Level of Cognitive Ability:** Applying  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Neurological  
**Health Problem:** Pediatric-Specific: Meningitis  
**Priority Concepts:** Clinical Judgment; Intracranial Regulation  

384. **Answer:** 4

**Rationale:** Head injury is the pathological result of any mechanical force to the skull, scalp, meninges, or brain. A head injury can cause bleeding in the brain and result in increased ICP. In a child, early signs include a slight change in level of consciousness, headache, nausea, vomiting, visual disturbances (diplopia), and seizures. Late signs of increased ICP include a significant decrease in level of consciousness, bradycardia, decreased motor and sensory responses, alterations in pupil size and reactivity, posturing, Cheyne-Stokes respirations, and coma.

**Test-Taking Strategy:** Note the age of the child and the strategic word, late. Think about the pathophysiology that occurs when pressure increases in the cranial vault to assist in answering correctly.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Neurological  
**Health Problem:** Pediatric-Specific: Head Injury  
**Priority Concepts:** Clinical Judgment; Intracranial Regulation  

385. **Answer:** 3

**Rationale:** A basilar skull fracture is a type of head injury. Nasotracheal suctioning is contraindicated in a child with a basilar skull fracture. Because of the nature of the injury, there is a possibility that the catheter will enter the brain through the fracture, creating a high risk of secondary infection. Fluid balance is monitored closely by daily weight determination, intake and output measurement, and serum osmolality determination to detect early signs of water retention, excessive dehydration, and states of hypertonicity or hypotonicity. The child is maintained on NPO (nothing by mouth) status or restricted to clear liquids until it is determined that vomiting will not occur. An intravenous line is maintained to administer fluids or medications, if necessary.

**Test-Taking Strategy:** Note the words question which prescription. Eliminate options 1, 2, and 4 because they are comparable or alike in that they address the subject of fluids. Remember that nasotracheal suctioning is contraindicated in a child with a skull fracture because of the risk of infection.
**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Safe and Effective Care Environment  
**Integrated Process:** Nursing Process—Implementation  
**Content Area:** Pediatrics: Neurological  
**Health Problem:** Pediatric-Specific: Head Injury  
**Priority Concepts:** Collaboration; Intracranial Regulation  

386. **Answer:** 3

**Rationale:** Decerebrate (extension) posturing is characterized by the rigid extension and pronation of the arms and legs. Option 1 is incorrect. Options 2 and 4 describe decorticate (flexion) posturing.

**Test-Taking Strategy:** Focus on the **subject**, characteristics of decerebrate (extension) posturing. Recalling the clinical manifestations associated with decerebrate posturing will direct you to the correct option. Remember that decerebrate posturing is characterized by the rigid extension and pronation of the arms and legs.

**Level of Cognitive Ability:** Analyzing  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Assessment  
**Content Area:** Pediatrics: Neurological  
**Health Problem:** Pediatric-Specific: Head Injury  
**Priority Concepts:** Clinical Judgment; Intracranial Regulation  

387. **Answer:** 4

**Rationale:** Reye’s syndrome is an acute encephalopathy that follows a viral illness and is characterized pathologically by cerebral edema and fatty changes in the liver. In Reye’s syndrome, supportive care is directed toward monitoring and managing cerebral edema. Decreasing stimuli in the environment by providing a quiet environment with dimmed lighting would decrease the stress on the cerebral tissue and neuron responses. Hearing loss and urine output are not affected. Changing the body position every 2 hours would not affect the cerebral edema directly. The child should be positioned with the head elevated to decrease the progression of the cerebral edema and promote drainage of cerebrospinal fluid.

**Test-Taking Strategy:** Focus on the **subject**, nursing care for the child with Reye’s syndrome. Think about the pathophysiology associated with Reye’s syndrome. Recalling that cerebral edema is a concern for a child with Reye’s syndrome will direct you to the correct option.

**Level of Cognitive Ability:** Creating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Nursing Process—Planning  
**Content Area:** Pediatrics: Neurological  
**Health Problem:** Pediatric-Specific: Reye Syndrome  
**Priority Concepts:** Clinical Judgment; Intracranial Regulation
Rationale: A seizure results from the excessive and unorganized neuronal discharges in the brain that activate associated motor and sensory organs. A type of generalized seizure is a tonic-clonic seizure. This type of seizure causes rigidity of all body muscles, followed by intense jerking movements. Because increased oral secretions and apnea can occur during and after the seizure, oxygen and suctioning equipment are placed at the bedside. A tracheotomy is not performed during a seizure. No object, including a padded tongue blade, is placed into the child’s mouth during a seizure. An emergency cart would not be left at the bedside but would be available in the treatment room or nearby on the nursing unit.

Test-Taking Strategy: Focus on the subject, seizure precautions. Note the words need to be placed at the child’s bedside. Eliminate option 2, knowing that a tracheotomy is not performed. Next, recalling that no object is placed into the mouth of a child experiencing a seizure assists in eliminating option 3. From the remaining options, focus on the primary concern during seizure activity. This will direct you to the correct option.

Level of Cognitive Ability: Creating
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Planning
Content Area: Pediatrics: Neurological
Health Problem: Pediatric-Specific: Seizures
Priority Concepts: Clinical Judgment; Intracranial Regulation

Rationale: Meningitis is an infectious process of the central nervous system caused by bacteria and viruses; it may be acquired as a primary disease or as a result of complications of neurosurgery, trauma, infection of the sinus or ears, or systemic infections. Meningitis is diagnosed by testing CSF obtained by lumbar puncture. In the case of bacterial meningitis, findings usually include an elevated pressure; turbid or cloudy CSF; and elevated leukocyte, elevated protein, and decreased glucose levels.

Test-Taking Strategy: Use knowledge regarding the diagnostic findings in meningitis. Eliminate options 1 and 2 first because they are comparable or alike; recall that clear CSF is not likely to be found in an infectious process such as meningitis. From this point, recall that an elevated protein level indicates a possible diagnosis of meningitis to direct you to the correct option.

Level of Cognitive Ability: Analyzing
Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Analysis
Content Area: Pediatrics: Neurological
Health Problem: Pediatric-Specific: Meningitis
Priority Concepts: Infection; Intracranial Regulation

390. **Answer**: 4

**Rationale**: Meningitis is an infectious process of the central nervous system caused by bacteria and viruses; it may be acquired as a primary disease or as a result of complications of neurosurgery, trauma, infection of the sinus or ears, or systemic infections. A major priority of nursing care for a child suspected to have meningitis is to administer the prescribed antibiotic as soon as a culture is obtained. The child also is placed on respiratory isolation precautions for at least 24 hours while culture results are obtained and the antibiotic is having an effect. Enteric precautions and neutropenic precautions are not associated with the mode of transmission of meningitis. Enteric precautions are instituted when the mode of transmission is through the gastrointestinal tract. Neutropenic precautions are instituted when a child has a low neutrophil count.

**Test-Taking Strategy**: Focus on the subject, the mode of transmission of meningitis. Eliminate options 1 and 2 first because they are comparable or alike, and are unrelated to the mode of transmission. Recalling that it takes about 24 hours for antibiotics to reach a therapeutic blood level will assist in directing you to the correct option.

**Level of Cognitive Ability**: Applying

**Client Needs**: Safe and Effective Care Environment

**Integrated Process**: Nursing Process—Planning

**Content Area**: Pediatrics: Neurological

**Health Problem**: Pediatric-Specific: Meningitis

**Priority Concepts**: Infection; Safety

391. **Answer**: 2

**Rationale**: Hydrocephalus occurs as a result of an imbalance of cerebrospinal fluid absorption or production that is caused by malformations, tumors, hemorrhage, infections, or trauma. It results in head enlargement and increased intracranial pressure (ICP). In infants with hydrocephalus, the head grows at an abnormal rate, and if the infant is not repositioned frequently, pressure ulcers can occur on the back and side of the head. An egg crate mattress under the head is also a nursing intervention that can help prevent skin breakdown. Proteinuria is not specific to hydrocephalus. Stimulus should be kept at a minimum because of the increase in ICP. It is not necessary to check the blood pressure every 15 minutes.

**Test-Taking Strategy**: Note the strategic word, priority. Focus on the child’s diagnosis. Eliminate option 4 because of the words 15 minutes. From the remaining options, recall that because of the severe head enlargement, the nursing intervention that has priority is to reposition the infant frequently to prevent the development of pressure areas.

**Level of Cognitive Ability**: Applying

**Client Needs**: Physiological Integrity

**Integrated Process**: Nursing Process—Implementation
**Rationale:** A seizure is a disorder that occurs as a result of excessive and unorganized neuronal discharges in the brain that activate associated motor and sensory organs. During a seizure, the child is placed on her or his side in a lateral position. Positioning on the side prevents aspiration, because saliva drains out the corner of the child’s mouth. The child is not restrained because this could cause injury to the child. The nurse would loosen clothing around the child’s neck and ensure a patent airway. Nothing is placed into the child’s mouth during a seizure, because this action may cause injury to the child’s mouth, gums, or teeth. The nurse would stay with the child to reduce the risk of injury and allow for observation and timing of the seizure.

**Test-Taking Strategy:** Focus on the subject and visualize this clinical situation. Recalling that airway patency and safety is the priority will assist in determining the appropriate interventions.

**Level of Cognitive Ability:** Creating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pediatrics: Neurological

**Health Problem:** Pediatric-Specific: Seizures

**Priority Concepts:** Intracranial Regulation; Safety

CHAPTER 39

Musculoskeletal Problems

http://evolve.elsevier.com/Silvestri/comprehensiveRN/

Priority Concepts
Development; Mobility

I. Developmental Dysplasia of the Hip
   A. Description
      1. Problems related to abnormal development of the hip
         that may develop during fetal life, infancy, or
         childhood; in these problems, the head of the femur is
         seated improperly in the acetabulum, or hip socket, of
         the pelvis.
      2. Degrees of developmental dysplasia of the hip (Box
         39-1)
   B. Assessment (Fig. 39-1)
      1. Neonate: Laxity of the ligaments around the hip
      2. Infant
         a. Shortening of the limb on the affected
            side (Galeazzi sign, also known as Allis
            sign)
         b. Restricted abduction of the hip on the
            affected side when the infant is placed
            supine with knees and hips flexed
            (limited range of motion in the affected
            hip)
         c. Unequal gluteal folds when the infant is
            prone and legs are extended against
            the examining table
         d. Positive Ortolani’s test: Ortolani’s
            maneuver is a test to assess for hip
            instability. The examiner abducts the
            thigh and applies gentle pressure
            forward over the greater trochanter. A
            “clicking” sensation indicates a
            dislocated femoral head moving into
            the acetabulum.
         e. Positive Barlow’s test: The examiner
adducts the hips and applies gentle pressure down and back with the thumbs. In hip dysplasia, the examiner can feel the femoral head move out of the acetabulum.

3. Older infant and child
   a. Affected leg is shorter than the other.
   b. The head of the femur can be felt to move up and down in the buttock when the extended thigh is pushed first toward the child’s head and then pulled distally.
   c. Positive Trendelenburg’s sign: The child stands on one foot and then the other foot, holding on to a support and bearing weight on the affected hip; the pelvis tilts downward on the normal side instead of upward, as it would with normal stability.
   d. Greater trochanter is prominent.
   e. Marked lordosis or waddling gait is noted in bilateral dislocations.

C. Interventions
   1. Birth to 6 months of age: Splinting of the hips with a Pavlik harness to maintain flexion and abduction and external rotation (worn continuously until hip is stable in about 3 to 6 months) (Fig. 39-2)
   2. Age 6 to 18 months: Gradual reduction by traction followed by closed reduction or open reduction (if necessary) under general anesthesia; child is then placed in a hip spica cast for 2 to 4 months until the hip is stable, and then a flexion-abduction brace is applied for approximately 3 months
   3. Older child: Operative reduction and reconstruction is usually required.
   4. Parents are instructed regarding proper care of a Pavlik harness, spica cast, or abduction brace.

II. Congenital Clubfoot
   A. Description
      1. Complex deformity of the ankle and foot that includes forefoot adduction, midfoot supination, hindfoot varus, and ankle equinus; defect may be unilateral or bilateral
      2. The goal of treatment is to achieve a painless plantigrade (able to walk on the sole of the foot with
the heel on the ground) and stable foot.
3. Long-term interval follow-up care is required until the child reaches skeletal maturity.

B. Assessment: Deformities are described on the basis of the position of the ankle and foot (Fig. 39-3).
1. Talipes varus: Inversion or bending inward
2. Talipes valgus: Eversion or bending outward
3. Talipes equinus: Plantar flexion in which the toes are lower than the heel
4. Talipes calcaneus: Dorsiflexion in which the toes are higher than the heel

C. Interventions
1. Treatment begins as soon after birth as possible.
2. Manipulation and casting are performed weekly for about 8 to 12 weeks because of the rapid growth of early infancy; a splint is then applied if casting and manipulation are successful.
3. Surgical intervention may be necessary if normal alignment is not achieved by about 6 to 12 weeks of age.
4. Monitor for pain, and monitor the neurovascular status of the toes.

Contact the primary health care provider (PHCP) immediately if signs of neurovascular impairment are noted in a child with a cast or brace.

III. Idiopathic Scoliosis
A. Description
1. Three-dimensional spinal deformity that usually involves lateral curvature, spinal rotation resulting in rib asymmetry, and hypokyphosis of the thorax
2. Idiopathic scoliosis usually is diagnosed during the preadolescent growth spurt; screenings are important when growth spurts occur.
3. Surgical (spinal fusion, which may be done by thoracoscopic surgery, placement of an instrumentation system, or use of metallic staples placed into vertebral bodies) and nonsurgical (bracing) interventions are used; the type of treatment depends on the location and degree of the curvatures, the age of the child, the amount of growth that is yet anticipated, and any underlying disease processes.
4. Long-term monitoring is essential to detect any progression of the curve.

B. Assessment

1. Asymmetry of the ribs and flanks is noted when the child bends forward at the waist and hangs the arms down toward the feet (Adam’s test).
2. Hip height, rib positioning, and shoulder height are asymmetrical (can be noted when standing behind an undressed child); leg length discrepancy is also apparent.
3. Radiographs are obtained to confirm the diagnosis.

C. Interventions

1. Monitor progression of the curvatures.
2. Prepare the child and parents for the use of a brace if prescribed.
3. Prepare the child and parents for surgery (spinal fusion, placement of internal instrumentation systems) if prescribed.

D. Braces

1. Braces are not curative but may slow the progression of the curvature to allow skeletal growth and maturity.
2. Braces usually are prescribed to be worn 16 to 23 hours a day.
3. Inspect the skin for signs of redness or breakdown.
4. Keep the skin clean and dry, and avoid lotions and powders, because these cake and lead to skin breakdown.
5. Advise the child to wear soft nonirritating clothing under the brace.
6. Instruct in prescribed exercises (exercises help maintain and strengthen spinal and abdominal muscles during treatment).
7. Encourage verbalization about body image and other psychosocial issues.

E. Postoperative interventions

1. Maintain proper alignment; avoid twisting movements.
2. Logroll the child when turning to maintain alignment.
3. Assess extremities for adequate neurovascular status.
4. Encourage coughing and deep breathing and the use of incentive spirometry.
5. Assess pain and administer prescribed analgesics.
7. Monitor for signs and symptoms of infection.
8. Monitor for superior mesenteric artery syndrome (caused by mechanical changes in the position of the child’s abdominal contents during surgery) and notify the PHCP if it occurs; symptoms include emesis and abdominal distention similar to what occurs with intestinal obstruction or paralytic ileus.
9. Instruct in activity restrictions.
10. Instruct the child how to roll from a side-lying position to a sitting position, and assist with ambulation.
11. Address a potential body image disturbance when formulating a plan of nursing care.

IV. Juvenile Idiopathic Arthritis

A. Description
1. Autoimmune inflammatory disease affecting the joints and other tissues, such as articular cartilage; occurs most often in girls
2. Treatment is supportive (there is no cure) and directed toward preserving joint function, controlling inflammation, minimizing deformity, and reducing the impact that the disease may have on the development of the child.
3. Treatment includes medications, physical and occupational therapies, and child and family education.
4. A pediatric rheumatology team can manage the complex needs of the child and family most effectively. The team may consist of a pediatric rheumatologist, physical and occupational therapist, social worker, and nurse specialist.
5. Surgical intervention may be implemented if the child has problems with joint contractures and unequal growth of extremities.

B. Assessment (Box 39-2)
1. There are no definitive tests to diagnose juvenile idiopathic arthritis.
2. Some laboratory tests, such as an elevated erythrocyte sedimentation rate or determination of the presence
of leukocytosis, may support evidence of the disease.
3. Radiographs may show soft tissue swelling and joint space widening from increased synovial fluid in the joint.

C. Interventions

1. Facilitate social and emotional development.
2. Instruct parents and child in the administration of medications; medications may be given alone or in combination and are prescribed depending on the progression of the disease (Box 39-3).
3. Assist the child with range-of-motion exercises and instruct in prescribed exercises.
5. Instruct parents and child in the use of hot or cold packs, splinting, and positioning the affected joint in a neutral position during painful episodes. Begin simple isometric exercises as soon as the child is able.
6. Encourage and support prescribed physical and occupational therapy.
7. Instruct in the importance of preventive eye care and reporting visual disturbances.
8. Assess the child’s and family’s perceptions regarding the chronic illness; plan to discuss the nature of a chronic illness and the associated life alterations that result from the chronic progression of the disorder.

V. Marfan’s Syndrome

A. Description

1. Disorder of connective tissue that affects the skeletal system, cardiovascular system, eyes, and skin.
2. Marfan’s syndrome is caused by defects in the fibrillin-1 gene, which serves as a building block for elastic tissue in the body; also, the disorder may be inherited.
3. There is no cure for the disorder.

B. Assessment

1. Tall and thin body structure: slender fingers, long arms and legs, curvature of the spine
2. Presence of visual problems
3. Presence of cardiac problems

C. Interventions

1. Monitor for vision problems and obtain visual examinations on a regular schedule.
2. Monitor for curvature of the spine, especially during adolescence.
3. Cardiac medications may be prescribed to slow the heart rate, to decrease stress on the aorta.
4. Instruct parents that the child should avoid participating in competitive athletics and contact sports to avoid injuring the heart.
5. Instruct parents to inform the dentist of the condition; antibiotics should be taken before dental procedures to prevent endocarditis.
6. Surgical replacement of the aortic root and valve may be necessary.

VI. Legg-Calve-Perthes Disease
   A. Description
      1. A condition affecting the hip where the femur and pelvis meet in the joint
      2. Blood supply is temporarily interrupted to the head of the femur and the bone dies and stops growing.
   B. Assessment
      1. Limping
      2. Pain or stiffness in the hip, groin, thigh, or knee
      3. Limited range of motion in the affected joint
   C. Interventions
      1. Physical therapy, particularly stretching exercises
      2. Use of crutches to avoid bearing weight on the affected hip
      3. Bed rest and traction if pain is severe
      4. Casting to keep the femoral head within its socket
      5. Use of a nighttime brace
      6. Hip replacement surgery

VII. Fractures
   A. Description (see also Chapter 60)
      1. A break in the continuity of the bone as a result of trauma, twisting, or bone decalcification
      2. Fractures in children usually occur as a result of increased mobility and inadequate or immature motor and cognitive skills; they may result from trauma or bone diseases such as congenital bone disease or bone tumors.

Fractures in infancy are generally rare and warrant further investigation to rule out the possibility of child abuse and to identify bone structure defects.

   B. Assessment
1. Pain or tenderness over the involved area
2. Obvious deformity
3. Edema
4. Ecchymosis
5. Muscle spasm
6. Loss of function
7. Crepitation

C. Initial care of a fracture (see Priority Nursing Actions)

### Priority Nursing Actions

**Extremity Fracture in a Child**

1. Assess extent of injury and immobilize the affected extremity check neurovascular status of the extremity.
2. If a compound fracture exists, cover the wound with a sterile dressing (apply a clean dressing if a sterile dressing is unavailable).
3. Elevate the injured extremity if appropriate.
4. Apply cold to injured area.
5. Continue to monitor neurovascular status.
6. Transport to the nearest emergency department.

### Reference

D. Interventions

1. Reduction
   a. Restoring the bone to proper alignment
   b. Closed reduction: Accomplished by manual alignment of the fragments, followed by immobilization
   c. Open reduction: Surgical insertion of internal fixation devices, such as rods, wires, or pins, that help maintain alignment while healing occurs

2. Retention: Application of traction or a cast to maintain alignment until healing occurs

E. Traction (see Chapter 60)

1. Russell skin traction
   a. Used to stabilize a fractured femur before surgery
   b. Similar to Buck’s traction but provides a double pull using a knee sling that pulls at the knee and foot

2. Balanced suspension
   a. Used with skin or skeletal traction to approximate fractures of the femur, tibia, or fibula

1138
b. Balanced suspension is produced by a counterforce other than the child.
c. Provide pin care if pins are used with the skeletal traction.

3. 90-degree–90-degree traction
   a. The lower leg is supported by a boot cast or a calf sling.
   b. A skeletal Steinmann pin or Kirschner wire is placed in the distal fragment of the femur, allowing 90-degree flexion at the hip and the knee.

4. Interventions
   a. Maintain correct amount of weight as prescribed.
   b. Ensure that weights hang freely.
   c. Check all ropes for fraying and all knots for tightness; be sure that the ropes are appropriately tracking in the grooves of the pulley wheels.
   d. Monitor neurovascular status of the involved extremity.
   e. Protect the skin from breakdown.
   f. Monitor for signs and symptoms of complications of immobilization, such as constipation, skin breakdown, lung congestion, renal complications, and disuse syndrome of unaffected extremities.
   g. Provide therapeutic and diversional play.

F. Casts (see Chapter 60)
   1. Description
      a. Made of plaster or fiberglass to provide immobilization of bone and joints after a fracture or injury
      b. Fractures of the hip or knee may require a spica cast.
   2. Interventions
      a. Examine the cast for pressure areas.
      b. Ensure that no rough casting material remains in contact with the skin; petal the cast edges with waterproof adhesive tape as necessary to ensure a smooth cast edge.
      c. If a hip spica cast is placed, the cast edges around the perineum and buttocks may need to be taped with waterproof tape.
d. Monitor the extremity for circulatory impairment, such as pain greater than that expected for the type of injury, edema, rubor, pallor, numbness and tingling, coolness, decreased sensation or mobility, or diminished pulse.

e. Notify the PHCP if circulatory impairment occurs.

f. Prepare for bivalving or cutting the cast if circulatory impairment occurs; prepare for emergency fasciotomy if cast removal does not improve the neurocirculatory compromise.

g. Instruct parents and child not to stick objects down the cast.

h. Teach parents and child to keep the cast clean and dry.

i. Instruct parents and child in isometric exercises to prevent muscle atrophy.

---

**Box 39-1**

### Degrees of Developmental Dysplasia of the Hip

**Acetabular Dysplasia (Preluxation)**

- Mildest form
- Neither subluxation nor dislocation
- Delay in acetabular development occurs
- Femoral head remains in acetabulum

**Subluxation**

- Incomplete dislocation of the hip
- Femoral head remains in acetabulum
- Stretched capsule and ligamentum teres causes head of the femur to be partially displaced

**Dislocation**

- Femoral head loses contact with acetabulum and is displaced posteriorly and superiorly over fibrocartilaginous rim
- Ligamentum teres is elongated and taut
FIG. 39-1  Signs of developmental dysplasia of the hip. A, Asymmetry of gluteal and thigh folds. B, Limited hip abduction, as seen in flexion. C, Apparent shortening of the femur, as indicated by the level of the knees in flexion. D, Ortolani click (if infant is younger than 4 weeks old). E, Positive Trendelenburg’s sign or gait (if child is weight-bearing).

FIG. 39-2  Child in Pavlik harness.
Box 39-2

Assessment Findings: Juvenile Idiopathic Arthritis

- Stiffness, swelling, and limited motion occur in affected joints.
- Affected joints are warm to touch, tender, and painful.
- Joint stiffness is present on arising in the morning and after inactivity.
- Uveitis (inflammation of structures in the uveal tract) can occur and cause blindness.
**Medications Used in Juvenile Idiopathic Arthritis**

*Corticosteroid injections*: Prescribed when only a few joints are involved. Usually do not have any significant side effects.

*Oral corticosteroids*: May be prescribed but only for as short a time and at the lowest dose possible. Long-term use is associated with side effects such as weight gain, poor growth, osteoporosis, cataracts, avascular necrosis, hypertension, and risk of infection.

*Disease modifying antirheumatic drugs*: Known as DMARDs are prescribed as a second-line treatment when many joints are involved or the child does not respond to corticosteroid joint injections. Biologics may also be prescribed, and these include antitumor necrosis factor agents. All of these medications cause side effects that need to be discussed with the child and/or parents.

### Practice Questions

393. A child has a right femur fracture caused by a motor vehicle crash and is placed in skin traction temporarily until surgery can be performed. During assessment, the nurse notes that the dorsalis pedis pulse is absent on the right foot. Which action should the nurse take?

1. Administer an analgesic.
2. Release the skin traction.
3. Apply ice to the extremity.
4. Notify the primary health care provider (PHCP).

394. A child is placed in skeletal traction for treatment of a fractured femur. The nurse creates a plan of care and should include which intervention?

1. Ensure that all ropes are outside the pulleys.
2. Ensure that the weights are resting lightly on the floor.
3. Restrict diversional and play activities until the child is out of traction.
4. Check the primary health care provider’s (PHCP’s) prescriptions for the amount of weight to be applied.

395. A 4-year-old child sustains a fall at home. After an x-ray examination, the child is determined to have a fractured arm and a plaster cast is applied. The nurse provides instructions to the parents regarding care for the child’s cast. Which statement by the parents indicates a need for further instruction?

1. “The cast may feel warm as the cast dries.”
2. “I can use lotion or powder around the cast edges to relieve itching.”
3. “A small amount of white shoe polish can touch up a soiled white cast.”
4. “If the cast becomes wet, a blow drier set on the cool setting may...”
be used to dry the cast.”

396. The parents of a child with juvenile idiopathic arthritis call the clinic nurse because the child is experiencing a painful exacerbation of the disease. The parents ask the nurse if the child can perform range-of-motion exercises at this time. The nurse should make which response?
1. “Avoid all exercise during painful periods.”
2. “Range-of-motion exercises must be performed every day.”
3. “Have the child perform simple isometric exercises during this time.”
4. “Administer additional pain medication before performing range-of-motion exercises.”

397. A child who has undergone spinal fusion for scoliosis complains of abdominal discomfort and begins to have episodes of vomiting. On further assessment, the nurse notes abdominal distention. On the basis of these findings, the nurse should take which action?
1. Administer an antiemetic.
2. Increase the intravenous fluids.
3. Place the child in a Sims’ position.
4. Notify the primary health care provider (PHCP).

398. The nurse is providing instructions to the parents of a child with scoliosis regarding the use of a brace. Which statement by the parents indicates a need for further instruction?
1. “I will encourage my child to perform prescribed exercises.”
2. “I will have my child wear soft fabric clothing under the brace.”
3. “I should apply lotion under the brace to prevent skin breakdown.”
4. “I should avoid the use of powder because it will cake under the brace.”

399. The nurse is assisting a primary health care provider (PHCP) examine a 3-week-old infant with developmental dysplasia of the hip. What test or sign should the nurse expect the PHCP to assess?
1. Babinski’s sign
2. The Moro reflex
3. Ortolani’s maneuver
4. The palmar-plantar grasp

400. A 1-month-old infant is seen in a clinic and is diagnosed with developmental dysplasia of the hip. On assessment, the nurse understands that which finding should be noted in this condition?
1. Limited range of motion in the affected hip
2. An apparent lengthened femur on the affected side
3. Asymmetrical adduction of the affected hip when the infant is placed supine with the knees and hips flexed
4. Symmetry of the gluteal skinfolds when the infant is placed prone and the legs are extended against the examining table

401. Parents bring their 2-week-old infant to a clinic for treatment after a diagnosis of clubfoot made at birth. Which statement by the parents indicates a need for further teaching regarding this disorder?
1. “Treatment needs to be started as soon as possible.”
2. “I realize my infant will require follow-up care until fully grown.”
3. “I need to bring my infant back to the clinic in 1 month for a new cast.”
4. “I need to come to the clinic every week with my infant for the casting.”

402. The nurse prepares a list of home care instructions for the parents of a child who has a plaster cast applied to the left forearm. Which instructions should be included on the list? Select all that apply.

- 1. Use the fingertips to lift the cast while it is drying.
- 2. Keep small toys and sharp objects away from the cast.
- 3. Use a padded ruler or another padded object to scratch the skin under the cast if it itches.
- 4. Place a heating pad on the lower end of the cast and over the fingers if the fingers feel cold.
- 5. Elevate the extremity on pillows for the first 24 to 48 hours after casting to prevent swelling.
- 6. Contact the primary health care provider (PHCP) if the child complains of numbness or tingling in the extremity.

Answers

393. Answer: 4

**Rationale:** An absent pulse to an extremity of the affected limb after a bone fracture could mean that the child is developing or experiencing compartment syndrome. This is an emergency situation, and the PHCP needs to be notified immediately. Administering analgesics would not improve circulation. The skin traction should not be released without a PHCP’s prescription. Applying ice to an extremity with absent perfusion will worsen the problem. Ice may be prescribed when perfusion is adequate to decrease swelling.

**Test-Taking Strategy:** Use the ABCs—airway, breathing, and circulation. Focusing on the data in the question indicates that circulation is impaired. This should direct you to the correct option.

**Level of Cognitive Ability:** Applying
**Client Needs:** Physiological Integrity
**Integrated Process:** Nursing Process—Implementation
**Content Area:** Complex Care: Emergency Situations/Management
**Health Problem:** Pediatric-Specific: Fractures
**Priority Concepts:** Clinical Judgment; Perfusion
**Reference:** McKinney et al. (2018), pp. 1213-1214.

394. Answer: 4
**Rationale:** When a child is in traction, the nurse would check the PHCP’s prescription to verify the prescribed amount of traction weight. The nurse would maintain the correct amount of weight as prescribed, ensure that the weights hang freely, check the ropes for fraying and ensure that they are on the pulleys appropriately, monitor the neurovascular status of the involved extremity, and monitor for signs and symptoms of complications of immobilization. The nurse would provide therapeutic and diversional play activities for the child.

**Test-Taking Strategy:** Focus on the subject, care of the child in traction. Eliminate option 3 first because of the word restrict. Next recall the general principles related to traction, recalling that weights should hang freely and ropes should remain in the pulleys.

**Level of Cognitive Ability:** Creating

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Planning

**Content Area:** Pediatrics: Musculoskeletal

**Health Problem:** Pediatric-Specific: Fractures

**Priority Concepts:** Mobility; Safety

395. **Answer:** 2

**Rationale:** Teaching about cast care is essential to prevent complications from the cast. The parents need to be instructed not to use lotion or powders on the skin around the cast edges or inside the cast. Lotions or powders can become sticky or caked and cause skin irritation. Options 1, 3, and 4 are appropriate statements and indicate the parents understand cast care.

**Test-Taking Strategy:** Note the strategic words, need for further instruction. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Remember that lotions or powders can become sticky or caked and cause skin irritation.

**Level of Cognitive Ability:** Evaluating

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Musculoskeletal

**Health Problem:** Pediatric-Specific: Fractures

**Priority Concepts:** Client Education; Skin Integrity

396. **Answer:** 3

**Rationale:** Juvenile idiopathic arthritis is an autoimmune inflammatory disease affecting the joints and other tissues, such as articular cartilage. During painful episodes of juvenile idiopathic arthritis, hot or cold packs and splinting and positioning the affected joint in a neutral position help reduce the pain. Although resting the extremity is appropriate, beginning simple isometric or tensing exercises as soon as the child is able is important. These exercises do not involve joint movement.

1146
**Test-Taking Strategy:** Focus on the subject, exercise during an acute exacerbation of the disease. Eliminate options 1 and 2 because of the closed-ended words “all” and “must,” and option 4 because of the word additional.

**Level of Cognitive Ability:** Applying

**Client Needs:** Physiological Integrity

**Integrated Process:** Teaching and Learning

**Content Area:** Pediatrics: Musculoskeletal

**Health Problem:** Pediatric-Specific: Juvenile Idiopathic Arthritis

**Priority Concepts:** Mobility; Pain

**Reference:** McKinney et al. (2018), pp. 1237-1238.

397. Answer: 4

**Rationale:** Scoliosis is a three-dimensional spinal deformity that usually involves lateral curvature, spinal rotation resulting in rib asymmetry, and hypokyphosis of the thorax. A complication after surgical treatment of scoliosis is superior mesenteric artery syndrome. This disorder is caused by mechanical changes in the position of the child’s abdominal contents, resulting from lengthening of the child’s body. The disorder results in a syndrome of emesis and abdominal distention similar to that which occurs with intestinal obstruction or paralytic ileus. Postoperative vomiting in children with body casts or children who have undergone spinal fusion warrants attention because of the possibility of superior mesenteric artery syndrome. Options 1, 2, and 3 are incorrect.

**Test-Taking Strategy:** Focus on the subject, complications after surgical treatment for scoliosis. Eliminate option 2 first because it should not be implemented unless prescribed by the PHCP. Eliminate option 3 next because this child requires logrolling, and Sims’ position may cause injury after surgery. From the remaining options, note the assessment signs and symptoms in the question. These should alert you that notification of the PHCP is necessary.

**Level of Cognitive Ability:** Synthesizing

**Client Needs:** Physiological Integrity

**Integrated Process:** Nursing Process—Implementation

**Content Area:** Pediatrics: Musculoskeletal

**Health Problem:** Pediatric-Specific: Scoliosis

**Priority Concepts:** Clinical Judgment; Collaboration

398. Answer: 3

**Rationale:** A brace may be prescribed to treat scoliosis. Braces are not curative but may slow the progression of the curvature to allow skeletal growth and maturity. The use of lotions or powders under a brace should be avoided because they can become sticky and cake under the brace, causing irritation. Options 1, 2, and 4 are appropriate interventions in the care of a child with a brace.

**Test-Taking Strategy:** Note the strategic words, need for further instruction. These words indicate a negative event query and ask you to select an option that is an incorrect statement. Careful reading of the options will assist in directing you to the
correct option. Also, applying the principles associated with cast care will direct you to the correct option.

**Level of Cognitive Ability:** Evaluating  
**Client Needs:** Physiological Integrity  
**Integrated Process:** Teaching and Learning  
**Content Area:** Pediatrics: Musculoskeletal  
**Health Problem:** Pediatric-Specific: Scoliosis  
**Priority Concepts:** Client Education; Mobility  

399. **Answer:** 3
