In loving memory of my parents—

*To my mother, Frances Mary, and my father, Arnold Lawrence,
who taught me to always love, care, and be the best that I could be.*

My memories of their love, support, and words of encouragement will remain in my heart forever!

Linda Anne Silvestri

*To my parents, Mary Elizabeth and Lawrence Peter,
who have instilled in me the values of working hard and being selfless,
and who have been my support system as I pursue my professional goals
and life aspirations. My success thus far would not have been possible without them.*

From the bottom of my heart, thank you, Mom & Dad!

Angela Elizabeth Silvestri

CLEX@Nepal

To All Future Registered Nurses,

Congratulations to you!

You should be very proud and pleased with yourself on your most recent well-deserved accomplishment of completing your nursing program to become a registered nurse. We know that you have worked very hard to become successful and that you have proven to yourself that indeed you can achieve your goals.

In our opinion, you are about to enter the most wonderful and rewarding profession that exists. Your willingness, desire, and ability to assist those who need nursing care will bring great satisfaction to your life. In the profession of nursing, your learning will be a lifelong process. This aspect of the profession makes it stimulating and dynamic. Your learning process will continue to expand and grow as the profession continues to evolve. Your next very important endeavor will be the learning process involved to achieve success in your examination to become a registered nurse.

We are excited and pleased to be able to provide you with the *Saunders Pyramid to Success* products, which will help you prepare for your next important professional goal, becoming a registered nurse. We want to thank all of our former and current nursing students whom we have assisted in their studies for the NCLEX-RN® examination for their willingness to offer ideas regarding their needs in preparing for licensure. Student ideas have certainly added a special uniqueness to all of the products available in the *Saunders Pyramid to Success*.

Saunders Pyramid to Success products provide you with everything that you need to ready yourself for the NCLEX-RN examination. These products include material that is required for the NCLEX-RN examination for all nursing students regardless of educational background, specific strengths, areas in need of improvement, or clinical experience during the nursing program.

So let's get started and begin our journey through the *Saunders Pyramid to Success*, and welcome to the wonderful profession of nursing!

Sincerely,

Dr. Linda Anne Silvestri and Dr. Angela Elizabeth Silvestri

About the Authors

Linda Anne Silvestri,
PhD, RN, FAAN

Linda is a well-known nurse educator, entrepreneur, and philanthropist whose professional aspirations focus on assisting nursing students to become successful. She has been teaching at all

levels of nursing education for many years. Linda is currently a nursing instructor at the University of Nevada, Las Vegas (UNLV). She earned her PhD in nursing from UNLV and conducted research on self-efficacy and the predictors of NCLEX® success. Her research findings are published in the *Journal of Nursing Education and Practice*. Dr. Silvestri has received several awards and honors. In 2019, she was inducted as a Fellow in the American Academy of Nursing. In 2012, she received the UNLV School of Nursing Alumna of the Year Award. And in 2010, she received the School of Nursing's Certificate of Recognition for Outstanding PhD Student. Linda is a member of several national nursing organizations, including the Honor Society of Nursing, Sigma Theta Tau International, the National League for Nursing, the American Nurses Association, and the American Academy of Nursing. Dr. Silvestri is a successful Elsevier author of numerous best-selling NCLEX® preparation resources on the national and international levels. She also serves as an Elsevier Subject Matter Expert for the Next Generation NCLEX® (NGN), and has presented numerous webinars on NCLEX® preparation and success. Dr. Silvestri is the President and Owner of Nursing Reviews, Inc., and the Director and Owner of Professional Nursing Seminars, Inc. Both companies are dedicated to helping nursing graduates achieve their goals of becoming licensed nurses.

Angela E. Silvestri,
PhD, APRN, FNP-BC,
CNE

Angela Silvestri is a well-known nurse educator, researcher, and author. She has been teaching and working in university administrative roles for the last 10 years at

all levels of nursing education. She has experience teaching in both classroom and clinical settings and in working with graduate students on their culminating projects and research dissertations. She currently serves as the Program Director for the undergraduate BSN program at the University of Nevada, Las Vegas (UNLV). Dr. Silvestri is a successful Elsevier author of numerous best-selling NCLEX® preparation resources on the national and international levels. She also serves as an Elsevier Subject Matter Expert for the Next Generation NCLEX® (NGN). Angela earned a bachelor's in Nursing and in Sociology from Salve Regina University in Newport, Rhode Island; she earned her master's degree with a focus in nursing education and her PhD from the University of Nevada, Las Vegas. She also has a post-master's graduate certificate in advanced practice and is a board-certified Family Nurse Practitioner. She is a Scholar in Sigma Theta Tau's New Academic Leadership Academy. She works with faculty, staff, and students on managing primary and episodic health care needs at UNLV's Student Wellness Center and Faculty and Staff Treatment Center as a Family Nurse Practitioner. Dr. Silvestri is passionate about college students' success. She is an expert in creating clinical judgment test-taking strategies for NGN items. This passion also comes through in her work at UNLV, where she teaches leadership and licensure exam preparation, and in the publication of her research and best-selling licensure exam review resources.

Preface

Linda Anne Silvestri, PhD, RN

“To laugh often and much, to appreciate beauty, to find the best in others, to leave the world a bit better, to know that even one life has breathed easier because you have lived, this is to have succeeded.”

—Ralph Waldo Emerson

Angela Elizabeth Silvestri, PhD, APRN,
FNP-BC, CNE

“The climb to the top is arduous and steep. People become exhausted, frustrated, and disenchanting, and are often tempted to give up. Genuine acts of caring draw people forward.”

—James M. Kouzes

Welcome to Saunders *Pyramid to Success!*

An Essential Resource for Test Success

Saunders Comprehensive Review for the NCLEX-RN® Examination is one in a series of products designed to assist you in achieving your goal of becoming a registered nurse. This text will provide you with a comprehensive review of all nursing content areas specifically related to the current test plan for the Next Generation NCLEX-RN examination, which is implemented by the National Council of State Boards of Nursing. This resource will help you achieve success on your nursing examinations during nursing school and on the NCLEX-RN examination.

Organization

This book contains 19 units and 70 chapters. The chapters are designed to identify specific components of nursing content. They contain practice questions, both multiple-choice and alternate item formats, that reflect the chapter content and the current test plan for the NCLEX-RN examination. All questions in the book and on the Evolve site are presented in NCLEX-style format. The NCLEX test plan identifies a framework based on *Client Needs*. These Client Needs categories include Safe and Effective Care Environment, Health Promotion

and Maintenance, Psychosocial Integrity, and Physiological Integrity. *Integrated Processes* are also identified as a component of the test plan. These include Caring, Communication and Documentation, Culture and Spirituality, Nursing Process, and Teaching and Learning. All chapters address the components of the test plan framework.

Special Features of the Book

Pyramid Terms

Pyramid Terms are important to the discussion of the content in the chapters in each unit. Therefore, they are in bold green type throughout the content section of each chapter. Definitions can be reviewed in the Audio Glossary on the Evolve site.

Pyramid to Success

The Pyramid to Success, a featured part of each unit introduction, provides you with an overview, guidance, and direction regarding the focus of review in the particular content area, as well as the content area’s relative importance to the test plan for the NCLEX-RN examination. *The Pyramid to Success* reviews the Client Needs and provides learning outcomes as they pertain to the content in that unit. These learning outcomes identify the specific components and cognitive skills to keep in mind as you review each chapter.

Priority Concepts

Each chapter identifies two *Priority Concepts* reflective of its content. These *Priority Concepts* will assist you to focus on the important aspects of the content and associated nursing interventions. These Priority Concepts are also helpful for those students who are learning in a concept-based curriculum.

Pyramid Points

Pyramid Points  are placed next to specific content throughout the chapters. The *Pyramid Points* highlight content that is important for preparing for the NCLEX-RN examination and identify content that is likely to appear on the NCLEX-RN examination.

Pyramid Alerts

Pyramid Alerts are the **red** text found throughout the chapters that alert you to important information about nursing concepts. These alerts identify concepts that are important to remember and relate to content that typically appears on the NCLEX-RN examination.

Clinical Judgment Boxes

Clinical Judgment (CJ) Boxes are located in every chapter in the book. These boxes present a clinical scenario that relates to one of the six cognitive skills (*recognize cues, analyze cues, prioritize hypotheses, generate solutions, take action, evaluate outcomes*) that will be measured in the Next Generation NCLEX (NGN) exam. These CJ boxes provide the thinking process needed and necessary information to make a clinical decision.

Special Features Found on Evolve

Pretest and Study Calendar

The accompanying Evolve site contains a 75-question pretest and a 75-question posttest that provide you with feedback on your strengths and areas in need of improvement. The results of your pretest will generate an individualized study calendar to guide you in your preparation for the NCLEX examination. Once you have completed your review of the practice questions in this resource, you can take the posttest to evaluate your improvement and need for any additional review in preparation for the NCLEX. After completion of each test you are provided with the opportunity to review the answers, rationales, and strategies, and we highly encourage you to do this.

Audio Questions

The accompanying Evolve site contains *Audio Questions* representative of content addressed in the current test plan for the NCLEX-RN examination. These questions are in NCLEX-style format, and each question presents an audio sound, such as lung sounds, as a component of the question.

Next Generation NCLEX® (NGN) Case Studies and NGN Test Questions

The accompanying Evolve site contains stand-alone items and unfolding case studies. The clinical judgment stand-alone items provide a clinical scenario and are accompanied by one NGN test question in either a Bow-tie or a Trend item format. These stand-alone items can measure up to all of the cognitive skills of the NCSBN Clinical Judgment Measurement Model (NCJMM). These cognitive skills include Recognize Cues, Analyze Cues, Prioritize Hypotheses, Generate Solutions, Take Action, and Evaluate Outcomes. Each unfolding case study is accompanied by six NGN test items, each measuring one of the cognitive skills in sequential order.

Audio Review Summaries

The companion Evolve site includes three *Audio Review Summaries* that cover challenging subject areas addressed in the test plan for the NCLEX-RN examination, including *Pharmacology, Acid-Base Balance, and Fluids and Electrolytes*.

Practice Questions

While preparing for the NCLEX-RN examination, it is crucial for students to practice answering test questions. This book contains multiple-choice and alternate item format questions. The accompanying software includes all the questions from the book, plus additional new Evolve questions for a total of more than 5700 questions. The alternate item format questions in the book and on the accompanying Evolve site may be presented as one of the following:

- Fill-in-the-blank question
- Multiple-response question
- Prioritizing (ordered response) question
- Figure/illustration question
- Graphic options question, in which each option contains a figure or illustration
- Chart/exhibit question
- Audio question
- NGN stand-alone items and unfolding case studies

The NGN stand-alone items and unfolding case studies provide you with practice in prioritizing, decision-making, and critical thinking, and strengthen your clinical judgment skills.

Multiple-Choice and Alternate Item Format Questions

Starting with Unit II, each chapter is followed by a practice test. Each practice test contains several questions reflective of the content in the chapter and those presented on the NCLEX-RN examination. These questions provide you with practice in prioritizing, decision-making, critical thinking, and clinical judgment skills. Chapter 1 of this book provides a description of each question type. The Next Generation NCLEX (NGN) is also discussed in this chapter.

The answer section for each practice question throughout the chapters and on the Evolve site provides the correct answer, the rationale for the correct and incorrect options, and a test-taking strategy that will assist you in answering the question correctly. The test-taking strategy is highlighted in bold blue type. This highlighting will provide you with guidance and direction for further remediation in the *Saunders Clinical Judgment and Test-Taking Strategies: Passing Nursing School and the NCLEX® Exam*.

The categories identified in each practice question on the Evolve site include Level of Cognitive Ability, Client Needs, Integrated Process, Clinical Judgment/Cognitive Skill, the nursing Content Area, the Health Problem, and Priority Concepts. Every question on the accompanying

Evolve site is organized by these question codes, so you can customize your study session to be as specific or as generic as you need. Additionally, a link to view normal laboratory reference intervals is provided with each practice question.

Pharmacology and Medication Calculations Review

Students consistently state that pharmacology is an area with which they need assistance. The NCLEX-RN test plan continues to incorporate pharmacology in the examination, but only the generic drug names will be included. Therefore, pharmacology chapters have been included for your review and practice. This book includes 13 pharmacology chapters, a medication and intravenous prescriptions calculation chapter, and a pediatric medication administration and calculation chapter. Each of these chapters is followed by a practice test that uses the same question format described earlier. This book contains numerous pharmacology questions. Additionally, more than 1000 pharmacology questions can be found on the accompanying Evolve site.

Next Generation NCLEX (NGN) Questions

As described above, the accompanying Evolve site contains stand-alone items and unfolding case studies. The NCSBN has conducted rigorous research over the past several years to develop NGN case studies and test items that will effectively measure clinical judgment. The NCSBN will launch the NGN questions on the examination starting in April 2023, and these item types are designed to test the candidate's ability to make safe and competent clinical judgments. The information in this book about the NGN reflects the most up-to-date information at the time of the printing of this book. Since the NCSBN continues to research and collect data on the NGN items, additional and continuous changes could be made. We encourage you to access the NCSBN website at www.ncsbn.org for these latest updates. The Evolve site for this resource provides you with NGN stand-alone items and unfolding case studies with accompanying test items that are reflective of the item types that NCSBN has indicated (as of the time of this publication) will be presented.

How to Use This Book

Saunders Comprehensive Review for the NCLEX-RN® Examination is especially designed to help you with your successful journey to the peak of the *Saunders Pyramid to Success*: becoming a registered nurse! As you begin your

journey through this book, you will be introduced to all of the important points regarding the current NCLEX-RN examination, the process of testing, and unique and special tips regarding how to prepare yourself for this very important examination. You will also be introduced to the NGN and the types of case studies and test items that will be on the NCLEX-RN.

You should begin your process through the *Saunders Pyramid to Success* by reading all of Unit I in this book and becoming familiar with the central points regarding the NCLEX-RN examination, including the NGN. **Chapter 2** describes self-efficacy and the unique and special tips regarding how to prepare yourself both academically and nonacademically for this important examination. Be sure to read **Chapter 3**, written by a nursing graduate who recently passed the examination, and note what the graduate has to say about the testing experience. **Chapter 4** will provide you with the critical testing strategies that will guide you in selecting the correct option or assist you in selecting an answer to a question if you must guess. Keep these strategies in mind as you proceed through this book. Continue by studying the specific content areas addressed in Units II through XIX. Review the definitions of the *Pyramid Terms*, located in each chapter, and the *Pyramid to Success* notes and the Client Needs and Learning Outcomes, located in each unit introduction. Read through the chapters and focus on the *Pyramid Points* and *Pyramid Alerts*, which identify the areas most likely to be tested on the NCLEX-RN examination. Pay particular attention to the *Clinical Judgment* boxes because they provide information about the cognitive skills in the NCSBN Clinical Judgment Measurement Model and the thinking processes in making an interpretation or decision.

As you read each chapter, identify your areas of strength and those in need of further review. Highlight these areas, and test your abilities by taking all practice tests provided at the end of the chapters. Be sure to review all rationales and test-taking strategies.

After reviewing all chapters in the book, reflect and identify any areas requiring further review; then take the time to review those areas in both the book and the companion Evolve site. In preparation for the NCLEX-RN examination, be sure to take the pretest on the Evolve site and generate your study calendar. Follow the calendar for your review because the calendar represents your pretest results and the best study path to follow based on your strong areas and content areas in need of review. Also, be sure to access the *NGN cases and items* and the *Audio Review Summaries* as part of your preparation for the NCLEX-RN examination.

Climbing the Pyramid to Success

The purpose of this book is to provide a comprehensive review of the nursing content you will be tested on during

the NCLEX-RN examination. However, *Saunders Comprehensive Review for the NCLEX-RN® Examination* is intended to do more than simply prepare you for the rigors of the NCLEX-RN examination; this book is also meant to serve as a valuable study tool that you can refer to throughout your nursing program, with specific customizable Evolve site selections, including a selection for NGN cases and test items, to help identify and reinforce key content areas and prepare you for your nursing exams.

After using this book for comprehensive content review, your next step in the *Pyramid to Success* is to get additional practice with the Q&A review product. *Saunders Q&A Review for the NCLEX-RN® Examination* offers more than 6000 unique practice questions in the book and on the companion Evolve site. The questions are focused on the Client Needs and Integrated Processes of the NCLEX-RN test plan, making it easy to access your study area of choice. The Evolve site for this book also provides you with NGN cases and test items. For on-the-go Q&A review, you can pick up *Saunders Q&A Review Cards for the NCLEX-RN® Examination*.

Your final step on the *Pyramid to Success* is to master the online review. The *HESI/Saunders Online Review for the NCLEX-RN® Examination* provides an interactive and individualized platform to get you ready for your NCLEX exam. This online course provides 10 high-level

content modules, supplemented with instructional videos, animations, audio, illustrations, case studies, and several subject matter exams. End-of-module practice tests are provided, along with several *Crossing the Finish Line* practice tests. In addition, you can assess your progress with a *Pretest*, *Test Yourself* quizzes, and a *Comprehensive Exam* in a computerized environment that prepares you for the actual NCLEX-RN examination. NGN cases and test items are also provided.

At the base of the *Pyramid to Success* are our test-taking strategies, which provide a foundation for understanding and unpacking the complexities of NCLEX-RN examination questions, including alternate item formats, NGN stand-alone items, and unfolding case studies with accompanying NGN items. *Saunders Clinical Judgment and Test-Taking Strategies: Passing Nursing School and the NCLEX® Exam* takes a detailed look at clinical judgment and all of the test-taking strategies you will need to know in order to pass any nursing examination, including the Next Generation NCLEX-RN. Special tips are integrated for nursing students, and more than 1200 practice questions are included so that you can apply the testing strategies. NGN questions are included on the Evolve site.

Good luck with your journey through the *Saunders Pyramid to Success*. We wish you continued success throughout your new career as a registered nurse!

CLEX@Nepal

Acknowledgments

A Few Words From Linda

There are many individuals who in their own ways have contributed to my success in making my professional dreams become a reality. My sincere appreciation and warmest thanks are extended to all of them.

First, I want to acknowledge my parents, who opened my door of opportunity in education. I thank my mother, Frances Mary, for all of her love, support, and assistance as I continuously worked to achieve my professional goals. I thank my father, Arnold Lawrence, who always provided insightful words of encouragement. My memories of their love and support will always remain in my heart. I am certain that they are very proud of my professional accomplishments.

I also thank my best friend and love of my life, my husband, Larry; my sister, Dianne Elodia, and her husband, Lawrence; my brother, Lawrence Peter, and my sister-in-law, Mary Elizabeth; my cousin Paula; and my nieces and nephews, Angela, Katie, Gina, Karen, Brianna, Gabby, and Nicholas, who were continuously supportive, giving, and helpful during my research and preparation of this publication. They were always there and by my side whenever I needed them.

I want to thank my nursing students at the Community College of Rhode Island who approached me in 1991 and persuaded me to assist them in preparing to take the NCLEX-RN examination. Their enthusiasm and inspiration led to the commencement of my professional endeavors in conducting review courses for the NCLEX-RN examination for nursing students. I also thank the numerous nursing students who have attended my review courses for their willingness to share their needs and ideas. Their input has certainly added a special uniqueness to all of the publications in the *Pyramid to Success*.

I also wish to acknowledge all of the nursing faculty who taught in my review courses for the NCLEX-RN examination. Their commitment, dedication, and expertise have certainly assisted nursing students in achieving success

with the NCLEX-RN examination. I also want to extend a very special thank-you to my niece, Angela, for joining me in preparing and authoring these NCLEX resources. Angela

is wonderful to work with. Her tremendous theoretical and clinical knowledge and expertise and her consistently outstanding ideas and work in creating clinical judgment test-taking strategies certainly added to the excellent quality of this product and all of the other products in the *Pyramid to Success*. She is very dedicated to promoting and ensuring student success. Thank you, Angela!

A special thank-you goes to Loren Wilson, former Senior Vice President, for her years of expert guidance and continuous support for all of the products in the *Pyramid to Success*.

I would also like to acknowledge Patricia Mieg and Jeff Price, former educational sales representatives, who encouraged me to submit my ideas and initial work for the first edition of this book to the W.B. Saunders Company.

And finally, a very sincere and special acknowledgment to my husband, Laurent (Larry) W. Valliere, for his contribution to this publication, for teaching in my review courses for the NCLEX-RN examination, and for his commitment and dedication in assisting my nursing students to prepare for the examination from a nonacademic point of view. I thank him for all of his continuous support; he was so loyal and loving to me each and every moment as I worked to achieve my professional goals. Larry, you are my "rock of support!" Thank you so much!

A Few Words From Angela

There are many people who contributed to my success in my work on this product. I am very grateful for their continued support in all of my endeavors.

First and foremost, I would like to thank my husband, Brent, for his lighthearted and positive attitude. He always knows how to make me laugh, especially when I'm stressed. All of this would not be possible without him!

I would also like to thank my parents, Mary and Larry, for their continued support throughout the years. Their words of encouragement and wisdom have been tremendously important to my success. I also don't

CLEX@Nepal

know what I would do without their support in caring for my kids!

I would like to thank my sister Katie, who is a wonderful nurse. Her ambitions as a nursing student were so inspiring and reminded me about why I'm so passionate about being an educator. Thank you to my brother, Nick, who always is positive and encouraging about my work. His wit and sarcasm are always a great way to lift your mood at the end of the day.

Finally, I want to extend a special thank you to Linda for her collaboration, guidance, and expertise. Without her, I would not be where I am today. Thank you, Linda!

A Few Words From Both Linda and Angela

First and foremost, we want to thank our associate editor, Jessica Grimm, for all of her dedicated and hard work in editing and preparing manuscript for this edition. Her expertise and close attention to details have certainly added to the quality of this resource.

We also want to acknowledge and thank Laurent W. Valliere for writing a chapter addressing those important self-efficacy and nonacademic test-preparation issues.

A very special thank-you goes to all of the reviewers, contributors, and item writers who updated and provided many of the practice questions, and to all of the previous contributors to this book. You were all awesome!

Additionally, we want to thank Paula Richards for her expertise and input in reviewing our chapter titled Population Health Nursing. Thank you, Paula!

We thank Dianne E. Fiorentino for her continuous support and dedication to our work and in her research and reference support and other administrative assistant responsibilities for the ninth edition of this book. We thank Karen Machnac for her help with reference support, Jimmy Guilbault for providing medication research support, and Mary and Larry Silvestri for their assistance with getting through all of the tasks and projects we needed completed. A special thank-you to all of you!

We also want to thank Donna Ignatavicius who created the unfolding case studies for the Evolve site for this book. She has been passionate about creating teaching and learning strategies that promote thinking and

clinical judgment in nursing students. Her case studies present real-world situations that nursing graduates are likely to encounter in the clinical settings. Thank you Donna!

We sincerely acknowledge and thank some very important and special people from Elsevier. We thank Heather Bays-Petrovic, Content Strategist, for her continuous support, enthusiasm, and expert professional guidance throughout the preparation of this edition. Heather, thank you so much—you are awesome! We also thank Laurie Gower, Director of Development, for always supporting our ideas and projects. Thank you, Laurie! A very special thank-you goes to Laura Goodrich, Senior Content Development Specialist, for her tremendous amount of support and assistance, for prioritizing for us to keep us on track, for her ideas for the product, and for her professional and expert skills in organizing and maintaining an enormous amount of manuscript for production. And we thank Senior Content Development Specialist Rebecca Leenhouts for her expertise in assisting us to complete this book. Thank you, Becky! We could not have completed this project without Laura or Becky!

We want to acknowledge all of the staff at Elsevier for their tremendous help throughout the preparation and production of this publication. A special thanks to all of them. We want to thank and acknowledge Tamara Myers, Director, Traditional Nursing Program, for reviewing our Population Health Nursing chapter. Thank you Tamara! We thank Julie Eddy, Publishing Services Manager, and Margaret Reid, Senior Book Designer. You have all played such significant roles in finalizing this publication. And we need to especially acknowledge Cindy Thoms, Senior Project Manager, who so expertly managed all of our copyedited manuscript and pages for review for this book. Cindy, you were so organized, supportive, and so awesome to work with. Your attention to the many details to ensure and maintain the quality of this book was so greatly appreciated. We thank you so much!

Lastly, a very special thank-you to all our nursing students: past, present, and future. All of you light up our lives! Your love and dedication to the profession of nursing and your commitment to provide expert and quality health care will bring never-ending rewards!

UNIT I

NCLEX-RN® Exam Preparation

Clinical Judgment and the Next Generation NCLEX (NGN)-RN[®] Examination

Linda A. Silvestri, PhD, RN, FAAN

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE

The Pyramid to Success

Saunders Comprehensive Review for the NCLEX-RN[®] Examination

About This Resource and the NCLEX-RN[®] Examination

Welcome to the *Pyramid to Success* and *Saunders Comprehensive Review for the NCLEX-RN[®] Examination*. This resource is specially designed to help you begin your successful journey to the peak of the pyramid, becoming a registered nurse. As you begin your journey, you will be introduced to all of the important points regarding the NCLEX-RN examination and the process of testing, and to unique and special tips regarding how to prepare yourself for this important examination, both academically and nonacademically. You will read what a nursing graduate who recently passed the NCLEX-RN examination has to say about the test. Important test-taking strategies are detailed. These details will guide you in selecting the correct option or assist you in making an educated guess if you are not entirely sure about the correct answer; they will also guide you in ways to answer the NGN test items. Each unit in this book begins with the Pyramid to Success. The Pyramid to Success addresses specific points related to the NCLEX-RN examination. Client Needs and activities as identified in the test plan framework for the examination are listed, as are learning outcomes and competencies for the unit. Cognitive Skills identified in the National Council of State Boards of Nursing (NCSBN) Clinical Judgment Measurement Model (NCJMM) are a focus in chapters and practice questions. Pyramid Terms are key words that are defined in the glossary on the accompanying Evolve site and set in a green color throughout each chapter to direct your attention to significant points for the examination.

This resource provides you with nursing content review, including the content identified in the current NCLEX test plan, and practice questions of all types, including the NGN item types. Throughout each chapter, you will find Pyramid Point bullets  that identify areas most likely to be tested on the NCLEX-RN examination and Pyramid Alert bullets  in red text throughout the chapter that alert you to important information about nursing concepts. Each chapter includes *Clinical Judgment: Cognitive Skill client scenarios* that focus on one of the cognitive skills.

The book contains 854 NCLEX-style questions. The Evolve site accompanying this book contains all of the questions from the book plus additional Evolve questions for a total of more than 6,000 practice questions. The types of practice questions include multiple choice; fill-in-the-blank; multiple-response (select all that apply); ordered-response; questions that contain a figure, chart/exhibit, or a graphic option item; and audio item formats. Examples of some question types can be located throughout this chapter. In addition, the NGN item types are provided on the accompanying Evolve site.

As you read each chapter, identify your strengths and areas that are in need of further review.

Test your strengths and abilities by answering all practice questions provided in this book and on the accompanying Evolve site. Be sure to read all rationales and test-taking strategies. The rationale provides you with significant information regarding the correct and incorrect options. The test-taking strategy provides you with the logical path to selecting the correct option. A reference source and page number are provided so that you can easily find information you need to review in another Elsevier text. Each practice question on the accompanying Evolve site is coded on the basis of the

Level of Cognitive Ability, the Client Needs category, Clinical Judgment/Cognitive Skill, the Integrated Process, the Content Area, the Health Problem if applicable, and Priority Concepts. The Health Problem code is a unique and helpful feature that allows you to filter and select questions based on a disease process when you are practicing questions on Evolve. For example, if heart failure is your area of interest, you can select “Adult Health, Cardiovascular, Heart Failure” on the Evolve site, and all questions on this content will be generated for practice. In addition, two Priority Concepts that relate to the content of the question are identified. This code is especially helpful for students whose curriculum is concept-based. Additionally, information about all of the special features of this resource and the question types is located in the preface of this book.

Other Resources in the Saunders Pyramid to Success

There are several other resources in the Saunders Pyramid to Success program. These include the following: *The Saunders Q&A Review for the NCLEX-RN® Examination*, *The HESI/Saunders Online Review for the NCLEX-RN® Examination*, *Saunders Clinical Judgment and Test-Taking Strategies: Passing Nursing School and the NCLEX® Exam*, *Strategies for Student Success on the Next Generation NCLEX® (NGN) Test Items*, *Saunders Q&A Review Cards for the NCLEX-RN® Exam*, and *Saunders RNentertainment for the NCLEX-RN® Exam*. The HESI® Compass™ Course is also a resource for NCLEX preparation and provides you with an individual coach to guide you in your preparation. Ask your nursing instructors about institutional access to this course.

The resources in the Saunders Pyramid to Success are described in the preface of this book and can be obtained online by visiting elsevierhealth.com or by calling 800-545-2522.

Let's begin our journey through the Pyramid to Success.

TABLE 1.1 Cognitive Skills/Processes and Descriptions

Cognitive Skill/Process	Description
Recognize cues	Identifying significant data; data can be from many sources (assessment)
Analyze cues	Connecting data to the client's clinical presentation—determining if the data is expected? Unexpected? (analysis)
Prioritize hypotheses	Ranking hypotheses; what are the concerns or client needs/problems and their priority? (analysis)
Generate solutions	Using hypotheses or client needs to determine interventions for an expected outcome (planning)
Take action	Implementing the generated solutions addressing the highest priorities or hypotheses (implementation)
Evaluate outcomes	Comparing observed outcomes with expected ones (evaluation)

From Dickison, P., Haerling, K.A., & Lasater, K. (2019). Integrating the National Council of State Boards of Nursing Clinical Judgment Model into Nursing Educational Frameworks. *Journal of Nursing Education*, 58(2), 72–78.

analyzing cues; (3) prioritizing hypotheses; (4) generating solutions; (5) taking action; and (6) evaluating outcomes (Dickison et al., 2019). Table 1.1 provides a description of these six cognitive skills/processes identified in the NCJMM. The NCJMM also serves as a guide for the NCSBN to create NGN® questions. The NCJMM continues to evolve as may the NGN® item types that will be presented in the exam. All of the current NCLEX item types known as stand-alone items, the new clinical judgment stand-alone items (bow-tie and trend), and unfolding case studies that include six NGN items will be presented in the NGN. Some of these new NGN® item types can be found on the Evolve site accompanying this book, and an example of a highlight-in-table NGN item can be located in Chapter 4, Box 4.5. The NCSBN conducts ongoing research on the NGN test design and NGN items. The information in this chapter reflects what is currently published by the NCSBN. The NGN will be implemented in April 2023 and because some additional changes in item types may occur, we encourage you to frequently access the NCSBN website at www.ncsbn.org for updates about the NGN design, items, and test plan updates.

Clinical Judgment and Next Generation NCLEX® Items

Clinical judgment is the observed outcome of critical thinking and decision-making (Dickison, Haerling, & Lasater, 2019). In recent years, heightened attention has been paid to clinical judgment as a means of teaching, learning, and assessment and testing. The Next Generation NCLEX-RN® examination requires candidates to demonstrate a higher level of ability in applying clinical judgment in the delivery of client care. Clinical judgment can also be used as a test-taking strategy to answer test questions (refer to Chapter 4). The National Council of State Boards of Nursing (NCSBN) has created a Clinical Judgment Measurement Model (NCJMM) that consists of applying six cognitive skills or processes. These include: (1) recognizing cues; (2)

Examination Process

An important step in the Pyramid to Success is to become as familiar as possible with the examination process. Candidates facing the challenge of this examination can experience significant anxiety. Knowing what the examination is all about and knowing what you will

encounter during the process of testing will assist in alleviating fear and anxiety. The information contained in this chapter was obtained from the NCSBN website (www.ncsbn.org) and from the current NCSBN test plan for the NCLEX-RN and includes some procedures related to registering for the exam, testing procedures, and the answers to the questions most commonly asked by nursing students and graduates preparing to take the NCLEX. You can obtain additional information regarding the test and its development by accessing the NCSBN website and clicking on the NCLEX Examination tab or by writing to the National Council of State Boards of Nursing, 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. You are encouraged to access the NCSBN website, because this site provides you with the most up-to-date and valuable information about the NCLEX and other resources available to an NCLEX candidate. You are also encouraged to access the most up-to-date *Candidate Bulletin*. This document provides you with everything you need to know about registration procedures and scheduling a test date.

Computer Adaptive Testing

The acronym *CAT* stands for *computer adaptive test*. The exam is delivered as a variable length CAT, which allows for the exam to select stand-alone items and item sets (unfolding case studies) that are optimal for each test-taker. The stand-alone items are selected and balanced on the basis of the percentages of each of the test plan categories and subcategories. Each item is selected to target the candidate's ability level. Once all test plan requirements are met, a stopping rule is triggered in which a reliable pass-or-fail decision is made.

When taking a CAT, once an answer is recorded, all subsequent questions administered depend, to an extent, on the answer selected for that question. Skipping questions or returning to earlier questions is incompatible with the logical methodology of a CAT. The inability to skip questions or go back to change previous answers will not be a disadvantage to you; you will not fall into that "trap" of changing a correct answer to an incorrect one with the CAT system.

If you are faced with a question that contains unfamiliar content, you may need to guess at the answer. There is no penalty for guessing, but you need to make an educated guess. With most of the questions, the answer will be right there in front of you. If you need to guess, use your nursing knowledge and clinical experiences and clinical judgment skills to their fullest extent and all of the test-taking strategies you have practiced in this review program.

You do not need any computer experience to take this examination. A keyboard tutorial is provided on the NCSBN website, and you are encouraged to view the

online tutorial when you are preparing for the NCLEX examination. The tutorial will instruct you on the use of the on-screen optional calculator, the use of the mouse, and how to record an answer. The tutorial also provides instructions on how to respond to the different question types on this examination. NCSBN also provides an online tutorial about the new item types that allows you to interact with these items as much as you need to before taking the exam. In addition, at the testing site, a test administrator is present to assist in explaining the use of the computer to ensure your full understanding of how to proceed.

⚠ The new NGN item types will not be scored as either all correct or all incorrect. Instead, new scoring models will be applied for new NGN items that allow partial credit scoring for most items. For specific information on the scoring models, refer to the NCSBN website at www.ncsbn.org and the National Council of State Boards of Nursing's *Next Generation NCLEX News (2021)* at https://www.ncsbn.org/NGN_Summer21_Eng.pdf.

Development of the Test Plan

The test plan for the NCLEX-RN examination is developed by the NCSBN. The examination is a national examination; the NCSBN considers the legal scope of nursing practice as governed by state laws and regulations, including the nurse practice act, and uses these laws to define the areas on the examination that will assess the competence of the test-taker for licensure.

The NCSBN also conducts an important study every 3 years, known as a *practice analysis study*, to link the examination to nursing practice. The results of this study determine the framework for the test plan for the examination. The participants in this study include newly licensed registered nurses from all types of generalist nursing education programs. Participants of this study provide valuable information about work settings. From a list of nursing care activities (activity statements) provided, the participants are asked about the applicability, frequency, and importance of performing these activities in relation to client safety. A panel of content experts at the NCSBN analyzes the results of the study and makes decisions regarding the test plan framework.

The NCSBN also conducted extensive research and experimentation and sought out subject matter expert feedback from educators, researchers, and practicing clinical nurses about clinical experiences and health problems commonly encountered by a new graduate nurse. Findings supported the need for developing a model for measuring clinical judgment in the test plan design. This led to the development of new NGN test items and continuous research to test item reliability and validity.

Test Plan

The questions are written to address Level of Cognitive Ability, Client Needs, and Integrated Processes, including Clinical Judgment and Cognitive Skills, as identified in the test plan developed by the NCSBN.

! The content of the NCLEX-RN examination reflects the activities identified in the practice analysis study conducted by the NCSBN. Exam items are written based on the test plan framework and these activities *rather than* on content areas such as adult health, maternity, pediatrics, or mental health.

Level of Cognitive Ability

Levels of cognitive ability include remembering, understanding, applying, analyzing, evaluating, and creating. The practice of nursing requires complex thought processing and critical thinking in decision making and in making clinical judgments. Therefore, you will not encounter any *remembering* or *understanding* questions on the NCLEX. Questions on this examination are written at the *applying* level or higher in terms of cognitive ability. Table 1.2 provides descriptions and examples of each level of cognitive ability. Box 1.1 presents an example of a question that requires you to apply data.

Client Needs

The NCSBN identifies a test plan framework based on Client Needs, which includes four major categories. Some of these categories are divided further into subcategories. The Client Needs categories are Safe and Effective Care Environment, Health Promotion and Maintenance, Psychosocial Integrity, and Physiological Integrity (Table 1.3).

Safe and Effective Care Environment

The Safe and Effective Care Environment category includes two subcategories: Management of Care, and Safety and Infection Control. According to the NCSBN, Management of Care addresses prioritizing care and providing and directing nursing care that will ensure a safe care delivery setting to protect clients and health care personnel. The NCSBN indicates that Safety and Infection Control addresses content that will protect clients and health care personnel from health and environmental hazards within health care facilities and in community settings. Box 1.2 presents examples of questions that address these two subcategories.

Health Promotion and Maintenance

The Health Promotion and Maintenance category addresses the principles related to growth and development. According to the NCSBN, this Client Needs

Psychosocial Integrity

The Psychosocial Integrity category addresses content required to promote and support the ability of the client to cope, adapt, and problem-solve during stressful events. The NCSBN also indicates that this Client Needs category addresses the emotional, mental, and social well-being of the client experiencing stressful events and care for the client with an acute or chronic mental illness. See [Box 1.4](#) for an example of a question in this Client Needs category.

TABLE 1.2 Levels of Cognitive Ability: Level and Descriptions and Examples

Level	Description and Example
Remembering	Recalling, retrieving information from memorization, previous learning, or long-term memory. Example: A normal blood glucose level is 70-99mg/dL (3.9-5.5 mmol/L).
Understanding	Determining the meaning of information. Example: A blood glucose level of 60 mg/dL (3.34mmol/L) is lower than the normal reference range.
Applying	Carrying out an appropriate action based on information. Example: Administering 10–15 g of carbohydrate such as a ½ glass of fruit juice to treat mild hypoglycemia.
Analyzing	Examining concepts or data and interpreting how the concepts or data connect or relate to one another. Example: The concept is mild hypoglycemia and the connecting data are the signs and symptoms of mild hypoglycemia, such as hunger, irritability, weakness, headache, blood glucose level lower than 60 mg/dL (3.34 mmol/L).
Evaluating	Making judgments, conclusions, or validations based on evidence. Example: Determining that treatment for mild hypoglycemia was effective if the blood glucose level returned to a normal level between 70-99 mg/dL (3.9-5.5 mmol/L) and signs and symptoms resolved.
Creating	Generating or producing a new outcome or plan of care by putting parts of information together. Example: Designing a safe and individualized plan of care with the interprofessional health care team for a client with diabetes mellitus that meets the client's physiological, psychosocial, and health maintenance needs.

Adapted from *Understanding Bloom's (and Anderson and Krathwohl's) Taxonomy*, 2015, ProEdit, Inc.
<http://www.proedit.com/understanding-blooms-and-anderson-and-krathwohls-taxonomy/>

category also addresses content required to assist the individual to prevent health problems; to recognize alterations in health; and to develop health practices that promote and support optimal wellness. See [Box 1.3](#) for an example of a question in this Client Needs category.

BOX 1.1 Level of Cognitive Ability: Applying

The nurse notes blanching, coolness, and edema at the peripheral intravenous (IV) site. On the basis of these findings, the nurse would implement which action first?

1. Remove the IV.
2. Apply a warm compress.
3. Check for a blood return.
4. Measure the area of infiltration.

Answer: 1

This question requires that you focus on the **data in the question** and analyze that data to determine that the client is experiencing an infiltration. Note the **strategic word**, *first*. Next, you need to consider the harmful effects of infiltration and determine the action to implement *first*. Because infiltration can be damaging to the surrounding tissue, the appropriate *first* action is to remove the IV to prevent further damage. Once the IV is removed, further action would be taken, depending on the medication infusing at the time of infiltration and based on agency protocol. Further action may include aspiration of the fluid from the site, injection of an antidote, application of warm or cool compresses for specified time intervals, or elevation of the extremity.

TABLE 1.3 The Client Needs Categories and Subcategories and Percentage of Questions on the NCLEX-RN Examination

Client Needs Category and Subcategory	Percentage of Questions
Safe and Effective Care Environment	
Management of Care	17-23
Safety and Infection Control	9-15
Health Promotion and Maintenance	
Psychosocial Integrity	
Physiological Integrity	
Basic Care and Comfort	6-12
Pharmacological and Parenteral Therapies	12-18
Reduction of Risk Potential	9-15
Physiological Adaptation	11-17

From National Council of State Boards of Nursing: *2019 NCLEX-RN® examination: Test plan for the National Council Licensure Examination for Registered Nurses*. Chicago, 2018, National Council of State Boards of Nursing.

Physiological Integrity

The Physiological Integrity category includes four subcategories: Basic Care and Comfort, Pharmacological and Parenteral Therapies, Reduction of Risk Potential, and Physiological Adaptation. The NCSBN describes

BOX 1.2 Safe and Effective Care Environment

Management of Care

The nurse has received the client assignment for the day. Which client would the nurse assess first?

1. The client who has a nasogastric tube attached to intermittent suction
2. The client who needs to receive subcutaneous insulin before breakfast
3. The client who is 2 days postoperative and is complaining of incisional pain
4. The client who has a blood glucose level of 50 mg/dL (2.8 mmol/L) and complains of blurred vision

Answer: 4

This question addresses the subcategory Management of Care in the Client Needs category Safe and Effective Care Environment. Note the **strategic word**, *first*, so you need to establish priorities by comparing the needs of each client and deciding which need is urgent. The client described in the correct option has a low blood glucose level and symptoms reflective of hypoglycemia. This client should be assessed *first* so that treatment can be implemented. Although the clients in options 1, 2, and 3 have needs that require assessment, their assessments can wait until the client in the correct option is stabilized.

Safety and Infection Control

The nurse prepares to care for a client on contact precautions who has a hospital-acquired infection caused by methicillin-resistant *Staphylococcus aureus* (MRSA). The client has an abdominal wound that requires irrigation and has a tracheostomy attached to a mechanical ventilator, which requires frequent suctioning. The nurse would assemble which necessary protective items before entering the client's room?

1. Gloves and gown
2. Gloves and face shield
3. Gloves, gown, and face shield
4. Gloves, gown, and shoe protectors

Answer: 3

This question addresses the subcategory Safety and Infection Control in the Client Needs category Safe and Effective Care Environment. It addresses content related to protecting oneself from contracting an infection and requires that you consider the methods of possible transmission of infection, based on the client's condition. Note the **data in the question**. Because of the potential for splashes of infective material occurring during the wound irrigation or suctioning of the tracheostomy, option 3 is correct.

these subcategories as follows: Basic Care and Comfort addresses content for providing comfort and assistance to the client in the performance of activities of daily living. Pharmacological and Parenteral Therapies addresses content for administering medications and parenteral therapies, such as intravenous therapies and parenteral nutrition, and administering blood and blood products. Reduction of Risk Potential addresses content for

BOX 1.3 Health Promotion and Maintenance

The nurse is choosing age-appropriate toys for a toddler. Which toy is the best choice for this age?

1. Puzzle
2. Toy soldiers
3. Large stacking blocks
4. A card game with large pictures

Answer: 3

This question addresses the Client Needs category Health Promotion and Maintenance and specifically relates to the principles of growth and development of a toddler. Note the **strategic word**, *best*. Toddlers like to master activities independently, such as stacking blocks. Because toddlers do not have the developmental ability to determine what could be harmful, toys that are safe need to be provided. A puzzle and toy soldiers provide objects that can be placed in the mouth and may be harmful for a toddler. A card game with large pictures may require cooperative play, which is more appropriate for a school-age child.

BOX 1.4 Psychosocial Integrity

A client with end-stage chronic obstructive pulmonary disease has selected guided imagery to help cope with psychological stress. Which client statement indicates the best understanding of this stress-reduction measure?

1. "This will help only if I play music at the same time."
2. "This will work for me if I am alone in a quiet area."
3. "I need to do this when I lie down in case I fall asleep."
4. "The best thing about this is that I can use it anywhere, anytime."

Answer: 4

This question addresses the Client Needs category Psychosocial Integrity, and the content addresses coping mechanisms. Note the **strategic word**, *best*. Focus on the **subject**, a characteristic of guided imagery. Guided imagery involves the client creating an image in the mind, concentrating on the image, and gradually becoming less aware of the offending stimulus. It can be done anytime and anywhere; some clients may use other relaxation techniques or play music with it.

preventing complications or health problems related to the client's condition or any prescribed treatments or procedures. Physiological Adaptation addresses content for managing and providing care to clients with acute, chronic, or life-threatening conditions. See [Box 1.5](#) for examples of questions in this Client Needs category.

Integrated Processes

The NCSBN identifies five processes in the test plan that are fundamental to the practice of nursing. These processes are incorporated throughout the major categories of Client Needs. The Integrated Process subcategories are Caring, Communication and Documentation, Nursing Process (Assessment, Analysis, Planning, Implementation, and Evaluation), Culture and Spirituality, and Teaching and Learning. See [Box 1.6](#) for an example of a question that incorporates the Integrated Process of Caring.

Types of Questions on the Examination and Scoring

The types of questions on the current NCLEX include multiple-choice; fill-in-the-blank; multiple-response; ordered-response (prioritizing); image (hot spot) questions; figure, chart/exhibit, or graphic option items; and audio formats. These question types will continue to be a part of the NCLEX examination, and each of these question types will be scored as either correct or incorrect, known as *dichotomous scoring*. Currently, no partial credit is given. Thus, the possible points for these question types will be 0 or 1 point. Examples of these question types follow.

The NGN question types will also be on the exam, starting in April 2023, and will use a case study approach

as stand-alone items and unfolding case studies. The stand-alone items will be accompanied by a question that tests more than one cognitive skill. Each unfolding case study will be accompanied by six NGN item type questions, and each cognitive skill will be tested. Every candidate will be administered three unfolding case studies, each with six accompanying items. These three unfolding case studies will be administered within the first 85 questions on the exam (minimum length exam). After the minimum-length exam, if a stopping rule is not triggered, then the exam will continue and stand-alone items (bow-tie and trend) will be administered as part of the exam. Examples of both stand-alone items and unfolding case studies and NGN items can be located on the Evolve site accompanying this book. These are specially designed to simulate the NCLEX experience of testing for these NGN item types. Both NGN stand-alone items (currently known as bow-tie and trend) and unfolding cases with accompanying NGN items are included. Refer to the Evolve site for practice with these question types. Additionally, the unique test-taking strategies used to answer NGN items are illustrated with each bow-tie and trend item and with items accompanying the unfolding case studies. [Chapter 4, Box 4.5](#) provides an example of one type of NGN question and its unique test-taking strategy.

In addition to the stand-alone items (bow-tie and trend), according to the NCSBN, other NGN item types will be used. [Table 1.4](#) provides a list of the NGN question types. The NCSBN also identifies three scoring methods for NGN items. These scoring methods are described in [Table 1.5](#).

The NCSBN provides specific directions for you to follow with all question types on the NCLEX to guide you through the testing process. Be sure to read these directions as they appear on the computer screen.

BOX 1.5 Physiological Integrity**Basic Care and Comfort**

A client with Parkinson's disease develops akinesia while ambulating, increasing the risk for falls. Which suggestion would the nurse provide to the client to alleviate this problem?

1. Use a wheelchair to move around.
2. Stand erect and use a cane to ambulate.
3. Keep the feet close together while ambulating and use a walker.
4. Consciously think about walking over imaginary lines on the floor.

Answer: 4

This question addresses the subcategory Basic Care and Comfort in the Client Needs category Physiological Integrity and addresses client mobility and promoting assistance in an activity of daily living to maintain safety. Focus on the **subject**, akinesia. Clients with Parkinson's disease can develop bradykinesia (slow movement) or akinesia (freezing or no movement). Having these clients imagine lines on the floor to walk over can keep them moving forward while remaining safe.

Pharmacological and Parenteral Therapies

The nurse monitors a client receiving digoxin for which early manifestation of digoxin toxicity?

1. Anorexia
2. Facial pain
3. Photophobia
4. Yellow color perception

Answer: 1

This question addresses the subcategory Pharmacological and Parenteral Therapies in the Client Needs category Physiological Integrity. Note the **strategic word**, *early*. Digoxin is a cardiac glycoside that is used to manage and treat heart failure in some clients and to control ventricular rates in some clients with atrial fibrillation. The most common early manifestations of toxicity include gastrointestinal disturbances such as anorexia, nausea, and vomiting. Neurological abnormalities can also occur early and include fatigue, headache, weakness, depression, drowsiness, confusion, and nightmares. Facial pain, personality changes, and ocular disturbances (photophobia, diplopia, light flashes, halos around bright objects, yellow or green color perception) are also signs of toxicity, but are not early signs.

Reduction of Risk Potential

A magnetic resonance imaging (MRI) study is prescribed for a client with a suspected brain tumor. The nurse would implement which action to prepare the client for this test?

1. Shave the groin for insertion of a femoral catheter.
2. Remove all metal-containing objects from the client.
3. Keep the client NPO (nothing by mouth) for 6 hours before the test.
4. Instruct the client in inhalation techniques for the administration of a radioisotope.

Answer: 2

This question addresses the subcategory Reduction of Risk Potential in the Client Needs category Physiological Integrity, and the nurse's responsibilities in preparing the client for the diagnostic test to prevent risks associated with the test. Focus on the **subject**, preparing a client for an MRI. In an MRI study, radiofrequency pulses in a magnetic field are converted into pictures. All metal objects, such as rings, bracelets, hairpins, and watches, should be removed. In addition, a history should be taken to ascertain whether the client has any internal metallic devices, such as orthopedic hardware, pacemakers, or shrapnel. An intravenous (IV) catheter may be inserted if a contrast agent is prescribed. A femoral catheter is not used for this diagnostic test. Additionally, shaving is not a common practice because of the risk for microabrasions and infection. If needed, hair may be clipped away from an insertion site. NPO status is not necessary for an MRI study of the head. Inhalation of a radioisotope may be prescribed with other types of scans, but it is not a part of the procedures for an MRI.

Physiological Adaptation

A client with renal insufficiency has a magnesium level of 3.5 mEq/L (1.44 mmol/L). On the basis of this laboratory result, the nurse interprets which sign as significant?

1. Hyperpnea
2. Drowsiness
3. Hypertension
4. Physical hyperactivity

Answer: 2

This question addresses the subcategory Physiological Adaptation in the Client Needs category Physiological Integrity. It addresses an alteration in body systems. Focus on the **data in the question**. The normal magnesium level is 1.8 to 2.6 mEq/L (0.74 to 1.07 mmol/L). A magnesium level of 3.5 mEq/L (1.44 mmol/L) indicates hypermagnesemia. Neurological manifestations begin to occur when magnesium levels are elevated and are noted as symptoms of neurological depression, such as drowsiness, sedation, lethargy, respiratory depression, muscle weakness, and areflexia. Bradycardia and hypotension also occur.

Examples of some of these types of questions are noted in this chapter and in this book, and all types, including the NGN items, are on the accompanying Evolve site.

Multiple-Choice Questions

Some of the questions that you will be asked to answer will be in the multiple-choice format. These questions provide you with data about a client situation and four answers, or options. Only one answer is correct.

Fill-in-the-Blank Questions

Fill-in-the-blank questions will ask you to perform a medication calculation, determine an intravenous flow rate, or calculate an intake or output record on a client. You will need to type only a number (your answer) in the answer box. If the question requires rounding the answer, this needs to be performed at the end of the calculation. The rules for rounding an answer are described in the tutorial provided by the NCSBN and are also provided in the specific question on the computer screen.

BOX 1.6 Integrated Processes

A client is scheduled for angioplasty. The client says to the nurse, “I’m so afraid that it will hurt and will make me worse off than I am.” Which response by the nurse is therapeutic?

1. “Can you tell me what you understand about the procedure?”
2. “Your fears are a sign that you really should have this procedure.”
3. “Those are very normal fears, but please be assured that everything will be okay.”
4. “Try not to worry. This is a well-known and easy procedure for the cardiologist.”

Answer: 1

This question addresses the subcategory Caring in the category of Integrated Processes. It also addresses the concept of communication. The correct option utilizes a **therapeutic communication technique** that explores the client’s feelings, determines the level of client understanding about the procedure, and displays caring. Option 2 demeans the client and does not encourage further sharing by the client. Option 3 does not address the client’s fears, provides false reassurance, and puts the client’s feelings on hold. Option 4 diminishes the client’s feelings by directing attention away from the client and toward the cardiologist’s importance.

TABLE 1.4 NGN Item Types

Type of Item/Case Scenario	Description	Item Types
Stand-alone Item	A stand-alone item will include a short scenario about a client and will be accompanied by one question that tests more than one cognitive skill.	Bow-tie Trend
Unfolding Case	An unfolding case study will include phases as the story about the client unfolds and changes. This will be accompanied by six NGN item type questions, and each of the six cognitive skills will be tested.	Highlight in Text Highlight in Table Matrix Multiple Choice Matrix Multiple Response Multiple Response Select N Multiple Response Select All That Apply Multiple Response Grouping Drag and Drop Cloze Drag and Drop Rationale Drop Down Cloze Drop Down Rationale Drop Down in Table

From Betts, J., Muntean, W., Kim, D, Kao, S. (Winter 2022). *Next Generation NCLEX®: Test design*. Chicago, NCSBN; National Council of State Boards of Nursing. (2022). *Next Generation NCLEX News*. Retrieved from [NGN_Winter22_English_Final.pdf](https://www.ncsbn.org/NGN_Winter22_English_Final.pdf) (ncsbn.org).

TABLE 1.5 NGN Scoring Methods

Method	Description
Plus-Minus (+/-) Scoring	One point is given for each correct response. One point is subtracted for each incorrect response. No negative scores; if the sum is negative, a zero is assigned. Used when the test-taker can select any number of options, such as a highlight in text, highlight in table, multiple response (select all that apply), multiple response grouping, or a matrix multiple response
Zero-One-(0/1) Scoring	One point is given for each correct response. Zero points given for incorrect responses. Points are NOT subtracted for incorrect responses. Used for items such as drag and drop cloze, drop down cloze, drop down-in-table, matrix multiple choice, multiple response select N or bow-tie
Rationale Scoring	One point is given for each correct <i>grouping</i> of response elements; both parts of the paired information must be correct to earn a point. Used when elements of a response are linked, such as drop down rationale or drag and drop rationale items

From National Council of State Boards of Nursing. (2021). *Next Generation NCLEX News*. Retrieved from https://www.ncsbn.org/NGN_Summer21_Eng.pdf; National Council of State Boards of Nursing. (2021). *Braving new pathways: Leading the way for regulatory transformation, 2021 NCSBN annual meeting*.

BOX 1.7 Fill-in-the-Blank Question

A prescription reads: acetaminophen liquid, 650 mg orally every 4 hours PRN for pain. The medication label reads: 500 mg/15 mL. The nurse prepares how many milliliters to administer one dose? Fill in the blank. Record your answer using one decimal place.

Answer: 19.5 mL

$$\text{Formula: } \frac{\text{Desired}}{\text{Available}} \times \text{Volume} = \text{mL}$$

$$\frac{650 \text{ mg}}{500 \text{ mg}} \times 15 \text{ mL} = 19.5 \text{ mL}$$

In this question, you need to focus on the **subject**, mL per dose, and use the formula for calculating a medication dose. When the dose is determined, you will need to type your numeric answer in the answer box. Always follow the specific directions noted on the computer screen. Also, remember that there will be an on-screen calculator on the computer for your use.

In addition, you must type in a decimal point if necessary. See **Box 1.7** for an example.

Multiple-Response Question

For a multiple-response question, also known as a “select all that apply (SATA)” question, you will be asked

to select or check all of the options, such as nursing interventions, that relate to the information in the question. In these question types, there may be one correct answer, there may be more than one correct answer, or all answers could be correct. See [Box 1.8](#) for an example.

Ordered-Response Question

In this type of question, you will be asked to place nursing actions in order of priority. Information will be presented in a question and, based on the data, you need to determine what you will do first, second, third, and so forth. Specific directions for answering are provided with the question. See [Figure 1.1](#) for an example.

Figure or Hot Spot Question

A question with a picture or graphic will ask you to answer the question based on the picture or graphic. The question could contain a chart, a table, or a figure or illustration. You also may be asked to use the computer mouse to point and click on a specific area (hot spot) in the visual. A chart, table, figure, or illustration may appear in any type of question, including a multiple-choice question. See [Box 1.10](#) for an example.

Chart/Exhibit Question

In this type of question, you will be presented with a client situation and a chart, medical record, or exhibit. You will be provided with tabs or buttons that you need to click to obtain the information needed to answer the question. A prompt or message will appear that will indicate the need to click on a tab or button. See [Box 1.9](#) for an example.

Graphic Item Option Question

In this type of question, the option selections will be pictures rather than text. You will select the option

that represents your answer choice. See [Box 1.11](#) for an example.

Audio Questions

Audio questions will require listening to a sound to answer the question. These questions will prompt you to use the headset provided and to click on the sound icon. You will be able to click on the volume button to adjust the volume to your comfort level, and you will be able to listen to the sound as many times as necessary. Content examples include, but are not limited to, various lung sounds, heart sounds, or bowel sounds. Examples of this question type are located on the accompanying Evolve site. See [Figure 1.2](#) for an example.

 The NCSBN provides a practice test for candidates that is composed of previously used NCLEX questions that are no longer a part of the NCLEX. This exam simulates the look of the real exam and provides the candidate with practice for the NCLEX. This practice test can be purchased through the NCSBN at www.ncsbn.org

Registering to Take the Examination

It is important to obtain an NCLEX Examination Candidate Bulletin from the NCSBN website at www.ncsbn.org, because this bulletin provides all of the information you need to register for and schedule your examination. It also provides you with website and telephone information for NCLEX examination contacts. The initial step in the registration process is to submit an application to the state board of nursing in the state in which you intend to obtain licensure. You need to obtain information from the board of nursing regarding

BOX 1.8 Multiple-Response Question

The emergency department nurse is caring for a child suspected of acute epiglottitis. Which interventions apply in the care of the child? Select all that apply.

- 1. Obtain a throat culture.
- 2. Auscultate lung sounds.
- 3. Maintain the child in a supine position.
- 4. Obtain a pediatric-size tracheostomy tray.
- 5. Place the child on an oxygen saturation monitor.
- 6. Prepare the child for a lateral neck and chest x-ray.

In a multiple-response question, you will be asked to select or check all of the options, such as interventions, that relate to the information in the question. Focus on the **subject**, interventions for the child with suspected acute epiglottitis. To answer this question, recall that acute epiglottitis is a serious obstructive inflammatory process that requires immediate intervention and that airway patency is a priority. Auscultating lung sounds allows the nurse to obtain information about airway patency without causing further airway compromise, which can happen by examining the throat. Examination of the throat with a tongue depressor or attempting to obtain a throat culture is contraindicated because the examination can precipitate further obstruction. A lateral neck and chest x-ray is obtained to determine the degree of obstruction, if present. To reduce respiratory distress, the child should sit upright. The child is placed on an oxygen saturation monitor to monitor oxygenation status. Tracheostomy and intubation may be necessary if respiratory distress is severe. Remember to follow the specific directions given on the computer screen.

SAUNDERS COMPREHENSIVE REVIEW FOR THE **NCLEX-RN® EXAMINATION** 7TH EDITION **Silvestri**

Home History **Study Mode** Calculator Help

Question 1 of 42 < 1 Go > Bookmark Stop

A client has a tracheostomy tube with a nondisposable inner cannula, and the nurse prepares to clean the tube. The nurse explains the procedure to the client, performs hand hygiene, and sets up a sterile field with appropriate equipment. **Arrange the actions in the order that they should be performed. All options must be used.**

Drag the text in the left column to the correct order in the right column.

Dons sterile gloves and suctions the tracheostomy	1	
Documents the procedure and the client's response	2	
Dons sterile gloves, unlocks and removes the inner cannula	3	
Cleans the inner cannula, replaces it, and locks it into place	4	
Removes the dressing and discards it, and removes sterile gloves	5	
Cleans the tracheostomy site, changes the ties, and applies a dressing	6	

Rationale Strategy Student Tip Reference(s) Submit Reset

FIG. 1.1 Example of an ordered-response question.

the specific registration process, because the process may vary from state to state. Then, use the NCLEX Examination Candidate Bulletin as your guide to complete the registration process.

Following the registration instructions and completing the registration forms precisely and accurately are important. Registration forms not properly completed or not accompanied by the proper fees in the required method of payment will be returned to you and will delay testing. You must pay a fee for taking the examination; you also may have to pay additional fees to the board of nursing in the state in which you are applying.

Authorization to Test Form and Scheduling an Appointment

Once you are eligible to test, you will receive an Authorization to Test (ATT) form. You cannot make an appointment until you receive an ATT form. Note the validity dates on the ATT form, and schedule a testing date and time before the expiration date on the ATT form. The NCLEX Examination Candidate Bulletin provides you with the directions for scheduling an appointment; you

do not have to take the examination in the same state in which you are seeking licensure.

The ATT form contains important information, including your test authorization number, candidate identification number, and validity date. You need to take your ATT form to the testing center on the day of your examination. You will not be admitted to the examination if you do not have it.

Changing Your Appointment

If for any reason you need to change your appointment to test, you can make the change on the candidate website or by calling candidate services. Refer to the NCLEX Examination Candidate Bulletin for this contact information and other important procedures for canceling and changing an appointment. If you fail to arrive for the examination or fail to cancel your appointment to test without providing appropriate notice, you will forfeit your examination fee and your ATT form will be invalidated. This information will be reported to the board of nursing in the state in which you have applied for licensure, and you will be required to register and pay the testing fees again.

BOX 1.9 Chart/Exhibit Question

A 30-year-old client visits the clinic and requests a prescription for oral contraceptives. The nurse performs an assessment on the client and reviews the history and physical examination documented in the medical record from the client's previous visit. The nurse determines that oral contraceptives are contraindicated because of which documented items? Refer to chart. Select all that apply.

Client's Chart

History and Physical	Medications	Diagnostic Results
Past medical history:	Multivitamin 1 orally daily	Renal ultrasound shows no hydronephrosis, no renal artery stenosis
Deep vein thrombosis with associated thrombophlebitis	Lisinopril 40 mg orally daily	Complete blood cell count shows white blood cells (WBC) 5,000 mm ³ (5 × 10 ⁹ /L), hemoglobin (Hgb) 16 g/dL (60 g/L), hematocrit (Hct) 47% (0.47), platelets 590,000 mm ³ (590 × 10 ⁹ /L)
Hypertension	Atorvastatin 10 mg orally daily	
Coronary artery disease	Metformin 500 mg orally twice daily	
Prediabetes		

- 1. Hypertension
- 2. Prediabetes
- 3. Coronary artery disease
- 4. Renal ultrasound results
- 5. Takes multivitamin orally daily
- 6. Takes lisinopril 40 mg orally daily

- 7. Takes atorvastatin 10 mg orally daily
- 8. Complete blood cell count results
- 9. Takes metformin 500 mg orally twice daily
- 10. Past medical history of deep vein thrombosis with associated thrombophlebitis

Answer: 1, 3, 8, 10

This chart/exhibit question provides you with data from the client's medical record. Focus on the **subject**, the item(s) that are a contraindication to the use of oral contraceptives. Oral contraceptives are contraindicated in women with a history of any of the following: thrombophlebitis and thromboembolic disorders, cardiovascular or cerebrovascular diseases (including stroke), any estrogen-dependent cancer or breast cancer, benign or malignant liver tumors, impaired liver function, hypertension, and diabetes mellitus with vascular involvement. This client has prediabetes, which is not a contraindication. Items 1 and 3 are cardiovascular diseases. The client has hypertension, coronary artery disease, and deep vein thrombosis with associated thrombophlebitis, all contraindications to the use of oral contraceptives. The renal ultrasound result is not significant. The medications the client is taking are not specific contraindications to oral contraceptives. The normal WBC is 5000-10,000 mm³ (5-10 × 10⁹/L). The normal Hgb ranges from 12-18 g/dL (120-180 g/L). The normal Hct ranges from 37-52% (0.37-0.52). The normal platelet count is 150,000-400,000 mm³ (150-400 × 10⁹/L). Item 8 has components that indicate a contraindication; of note is that the platelet count is elevated and thus this client has polycythemia, which is a thromboembolic disorder and therefore a contraindication for the use of oral contraceptives. Option 10 notes that the client has a history of deep vein thrombosis with associated thrombophlebitis, a contraindication to the use of oral contraceptives.

BOX 1.10 Figure Question

A client who experienced a myocardial infarction is being monitored via cardiac telemetry. The nurse notes the sudden onset of this cardiac rhythm on the monitor (refer to figure) and immediately takes which action?

1. Takes the client's blood pressure
2. Initiates cardiopulmonary resuscitation (CPR)
3. Places a nitroglycerin tablet under the client's tongue
4. Continues to monitor the client and then contacts the cardiologist

Answer: 2

This question requires you to identify the cardiac rhythm and then determine the priority nursing action. Note the **strategic**

word, *immediately*. This cardiac rhythm identifies a coarse ventricular fibrillation (VF). The goals of treatment are to terminate VF promptly and to convert it to an organized rhythm. The physician, cardiologist, or an Advanced Cardiac Life Support (ACLS)-qualified nurse must immediately debrillate the client. If a debrillator is not readily available, CPR is initiated until the debrillator arrives. Options 1, 3, and 4 are incorrect actions and delay lifesaving treatment.

Day of the Examination

It is important that you arrive at the testing center at least 30 minutes before the test is scheduled. If you arrive late for the scheduled testing appointment, you may be required to forfeit your examination appointment. If it is necessary to forfeit your appointment, you will need to reregister for the examination and pay an additional fee. The board of nursing will be notified that you did not take the test. A few days before your scheduled date of testing, take the time to drive to the testing center to determine its exact location, the length of time required to arrive at that destination, and any potential obstacles that might delay you, such as road construction, traffic, or parking sites.

In addition to the ATT form, you must have proper identification (ID), such as a U.S. driver's license, passport, U.S. state ID, or U.S. military ID, to be admitted to take the examination. All acceptable identification must be valid and not expired and contain a photograph and signature (in English). In addition, the first and last names on the ID must match the ATT form. According to the NCSBN guidelines, any name discrepancies require legal documentation, such as a marriage license, divorce decree, or court action legal name change. Refer to the NCLEX Examination Candidate Bulletin for acceptable forms of identification.

BOX 1.11 Graphic Item Option Question

The nurse would place the client in which position to administer an enema? (Refer to the figures in 1 to 4.)

Answer: 2

This question requires you to select the picture that represents your answer choice. Focus on the **subject**, the position for administering an enema. To administer an enema, the nurse assists the client into the modified left lateral side-lying position with the right knee flexed. This position allows the enema solution to flow downward by gravity along the natural curve of the sigmoid colon and rectum, improving the retention of solution. Option 1 is a prone position. Option 3 is a dorsal recumbent position. Option 4 is a supine position.

FIG. 1.2 Example of an audio question.

Testing Accommodations

If you require testing accommodations, you should contact the board of nursing before submitting a registration form. The board of nursing will provide the procedures for the request. The board of nursing must authorize testing accommodations. Following board of nursing approval, the NCSBN reviews the requested accommodations and must approve the request. If the request is approved, the candidate will be notified and provided the procedure for registering for and scheduling the examination.

Testing Center

The testing center is designed to ensure complete security of the testing process. Strict candidate identification requirements have been established. You will be asked to read the rules related to testing. A digital fingerprint and palm vein print will be taken. A digital signature and photograph will also be taken at the testing center. These identity confirmations will accompany the NCLEX exam results. In addition, if you leave the testing room for any reason, you may be required to perform these identity confirmation procedures again to be readmitted to the room.

Personal belongings are not allowed in the testing room; all electronic devices must be placed in a sealable bag provided by the test administrator and kept in a locker. Any evidence of tampering with the bag could result in the need to report the incident and test cancellation. A locker and locker key will be provided for you; however, storage space is limited, so you must plan accordingly. In addition, the testing center will not assume responsibility for your personal belongings. The testing waiting areas are generally small; friends or family members who accompany you are not permitted to wait in the testing center while you are taking the examination.

Once you have completed the admission process, the test administrator will escort you to the assigned computer. You will be seated at an individual workspace area that includes computer equipment, appropriate lighting, an erasable note board, and a marker. No items, including unauthorized scratch paper, are allowed into the testing room. Eating, drinking, or the use of tobacco is not allowed in the testing room. You will be observed at all times by the test administrator while taking the examination. In addition, video and audio recordings of all test sessions are made. The testing center has no control over the sounds made by typing on the computer by others. If these sounds are distracting, raise your hand to summon the test administrator. Earplugs are available on request.

You must follow the directions given by the testing center staff and must remain seated during the test except when authorized to leave. If you think that you have a problem with the computer, need a clean note board, need to take a break, or need the test administrator

for any reason, you must raise your hand. You are also encouraged to access the NCSBN candidate website to obtain additional information about the physical environment of the testing center and to view a virtual tour of the testing center.

NGN Test Design

The time allowed for the exam is 5 hours; this period includes the tutorial, the sample items, all breaks, and the examination. All breaks are optional. Remember that all breaks count against testing time. If you take a break, you must leave the testing room, and when you return, you may be required to perform identity confirmation procedures to be readmitted. Pretest items will be a part of the examination. The pretest questions are 15 questions that may be presented as scored questions on future examinations. These pretest questions are not identified as such. In other words, you do not know which questions are the pretest (unscored) questions. Pretest questions will be presented within the first 85 questions and will come in one of three combinations: all stand-alone items (current NCLEX type items); one unfolding case study with 6 items and 9 stand-alone items; or 2 unfolding case studies (12 items) and 3 stand-alone items. [Table 1.6](#) provides information about the test design.

Pass-or-Fail Decisions

All examination questions are categorized by test plan area and level of difficulty. This is an important point to keep in mind when you consider how the computer makes a pass-or-fail decision, because a pass-or-fail decision is not based on a percentage

TABLE 1.6 NGN Test Design

Features	Specifications
Total exam length (minimum length-maximum length)	85 - 150
Scored items (minimum length-maximum length)	70 - 135
Unfolding case studies	3 (18 items) ^a
Stand-alone items	52 - 117 ^b
CJ Stand-alone items (bowtie or trend) (minimum length-maximum length)	0 - 6 to 7
Pretest (unscored) items	15
Time allowed	5 hours

^aItems within a case study are static, not adaptive

^bRange possible due to variable-length CAT

Modified from Betts, J., Muntean, W., Kim, D, Kao, S. (Winter 2022). *Next Generation NCLEX®: Test design*. Chicago, NCSBN; National Council of State Boards of Nursing. (2022). *Next Generation NCLEX News*. Retrieved from [NGN_Winter22_English_Final.pdf](#) (ncsbn.org).

of correctly answered questions. Additional information about pass-or-fail decisions can be found in the NCLEX Examination Candidate Bulletin located at www.ncsbn.org.

Completing the Examination

When the examination has ended, you will complete a brief computer-delivered questionnaire about your testing experience. After you complete this questionnaire, you need to raise your hand to summon the test administrator. The test administrator will collect and inventory all note boards and then permit you to leave.

Processing Results

Every computerized examination is scored twice, once by the computer at the testing center and again after the examination is transmitted to the test scoring center. No results are released at the testing center; additionally, testing center staff do not have access to examination results. The board of nursing receives your result, and your result will be mailed to you approximately 6 weeks after you take the examination. In some states, an unofficial result can be obtained via the Quick Results Service two business days after taking the examination. There is a fee for this service, and information about obtaining your NCLEX result by this method can be obtained on the NCSBN website under candidate services.

Candidate Performance Report

A candidate performance report is provided to a test-taker who failed the examination. This report provides the test-taker with information related to the passing standard on each client needs category and subcategory specified in the test plan, and whether the test-taker was above, below, or near the standard. A clinical judgment overall score is also provided along with scores for each cognitive skill (recognize cues, analyze cues, prioritize hypotheses, generate solutions, take action, and evaluate outcomes). This report provides a guide for studying and retaking the examination. If a retake is necessary, the candidate must wait 45 days between examinations, depending on state procedures. Test-takers should refer to the state board of nursing in the state in which licensure is sought for procedures regarding when the examination can be taken again.

Interstate Endorsement and Nurse Licensure Compact

Because the NCLEX-RN examination is a national examination, you can apply to take the examination

BOX 1.12 International-Educated Nurse: Some Documents Needed to Obtain Licensure

1. Proof of citizenship or lawful alien status
2. Work visa
3. VisaScreen certificate
4. Commission on Graduates of Foreign Nursing Schools (CGFNS) certificate
5. Criminal background check documents
6. Official transcripts of educational credentials sent directly to credentialing agency or board of nursing from home country school of nursing
7. Validation of a comparable nursing education as that provided in U.S. nursing programs; this may include theoretical instruction and clinical practice in a variety of nursing areas including, but not limited to, medical nursing, surgical nursing, pediatric nursing, maternity and newborn nursing, community and public health nursing, and mental health nursing
8. Validation of safe professional nursing practice in home country
9. Copy of nursing license or diploma or both
10. Proof of proficiency in the English language
11. Photograph(s)
12. Social Security number
13. Application and fees

in any state. When licensure is received, you can apply for interstate endorsement, which is obtaining another license in another state to practice nursing in that state. The procedures and requirements for interstate endorsement may vary from state to state, and these procedures can be obtained from the state board of nursing in the state in which endorsement is sought. It may be possible to practice nursing in another state under the mutual recognition model of nursing licensure if the state has enacted a Nurse Licensure Compact. To obtain information about the Nurse Licensure Compact and the states that are part of this interstate compact, access the NCSBN website at www.ncsbn.org.

The International-Educated Nurse

An important first step in the process of obtaining information about becoming a registered nurse in the United States is to access the NCSBN website at www.ncsbn.org and obtain the most current information provided for international nurses in the NCLEX website link about seeking licensure. The NCSBN provides information about some of the documents you need to obtain as an international nurse seeking licensure in the United States and about credentialing agencies. Refer to [Box 1.12](#) for a listing of some of these documents. The NCSBN also provides information regarding the requirements for education and English proficiency, and immigration requirements such as visas and VisaScreen.

An important factor to consider as you pursue this process is that some requirements may vary from state to state. You need to contact the board of nursing in the state in which you are planning to obtain licensure to determine the specific requirements and documents that you need to submit.

Boards of nursing can decide either to use a credentialing agency to evaluate your documents or to review your documents at the specific state board, known as in-house evaluation. When you contact the board of nursing in the state in which you intend to work as a nurse, inform them that you were educated outside of the

United States and ask that they send you an application to apply for licensure by examination. Be sure to specify that you are applying for registered nurse (RN) licensure. You should also ask about the specific documents needed to become eligible to take the NCLEX exam. You can obtain contact information for each state board of nursing through the NCSBN website at www.ncsbn.org. In addition, you can write to the NCSBN regarding the NCLEX exam. The address is 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. The telephone number for the NCSBN is 1-866-293-9600; international telephone is 1 011 312 525 3600; the fax number is 1-312-279-1032.

Self-Efficacy and Pathways to Success

Laurent W. Valliere, BS, DD

The Pyramid to Success

Preparing to take the NCLEX-RN® examination can produce a great deal of anxiety. You may be thinking that this exam is the most important test you will ever have to take and that it reflects the culmination of everything you have worked so hard for. This is an important examination because receiving your nursing license means that you can begin your career as a registered nurse. Your success on this exam involves freeing yourself of all thoughts that allow this examination to appear overwhelming and intimidating. Such thoughts can take control over your destiny. A strong positive attitude, self-efficacy, a structured plan for preparation, and the development of self-control in your pathway to success ensure reaching the peak of the Pyramid to Success (Fig. 2.1). For additional information about study habits, testing, and test anxiety, we refer you to *Saunders 2022-2023 Clinical Judgment and Test-Taking Strategies*.

Self-Efficacy

The concept of self-efficacy was originally proposed by Albert Bandura (1977) in social science research in developing social cognitive theory. This theory has been used extensively in the field of psychology. Central to Bandura's work are the concepts of self-efficacy and self-efficacy (outcome) expectations. The concept of self-efficacy is described as a type of self-reflection that affects one's behavior (Bandura, 1977). Self-reflection enables an individual to assess their own experiences, develop perceptions about their own capabilities that guide behavior, and determine how much effort will ensue for performance. Thus, self-reflection leads to an individual's self-efficacy expectations and confidence in the ability to succeed.

! A study by Silvestri, Clark, & Moonie (2013) showed that self-efficacy expectations were an important predictor for NCLEX success.

Self-Efficacy Expectations

Self-efficacy expectations are focused on the belief in one's own capacity to carry out particular behaviors. These expectations determine the behaviors a person chooses to perform, the degree of perseverance, and the quality of the performance. Bandura (1997) describes self-efficacy as an individual's belief regarding their abilities to successfully perform activities or tasks and indicates that the stronger the sense of self-efficacy, the more confident one is to succeed. In applying Bandura's (1977) theory to NCLEX success, if you have high self-efficacy expectations, you will work hard and persevere and believe that you will achieve NCLEX success. Conversely, if your self-efficacy expectations are low, this could lead to self-doubt about your ability to achieve success on NCLEX.

Pathways to Success: Increasing Self-Efficacy

Self-Reflection

Self-reflection enables individuals to assess their own experiences, develop perceptions about their capabilities that guide behavior, and determine how much effort will ensue for performance. Thus, self-reflection leads to an individual's self-efficacy expectations and confidence in the ability to succeed. According to Bandura (1997), individuals possess a self-regulatory function that provides the capability to influence their own cognitive processes and actions and thus alter their environments. Therefore, whatever self-efficacy beliefs an individual holds will help to determine what activities the individual will pursue, the effort that they will expend in pursuing these activities, and how long they will persist in the face of obstacles and hardships.

To start, take time to self-reflect. Think about your accomplishments and how you achieved them. Journal these accomplishments and keep them in mind. Review them whenever you begin to feel self-doubt about your

FIG. 2.1 Pyramid to Success.

ability to succeed on the NCLEX. Some self-reflection questions to ask yourself include:

1. Am I a goal-setter?
2. Do I develop a plan and determine what activities I need to pursue to achieve my goals?
3. Do I set goals that are unrealistic to achieve in a specific time frame?
4. Do I accomplish the goals that I set?
5. How much time and effort do I put in to accomplish my goals?
6. Do I find ways to achieve my goals when I am faced with life challenges and obstacles?
7. How do I feel when I accomplish a goal?

The Foundation (Box 2.1)

The foundation begins with a strong positive attitude, a sense of self-efficacy, a belief that you will achieve success, and a commitment to develop self-control. It also includes developing a list of your personal short-term and long-term goals and a plan for preparation. Without these components, your pathway to success leads to nowhere and has no endpoint. You will expend energy and valuable time in your journey, lack control over where you are heading, and experience exhaustion without any accomplishment.

Where do you start to build your foundation? To begin, find a location that offers solitude. Sit or lie in a comfortable position, close your eyes, relax, inhale deeply through your nose, hold your breath to a count of 4, exhale slowly through your mouth, and, again, relax. Repeat this breathing exercise several times until you feel relaxed, free from anxiety, and in control of your destiny. Allow your mind to become void of all mind chatter; now you are in control and your mind's eye can see for miles. Next, self-reflect and think about the answers to the self-reflection questions. Think about all that you have accomplished and the path that brought you to where you are today. Maintain a journal of your reflections as you plan the order of your journey through the Pyramid to Success.

! Create a list of your goals related to NCLEX preparation. Open your calendar and start with listing your daily goals and what you want to accomplish each day. Your daily goal could be to practice a specific number of questions, review a specific content area, or to spend time resting and relaxing!

The List

It is time to create the "List." The List is your set of short-term and long-term goals. Begin by developing the goals that you wish to accomplish today, tomorrow, over the next month, and in the future. Allow yourself the opportunity to list all that is flowing from your mind. Write your goals in your journal. When the List is complete, put it away for 2 or 3 days. After that time, retrieve and review the List and begin the process of planning to prepare for the NCLEX-RN exam.

Plan for Preparation

Now that you have the List in order, look at the goals that relate to studying for the licensing exam. The first task is to decide what study pattern works best for you. Think about what has worked most successfully for you in the past. Questions that can be addressed to develop your plan for study are listed in Box 2.2.

The plan needs to include a schedule. Use a calendar to plan and document the daily times and nursing content areas for your study sessions. Establish a realistic schedule that includes your daily, weekly, and future goals, and stick to your plan of study. This consistency will provide advantages to you and the people supporting you. You will develop a rhythm that can enhance your retention and positive momentum. The people who are supporting you will share this rhythm and be able to schedule their activities and lives better when you are consistent with your study schedule.

The length of the study session depends on your ability to focus and concentrate. You need to think about quality rather than quantity when you are deciding on a realistic amount of time for each session. Plan to schedule at least 2 hours of quality study time daily. If you can spend more than 2 hours, by all means do so.

You may ask, "What do you mean by quality study time?" Quality study time means spending uninterrupted quiet time at your study session. This may mean that you have to isolate yourself for these study sessions. Think again about what has worked for you during nursing school when you studied for examinations; select a study place that has worked for you in the past. If you have a special study room at home that you have always used, plan your study sessions in that special room. If you have always studied at a library, plan your study sessions at the library. Sometimes it is difficult to balance your study time with your family obligations and possibly a work schedule, but if you can, plan your study time when you know that you will be at home alone. Try to eliminate anything that may be distracting during your study time. Silence your cell phone appropriately so that you will not be disturbed. If you have small children, plan your study time during their nap time or during their school hours.

Your plan must include how you will manage your study needs with your other obligations. Your family

BOX 2.1 Pathways to Success**Foundation**

Maintaining a strong positive attitude and self-efficacy
Thinking about short-term and long-term realistic goals
Developing a plan for preparation
Maintaining control

List

Writing short-term and long-term realistic goals in a journal

Plan for Preparation

Developing a study plan and schedule
Deciding on the place to study
Balancing personal and work obligations with the study schedule
Sharing the study schedule and personal needs with others
Implementing the study plan

Implementing Your Study Plan

Selecting as your starting point questions in the content area that is your weaker area
Making notes of content areas that you are unfamiliar with or are having difficulty with
Reading about these unfamiliar or difficult areas in your review book and nursing textbooks
Using the Evolve site accompanying this book and starting with the *Study Mode*
Practicing at least 4000 questions before taking the NCLEX

Reading rationales and strategies for every question
Moving to the *Exam Mode* on the Evolve site
Taking exams to determine your readiness for the NCLEX and any content areas that still need some fine-tuning

Positive Pampering

Planning time for exercise and fun activities
Establishing healthy eating habits
Including activities in the schedule that provide positive mental stimulation

Final Preparation

Reviewing and identifying goals achieved
Remaining focused to complete the plan of study
Writing down the date and time of the examination and posting it next to your name with the letters "RN" following, and the word "YES!"

Planning a test drive to the testing center
Engaging in relaxing activities on the day before the examination

Day of the Examination

Grooming yourself for success
Eating a nutritious breakfast
Maintaining a confident and positive attitude and self-efficacy
Maintaining control—breathe and focus
Meeting the challenges of the day
Reaching the peak of the Pyramid to Success

BOX 2.2 Developing a Plan for Study

Do I work better alone or in a study group?
If I work best in a group, how many study partners should I have?
Who are these study partners?
How long should my study sessions last?
Does the time of day that I study make a difference? Do I retain more if I study in the morning?
How does my work schedule affect my study pattern?
How do I balance my family obligations with my need to study?
Do I have a comfortable study area at home, or should I find another environment that is conducive to my study needs?

and friends are key players in your life and are going to become part of your Pyramid to Success. After you have established your study needs, communicate your needs and the importance of your study plan to your family and friends.

A difficult part of the plan may be how to deal with family members and friends who choose not to participate in your plan for success. For example, what do you do if a friend asks you to go to a movie and it is your scheduled study time? Your friend may say, "Take some time off. You have plenty of time to

study. Study later when we get back!" You are faced with a decision. You must weigh all factors carefully. You must keep your goals in mind and remember that your need for positive momentum is critical. Your decision may not be an easy one, but it must be one that will ensure that your goal of becoming a registered nurse is achieved.

Implementing Your Preparation Plan

Begin with a self-assessment of your strong and weaker areas in nursing content. Ask yourself the following questions.

1. What are my strong areas in nursing content?
2. What are my weaker areas in nursing content?
3. What strong and weaker areas were identified in any standardized tests that I took?

Prepare for the NCLEX by practicing test questions, selecting questions in the content area that is your weaker area as a starting point. Make notes of content areas that you are unfamiliar with or are having difficulty with. At the end of your scheduled study session look up and read about these unfamiliar or difficult areas in your review book and nursing textbooks. This will strengthen these weaker areas.

Where do you find these practice questions? All content-area chapters have practice questions at the end of the chapter. Start with these and be sure to read

the rationales and the strategies. Then, use the Evolve site accompanying this book. Start with the *Study Mode* because you will receive the answers, rationales, and test-taking strategies immediately after answering. Practice questions, practice questions, and practice more questions. You need to practice at least 4000 questions before taking the NCLEX. Be sure that you read rationales and strategies for every question. Once you feel comfortable with a content area, move to the *Exam Mode* on the Evolve site, and take exams to determine your readiness for the NCLEX and any content areas that still need some fine-tuning.

Positive Pampering

Positive pampering means that you must continue to care for yourself holistically. Positive momentum can be maintained only if you are properly balanced. Proper exercise, diet, and positive mental stimulation are crucial to achieving your goal of becoming a registered nurse. Just as you have developed a schedule for study, you should have a schedule that includes fun and physical activity. It is your choice—aerobics, walking, weightlifting, bowling, or whatever makes you feel good about yourself. Time spent away from the hard study schedule and devoted to some fun and physical exercise pays you back a hundredfold. You will be more energetic with a schedule that includes these activities.

Establish healthy eating habits. Be sure to drink plenty of water, which will flush and clean your body cells. Stay away from fatty foods because they slow you down. Eat lighter meals and eat more frequently. Include complex carbohydrates such as oatmeal or whole-grain foods for energy, and be careful not to include too much caffeine in your daily diet.

Take the time to pamper yourself with activities that make you feel even better about who you are. Make dinner reservations at your favorite restaurant with someone who is special and is supporting your goal. Take walks in a tranquil place that enables you to reflect on the momentum you have achieved and maintained. Whatever it is, wherever it takes you, allow yourself the time to do some positive pampering.

! Take time for you! Holistic preparation is important, so be sure to include self-care and positive pampering in your preparation plan.

Final Preparation

You have established the foundation of your Pyramid to Success. You have developed your list of goals and your study plan, and you have maintained your positive momentum. You are moving forward and in control. When you receive your date and time for the NCLEX-RN examination, you may immediately think, “I am not ready!” Stop! Reflect on all you have achieved and your positive life momentum. Think about all of the people who love you and support your effort to become

a registered nurse. Believe that the challenge awaiting you is one that you have successfully prepared for and that will lead you to your goal of becoming a registered nurse.

Take a deep breath and organize the remaining days so that they support your educational and personal needs. Support your positive momentum with a visual technique. Maintain your positive attitude and self-efficacy. Write your name in large letters, and write the letters “RN” after it. Post one or more of these visual reinforcements in areas that you frequent. This is a visual motivational technique that works for many nursing graduates preparing for this examination.

It is imperative that you not fall into the trap of expecting too much of yourself. The idea of perfection must not drive you to a point that leads to anxiety or causes your momentum to falter. You must believe and stay focused on your goal. The date and time are at hand. Write the date and time, and underneath write the word “YES!” Post this next to your name plus “RN.”

Ensure that you have command over how to get to the testing center. A test run is a must. Time the drive, and allow for road construction or other factors that might slow traffic. On the test run, when you arrive at the test facility, walk into it and become familiar with the lobby and the surroundings. This may help alleviate some of the peripheral nervousness associated with entering an unknown building. Remember that you must do whatever it takes to keep yourself in control. If familiarizing yourself with the facility will help you maintain positive momentum, by all means be sure to do so.

It is time to check your study plan and make the necessary adjustments now that a firm date and time are set. Adjust your review so that your study plan ends 2 days before the examination. The mind is like a muscle. If it is overworked, it has no strength or stamina. Your strategy is to rest the body and mind on the day before the examination. Your strategy is to stay in control and allow yourself the opportunity to be absolutely fresh and attentive on the day of the examination. This will help you control the nervousness that is natural, achieve the clear thought processes required, and feel confident that you have done all that is necessary to prepare for and conquer this challenge. The day before the examination is to be one of pleasure. Treat yourself to what you enjoy the most.

Relax! Take a deep breath through your nose, hold to a count of 4, and exhale slowly through your mouth. You have prepared yourself well for the challenge of tomorrow. Allow yourself a restful night’s sleep, and wake up on the day of the examination knowing that you are absolutely prepared to succeed. Look at your name with “RN” after it and the word “YES!”

Day of the Examination (Box 2.3)

Wake up believing in yourself and that all you have accomplished is about to propel you to the professional

BOX 2.3 Day of the Examination

Breathe: Inhale deeply through your nose, hold your breath to a count of 4, exhale slowly through your mouth.

Believe: Have positive and confident thoughts today, and keep those thoughts focused on your achievements. Maintain that strong positive attitude and self-efficacy beliefs.

Control: You are in command.

Believe: This is your day.

Visualize: "RN" with your name.

Be proud and confident of your achievements. You have worked hard to achieve your goal of becoming a registered nurse. If you believe in yourself and your goals, no one person or obstacle can move you off the pathway that leads to success! Congratulations, and we wish you the very best in your career as a registered nurse!

level of registered nurse. Allow yourself plenty of time, eat a nutritious breakfast, and groom yourself for success. You are ready to meet the challenges of the day and overcome any obstacle that you may face. Today will soon be history, and tomorrow will bring you the results on which you read your name with the words "Registered Nurse" after it.

Believe!

CLEX@Nepal

CHAPTER 3

The NCLEX-RN® Examination from a Graduate's Perspective

Rosybel Aberle, RN, BSN

The journey of becoming a nurse begins before nursing school and continues after nursing school. Everyone's journey will look a little different, but we have a shared interest to serve our community. My journey began when I welcomed my firstborn into this world. I wanted to do something meaningful in my life and serve as a role model to this precious little boy. In 2017, my life was ignited when tragedy hit my hometown of Las Vegas, Nevada. October 1, the day of a devastating mass shooting in which many people were killed by a gunman and others were wounded by gunfire or injured in the aftermath, was the day that changed the course of my life. I felt helpless because I did not have any medical background to help my community. I watched on the sidelines as hundreds of nurses worked tirelessly and selflessly to help the victims who had been injured. At that moment, I vowed that I would serve my community as a registered nurse (RN). Three years later and after 16 months in nursing school, I am now an RN on the frontline.

In order to be where I am now, I needed to make it through 16 months of nursing school—16 months of lectures, exams, clinical hours, care plans, and simulations, and endless hours of studying. In the end, my hard work was rewarded with a degree in nursing. It was a proud moment that every nursing graduate should cherish and appreciate. With a degree in hand and school behind me, I realized that I needed to complete one more task before I could work in the capacity of an RN; I needed to take and pass the NCLEX®. The NCLEX is a national licensure examination that is administered to all nursing graduates; it tests the graduate's ability to think critically and make nursing judgments based on knowledge learned in nursing school. Passing the NCLEX would be the next step in my journey, and I knew I needed to prepare for it.

Prior to studying and taking the NCLEX, I needed to handle a few tasks both before and after graduation. About 2 months before graduation, I registered

and completed and submitted a signed application form, along with the applicable license and fingerprinting fees. It does take time for the state board of nursing to process this paperwork, so it is important to complete this step a few weeks in advance, prior to graduation if your state allows pregraduation application, to avoid delays in scheduling your NCLEX test date. I recommend that you go to the National Council of State Boards of Nursing website at www.ncsbn.org and download the Candidate Bulletin. There are additional steps that you have to take in registering to take the NCLEX, and procedures may vary from state to state. For example, depending on the state, you can get your fingerprinting done prior to applying for licensure. You also may need to register with the NCSBN's testing vendor, Pearson VUE®, once your state application has been approved. Pearson VUE then sends you an Authorization to Test (ATT) form, and you will need this form to schedule your test date and location.

Although I knew I needed to start to study for the NCLEX after graduation, I took a break from the books to spend time with family and friends whom I had not spent a lot of time with during nursing school. It was a time to regroup and reenergize. Since I started the application process ahead of time, my ATT came within a few weeks. Due to the effects of the global pandemic, appointment times for the examination were limited. My test date was scheduled at a time much further out than I had anticipated. Every person has a different approach to studying and preparing, and I knew that if I kept my original test date, I would study every day until that date. To avoid burning out, I visited the testing website every morning for about a week to check for cancellations. It was my lucky day when I saw that a time had opened up that was about 3 weeks away. It was going to be a lot of work; therefore, I understood how crucial it was to come up with a study plan.

With the many resources available for NCLEX review, the flood of information can feel overwhelming. Understanding what has helped in the past can be the first step in your NCLEX preparation. I had studied for other

•• an account with my state board of nursing. There I

exams throughout nursing school using *Saunders Comprehensive Review for the NCLEX-RN® Examination*, and I knew this was going to be a valuable resource to use for this final exam before becoming an RN. I had online access to Evolve and access to the Saunders book; therefore, my plan consisted of taking an initial assessment to test my knowledge and areas in need of improvement. From there, I scheduled 3 to 4 hours a day to do 100 to 150 practice questions. After each question I would read the rationale and test-taking strategy. This allowed me to understand why I got a question correct or incorrect. Although I might have answered a question correctly, the rationale allowed me to see whether my thinking was in-line. When I answered a question incorrectly, I used the rationale to not only read about the correct answer, but also to learn why the other options were not the best choice. This provided exposure to other concepts and reinforced continued learning. After I finished my daily goal of practice questions, I would take the rest of the day off for self-care. I would spend quality time with my family and friends. It is important to appreciate the hard work that goes into studying, as well as to appreciate the time when you can destress and relax. About a week prior to exam day, I took one more assessment exam to identify areas that still needed improvement. Then in that last week before the NCLEX, I focused on those concepts.

As the exam date grows closer, you may start to feel anxious. I found that it was important to validate my feelings, yet also to acknowledge the hard work I had put in, not only in the weeks leading up to the exam, but also throughout my 16 months in nursing school. On the day before the exam, I dedicated myself to self-care. I did not look at any questions or content in order to keep my mind clear. I did activities that made me happy and communicated with trusted friends to help me relieve stress. The night before, I prepared for the exam by rechecking the address to the testing center and the directions to ensure I would arrive with plenty of time. I made sure that I had everything I needed in hand—my identification and ATT form. Finally, knowing that the exam can last up to 5 hours, I knew it was important to try to get a good night's rest.

It was the day of my exam, and I didn't know how to feel—scared, excited, nervous, proud. This was the day that nursing school had prepared me for. I had a light breakfast and gathered everything that I needed for the exam. As I drove to the testing center, I did the one thing that helps me relieve stress: I sang my favorite songs at the

top of my lungs. This is the time to do what you need to do to alleviate test anxiety in your own special way.

When you arrive at the testing center, you will be provided with a small locker for storing personal belongings. During the check-in process, testing officials will ask for your identification and ATT form. In addition, they will scan your fingers and palms and take your photo. After reviewing and signing the exam instructions, the proctor will guide you to your assigned computer. This is the moment. Take a deep breath and trust yourself; you prepared for this moment. When your exam starts, just focus on one question at a time, and remember the knowledge base that you have and your test-taking strategies. Use this strategy for every question. When my exam shut off, I was overcome with both excitement and doubt. It is natural to worry, but just remember that the exam is complete and you know that you planned and did everything you could have. Be proud of this moment!

I drove home trying to replay every question that I answered. I would go through phases of confidence and then phases of extreme doubt. The next couple of days I tried not to think about the exam and to go on with my day-to-day life, but it would be wrong of me to say that I was “as cool as a cucumber.” This is a normal reaction that I witnessed not only in myself but also in other students. You may be the type of student who can maintain confidence, and that is a great attribute, but if you are not that type of student, just know that you are not alone and that your feelings after the exam are also okay. A couple of days passed, and it was time to look at my results. I was so nervous. I opened the document on the website that the National Council of State Boards of Nursing offers for early results, and when I searched for my result, it said the word “Pass.” I was officially a registered nurse!

I started this journey because of my son and a tragedy in my hometown. I went back to school, received a BSN, and passed the NCLEX. I have come full circle as I am now caring for patients during a global pandemic; it is scary, but I know that this is where I am meant to be. It was a long road, and at times it seemed like too much to handle, but one thing that I learned is to believe in yourself, trust yourself, and avoid being too hard on yourself. You've got this, and I hope my tips will help guide you during your journey. Congratulations on making it to this point, and good luck in your upcoming career!

CHAPTER 4

Clinical Judgment and Test-Taking Strategies

Angela E. Silvestri PhD, APRN, FNP-BC, CNE
Linda A. Silvestri, PhD, RN, FAAN

If you would like to read more about test-taking strategies after completing this chapter, *Saunders Clinical Judgment and Test-Taking Strategies: Passing Nursing School and the NCLEX® Exam* focuses on the test-taking strategies that will help you to pass your nursing examinations while in nursing school and will prepare you for the NCLEX-RN® examination.

I. Clinical Judgment

Clinical judgment is the observed outcome of critical thinking and decision-making (Dickison, Haerling, & Lasater, 2019). The NCLEX-RN® examination requires candidates to demonstrate the ability to use clinical judgment in client care. Thus, clinical judgment skills along with other test-taking strategies will be helpful to answer test questions. The National

Council of State Boards of Nursing (NCSBN) has created a Clinical Judgment Measurement Model (NCJMM) that consists of applying six cognitive skills or processes: (1) recognize cues; (2) analyze cues; (3) prioritize hypotheses; (4) generate solutions; (5) take action; and (6) evaluate outcomes. See [Chapter 1, Table 1.1](#) for a description of these six cognitive skills/processes.

II. Key Test-Taking Strategies (Box v.⤵)

III. How to Avoid Reading into the Question (Box v.⤵)

A. Pyramid Points

1. For traditional NCLEX items, such as multiple choice or multiple response, avoid asking yourself the forbidden words, “Well, what if...?”

BOX 4.1 Key Test-Taking Strategies

The Question

- Focus on the data in the case study or question, read every word, and make a decision about what the question is asking.
- Note the subject and determine what content is being tested.
- Visualize the event and recognize cues; note if an abnormality exists in the data and analyze or interpret the data provided.
- Determine who “the client of the question” is.
- Look for the strategic words; strategic words make a difference regarding what the question is asking about.
- Determine whether the question presents a positive or negative event query.
- For traditional NCLEX items, such as multiple choice or multiple response, avoid asking yourself the forbidden words “Well, what if...?” because this will lead you to the “forbidden” area: reading into the question.
- Remember that for NGN items you will have to ask yourself “What if...?” because you need to think about and consider all existing and potential concerns, such as complications, that can occur in the client. For NGN items, be sure to focus on what the question is asking to assist you in determining what you need to consider in answering.
- Apply the NCSBN Clinical Judgment Measurement Model (NCJMM) and the six cognitive skills/processes alongside other test-taking strategies.

The Options

- Always use the process of elimination when choices or options are presented, and always read each option carefully; once you have eliminated options, reread the question before selecting your final choice or choices.
- In multiple choice questions, look for comparable or alike options and eliminate these.
- Determine whether there is an umbrella option; if so, this could be the correct option.
- Identify any closed-ended words; if present, the option is likely incorrect.
- Use the ABCs (airway, breathing, and circulation), Maslow’s Hierarchy of Needs, the steps of the nursing process, and the NCJMM to answer questions that require prioritizing; use CAB (compressions, airway, breathing) for cardiopulmonary resuscitation (CPR).
- Use therapeutic communication techniques to answer communication questions, and remember to focus on the client’s thoughts, feelings, concerns, anxieties, and fears.
- Use delegating and assignment-making guidelines to match the client’s needs with the scope of practice of the health care provider.
- Use pharmacology guidelines to select the correct option if the question addresses a medication.

BOX 4.2 Practice Question: Avoiding the “What if...” Syndrome and Reading into the Question

The nurse is caring for a hospitalized client with a diagnosis of heart failure who suddenly complains of shortness of breath and dyspnea during activity. After assisting the client to bed and placing the client in high-Fowler’s position, the nurse would take which immediate action?

1. Administer high-flow oxygen to the client.
2. Call the consulting cardiologist to report the findings.
3. Prepare to administer an additional dose of furosemide.
4. Obtain a set of vital signs and perform focused respiratory and cardiovascular assessments.

Answer: 4

Test-Taking Strategy: You may immediately think that the client has developed pulmonary edema, a complication of heart failure, and needs additional diuresis. Pulmonary edema is an emergency, and you might think an action needs to be taken before further assessment, which may lead you to choose option 3. Although pulmonary edema is a complication of heart failure, the question does not specifically state that pulmonary edema has developed; the client could be experiencing shortness of breath or dyspnea as a symptom of heart failure exacerbation, which may be expected, particularly on exertion or during activity. This is why it is important to base your answer only on the information presented, without assuming something else could be occurring. Read the question carefully. Note the **strategic word**, *immediate*, and focus on the **data in the question**, the client’s complaints. Use the **nursing process**, and note that vital signs and assessment data would be needed before administering oxygen, administering medications, or contacting the cardiologist. Although the cardiologist may need to be notified, this is not the immediate action. Because there are no data in the question that indicate the presence of pulmonary edema, option 4 is correct. Additionally, focus on what the question is asking. The question is asking you for a nursing action, so that is what you need to look for as you eliminate the incorrect options. Use nursing knowledge, clinical experiences, clinical judgment, and test-taking strategies to assist in answering the question. Remember to focus on the **data in the question** and what the question is asking, and avoid the “What if...?” syndrome and reading into the question.

because this will lead you to the “forbidden” area: Reading into the question.

! For NGN items, you will have to ask yourself “What if...?” because you need to think about and consider all existing and potential concerns, such as complications, that can occur in the client.

2. Focus only on the data in the question, read every word, and make a decision about what the question is asking. Reread the question more than one time; ask yourself, “What is this question asking?” and “What content is this question testing?” (see [Box 4.2](#)).

BOX 4.3 Common Strategic Words

Words That Indicate the Need to Prioritize

Best
Early or late
Essential
First
Highest priority
Immediate
Initial
Most
Most appropriate
Most important
Most likely
Next
Priority
Primary

Words That Reflect Assessment

Ascertain
Assess
Check
Collect
Determine
Find out
Gather
Identify
Monitor
Observe
Obtain information
Recognize cues

Additional Strategic Words

Need for further teaching
Need for further education
Need for follow-up

3. Determine whether an abnormality exists. Look at data in the question and in the responses and decide what is abnormal. Pay close attention to this information as you answer the question.
4. Focus on the client in the question. At times, there are other people discussed in the question who also impact how the question should be answered. Remember the concepts of client-centered and family-centered care.
5. Consider available resources as you answer the question. Remember that you will have all the resources you need at the client’s bedside to provide quality client care.
6. Look for the strategic words in the question, such as *immediate*, *initial*, *first*, *priority*, *best*, *need for follow-up*, and *need for further teaching*; strategic words make a difference regarding what the question is asking ([Box 4.3](#)). For a list of words that will be in bold on the NCLEX see *NCLEX FAQs, What the Exam Looks Like* at www.ncsbn.org, <https://www.ncsbn.org/9010.htm>

BOX 4.4 Ingredients of a Question: Event, Event Query, and Options**Event:**

The nurse is caring for a client with terminal cancer.

Event Query:

The nurse would consider which factor when planning pain relief?

Options:

1. Not all pain is real.
2. Opioid analgesics are highly addictive.
3. Opioid analgesics can cause tachycardia.
4. Around-the-clock dosing gives better pain relief than as-needed dosing.

Answer: 4

Test-Taking Strategy: Focus on the **subject** and what the question (event query) is asking, *the factor to consider when planning pain relief for a client with a diagnosis of terminal cancer*. Around-the-clock dosing provides increased pain relief and decreases stressors associated with pain, such as anxiety and fear. Pain is what the client describes it as, and any indication of pain should be perceived as real for the client. Opioid analgesics may be addictive, but this is not a concern for a client with terminal cancer. Not all opioid analgesics cause tachycardia. As you can see, some of the other options may be correct or partially correct but do not pertain to the information presented in the event and event query. Remember to focus on the subject, what the question is asking, and to look at each part of the question to answer correctly.

7. In multiple-choice questions, multiple-response questions, or questions that require you to arrange nursing interventions or other data in order of priority, read every choice or option presented before answering.
 8. *Always* use the process of elimination when choices or options are presented; after you have eliminated options, reread the question before selecting your final choice or choices. Focus on the data in both the question and the options to assist in the process of elimination and direct you to the correct answer (see **Box 4.2**).
 9. With questions that require you to fill in the blank, focus on the data in the question and determine what the question is asking; if the question requires you to calculate a medication dose, an intravenous flow rate, or intake and output amounts, recheck your work in calculating and always use the on-screen calculator to verify the answer.
- B. Ingredients of a question (Box 4.4)**
1. The *ingredients of a question* include the event, which is a client or clinical situation; the event query or the stem of the question; and the options or answers.
 2. The event provides you with the content about the client or clinical situation that you need to think about when answering the question.
 3. The event query asks something specific about the content of the event.
4. The options are all of the answers provided with the question.
 5. In a multiple-choice question, there will be four options and you must select one; read every option carefully and think about the event and the event query as you use the process of elimination.
 6. In a multiple-response question, there will be several options and you must select all options that apply to the event in the question. Each option provided is a true or false statement; choose the true statements. Also, visualize the event and use your nursing knowledge, clinical experiences, and clinical judgment strategies to answer the question.
 7. In an ordered-response (prioritizing) question, you will be required to arrange in order of priority nursing interventions or other data; visualize the event and use your nursing knowledge, clinical experiences, and clinical judgment strategies to answer the question.
 8. A fill-in-the-blank question does not contain options, and some figure/illustration questions and audio item formats may or may not contain options. A graphic option item will contain options in the form of a picture or graphic.
 9. A chart/exhibit question will most likely contain options; read the question carefully and all of the data in the chart or exhibit before selecting an answer. In this question type, there will be information in the chart/exhibit that is pertinent to how the question is answered, and there may also be information that is not pertinent. It is necessary to discern what information is important and what the “distracters” are.
 10. The NGN® item types will use a case study approach. The stand-alone items will be accompanied by a case scenario and tests more than one cognitive skill. The unfolding case studies will be accompanied by six NGN item type questions, and each cognitive skill will be tested. Examples of both stand-alone items and unfolding case studies and accompanying items can be located on the Evolve site accompanying this book. **Box 4.5** provides an example of one type of NGN question and test-taking strategy.
- IV. Strategic Words (Box 4.4)**
- A. *Strategic words* focus your attention on a critical point to consider when answering the question and will assist you in eliminating the incorrect options. These words can be located in either the event or the query of the question.
 - B. Some strategic words may indicate that all options are correct and that it will be necessary to prioritize to select the correct option; words that reflect the process of assessment are also important to note

BOX 4.5 NGN Item: Stand-alone Trend — Highlight-in-Table Item and Test-Taking Strategy

The nurse is caring for a client admitted to the hospital 1 day ago for newly diagnosed type 2 diabetes mellitus. The nurse reviews the clinical findings noted during the last 24 hours.

	Current	12 hours ago	24 hours ago
Blood pressure	120/70 mm Hg	128/70 mm Hg	130/70 mm Hg
Pulse	122 beats per minute (bpm)	110 bpm	108 bpm
Respirations	24 breaths per minute (bpm)	22 bpm	22 bpm
Oral temperature	36.2° C (97.1° F)	36.4° C (97.5° F)	36.2° C (97.1° F)
Capillary glucose	410 mg/dL (23.4 mmol/L)	360 mg/dL (20.57 mmol/L)	400 mg/dL (22.85 mmol/L)
Serum glucose	425 mg/dL (25.2 mmol/L)	360 mg/dL (20.57 mmol/L)	410 mg/dL (23.4 mmol/L)
Serum potassium	2.8 mEq/L (2.8 mmol/L)	3.2 mEq/L (3.2 mmol/L)	3.6 mEq/L (3.6 mmol/L)
Urine output	23 mL/hr	30 mL/hr	40 mL/hr

Highlight the clinical findings during the last 24 hours that would be essential to follow up on.

Answer:

	Current	12 hours ago	24 hours ago
Blood pressure	120/70 mm Hg	128/70 mm Hg	130/70 mm Hg
Pulse	122 BPM	110 BPM	108 BPM
Respirations	24 bpm	22 bpm	22 bpm
Oral temperature	36.2° C (97.1° F)	36.4° C (97.5° F)	36.2° C (97.1° F)
Capillary glucose	410 mg/dL (23.4 mmol/L)	360 mg/dL (20.57 mmol/L)	400 mg/dL (22.85 mmol/L)
Serum glucose	425 mg/dL (25.2 mmol/L)	360 mg/dL (20.57 mmol/L)	410 mg/dL (23.4 mmol/L)
Serum potassium	2.8 mEq/L (2.8 mmol/L)	3.2 mEq/L (3.2 mmol/L)	3.6 mEq/L (3.6 mmol/L)
Urine output	23 mL/hr	30 mL/hr	40 mL/hr

Rationale: With newly diagnosed type 2 diabetes mellitus, the client is at risk for diabetic ketoacidosis or hyperglycemic hyperosmolar nonketotic syndrome, both of which can lead to hypovolemia and shock. The blood pressure has remained stable for this client but is declining. At this time, it does not require further follow-up. The pulse rate has increased significantly since admission, and is a sign of hypovolemia and impending shock, which is a finding that would be addressed. The respiratory rate is slightly elevated and would be addressed early on because this is a sensitive indicator of fluid status and could be a sign of acidosis. The capillary glucose and serum glucose levels at each of the time points have been elevated, and an intervention is required to address this abnormality. The serum potassium level was within the normal range initially but has decreased since admission and is now at a critical level. This could be due to the client's treatment, which likely involves insulin. This requires follow-up because of the risks associated with hypokalemia. The urine output has steadily decreased and could be an indicator of hypovolemia; therefore, it requires follow-up. The temperature is normal and does not require follow-up.

Test-Taking Strategy: Focus on the **subject** and note the **strategic word**, *essential*. Considering that this question is asking about findings that require follow-up and therefore would be of concern to the nurse, look at each clinical finding and first determine whether it is normal or abnormal. If abnormal, it likely requires follow-up. The current blood pressure is normal and so is the temperature; so, you could begin by *not highlighting* these options. All other options are abnormal, except the potassium level 24 hours ago, and the urine output 12 and 24 hours ago. You would consider *not highlighting* these options. Then determine how it is trending—downward, upward, or staying the same. Think about how that trend impacts the answer to the question. Next, think about whether the clinical finding indicates worsening or improvement of the client's condition, or if it is unchanged or not yet concerning even though it may be trending. All findings are trending except the temperature, which is staying the same; this is another reason to *not highlight* temperature findings. The blood pressure, although trending downward, is normal and therefore is not concerning, confirming the decision to *not highlight* the blood pressure findings. Lastly, determine whether the finding is consistent with a complication of uncontrolled diabetes mellitus, such as diabetic ketoacidosis, hyperglycemic hyperosmolar nonketotic syndrome, or shock, as illustrated below. After thinking through this scenario, any abnormal findings and trends would be considered; any findings that are improving, unchanged, or are not yet concerning, even if they could be a sign of a complication, would not be highlighted. Any findings that are worsening would be highlighted as essential to follow up on.

BOX 4.5 NGN Item: Stand-alone Trend — Highlight-in-Table Item and Test-Taking Strategy—cont'd

Clinical Finding	Normal/ Abnormal	Trend?	Worsening/Improvement/ Unchanged or Not Concerning	Sign of Complication? Yes/No
Blood pressure	Normal	Downward	Not Concerning	No
Pulse	Abnormal – High	Upward	Worsening	Yes
Respirations	Abnormal – High	Upward	Worsening	Yes
Oral temperature	Normal	Same	Unchanged	No
Capillary glucose	Abnormal – High	Upward	Worsening	Yes
Serum glucose	Abnormal – High	Upward	Worsening	Yes
Serum potassium	Abnormal – Low	Downward	Worsening	Yes
Urine output	Abnormal – Low	Downward	Worsening	Yes

BOX 4.6 Practice Question: Strategic Words

The nurse is caring for a client who just returned from the recovery room after undergoing abdominal surgery. The nurse would monitor for which early sign of hypovolemic shock?

1. Sleepiness
2. Increased pulse rate
3. Increased depth of respiration
4. Increased orientation to surroundings

Answer: 2

Test-Taking Strategy: Note the **strategic word**, *early*, in the query and the words *just returned from the recovery room* in the event. Think about the pathophysiology that occurs in hypovolemic shock to direct you to the correct option. Restlessness is one of the earliest signs, followed by cardiovascular changes (increased heart rate and a decrease in blood pressure). Sleepiness is expected in a client who has just returned from surgery. Although increased depth of respirations occurs in hypovolemic shock, it is not an early sign. Rather, it occurs as the shock progresses. This is why it is important to recognize the **strategic word**, *early*, when you read the question. It requires the ability to recognize and analyze cues to discern between early and late signs of impending shock. Increased orientation to surroundings is expected and will occur as the effects of anesthesia resolve. Remember to look for **strategic words**, in both the event and the query of the question.

(see **Box 4.3**). Words that reflect assessment usually indicate the need to look for an option that is a first step, because assessment is the first step in the nursing process.

- C. As you read the question, look for the strategic words; strategic words make a difference regarding the focus of the question. Throughout this book, *strategic words* presented in the question, such as those that indicate the need to prioritize, are bolded. If the test-taking strategy is to focus on *strategic words*, then the term *strategic word(s)* is highlighted in blue where it appears in the test-taking strategy.

BOX 4.7 Practice Question: Subject of the Question

The nurse is teaching a client in skeletal leg traction about measures to increase bed mobility. Which item would be most helpful for this client?

1. Television
2. Fracture bedpan
3. Overhead trapeze
4. Reading materials

Answer: 3

Test-Taking Strategy: Focus on the **subject**, increasing bed mobility. Also note the **strategic word**, *most*. The use of an overhead trapeze is extremely helpful in assisting a client to move about in bed and to get on and off the bedpan. Television and reading materials are helpful in reducing boredom and providing distraction, and a fracture bedpan is useful in reducing discomfort with elimination; these items are helpful for a client in traction, but they are not directly related to the **subject** of the question. Remember to focus on the **subject**.

V. Subject of the Question (Box 4.7)

- A. The *subject of the question* is the specific topic that the question is asking about. Identifying the subject of the question will assist you in eliminating the incorrect options and direct you in selecting the correct option. Throughout this book, if the *subject of the question* is a specific strategy to use in answering the question correctly, it is highlighted in blue in the test-taking strategy.

! The specific test-taking strategy for every practice question in this book is highlighted in blue. Highlighting the strategy will point out and provide you with guidance on what strategies you need to review in *Saunders Clinical Judgment and Test-Taking Strategies: Passing Nursing School and the NCLEX® Exam*. The Health Problem code that accompanies each practice question will provide insight into the content areas in need of further remediation in *Saunders Comprehensive Review for the NCLEX-RN® Examination*.

BOX 4.8 Practice Question: Positive Event Query

The nurse provides medication instructions to a client about digoxin. Which statement by the client indicates an understanding of its adverse effects?

1. "Blurred vision is expected."
2. "If my pulse rate drops below 60 beats per minute, I should let my cardiologist know."
3. "If I am nauseated or vomiting, I should stay on liquids and take some liquid antacids."
4. "This medication may cause headache and weakness, but that is nothing to worry about."

Answer: 2

Test-Taking Strategy: This question is an example of a positive event query question. Note the words *indicates an understanding*, and focus on the **subject**, adverse effects of digoxin. Digoxin is a cardiac glycoside and works by increasing contractility of the heart. This medication has a narrow therapeutic range, and toxicity is a major concern. Currently, it is considered second-line treatment for heart failure because of its narrow therapeutic range and potential for adverse effects. Adverse effects that indicate toxicity include gastrointestinal disturbances, neurological abnormalities, bradycardia or other cardiac irregularities, and ocular disturbances. If any of these occurs, the cardiologist is notified. Additionally, the client needs to notify the cardiologist if the pulse rate drops below 60 beats per minute, because serious dysrhythmias are another potential adverse effect of digoxin therapy. Remember to read the event query, focus on the **subject**, and note whether it is a positive event query.

VI. Positive and Negative Event Queries (Boxes 4.8 and 4.9)

- A positive event query uses strategic words that ask you to select an option that is correct; for example, the event query may read, "Which statement by a client *indicates an understanding* of the side effects of the prescribed medication?"
- A negative event query uses strategic words that ask you to select an option that is an incorrect item or statement; for example, the event query may read, "Which statement by a client *indicates a need for further teaching* about the side effects of the prescribed medication?"

VII. Questions That Require Prioritizing

- Many questions in the examination will require you to use the skill of prioritizing nursing actions.
- Look for the strategic words in the question that indicate the need to prioritize (see Box 4.3). Remember that when a question requires prioritization, all options may be correct and you need to determine the correct order of action.
- Strategies to use to prioritize include the ABCs (airway, breathing, and circulation), Maslow's Hierarchy of Needs theory, the steps of the nursing process, and the cognitive skills in the NCJMM (recognize

BOX 4.9 Practice Question: Negative Event Query

The nurse has provided discharge instructions to a client who has undergone a right mastectomy with axillary lymph node dissection. Which statement by the client indicates a need for further teaching regarding home care measures?

1. "I should use a straight razor to shave under my arms."
2. "I should inform all of my other doctors that I have had this surgical procedure."
3. "I need to be sure that I do not have blood pressures or blood drawn from my right arm."
4. "I need to be sure to wear thick mitt hand covers or use thick pot holders when I am cooking and touching hot pans."

Answer: 1

Test-Taking Strategy: This question is an example of a **negative event query**. Note the **strategic words**, *need for further teaching*. These strategic words indicate that you need to select an option that identifies an incorrect client statement. Recall that edema and infection are concerns with this client due to the removal of lymph nodes in the surgical area. Lymphadenopathy with associated lymphedema can result, and the client needs to be instructed in the measures that will avoid trauma to the affected arm. Recalling that trauma to the affected arm could potentially result in edema and/or infection will direct you to the correct option. Remember that **negative event queries** ask you to select an option that is an *incorrect* item or statement! Watch for **negative event queries**!

cues, analyze cues, prioritize hypotheses, generate solutions, take action, and evaluate outcomes).

 The cognitive skills in the NCJMM include recognize cues, analyze cues, prioritize hypotheses, generate solutions, take action, and evaluate outcomes.

D. The ABCs (Box 4.10)

- Use the ABCs—airway, breathing, and circulation—when selecting an answer or determining the order of priority.
- Remember the order of priority: airway, breathing, and circulation.
- Airway is always the first priority. Note that an exception occurs when cardiopulmonary resuscitation (CPR) is performed; in this situation, the nurse follows CAB (compressions, airway, breathing) guidelines.

E. Maslow's Hierarchy of Needs theory (Box 4.11 and Fig. 4.1)

- According to Maslow's Hierarchy of Needs theory, physiological needs are the priority, followed by safety and security needs, love and belonging needs, self-esteem needs, and finally, self-actualization needs; select the option or determine the order of priority by addressing physiological needs first.
- When a physiological need is not addressed in the question or noted in one of the options, con-

BOX 4.10 Practice Question: Use of the ABCs

A client with a diagnosis of cancer is receiving morphine sulfate for pain. The nurse would plan to employ which priority action in the care of the client?

1. Monitor stools.
2. Monitor urine output.
3. Encourage fluid intake.
4. Encourage the client to cough and deep-breathe.

Answer: 4

Test-Taking Strategy: Use the **ABCs—airway, breathing, circulation**—as a guide to direct you to the correct option and note the **strategic word, priority**. The nurse needs to use knowledge about morphine sulfate and its effects to determine the client's needs, prioritize hypotheses, and generate solutions. Recall that morphine sulfate suppresses the cough reflex and the respiratory reflex, and a common adverse effect is respiratory depression. Coughing and deep breathing can assist with ensuring adequate oxygenation, since the number of respirations per minute can potentially be decreased in a client receiving this medication. Although options 1, 2, and 3 are components of the plan of care, the correct option addresses airway and breathing. Remember to use the **ABCs—airway, breathing, circulation**—to help prioritize actions you will take!

BOX 4.11 Practice Question: Maslow's Hierarchy of Needs Theory

The nurse planning care for a client experiencing dystocia determines that the priority is which action?

1. Position changes and providing comfort measures
2. Explanations to the client about what is happening
3. Monitoring for changes in the condition of the birthing parent and fetus
4. Encouraging the use of breathing techniques learned in childbirth preparatory classes

Answer: 3

Test-Taking Strategy: Note the **strategic word, priority**, and use **Maslow's Hierarchy of Needs theory** to prioritize, remembering that physiological needs come first. The nurse needs to have knowledge of the client's priority needs and generate solutions. All the options are correct and would be implemented during the care of a client with dystocia. Also note that the correct option is the only one that addresses both the birthing parent and the fetus. Remember to use **Maslow's Hierarchy of Needs theory** to help prioritize and generate solutions!

tinue to use Maslow's Hierarchy of Needs theory sequentially as a guide and look for the option that addresses safety.

! The steps of the nursing process are assessment, analyzing, planning, implementation, and evaluation. Cognitive skills identified in the NCJMM include recognize cues, analyze cues, prioritize hypotheses, generate solutions, take action, and evaluate outcomes.

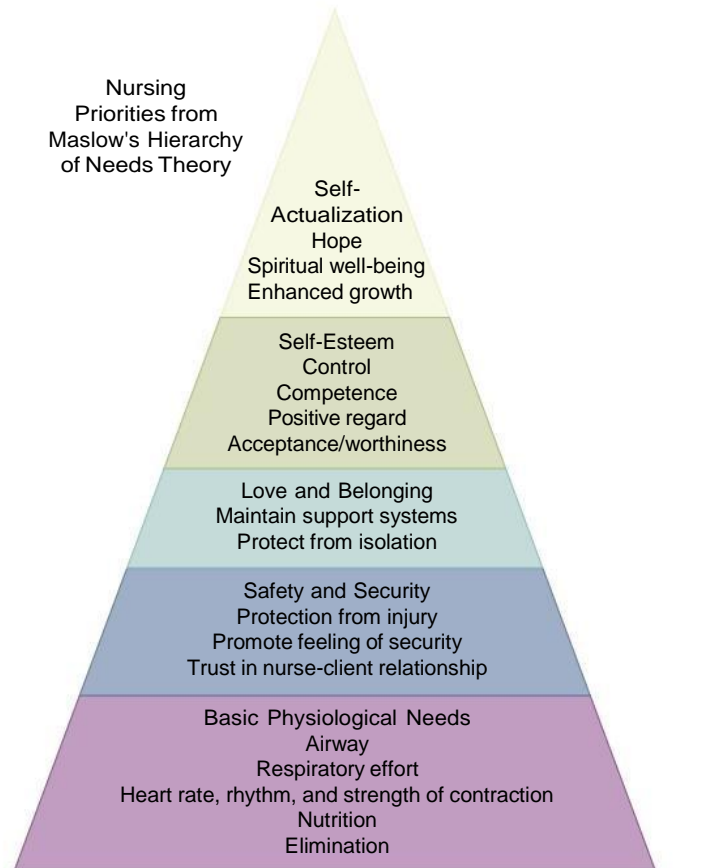

FIGURE 4.1 Use Maslow's Hierarchy of Needs theory to establish priorities.

F. Steps of the nursing process and NCJMM Cognitive Skills

1. Assessment/Recognize Cues
 - a. The nurse recognizes cues by identifying significant data from many sources.
 - b. These questions address the process of gathering subjective and objective data relative to the client, confirming the data, and communicating and documenting the data.
 - c. Remember that assessment/recognizing cues is the first step.
 - d. When you are asked to select your first, immediate, or initial nursing action, assess/recognize cues first to prioritize when selecting the correct option.
 - e. Look for strategic words in the options that reflect assessment/recognizing cues (see Box 4.3).
 - f. If an option contains the concept of collection of client data, the best choice is to select that option (Box 4.12).
 - g. Possible exception to the guideline—if the question presents an emergency situation, read carefully; in an emergency situation, an action may be the priority rather than taking the time to collect further data.
2. Analysis/Analyze Cues and Prioritize Hypotheses (Box 4.13 and Box 4.14)
 - a. The nurse analyzes cues by connecting significant data to the client's clinical presentation

BOX 4.12 Practice Question: Assessment/
Recognize Cues

A client who had an application of a right arm cast complains of pain at the wrist when the arm is passively moved. Based on the assessment findings, the nurse recognizes cues that indicate the need to take which action first?

1. Elevate the arm.
2. Document the findings.
3. Medicate with an additional dose of an opioid.
4. Check for paresthesias and paralysis of the right arm.

Answer: 4

Test-Taking Strategy: Note the **strategic word** *first*, which indicates the need to prioritize. The nurse needs to have knowledge of the complications associated with a cast in order to recognize cues that indicate a complication. The question event indicates that the client complains of pain at the wrist when the arm is passively moved. This could indicate an abnormality; therefore, further assessment or action is required. Use the **steps of the nursing process**, remembering that assessment is the *first* step. The only option that addresses the significant cue in the question is option 4. Options 1, 2, and 3 address the implementation step of the nursing process. Also, these options are incorrect *first* actions. The arm in a cast should have already been elevated. The client may be experiencing compartment syndrome, a complication following trauma to the extremities and application of a cast. Additional data need to be collected to determine whether this complication is present. Remember that assessment is the *first step in the nursing process* and that the nurse needs to be able to recognize cues that indicate a complication.

and determining: is the data expected? Unexpected? What are the concerns?

- b. After analyzing cues, the nurse identifies concerns and client needs (hypotheses) and prioritizes by ranking the hypotheses from highest to lowest priority.
 - c. Analyzing questions are the most difficult questions because they require understanding of the principles of physiological responses and require interpretation of the data collected.
 - d. They require critical thinking and decision making and determining priority concerns and client needs.
 - e. These questions may also include the communication and documentation of the results from the process of analyzing cues and identifying priority hypotheses.
 - f. Often, these types of questions require examining a broad concept and breaking it down into smaller parts and assimilation of the information and application to a client scenario.
3. Planning/Generate Solutions (**Box 4.15**)
- a. The nurse generates solutions by using hypotheses to determine interventions for an expected outcome.

BOX 4.13 Practice Question: Analysis/Analyze
Cues

The nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45, P_{CO_2} 30 mm Hg, and HCO_3^- 22 mEq/L (22 mmol/L). The nurse analyzes these results as indicating which condition?

1. Metabolic acidosis, compensated
2. Respiratory alkalosis, compensated
3. Metabolic alkalosis, uncompensated
4. Respiratory acidosis, uncompensated

Answer: 2

Test-Taking Strategy: Focus on the **data in the question** and the **subject**, interpreting arterial blood gas results. The nurse needs to analyze the cues provided in the question and have knowledge of normal arterial blood gas results and acid-base disorders to determine the condition the client is experiencing. Use the **steps of the nursing process** and analyze the values. The question does not require further assessment; therefore, it is appropriate to move to the next step in the nursing process, analysis. The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the P_{CO_2} . In this situation, the pH is at the high end of the normal value and the P_{CO_2} is low. So, you can eliminate options 1 and 3. In an alkalotic condition, the pH is elevated. The values identified indicate a respiratory alkalosis. Compensation occurs when the pH returns to a normal value. Because the pH is in the normal range at the high end, compensation has occurred. Remember that analysis is the second **step in the nursing process** and that the nurse needs to analyze cues and connect data to the client's presentation.

BOX 4.14 Practice Question: Analysis/
Prioritizing Hypotheses

The home care nurse visits a client who has cataracts. The nurse identifies which problem as the priority for this client?

1. Concern about the loss of eyesight
2. Altered vision due to opacity of the ocular lens
3. Difficulty moving around because of the need for glasses
4. Loneliness because of decreased community immersion

Answer: 2

Test-Taking Strategy: Note the **strategic word**, *priority*, and use the **steps of the nursing process**. This question relates to planning nursing care and asks you to prioritize hypotheses and identify the priority problem in order to generate solutions. Use **Maslow's Hierarchy of Needs theory** to answer the question, remembering that physiological needs are the priority. Concern and loneliness are psychosocial needs and would be the last priorities. Note that the correct option directly addresses the client's problem. Remember that analysis is the second **step of the nursing process** and that the nurse needs to analyze cues, connect data to the client's presentation, and determine priority client needs.

BOX 4.15 Practice Question: Planning/
Generating Solutions

The nurse is caring for a client who is receiving total parenteral nutrition through a central venous catheter. Which action would the nurse plan to decrease the risk of infection in this client?

1. Track the client's oral temperature.
2. Administer antibiotics intravenously.
3. Check the differential of the leukocytes.
4. Use sterile technique for dressing changes.

Answer: 4

Test-Taking Strategy: Focus on the **subject**, *preventing infection*. This question relates to planning nursing care and asks you to generate solutions to decrease the risk of infection in a client with a central venous catheter. Sterile technique is vital during dressing changes of a central venous catheter. Central venous catheters are large-bore catheters that can serve as a direct-entry point for microorganisms into the heart and circulatory system. Using aseptic technique helps avoid catheter-related infections by preventing the introduction of potential pathogens to the site. Although the remaining options are reasonable nursing interventions for a client with a central venous catheter, none of them prevents infection. Options 1 and 3 are assessment methods, and option 2 is implemented after the confirmation of an existing infection. Note the relationship between the words "risk of infection" in the question and "sterile" in the correct option. In addition, the only option that will prevent infection is the correct option. Remember that planning is the third **step of the nursing process** and that the nurse needs to plan and generate solutions to determine interventions for an expected outcome.

- b. These questions require prioritizing client problems, determining goals and outcome criteria for goals of care, developing the plan of care, and communicating and documenting the plan of care.
- c. Remember that actual client problems rather than potential client problems will be the priority in most client situations.
4. Implementation/Take Action (**Box 4.16**)
 - a. The nurse implements the generated solutions addressing the highest priorities or hypotheses.
 - b. These questions address further assessment or analyzing, organizing and managing care, counseling and teaching, providing care to achieve established goals, supervising and coordinating care, and communicating and documenting nursing interventions.
 - c. Focus on a nursing action rather than on a medical action when you are answering a question, unless the question is asking you to determine what prescribed medical action is anticipated and necessary. You may be required to anticipate what interventions may be prescribed.

BOX 4.16 Practice Question: Implementation/
Take Action

The nurse is caring for a hospitalized client with coronary artery disease who begins to experience chest pain. The nurse administers a nitroglycerin tablet sublingually as prescribed, but the pain is unrelieved. The nurse would take which action next?

1. Reposition the client.
2. Call the client's family.
3. Contact the cardiologist.
4. Administer another nitroglycerin tablet.

Answer: 4

Test-Taking Strategy: Focus on the **subject**, unrelieved chest pain. The nurse would use knowledge about interventions to relieve chest pain to generate solutions and take action. Note the **strategic word**, *next*, and use the **steps of the nursing process**. Implementation questions address the process of organizing and managing care. This question also requires that you prioritize nursing actions. Additionally, focus on the **data in the question** to assist in avoiding reading into the question. You may think it is necessary to check the blood pressure before administering another tablet, which is correct. However, checking the blood pressure is not one of the options. Recalling that the nurse would administer 3 nitroglycerin tablets 5 minutes apart from each other to relieve chest pain in a hospitalized client will assist in directing you to the correct option. Remember that implementation is the fourth **step of the nursing process** and that the nurse needs to take action.

- d. On the NCLEX-RN examination, the only client whom you need to be concerned about is the client in the case study or question that you are answering; avoid the "What if...?" syndrome, and remember that the client in the question on the computer screen is your *only* assigned client.
- e. Answer the question from a textbook and ideal point of view, and think about and visualize the data in the question as if it were in real time or a real clinical situation; however, remember that this is your *only* assigned client and that you have all of the time and all of the equipment needed to care for the client readily available at the bedside; remember that you do not need to run to the supply room to obtain, for example, sterile gloves because the sterile gloves will be at the client's bedside. See Section XIII.
5. Evaluation/Evaluate Outcomes (**Box 4.17**)
 - a. The nurse compares observed outcomes with expected ones.
 - b. These questions focus on comparing the actual outcomes of care with the generated solutions and expected outcomes and on

BOX 4.17 Practice Question: Evaluation/Evaluate Outcomes

The nurse is evaluating the client's response to treatment of a pleural effusion with a chest tube. The nurse notes a respiratory rate of 20 breaths per minute, fluctuation of the fluid level in the water seal chamber, and a decrease in the amount of drainage by 30 mL since the previous shift. On evaluation, which interpretation would the nurse make?

1. The client is responding well to treatment.
2. Suction should be decreased to the system.
3. The system should be assessed for an air leak.
4. Water should be added to the water seal chamber.

Answer: 1

Test-Taking Strategy: Use the [steps of the nursing process](#), and note that the nurse needs to evaluate the client's response to treatment. Focus on the [data in the question](#). Also, [determine whether an abnormality exists](#) based on these data. Remember that fluctuation in the water seal chamber is a normal and expected finding with a chest tube. Because the client is being treated for a pleural effusion, it can be determined that the client is responding well to treatment if the amount of drainage is gradually decreasing because the fluid from the pleural effusion is being effectively removed. If the drainage were to stop suddenly, the chest tube would be assessed for a kink or blockage. There is no indication based on the [data in the question](#) to decrease suction to the system. There are no [data in the question](#) indicating an air leak. Lastly, there are no [data in the question](#) indicating the need to add water to the water seal chamber. Remember that evaluation is the [fifth step of the nursing process](#) and that the nurse needs to evaluate outcomes by comparing observed outcomes with expected ones.

communicating and documenting findings.

- c. They also focus on assisting in determining the client's response to care and identifying factors that may interfere with achieving expected outcomes.
 - d. In these question types, watch for negative event queries because they are frequently used.
- G. Determine if an abnormality exists ([Box 4.18](#))
1. In the question, the client scenario will be described. Use your nursing knowledge, and recognize cues that determine whether any of the information presented is indicating an abnormality.
 2. If an abnormality exists, either further nursing assessment and analysis or further nursing action will be required. Therefore, continuing to monitor or documenting will not likely be a correct answer; do not select these options if they are presented!

BOX 4.18 Practice Question: Determine Whether an Abnormality Exists

The nurse is caring for a client who is taking digoxin and is complaining of nausea. The nurse gathers additional assessment data and checks the most recent laboratory results. Which laboratory value requires the need for follow-up by the nurse?

1. Sodium 138 mEq/L (138 mmol/L)
2. Potassium 3.3 mEq/L (3.3 mmol/L)
3. Phosphorus 3.1 mg/dL (1.0 mmol/L)
4. Magnesium 1.8 mg/dL (0.9 mmol/L)

Answer: 2

Test-Taking Strategy: Note the [strategic words](#), *need for follow-up*. The first step in approaching the answer to this question is to [determine whether an abnormality exists](#). Recognize cues in the question that are significant, and analyze the cues by connecting the data to a possible hypothesis. The client is taking digoxin and is complaining of nausea and the nurse should suspect toxicity as a possible hypothesis. The normal reference range for sodium is 135 to 145 mEq/L (135 to 145 mmol/L); potassium, 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L); phosphorus, 3.0 to 4.5 mg/dL (0.97 to 1.45 mmol/L); and magnesium, 1.8 to 2.6 mEq/L (0.74 to 1.07 mmol/L). The laboratory values noted in the options are all within normal range except for the potassium level. Recall that the potassium level must stay consistent while the client is taking digoxin to prevent adverse effects such as toxicity from occurring. Remember to recognize cues, analyze them, and [determine whether an abnormality exists](#) in the event before choosing the correct option.

- H. Focus on the data in the question and recognize cues ([Box 4.19](#))
1. With this strategy, data are provided in either the question or the options (or both) that are important in answering the question correctly.
 2. Data needed to answer the question will be abnormal and will not be borderline. In other words, using nursing knowledge, clinical experiences, and clinical judgment will assist you in recognizing the abnormal data. If the data are borderline, there will be another event in the question that could cause the data to become abnormal.
- I. Choose options that ensure client safety (see [Box 4.19](#))
1. When choosing an option, think about whether the option could cause a compromise in client safety.
 2. If an option could potentially result in an adverse effect or increase the client's risk for injury, eliminate that option.

VIII. Client Needs

 **Client Needs in the NCSBN Test Plan for the NCLEX-RN include Physiological Integrity, Safe and Effective Care Environment, Health Promotion and Maintenance, and Psychosocial Integrity.**

BOX 4.19 Practice Question: Focus on the Data in the Question and Ensure Client Safety

The nurse is providing discharge instructions to a client with diabetes mellitus. The client's glycosylated hemoglobin (HbA1c) level is 10%. The nurse would make which statement to the client?

1. "Increase the amount of vegetables and water intake in your diet regimen."
2. "Change the time of day you exercise because it may cause hypoglycemia."
3. "Continue with the same diet and exercise regimen you are currently using."
4. "Start a high-intensity exercise regimen and decrease carbohydrate consumption."

Answer: 1

Test-Taking Strategy: Focus on the **data in the question**, an HbA1c level of 10%. The nurse needs to recognize cues and analyze the cues to determine that the HbA1c level is above the recommended range for a client with diabetes mellitus, and indicates poor glycemic control. Therefore, an **abnormality exists**. Choose the option that addresses this abnormality and ensures client safety. Option 1 is a safe recommendation to make to a diabetic client, and will help to reduce the HbA1c level. Changing the time of day for exercise and continuing with the same diet and exercise regimen will not address the client's problem. Note the word *high-intensity* in option 4. Initiating a high-intensity exercise regimen and decreasing carbohydrate consumption could potentially result in a hypoglycemic reaction, and does not ensure client safety. Remember to focus on the **data in the question** and to recognize and analyze cues to determine whether an abnormality is present.

A. Physiological Integrity

1. According to the National Council of State Boards of Nursing (NCSBN), these questions test the concepts of nursing care as they relate to comfort and assistance in the client's performance of activities of daily living, as well as care related to the administration of medications and parenteral therapies.
2. These questions also address the nurse's ability to reduce the client's potential for developing complications or health problems related to treatments, procedures, or existing conditions and to provide care to clients with acute, chronic, or life-threatening physical health conditions.
3. Focus on Maslow's Hierarchy of Needs theory in these types of questions, and remember that physiological needs are a priority and are addressed first.
4. Use the ABCs (airway, breathing, and circulation), the nursing process, and the NCJMM when selecting an option addressing Physiological Integrity. Note that when CPR is necessary, follow the CAB guidelines rather than the ABCs.

B. Safe and Effective Care Environment

1. The NCSBN indicates that these questions test the concepts of providing safe nursing care and collaborating with interprofessional team members to facilitate effective client care; these questions also focus on the protection of clients, significant others, and health care personnel from environmental hazards.
2. Focus on safety with these types of questions, and remember the importance of handwashing, the nurse call system, bed positioning, the appropriate use of side rails, asepsis, the use of standard precautions and other precautions, triage, environmental safety, and emergency response planning.

C. Health Promotion and Maintenance

1. According to the NCSBN, these questions test the concepts that the nurse provides and assists with in directing nursing care to promote and maintain health.
2. Content addressed in these questions relates to assisting the client and significant others during the normal expected stages of growth and development, and providing client care related to the prevention and early detection of health problems.
3. Use teaching and learning theory if the question addresses client teaching, remembering that the client's willingness, desire, and readiness to learn is the first priority.
4. Watch for negative event queries because they are frequently used in questions that address Health Promotion and Maintenance and client education.

D. Psychosocial Integrity

1. The NCSBN notes that these questions test the concepts of nursing care that promote and support the emotional, mental, and social well-being of the client and significant others.
2. Content addressed in these questions relates to supporting and promoting the client's or significant others' ability to cope, adapt, or problem-solve in situations such as illnesses; disabilities; or stressful events, including abuse, neglect, or violence.
3. In this Client Needs category, you may be asked communication-type questions that relate to how you would respond to a client, a client's family member or significant other, or other health care team members.
4. Use therapeutic communication techniques to answer communication questions because of their effectiveness in the communication process (Box 4.20).
5. Remember to identify the client of the question and to select the option that focuses on the thoughts, feelings, concerns, anxieties, or fears of the client, client's family member, or significant other (see Box 4.20).

BOX 4.20 Practice Question: Communication and the Client of the Question

A client scheduled for surgery states to the nurse, “I’m not sure if I should have this surgery.” Which response by the nurse is appropriate?

1. “It’s your decision.”
2. “Don’t worry. Everything will be fine.”
3. “Why don’t you want to have this surgery?”
4. “Tell me what concerns you have about the surgery.”

Answer: 4

Test-Taking Strategy: Use **therapeutic communication techniques** to answer this question, and focus on the client of the question. Recognize cues in the question, and analyze them to determine the significance of the client’s statement. Remember to address the client’s feelings and concerns. Additionally, asking the client about what specific concerns they have about the surgery will allow for further decisions in the treatment process to be made. Option 1 is a blunt response and does not address the client’s concern. Option 2 provides false reassurance. Option 3 can make the client feel defensive and uses the nontherapeutic communication technique of asking “why.” The correct option is the only one that addresses the client’s concern. Remember to recognize and analyze cues, use **therapeutic communication techniques**, and focus on the client.

BOX 4.21 Practice Question: Eliminate Comparable or Alike Options

The nurse is caring for a group of clients. On review of the clients’ medical records, the nurse determines that which client is at risk for excess fluid volume?

1. The client taking diuretics
2. The client with an ileostomy
3. The client with kidney disease
4. The client undergoing gastrointestinal suctioning

Answer: 3

Test-Taking Strategy: Focus on the **subject**, the client at risk for excess fluid volume. Think about the pathophysiology associated with each condition identified in the options. The only client who retains fluid is the client with kidney disease. The client taking diuretics, the client with an ileostomy, and the client undergoing gastrointestinal suctioning all lose fluid; these are **comparable or alike** options. Remember to think about the pathophysiology of each condition and to eliminate **comparable or alike** options.

E. For additional information about Client Needs, refer to the NCLEX-RN test plan at the NCSBN website (<http://www.ncsbn.org>).

IX. Eliminate Comparable or Alike Options (Box 4.21)

A. When reading the options in multiple-choice questions, look for options that are comparable or alike.

BOX 4.22 Practice Question: Eliminate Options That Contain Closed-Ended Words

A client is to undergo a computed tomography (CT) scan of the abdomen with oral contrast, and the nurse provides preprocedure instructions. The nurse instructs the client to take which action in the preprocedure period?

1. Avoid eating or drinking for at least 3 hours before the test.
2. Limit self to only two cigarettes on the morning of the test.
3. Have a clear liquid breakfast only on the morning of the test.
4. Take all routine medications with a glass of water on the morning of the test.

Answer: 1

Test-Taking Strategy: The nurse needs to use knowledge about the preparation for a CT scan of the abdomen in order to take action with regard to preprocedure instructions. Note the **closed-ended words** “only” in options 2 and 3 and “all” in option 4. Eliminate options that contain **closed-ended words**, because these options are usually incorrect. Also, note that options 2, 3, and 4 are **comparable or alike** options in that they all involve taking in something on the morning of the test. Remember to eliminate options that contain **closed-ended words**.

B. Comparable or alike options can be eliminated as possible answers because it is unlikely that both options will be correct.

X. Eliminate Options Containing Closed-Ended Words (Box 4.22)

- A. Some closed-ended words are *all, always, every, must, none, never, and only*.
- B. Eliminate options that contain closed-ended words because these words imply a fixed or extreme meaning; these types of options are usually incorrect.
- C. Options that contain open-ended words, such as *may, usually, normally, commonly, or generally*, should be considered as possible correct options.

XI. Look for the Umbrella Option (Box 4.22)

- A. When answering a question, look for the umbrella option.
- B. The umbrella option is one that is a broad, comprehensive, or universal statement and that usually contains the concepts of the other options within it.
- C. The umbrella option will be the correct answer.

XII. Use the Guidelines for Delegating and Assignment-Making (Box 4.22)

A. You may be asked a question that will require you to decide how you will delegate a task or assign clients to other health care providers (HCPs).

BOX 4.23 Practice Question: Look for the Umbrella Option

A client admitted to the hospital is diagnosed with a pressure injury on the coccyx and has a wound vac. The wound culture results indicate that *methicillin-resistant Staphylococcus aureus* is present. The wound dressing and wound vac foam are due to be changed. The nurse would employ which protective precautions to prevent contraction of the infection during care?

1. Gloves and a mask
2. Contact precautions
3. Airborne precautions
4. Face shield and gloves

Answer: 2

Test-Taking Strategy: Focus on the client's diagnosis, use knowledge about the diagnosis, and recall that this infection is through direct contact. Recall that contact precautions involve the use of gown and gloves for routine care, and the use of gown, gloves, and face shield if splashing is anticipated during care. Note that the correct option is the **umbrella option**. Remember to look for the **umbrella option**, a broad or universal option that includes the concepts of other options in it.

BOX 4.24 Practice Question: Use Guidelines for Delegating and Assignment Making

The nurse in charge of a long-term care facility is planning the client assignments for the day. Which client would the nurse assign to the assistive personnel (AP)?

1. A client on strict bed rest
2. A client with dyspnea who is receiving oxygen therapy
3. A client scheduled for transfer to the hospital for surgery
4. A client with a gastrostomy tube who requires tube feedings every 4 hours

Answer: 1

Test-Taking Strategy: Note the **subject** of the question, the assignment to be delegated to the AP. When asked questions about delegation, think about the role description and scope of practice of the employee and the needs of the client. A client with dyspnea who is receiving oxygen therapy, a client scheduled for transfer to the hospital for surgery, or a client with a gastrostomy tube who requires tube feedings every 4 hours has both physiological and psychosocial needs that require care by a licensed nurse. The AP has been trained to care for a client on bed rest. Remember that the nurse needs to match the client's needs with the scope of practice of the health care provider in order to plan and generate solutions for a safe client assignment!

- B. Focus on the data in the question and what task or assignment is to be delegated and the available HCPs.
- C. When you have determined what task or assignment is to be delegated and the available HCPs, consider

the client's needs and match the client's needs with the scope of practice of the HCPs identified.

- D. The Nurse Practice Act and any practice limitations define which aspects of care can be delegated and which must be performed by a registered nurse. Use nursing scope of practice as a guide to assist in answering questions. Remember that the NCLEX is a national examination and that national standards rather than agency-specific standards must be followed when delegating.
- E. In general, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to an assistive personnel (AP), also known as a nursing assistant or certified nursing assistant.
- F. A licensed practical/vocational nurse (LPN/LVN) can perform the tasks that an AP can perform, can perform *focused* assessments, and usually can perform certain invasive tasks, such as dressings, suctioning, urinary catheterization, and administering medications orally or by the subcutaneous or intramuscular route. According to the NCSBN PN test plan, some selected piggyback intravenous medications may also be administered. The LPN/LVN can reinforce teaching that was initiated by the registered nurse (RN). Additionally, the NCJMM specifies that the LPN/LVN is responsible for applying the six cognitive skills or processes: (1) recognize cues; (2) analyze cues; (3) prioritize hypotheses; (4) generate solutions; (5) take action; and (6) evaluate outcomes.
- G. A registered nurse can perform the tasks that an LPN/LVN can perform and is responsible for *comprehensive* assessments and applying the six cognitive skills or processes: (1) recognize cues; (2) analyze cues; (3) prioritize hypotheses; (4) generate solutions; (5) take action; and (6) evaluate outcomes. The RN is also responsible for supervising care, initiating teaching, and administering medications intravenously.

XIII. Available Resources and Ideal Situations (Box 4.24)

- A. When providing care to a client, particularly in emergency situations, keep in mind that all of the resources needed (e.g., blood pressure cuff, dressing supplies) to provide client care will be readily available. Remember, you have everything you need wherever and whenever you need it!
- B. Answer the question as if it were an ideal situation. Remember that NCLEX requires that you will answer questions based on textbook information, and you need to use knowledge about the client's health problem and condition to answer the question.

BOX 4.25 Available Resources

The nurse is called to a client's room to assist the client who has a chest tube. The client states that it feels as if the tube has pulled out of the chest. The nurse assesses the client and finds that the tube has dislodged and is lying on the floor. What action would the nurse take next?

1. Ask for a pair of sterile gloves.
2. Contact the charge nurse for help.
3. Cover the insertion site with a sterile dressing.
4. Submerge the dislodged tube into sterile water.

Answer: 3

Test-Taking Strategy: Note the **strategic word**, *next*. Recognize cues in the question, and analyze the cues for their significance to identify the action that needs to be taken. When providing care to a client, particularly in emergency situations, keep in mind that all of the resources needed to provide client care will be readily available at the client's bedside. Most students would eliminate option 4 first, knowing that this action is not necessary in this scenario. From the remaining options, you may think, "I don't have sterile gloves or a sterile dressing with me, so let me call for help first." Remember, you have everything you need wherever and whenever you need it!

BOX 4.26 Practice Question: Answering Pharmacology Questions

Lisinopril is prescribed as adjunctive therapy in the treatment of heart failure. After administering the first dose, the nurse would monitor which item as the priority?

1. Weight
2. Urine output
3. Lung sounds
4. Blood pressure

Answer: 4

Test-Taking Strategy: Focus on the name of the medication and note the **strategic word**, *priority*. Recall that the medication names of most angiotensin-converting enzyme (ACE) inhibitors end with "*-pril*," and one of the indications for use of these medications is hypertension. Excessive hypotension ("first-dose syncope") can occur in clients with heart failure or in clients who are severely sodium-depleted or volume-depleted. Although weight, urine output, and lung sounds would be monitored, monitoring the blood pressure is the priority. Remember to use pharmacology guidelines to assist in answering questions about medications and note the **strategic word**.

XIV. Answering Pharmacology Questions (Box 4.26)

- A. If you are familiar with the medication, use nursing knowledge to answer the question.
- B. Remember that the question will identify the generic name of the medication only.
- C. If the question identifies a medical diagnosis, try to form a relationship between the medication and the diagnosis; for example, you can determine that cyclophosphamide is an antineoplastic medication if the question refers to a client with breast cancer who is taking this medication. Remember though that on the NCLEX a diagnosis may or may not be presented in a question.
- D. Try to determine the classification of the medication being addressed to assist in answering the question. Identifying the classification will assist in determining a medication's action or side/adverse effects or both.

 **Recognize the common side effects and adverse effects associated with each medication classification, and relate the appropriate nursing interventions to each effect; for example, if a side effect is hypertension, the associated nursing intervention would be to monitor the blood pressure.**

- E. Focus on what the question is asking or the subject of the question—for example, intended effect, side effect, adverse effect, or toxic effect.
- F. Learn medications that belong to a classification by commonalities in their medication names; for example, medications that act as beta blockers end with "*-lol*" (e.g., *atenolol*).

- G. If the question requires a medication calculation, remember that a calculator is available on the computer; talk yourself through each step to be sure that the answer makes sense, and recheck the calculation before answering the question, particularly if the answer seems like an unusual dosage.
- H. Pharmacology: Pyramid Points to remember 
 1. In general, the client would not take an antacid with medication because the antacid will affect the absorption of the medication.
 2. Enteric-coated and sustained-release tablets are not to be crushed; also, capsules should not be opened.
 3. The client would never adjust or change a medication dose or abruptly stop taking a medication.
 4. The nurse never adjusts or changes the client's medication dosage and never discontinues a medication.
 5. The client needs to avoid taking any over-the-counter medications or any other medications, such as herbal preparations, unless they are approved for use by the primary health care provider.
 6. The client needs to avoid consuming alcohol.
 7. Medications are never administered if the prescription is difficult to read, is unclear, or identifies a medication dose that is not a normal one.
 8. Additional strategies for answering pharmacology questions are presented in *Saunders Clinical Judgment and Test-Taking Strategies: Passing Nursing School and the NCLEX® Exam*.

UNIT II

Professional Standards in Nursing

Pyramid to Success

Nurses often care for clients who come from ethnic, cultural, or religious backgrounds that are different from their own. Nurses are also in a primary and unique position to address the individualized needs and care for various population groups. Awareness of and sensitivity to the unique health and illness beliefs and practices of people of various population groups are essential for the delivery of safe and effective care. Acknowledgment and acceptance of personal, cultural, religious, and spiritual differences with a nonjudgmental attitude are required for providing culturally competent and sensitive care. The NCLEX-RN® test plan includes information about recognizing a client's personal and cultural beliefs as integral to patient care quality. The nurse needs to avoid stereotyping and needs to be aware that there are several population groups, subcultures within cultures, and there are several dialects within languages. In nursing practice, the nurse needs to assess the client's perceived needs before planning and implementing a plan of care.

Across all settings in the practice of nursing, nurses frequently are confronted with ethical and legal issues related to client care. The professional nurse has the responsibility to be aware of the ethical principles, laws, and guidelines related to providing safe and quality care to clients. In the Pyramid to Success, focus on ethical practices; the Nurse Practice Act and the rights of all clients, particularly confidentiality, information security, and informed consent; advocacy, documentation, and advance directives; and cultural, religious, and spiritual issues. Knowledgeable use of information technology, such as an electronic health record, is also an important aspect of the role of the nurse.

The National Council of State Boards of Nursing (NCSBN) defines management of care as the nurse directing nursing care to enhance the care delivery setting to protect the client and health care personnel. As described in the NCLEX-RN exam test plan, a professional nurse needs to provide integrated, cost-effective

care to clients by coordinating, supervising, and collaborating or consulting with members of the interprofessional health care team. A primary Pyramid Point focuses on the skills required to prioritize client care activities. Pyramid Points also focus on concepts of leadership and management, the process of delegation, emergency response planning, and triaging clients.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

- Acting as a client advocate
- Becoming familiar with the emergency response plan
- Collaborating with interprofessional teams
- Delegating client care activities and providing continuity of care
- Ensuring ethical practices are implemented
- Ensuring informed consent has been obtained
- Ensuring legal rights and responsibilities are maintained
- Establishing priorities related to client needs and client care activities
- Instituting quality improvement procedures
- Integrating advance directives into the plan of care
- Integrating case management concepts
- Maintaining confidentiality and information security issues related to the client's health care
- Recognizing cues that indicate a safety issue
- Supervising the delivery of client care
- Triaging clients
- Upholding the rights of all clients
- Using information technology in a confidential manner
- Using leadership and management skills effectively

Health Promotion and Maintenance

- Considering cultural, religious, and spiritual issues related to family systems and family planning
- Considering personal viewpoints and individualized health care needs of population groups
- Generating solutions in the plan of care that address the client's preferences and lifestyle choices

Identifying high-risk behaviors of the client
Performing physical assessment techniques
Promoting health and preventing disease
Promoting the client's ability to perform self-care
Providing health screening and health promotion programs
Recognizing cues indicating a risk for a health problem
Respecting client preferences and lifestyle choices

Psychosocial Integrity

Addressing needs based on the client's preferences and beliefs
Assessing the use of effective coping mechanisms
Becoming aware of personal, cultural, religious, and spiritual preferences and incorporating these preferences when planning and implementing care
Identifying clients who do not speak or understand English and determining how language needs will be met by the use of agency-approved interpreters

Identifying family dynamics as they relate to the client
Identifying support systems for the client
Providing a therapeutic environment and building a relationship based on trust
Recognizing cues that indicate abuse or neglect issues

Physiological Integrity

Analyzing cues when monitoring for alterations in body systems or unexpected responses to therapy
Evaluating outcomes of care
Generating solutions or providing nutrition and oral hydration, considering client preferences
Implementing therapeutic procedures considering individual preferences
Prioritizing hypotheses regarding client preferences for providing holistic client care
Providing nonpharmacological comfort interventions
Taking action to ensure that emergencies are handled using a prioritization procedure

CLEX@Nepal

CHAPTER 5

Population Health Nursing

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE

Linda A. Silvestri, PhD, RN, FAAN

PRIORITY CONCEPTS Caregiving, Health Disparities

I. Population Groups

- A. For this chapter, based on the literature, the authors have identified certain population groups most commonly cared for in the health care environment that require nursing's special attention, care, and sensitivity regarding their health care needs to ensure that their needs are met.

II. Health Care Disparities

- A. Health care disparities are differences in health care offered to different groups of people.
- B. Some of the vulnerable groups that are at risk for health disparities include minority groups, those who are uninsured, those who live in poverty or who are homeless, those with chronic health problems and disabilities, immigrants, refugees, those with limited English proficiency, those who are incarcerated, and members of the LGBTQIA (lesbian, gay, bisexual, transgender, queer, intersex, asexual) community.
- C. Vulnerable groups experience greater risk factors, a lack of necessary access to care, and increased morbidity and mortality as compared with the general population. (Joszt, L. [2018]. 5 Vulnerable populations in health care. *The American Journal of Managed Care [AJM]*. Retrieved from <https://www.ajmc.com/view/5-vulnerable-populations-in-healthcare>)
- D. Nurses often care for clients who are vulnerable and at risk for health care disparities; nurses need to be aware that health care disparities exist and plan and provide care to prevent a disparity.
- E. Nurses also need to be aware of the most prevalent chronic health problems and infectious diseases in the United States and their associated risk factors. This is important because when performing assessments, the nurse needs to screen for these health problems and infections and their associated risk

factors, and to determine necessary protective measures and support services for the individual or family. Then, the nurse needs to plan appropriate educational strategies and teach about the measures that will either prevent or treat these health problems and infectious diseases and connect the client or family with identified support services. **Box 5.1** identifies chronic health problems in the United States and associated risk factors. **Box 5.2** identifies common infectious diseases.

III. Nursing Assessment

- A. See **Box 5.3** for a comprehensive nursing assessment tool titled *Population Health: Needs Assessment Tool*, written by the authors of this chapter. This tool can

BOX 5.1 Chronic Health Problems in the U.S. and Risk Factors

Chronic Health Problems

Heart disease
Cancer
Lung disease
Stroke
Alzheimer's disease
Diabetes mellitus
Kidney disease

Risk Factors

Tobacco use
Poor nutrition
Obesity
Lack of physical activity
Excessive alcohol use

Centers for Disease Control and Prevention (2021). *National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP)*. Retrieved from <https://www.cdc.gov/chronicdisease/index.htm>

BOX 5.2 Common Infectious Diseases in the U.S.

COVID-19 (coronavirus)
 Sexually transmitted diseases (chlamydia, syphilis, gonorrhea, genital herpes, human papilloma virus, human immunodeficiency virus and acquired immunodeficiency syndrome)
 Influenza
Staphylococcus aureus
Escherichia coli (*E. coli*)
 Herpes simplex 1, Herpes simplex 2
 Shigellosis
 Norovirus
 Salmonella
 Pneumonia
 Hepatitis C

Data in part from John Hopkins Medicine (2020). *Infectious diseases*. Retrieved from <https://www.hopkinsmedicine.org/health/infectious-diseases>

be used to obtain information from the client about their needs in order to plan care. It can be adapted based on the individual or family group being cared for.

- B. The initial health care visit and every visit thereafter need to be done with a nonjudgmental, nonthreatening approach.
- C. The nurse needs to focus on reported symptoms first. This will encourage adherence and follow-up.
- D. Subsequent care should include health maintenance, attention to common problems and concerns, and establishing an emergency contact person if available.
- E. Nurses' self-awareness of their own culture, values, beliefs, ethics, personality, and communication style helps to promote optimal health outcomes for clients of diverse populations. Recognizing one's own biases and being respectful to all people despite differences can influence satisfaction and quality of care.

BOX 5.3 Population Health: Needs Assessment Tool

Not all questions listed in this assessment tool will need to be used for the assessment. The nurse needs to make a judgment on appropriate questions for each population and needs to ask questions within that list, if appropriate for the client, based on the *General Background Questions*. Use the *General Background Questions* as a guide to determine additional questions that should be included in the assessment. It is also important to remember to perform a focused assessment when a client voluntarily seeks care. For example, if a client comes to the health care agency complaining of a cough and chills, focus on a respiratory assessment and treatment of this client problem as a priority.

Initial

- Introduce yourself and describe your role.
- Example: "I would like to ask you some questions so that we have information about your individualized needs. Do I have your permission to ask you some questions?"

General Background Questions

- Are you comfortable talking to me?
- What name would you like us to use to address you?
- What is your primary language spoken?
- Do you speak and understand English?
- In which language do you wish to communicate?
- Do you need an interpreter?
- Do you feel you are able to adequately answer questions regarding your health?
- What is your age?
- Is there a specific gender you identify with?
- What is your ethnicity?
- Do you have any cultural, religious, or spiritual preferences you would like us to consider in your plan of care?
- Do you have any dietary preferences that you would like us to include in your plan of care? Describe your eating patterns in a 24-hour period.
- Do you exercise? What do you do and how often?
- Do you use any remedies when you are sick?

- What do you do when you are sick?
- What is your living situation? Where do you live? Who do you live with? Do you have children?
- Do you have a support system?
- Would you like to name a support person or emergency contact person?
- Do you have access to financial resources needed to live?
- Do you have health insurance?
- Do you feel safe at home or where you live? Have you been abused within the last 12 months? Do you encounter crime or violence in your life? Is anyone hurting you, physically or emotionally or in any other way? Have you ever been or are you now being bullied?
- Do you smoke, drink alcohol, or use any type of drug?
- Do you have or need a health care proxy?
- Do you have an advance directive? If not, would you like more information about this?
- When was the last time you sought health care? For what reason?
- Do you have any fears about seeing your provider?
- Do you currently or have you ever had an infectious disease?
- Have you been exposed to anyone with an infectious disease? If so, how was this exposure treated?
- Have you ever been tested for COVID-19? Or tested for immunity?
- Have you had the recommended COVID vaccines?
- Have you traveled outside of the country recently?
- Are you up to date on immunizations?
- When was your last influenza vaccine?
- Have you ever been vaccinated for pneumonia? If so, when?
- Do you have a history of mental health problems?
- Have you ever had feelings of committing suicide? If so, do you have these feelings now? Do you have a plan?
- Are you a veteran or member of the military?
- Do you have any chronic illness, disability, or other past medical history?
- Have you ever been incarcerated?
- Are you an immigrant or refugee?

BOX 5.3 Population Health: Needs Assessment Tool—cont'd**Further Questions Based on Living Situation**

- Do you have a home? Do you live alone? Whom do you live with at home?
- Do you drink alcohol? Any other type of drug use?
- Have you been exposed to environmental irritants?
- Have you had problems with asthma, anemia, lead exposure, ear infections, gastrointestinal illness, or mental health?
- Are you willing to follow up on your health care recommendations if given the necessary resources?

Further Questions Based on Health Insurance Coverage

- What health insurance do you have?
- Do you have the financial means to pay for your health care?
- Are you willing to work with a social worker to seek health coverage?

Further Questions Based on Financial Status and Access to Resources

- What is your education level?
- What is your income?
- Do you have family you are in contact with?
- Is anyone in your immediate family disabled?
- Do you have a support system?
- Do you live in a safe community?
- Do you seek health care on a routine basis?
- Are you willing to work with a social worker to increase your access to community resources?

Further Questions Related to Abuse

- Do you have or have you had any bruises, sprains, broken bones, fatigue, shortness of breath, muscle tension, involuntary shaking, changes in eating or sleeping, sexual dysfunction, or fertility problems?
- Do you experience nightmares, anxiety, uncontrollable thoughts, depression, or low self-esteem?
- Do you have anxiety or depression? Do you have thoughts of harming yourself or others? If so, do you have a plan?
- Do you ever feel hopeless, worthless, apprehensive, discouraged? Do you lack motivation or faith? Have you questioned your trust in others?
- For a child: Do you have any problems at school? Are you bullied?

Further Questions Based on Gender and Sexual Orientation

- Can you describe your gender identity and sexual orientation preferences?
- Which pronoun would you like us to use for you (he, she, they, other)?
- Do you seek regular and routine health care? When were you last seen?
- When was your last breast exam, mammogram, Pap smear, testicular exam, prostate exam?
- Do you do a breast self-examination or a testicular self-examination?
- Do you have any past medical history?
- Are you sexually active? If so, how many partners do you have? Do you employ safe sex practices?
- Do you smoke, drink alcohol, or use any other type of drug?

- Do you have any problems with depression or anxiety? Do you have thoughts of harming yourself or others? If so, do you have a plan?
- Do you take hormone therapy?
- Are you up to date on your immunizations?
- Do you have children? If not, do you wish to or do you plan on having children?
- Do you feel you have access to necessary resources such as health care or other benefits?

Further Questions Related to Mental Health

- Do you seek routine health care?
- Describe your eating habits in a 24-hour period.
- Describe your activity level.
- Do you have any past medical history?
- Do you take any medications? If so, what are they and do you experience any side effects?
- Do you smoke, drink, or use any other type of drug?
- Do you experience depression or anxiety? Do you have thoughts of harming yourself or others? If so, do you have a plan?
- What do you do to cope with stressful situations? Do these coping strategies help you?
- Do you have a support person in your life?
- Are you sexually active? If so, do you employ safe sex practices? How many partners do you have?

Further Questions Related to Veteran/Military Status

- Do you have any problems with mental health, such as post-traumatic stress disorder, moral injury?
- Have you had any traumatic brain injuries?
- Have you had any other injuries?
- Describe your living situation.
- Are you interested in any community support groups?

Further Questions Related to Incarceration

- Have you ever been a victim of abuse or rape?
- Do you have any past medical history, particularly asthma, diabetes mellitus, hypertension, heart disease, mental health problems, or communicable diseases?

Further Questions Related to Immigration

- Do you have problems with mental health?
- Are you able to speak and understand English?
- Do you have access to resources such as housing, transportation, health care, and educational services?
- Do you have any past medical history, such as accidents, injuries, hypothermia, gastrointestinal illness, heart problems, pregnancy complications, diabetes, hypertension, malnutrition, or infectious or communicable disease?

Further Questions Related to Chronic Illness

- Do you have access to a primary health care provider?
- Do you see a primary health care provider or specialist on a regular basis?
- Are you able to follow up on the recommendations made by your primary health care provider and/or specialist?

Summary

- Is there anything else you would like to share regarding your ability to maintain your health or any other issue or concern?

⚠ Encounters with clients need to elicit the clients' unique perspectives based on their own preferences. This will allow the nurse to understand what health care treatments will be realistic and acceptable.

- F. It is imperative for nurses to understand that population groups may share dominant characteristics; however, all clients are individuals, and stereotyping needs to be avoided.
- G. It is important for nurses to be aware of the health problems that are common in a population group so that specific attention can be used when performing a comprehensive assessment.

and preventing that client from contracting the illness.

- J. The nurse needs to be aware of the critical measures needed to protect oneself from contracting the virus and must be an advocate in educating the public about the measures to prevent spread. These primary measures are handwashing, wearing a mask and eye protection, physical distancing, avoiding crowded situations, avoiding close contact with people who are sick, covering the nose and mouth when coughing or sneezing, keeping the hands away from the eyes and face, and self-quarantine.
- K. Refer to [Chapters 23 and 41](#) for information about COVID in pregnancy and in children, and [Chapter 51](#) for additional information on adults.

IV. COVID-19 - Coronavirus

- A. The COVID-19 pandemic is a serious global health threat and is a major public health concern. It has caused severe illness and even death in some individuals.
- B. Risk for contracting and becoming severely ill or dying from COVID-19 may be higher for certain populations. Those at high risk include the elderly; those with a chronic health condition such as diabetes or respiratory or cardiac disease; those who have cancer; those who are immunocompromised from chemotherapy or a disease; and minority groups (<https://www.hopkinsmedicine.org/health/conditions-and-diseases/coronavirus/covid19-racial-disparities>).
- C. It is considered a respiratory illness that is caused by a virus called SARS-CoV. Although the illness is respiratory in nature, the virus also attacks and affects many different body systems.
- D. Symptoms of the illness include but are not limited to cough, shortness of breath, respiratory congestion, fever, muscle pain, sore throat, and loss of taste and/or smell. Additional symptoms include body aches, fatigue, runny nose, and gastrointestinal symptoms such as nausea, vomiting, and diarrhea.
- E. Be alert to emergency warning signs for COVID-19 requiring emergency care: difficulty breathing, persistent pain or pressure in the chest, new confusion, inability to wake or stay awake, bluish lips or face (cyanosis).
- F. COVID-19 is a highly contagious illness, and controlling its spread is a primary goal.
- G. Other population groups at risk are those who are living in crowded conditions or who are institutionalized, such as those in a nursing home or in a prison.
- H. Some factors that play a role in increasing the risk for this infection are employment in essential fields such as health care environments, inconsistent access to health care, stress, and a low immune response.
- I. When performing an assessment on a client, the nurse must assess for any risk factors for COVID-19 and must institute safety measures for protecting

V. Minority Groups

- A. Minority groups are more often affected by health care disparities than nonminority groups.
- B. Some individuals in these groups may be less likely to have health insurance coverage or a regular source of health care. (Carratala, S., & Maxwell, C. [2020]. *Fact sheet: Health disparities by race and ethnicity*. Retrieved from https://cdn.americanprogress.org/content/uploads/2020/05/06130714/HealthRace-factsheet.pdf?_ga=2.26243709.1539460156.1624832457-65922829.1624832457)
- C. Obesity, diabetes mellitus, end-stage renal disease secondary to diabetes, and cervical cancer are more common among the Hispanic American/Latinx population.
- D. The Native Hawaiians and other Pacific Islanders population is noted to have higher rates of smoking, alcohol consumption, obesity, and diabetes mellitus. Hepatitis B, human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS), and tuberculosis are more frequent diseases. Noted is that there is a high incidence of infant mortality and sudden infant death syndrome (SIDS) in this population.
- E. In the Native American and Alaska Native populations, geographic isolation and income may be factors with regard to receiving health care. Inadequate water supply and sewage disposal can be a factor with infectious diseases. Smoking and the use of alcohol are more common, and diabetes mellitus, cancer, stroke, heart disease, and accidents are a concern. Additional concerns include mental health alterations, suicide, infant mortality, sudden infant death syndrome (SIDS), teenage pregnancy, liver disease, and hepatitis.
- F. Obesity, diabetes mellitus, hypertension, heart disease, asthma, and cancer occur more commonly among African Americans, with leading causes of death being heart disease, cancer, and stroke.
- G. Cancer, tuberculosis, and hepatitis are more common health problems of Asian Americans, with

leading causes of death being cancer, heart disease, and stroke.

 Some people in minority groups report hesitancy in seeking health care due to a language barrier. Ineffective communication between the nurse or other health care provider and the client can affect the client's health care and the client's ability to comply with follow-up care.

H. Health care considerations for minority groups

1. Cultural responsiveness is critical in the effort to reduce health care disparity and is a necessary ability for health care professionals to acquire in order to provide care for a diverse population. This can help improve health outcomes and quality of care.
2. The nurse and other health care professionals need to be aware of health care variations and risk factors for various populations in order to facilitate appropriate care and access to needed health care services.
3. It is important for the nurse to examine their own values to be responsive to the needs of someone from another population group; awareness is a useful tool in caring for others.
4. Language barriers influence access to health care. It is important to remember that family members and friends must not be asked to be an interpreter for the client because of **confidentiality**, the potential for conflict of interest, and the risk associated with relaying inaccurate information; only specified individuals as designated by the health care agency should be asked to interpret for a client.
5. Lack of access to preventive care needs to be addressed; lack of routine health care and delay in seeking health care for illness are common.
6. Some important educational health topics include diet and meal planning, exercise, and other lifestyle practices that help prevent disease, including infectious and communicable diseases.
7. Return explanation and demonstration (teach-back) are of particular importance to ensure safety and mutual understanding.

VI. Lesbian, Gay, Bisexual, Transgender, Queer, Intersex, Asexual Individuals

- A. Commonly referred to as the "LGBTQIA" community, this group is represented by a wide range of varying characteristics.
- B. There is often a lack of awareness and understanding among health care professionals in managing the health care needs of this population. Providing access to health care that meets their needs is critical.
- C. Some LGBTQIA persons may be less likely to access health care than other population groups due to fear of stigmatization and being viewed as different.

- D. Transgender individuals may be less likely than other groups to have certain screenings completed, such as mammograms, breast exams, cervical cancer screening, testicular cancer exams, and prostate screening. For additional information, refer to the GLAAD Media Reference Guide: Transgender at <https://www.glaad.org/reference/transgender>
- E. Sexually transmitted infections are of concern in this population.
- F. Breast cancer and cervical cancer are a concern, probably as a result of decreased screening and nulliparity.
- G. Depression and suicide are concerns.
- H. Rejection from friends, family members, and social support systems may be a stressor. Teenage members of the LGBTQIA population are more likely to be threatened, bullied, injured, raped, and victimized. For these reasons, school absenteeism can be a problem. LGBTQIA youth are at risk for abuse by family members due to their sexual orientation.
- I. Many same-sex couples desire children; there may be some barriers to child-rearing, such as the expenses associated with adoption, artificial insemination, and surrogacy.

 Members of the LGBTQIA population are less likely to have family members who can assist them with elder or disability care. Additionally, certain benefits, such as spousal death benefits, may be unavailable to them, which could impact their ability to manage finances and health care expenses.

J. Health care considerations for the LGBTQIA population

1. Health care professionals need to create a welcoming, nonjudgmental environment when caring for this population.
2. Using the correct pronoun is important in developing and maintaining a rapport.
3. Measures such as altering signage on paperwork and documents asking for gender identification will better serve the health needs of this population. In addition, the health care facility must develop institutional policies inclusive of all gender identities and preferences. Such measures will allow care providers to treat the client according to their identity while also maintaining an understanding of their risk factors based on biological drivers of health.
4. Health promotion measures need to focus on screening for health concerns such as cancer, sexually transmitted infections, depression, and suicide, and on educating on safe-sex practices.
5. A careful sexual history and appropriate counseling are important for all members of the LGBTQIA population.

6. Nonoccupational postexposure prophylaxis (nPEP) or the use of prophylactic antiretrovirals before and after potential HIV exposure needs to be considered.
 7. Transgender persons taking hormone therapy need to be monitored at regular intervals; associated complications, such as polycythemia occurring with exogenous testosterone use, need to be detected and treated early.
 8. Transgender persons who have undergone sexual reassignment surgery need to have the respective preventive screenings. For example, persons who have undergone male-to-female reassignment need to have breast cancer screening by way of mammography if they are older than 50 years. Additionally, female-to-male individuals should still undergo mammography routinely as indicated due to the risk for residual breast tissue to develop cancerous growth.
- E. Children affected by homelessness are sick more often with illnesses such as asthma, iron deficiency, lead poisoning, ear infections, gastrointestinal illness, and behavioral and mental health problems.
 - F. Children may begin to act out or become less attentive in the classroom when basic needs are not met.
 - G. Youth experience health problems related to risk-taking behaviors such as alcohol and drug abuse, and depression and suicide are concerns. Unintended pregnancy and sexually transmitted infections (STIs) are a concern; physical and sexual abuse is also a concern.
 - H. Health care considerations for the homeless (see **Clinical Judgment: Prioritize Hypotheses Box**)

VII. Homeless

- A. Affects any person from all backgrounds, and family units can be affected as a whole.
- B. There is a risk for early death related to health problems. **Box 5.4** lists common health problems.
- C. Disability often results from illness and becomes a barrier to employment, which further augments the problem of homelessness.
- D. Infants affected by homelessness often have low birth weights and are more likely to die within the first 12 months of life than infants in other population groups.

BOX 5.4 Links Between Homeless and Health and Common Problems in the Homeless

Links Between Homeless and Health

Limited access to health care
 Problems getting enough food
 Difficulty staying safe
 Violence
 Stress
 Unsanitary living conditions
 Exposure to extremes in weather

Common Health Problems

Dental problems
 Malnutrition
 Sexually transmitted diseases, including HIV and AIDS
 Lung diseases, including bronchitis, tuberculosis, and pneumonia
 Infectious and communicable diseases
 Mental health problems
 Substance abuse problems
 Wounds and skin infections

MedlinePlus (2020). *Homeless health concerns*. <https://medlineplus.gov/homelesshealthconcerns.html>

⚡ CLINICAL JUDGMENT: PRIORITIZE HYPOTHESES

A client who is homeless comes to the health care clinic for treatment of a painful open foot wound. *Priority* client needs include the following:

- Provide measures for pain relief.
- Identify the cause of the open foot wound.
- Assess and treat the open foot wound.
- Provide care with a nonjudgmental and nonthreatening approach.
- Determine medical history and existing health problems.
- Provide available access to health care resources.
- Establish an emergency contact person if available.
- Establish a follow-up plan of care.

1. Identification of those who are homeless needs to be accomplished through avenues such as outreach programs.
2. The initial health care visit and every visit thereafter need to be done with a nonjudgmental, nonthreatening approach.
3. The nurse needs to focus on reported symptoms first; this will encourage adherence and follow-up.
4. Subsequent care should include health maintenance, attention to common problems and concerns, and establishing an emergency contact person if available.
5. Members of the homeless population may not adhere to medical treatment recommendations and therefore require close follow-up as much as possible.
6. This population tends to have longer hospital stays and poorer health outcomes.
7. Certain medications need to be avoided in the homeless population due to the potential for

abuse and because of contraindications in chronic conditions; the nurse needs to ensure that any medication prescribed is safe for the person.

8. Multiple resources are available to increase access to health care for the homeless population, and the nurse needs to establish connections for the client as appropriate.
9. See <https://www.aafp.org/afp/2014/0415/p634.html> for more information about the homeless population.

VIII. Socioeconomically Disadvantaged Individuals and Families

- A. Disadvantage in the socioeconomic sense can correlate with poor health outcomes.
- B. Educational level, income, family, social support, and community safety are social determinants that can influence health and health outcomes.
- C. The social determinants of health are equally as important in promoting positive health outcomes as engaging in a healthy lifestyle and having access to routine, quality care.
- D. Individuals of low socioeconomic status (SES) are more likely to engage in risky health behaviors.
- E. Due to limited financial resources, these individuals are at a higher risk for chronic disease and any diseases associated with primary prevention.
- F. The health of children can be affected later in life due to risk factors.
- G. Health care considerations for socioeconomically disadvantaged individuals and families
 1. Social work services are helpful in connecting this population to needed health care services and resources to assist in paying for health care.
 2. The nurse needs to carefully assess the client for at-risk behaviors and intervene appropriately, including providing education.
 3. The nurse also needs to initiate social service contacts to ensure adequate health care.

IX. Uninsured and Underinsured Individuals

- A. Individuals with low incomes are most at risk for being uninsured or underinsured.
- B. Those who are uninsured or underinsured are at increased risk for health complications due to lack of access to care and the likelihood that preventive care services and chronic disease management will not be sought.
- C. Most individuals receive health insurance coverage through an employer. If the employer does not offer this coverage, the employee is at risk for being uninsured or underinsured.
- D. Medicaid is an option for some low-income families who meet eligibility criteria. Commercial insurance is another option but may still be cost prohibitive, depending on the individual circumstance. The

client should be referred to social services or financial services to apply for Medicaid.

- E. Risk factors: Refer to risk factors for socioeconomically disadvantaged individuals and families.
- F. Health care considerations for uninsured and underinsured individuals: Refer to health care considerations for socioeconomically disadvantaged individuals and families.

X. Intellectually Disabled Individuals

- A. Intellectually disabled individuals are at high risk for certain health disorders.
- B. Often, these health disorders go untreated due to atypical symptom presentation, which leads to additional problems later in life.
- C. Communication barriers between health care professionals and those with an intellectual disability present a unique challenge in identifying and managing health care needs in this population.
- D. These clients may have difficulty recalling their personal medical history, so it may be necessary to take more time to ask questions in a variety of different ways.
- E. More common health conditions include motor deficits, epilepsy, allergies, otitis media, gastroesophageal reflux disease (GERD), dysmenorrhea, sleep problems, mental health problems, vision and hearing impairments, constipation, and oral health problems.
- F. These clients may tend to eat quickly and so should be assessed for risk of choking and aspiration.
- G. Certain conditions can cause changes in behavior; for example, there may be eating disturbances due to GERD or self-injury due to the presence of an ear infection.
- H. Health care considerations for intellectually disabled individuals
 1. Safety is a priority; ensure a safe environment.
 2. Functional behavioral assessment is important in identifying existing health problems.
 3. Awareness of altered behavior as a manifestation of an illness is important in early identification and prevention of secondary problems.
 4. Health interventions must be focused on treating a medical condition, followed by behavioral interventions to prevent continued behavioral response to an illness.

XI. Battered Individuals and Victims of Abuse or Neglect

 Health care professionals are often the first point of contact for victims of abuse or neglect.

- A. Abuse of the older client (refer to [Chapter 20](#) and [Chapter 68](#)).
- B. Child abuse: Consequences are long-lasting, both impacting initial development and influencing adult health (refer to [Chapter 68](#)).

- C. Women are affected more than men.
- D. Some of the outcomes of abuse or neglect may include physical, somatic, psychological, behavioral, sexual, and pregnancy-related effects.
- E. Children birth to 1 year of age are at risk of maltreatment; the majority are victims of neglect. Maternal socioeconomic status and parental behavioral issues impact a child's risk.
- F. Victims are prone to certain health effects as a result of the abuse or neglect; these effects can include bruises, sprains or broken bones, chronic fatigue, shortness of breath, muscle tension, involuntary shaking, changes in eating and sleeping patterns, sexual dysfunction, and fertility issues.
- G. Mental health issues can arise, including post-traumatic stress disorder (PTSD), nightmares, anxiety, uncontrollable thoughts, depression, low self-esteem, and alcohol and drug abuse.
- H. Feelings of hopelessness, lack of worth, apprehension, discouragement, inability to trust others, and lack of motivation are common.
- I. Children who witness violence are prone to fearfulness, anxiety, depression, and problems in school.
- J. Health care considerations for battered individuals and victims of abuse or neglect
 1. Safety is a priority. Provide a safe environment, and ensure that the victim has a safe environment in which to live and is provided with contact information for seeking a safe haven if necessary.
 2. Treat victims with compassion and respect.
 3. Acknowledge and respect the dignity of each person.
 4. Nurses are mandated reporters of domestic violence and abuse incidents; it may be necessary to take photographs of injuries for legal reasons.
 5. Cleaning and dressing wounds, administering pain medications, use of assistive devices such as for sprains or fractures, education for self-management and seeking safety, and emotional support may be needed in the care of these victims.
 6. Provide parental education and support programs; increase awareness of potential battering and abuse or neglect.

XII. Single Parents

- A. The nurse should establish a therapeutic relationship with the client and encourage the single parent to express any concerns and needs about single parenting; this information will assist the nurse in identifying appropriate resources for the client.
- B. Initiating access to community organizations can assist in alleviating some burden and in providing needed services such as child care, food security, health care including immunizations, and employment.

- C. The nurse may need to assist single parents to address the child's sexual development, especially those with a child of the opposite sex.
- D. Preventive screenings are important in this population due to risk factors and the negative effects of stress from single parenting.

XIII. Foster Children

- A. Needs that often go unmet for children in foster care include physical, mental, behavioral, and dental health; this increases the risk for health problems later in life.
- B. Some children in foster care may have complex and chronic health conditions.
- C. Health care considerations for foster children
 1. Community resources are important for this population to facilitate the provision of health, safety, stability, and permanence.
 2. Social workers must be included in the care of a foster child to facilitate access to community resources.
 3. Medically equipped homes may be needed, as well as in-home nursing care services for those children with complex or chronic health conditions.
 4. Frequent health visits may be needed for children transitioning to and from foster care.

XIV. Individuals with Mental Health Problems

- A. Lifestyle choices, chronic health problems, psychotropic medications, limitation in access to health care, and lack of preventive screening are concerns.
- B. Side effects of psychotropic medications may contribute to an altered health state. Certain psychotropic medications can contribute to weight gain.
- C. Lack of exercise and poor diet, as well as features of an illness, such as depression or disorganized thought processes, may contribute to health problem development.
- D. Side effects from psychotropic medications, such as sedation, weight gain, and increased appetite contribute to the incidence of diabetes mellitus and metabolic syndrome in this population.
- E. Due to the higher frequency of substance abuse, risky sexual behaviors, and lack of knowledge regarding risks, individuals with a mental health problem are at increased risk for sexually transmitted infections.
- F. Sexual dysfunction can result from the mental health problem as well as the medication used to treat it.
- G. Xerostomia from reduction in salivary gland flow due to medications can result in difficulty maintaining oral hygiene and overall health.
- H. Health care considerations for individuals with a mental health problem
 1. Individuals with a mental health problem have a difficult time accessing needed and available health care services.

2. Family and social service support are important for these individuals.
 3. Governmental insurance has expanded to cover individuals in need of mental health care.
 4. Mental health screenings must be completed regularly for all individuals, which allows for prompt and accurate treatment strategies to prevent further health complications.
 5. Refer to the mental health chapters for additional information about this population.
- F. Limb amputations and disfigurement are more common.
 - G. Long-term health problems may result from exposure to chemicals and environmental irritants.
 - H. Military veterans can experience issues leading to homelessness.
 - I. Health care considerations for military veterans
 1. Identifying and treating mental health problems assist in mitigating suicide risk.
 2. Treatment of comorbid conditions such as PTSD or moral injury may help to address substance use disorders.
 3. The use of screening tools in identifying substance use disorder will help to plan appropriate care.
 4. The U.S. Department of Veterans Affairs can assist in managing some of the health issues experienced by these individuals.

XV. Older Adults

- A. Elder abuse is a concern for this population; health care providers are mandated to report if there is suspicion of elder abuse. The most common type of abuse is neglect.
- B. Many health problems can occur in the older client. (Box 5.5 lists some of these health problems.)
- C. See Chapter 20 for more information on common health conditions experienced by older adults and on the care of the older adult.

XVI. Military Veterans

- A. This population is at increased risk for injury-related and stress-related health illnesses.
- B. Mental health or behavioral adjustment disorders are common.
- C. Substance use disorders with tobacco, alcohol, or other drugs and suicide are more common.
- D. PTSD and moral injury are common among this population.
- E. Traumatic brain injury can occur as a result of external force injuries.

BOX 5.5 Health Problems That Occur in Older Adults

Alzheimer's disease
 Arthritis
 Dementia
 Depression
 Falls
 Heart disease
 Influenza
 Obesity
 Oral/dental health problems
 Osteoporosis
 Pneumonia
 Poverty
 Respiratory diseases
 Shingles
 Substance abuse

Healthy People 2020. (2020). *Older adults*. Retrieved from <https://www.healthypeople.gov/2020/topics-objectives/topic/older-adults>; Healthy West Orange. (n.d.). *15 common health concerns for seniors*. Retrieved from <https://healthywestorange.org/15-senior-concerns/>

XVII. Prisoners

 The environment of a prison predisposes a person to different health conditions, such as tuberculosis, sexually transmitted diseases, or other infectious or communicable diseases.

- A. Social determinants of poor health are often present in prisoners.
- B. Health concerns are asthma, diabetes, hypertension, heart disease, and mental health problems.
- C. Infectious and communicable diseases are also a concern for this population.
- D. Health care considerations for prisoners
 1. The correctional facility is usually the sole provider of health care for this population.
 2. Screening protocols and procedures for individuals in this setting need to be thorough, consistent, and performed regularly.
 3. Educational and vocational programs may help mitigate the health problems associated with living in a prison.
 4. History of incarceration increases the risk of poor health due to limited opportunities to reform; inadequate housing, employment, and education; and lack of family stability.
 5. Failure to address mental health issues among this population may contribute to repeated crimes when released from prison; those who are in prison for life need adequate screening and health care as well.

XVIII. Immigrants and Refugees

- A. Challenges include learning to speak English (or the adopted language of their new country), raising children, overcoming cultural barriers, citizenship, employment, housing, access to health care, and transportation.

- B. **Acculturation** to the United States increases the risk for poor health. Poor health can be the result of eating a less healthy diet, increased risk-taking behaviors, and separation from family support networks.
- C. There are many health concerns for this population. Many result from the process of migration and include infectious diseases such as tuberculosis, hepatitis, vector-borne disease, influenza, coronavirus, sexually transmitted diseases, and childhood diseases such as measles, mumps, rubella, and polio; antimicrobial resistance is a concern.
- D. For refugees, mental health problems due to war, violence, and rape occurring in camps are a concern.
- E. Health care considerations for immigrants and refugees
 1. A process for offering services and treating immigrants and refugees must be available regardless of insurance status.
 2. Refugees may be eligible for short-term medical assistance in the United States but then may lack health care coverage due to ineligibility for state medical assistance or inability to afford private health insurance.
 3. Nurses need to be aware of the limited access to health care resources and explore possible health care services for this population.
 4. Vaccinations must be provided to prevent communicable diseases.

XIX. Individuals with Chronic Illness

- A. Chronic illness is the leading cause of death and disability in the United States; the prevalence increases with age and is a major cause of disability.
- B. Chronic illnesses include cardiovascular disease, cancer, respiratory disease, diabetes, mental health problems, vision and hearing impairment, oral diseases, bone and joint disorders, and genetic disorders.
- C. Poor health outcomes and high health care costs are associated with chronic illness.
- D. Optimal care for individuals with multiple chronic illnesses may be limited because of the multiple health needs present.
- E. Many health professionals do not feel adequately prepared to manage individuals with multiple chronic illnesses.
- F. Individuals with one chronic illness are at risk for developing multiple chronic illnesses.
- G. Modifiable factors include an unhealthy diet, physical inactivity, and tobacco use; nonmodifiable factors include age and genetics.
- H. Health care considerations for individuals with chronic illness
 1. Follow-up care is important in promoting health for individuals with chronic illness.
 2. Focusing on a single illness does not effectively manage an individual with multiple chronic diseases—rather, the “big picture” needs to be understood in managing these clients.

3. Interprofessional collaboration is important in safely managing individuals with chronic diseases.
4. Nurses play a key role in facilitating interprofessional communication between providers and specialists.
5. Inclusion of the client and support person(s) in health care decisions helps to increase adherence to a complex health care regimen.

PRACTICE QUESTIONS

1. Which teaching method is most effective when providing health care instructions to members of specific populations?
 1. Teach-back
 2. Video instruction
 3. Written materials
 4. Verbal explanation
2. Which is most appropriate when communicating with a transgender person?
 1. Using identified pronouns
 2. Using their first name to address them
 3. Using pronouns associated with birth sex
 4. Anticipating the client’s needs and making suggestions
3. The nurse is volunteering with an outreach program to provide basic health care for homeless people. Which finding, if noted, must be addressed first?
 1. Blood pressure 154/72 mm Hg
 2. Visual acuity of 20/200 in both eyes
 3. Random blood glucose level of 206 mg/dL (11.77 mmol/L)
 4. Complaints of pain associated with numbness and tingling in both feet
4. The nurse is completing the admission assessment of a client who is intellectually disabled. Which part of the client encounter may require more time to complete?
 1. The history
 2. The physical assessment
 3. The nursing plan of care
 4. The medication reconciliation
5. The nurse working in a correctional facility is caring for a new prisoner. The client asks about health risks associated with living in a prison. How would the nurse respond?
 1. “Health care is very limited in the prison setting.”
 2. “Living in a prison isn’t different than living at home.”
 3. “Living in a prison can predispose a person to different health conditions.”
 4. “Living in a prison is similar to living in a condominium complex or dormitory.”

6. The nurse is caring for a client in the emergency department who presents with a complaint of fatigue and shortness of breath. Which physical assessment finding, if noted by the nurse, warrants a need for follow-up?
 1. Reddened sclera of the eyes
 2. Dry flaking noted on the scalp
 3. A reddish-purple mark on the neck
 4. A scaly rash noted on the elbows and knees
7. The nurse working in a community outreach program for foster children plans care, knowing that which health conditions are common in this population? Select all that apply.
 - 1. Asthma
 - 2. Claustrophobia
 - 3. Sleep problems
 - 4. Bipolar disorder
 - 5. Aggressive behavior
 - 6. Attention-deficit/hyperactivity disorder (ADHD)
8. The nurse planning care for a military veteran needs to prioritize nursing interventions targeted at managing which condition, if present, that commonly occurs in this population?
 1. Hypertension
 2. Hyperlipidemia
 3. Substance abuse disorder
 4. Post-traumatic stress disorder
9. The nurse caring for a refugee considers which health care need a priority for this client?
 1. Access to housing
 2. Access to clean water
 3. Access to transportation
 4. Access to mental health care services
10. Which action by the nurse will best facilitate adherence to the treatment regimen for a client with a chronic illness?
 1. Arranging for home health care
 2. Focusing on managing a single illness at a time
 3. Communicating with one provider only to avoid confusion for the client
 4. Allowing the client to teach a support person about the treatment regimen

ANSWERS

1. Answer: 1

Rationale: When providing health care instructions to members of specific populations, return explanation and demonstration (teach-back) are of particular importance to ensure safety and mutual understanding. This method is the most reliable in confirming client understanding of the instructions. Video instruction, written materials, and verbal explanation are helpful and may be incorporated with the teach-back method.

Test-Taking Strategy: Note the **strategic words**, *most effective*. Note that the correct option—the teach-back method—is the **umbrella option**, which encompasses all other options. Recall that asking the client to perform a return demonstration is the best way to confirm understanding.

Reference: Carratala, S., & Maxwell, C. (2020). *Fact sheet: Health disparities by race and ethnicity*. Retrieved from https://cdn.americanprogress.org/content/uploads/2020/05/06130714/HealthRace-factsheet.pdf?_ga=2.26243709.1539460156.1624832457-65922829.1624832457

2. Answer: 1

Rationale: The nurse needs to address the client with the name and pronouns that the client identifies with, and the first name may not necessarily be what they use. For the transgender person, it is likely that they would expect to be addressed using pronouns associated with the sex they identify with now, which typically is not their birth sex. Anticipating the client's needs and making suggestions may be seen as judgmental, so the nurse needs to refrain from doing this.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Recalling that clarification regarding name identity is important for any client will assist you in eliminating option 2. Recalling that use of pronouns associated with birth sex is inappropriate will assist you in eliminating option 3. Noting the word *making suggestions* in option 4 will assist you in eliminating this option.

Reference: Ard, K. L. (n.d.). *Improving the health care of lesbian, gay, bisexual, and transgender people: Understanding and eliminating health disparities*. Retrieved from <https://www.lgbthealtheducation.org/wp-content/uploads/Improving-the-Health-of-LGBT-People.pdf>

3. Answer: 4

Rationale: The nurse needs to address the complaints of pain and numbness and tingling in both feet first with this population. If the client perceives value to the service provided and the complaint is addressed, the client will be more likely to return for follow-up care. While the blood pressure, blood glucose, and vision results need follow-up, the client's stated concern must be addressed first.

Test-Taking Strategy: Note the **subject**, the finding to be addressed, and focus on the **strategic word**, *first*. Recalling that adherence is a problem for this population will direct you to the correct option. Also note that the correct option is the only subjective finding.

References: Maness, D. L., & Khan, M. (2014). Care of the homeless: An overview. *American Family Physician*, 89(8), 634-640. Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 124.

4. Answer: 1

Rationale: Intellectually disabled clients tend to have difficulty trying to remember their medical history. It may be necessary for the nurse to take more time to ask questions in a variety of different ways when collecting the history data. The physical assessment, nursing plan of care, and medication reconciliation portions, although they rely on the history, take less time because they require less client questioning.

Test-Taking Strategy: Note the **subject**, conducting an admission assessment for an intellectually disabled client and the part that may take more time to complete. Recall that individuals in this population group tend to have difficulty remembering their medical history. The use of questioning in a variety of ways may be necessary to obtain the necessary assessment data.

References: May, M. E., & Kennedy, C. H. (2010). Health and problem behavior among people with intellectual disabilities. *Behavioral Annals of Practice, 3*(2), 4-12.

Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 359.

5. Answer: 3

Rationale: The environment of a prison predisposes a person to different health conditions, such as tuberculosis, sexually transmitted infections, or other infectious diseases. Option 1 does not address the client's question. Options 2 and 4 convey incorrect information.

Test-Taking Strategy: Note the **subject**—health conditions associated with living in a prison. Remember that the prison is a confined environment, and a variety of health problems including infectious diseases are prevalent.

References: Centers for Disease Control and Prevention. (2014). *Behind the wall*. Retrieved from <https://www.cdc.gov/correctionalhealth/default.htm>

Foster, K., Marks, P., O'Brien, A., & Raeburn, T. (2021). *Mental health in nursing: Theory and practice for clinical settings*. (5th ed.). St. Louis: Elsevier. pp. 446-447.

6. Answer: 3

Rationale: The client in this question must be screened for abuse. Battered persons experience bruises, particularly around the eyes, red or purple marks on the neck, sprained or broken wrists, chronic fatigue, shortness of breath, muscle tension, involuntary shaking, changes in eating and sleeping, sexual dysfunction, and fertility issues. Mental health problems can also arise, including post-traumatic stress disorder, nightmares, anxiety, uncontrollable thoughts, depression, low self-esteem, and alcohol and drug abuse. Reddened sclera, a dry rash on the elbows, and flaking of the scalp do not pose an indication of abuse.

Test-Taking Strategy: Note the **strategic words**, *need for follow-up*. Also focus on the **data in the question** and select the option that indicates the most concern and is indicative of abuse. Remember that battered persons often present with bruising around the eyes or on the neck.

References: Bohn, D. K., & Holz, K. A. (1996). Sequelae of abuse: Health effects of childhood sexual abuse, domestic battering, and rape. *Journal of Midwifery & Women's Health, 41*(6), 442-456.

Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 526.

7. Answer: 3, 4, 5, 6

Rationale: Foster children are at risk for a variety of health conditions, including ADHD, aggressive behavior, anxiety disorder, bipolar disorder, depression, mood disorder, post-traumatic stress disorder, reactive detachment disorder, sleep problems, and personality disorder. Asthma and claustrophobia are not specifically associated with foster children.

Test-Taking Strategy: Note the **subject**—health concerns for foster children. Recall that mental health is a major concern for this population. This will assist in directing you to the correct options.

Reference: American Academy of Pediatrics. (n.d.). *Healthy foster care America*. Retrieved from <https://www.aap.org/en/patient-care/foster-care/>

8. Answer: 4

Rationale: Post-traumatic stress disorder (PTSD) is extremely common in this population. Identifying and treating mental health disorders assists in mitigating suicide risk. Treatment of comorbid conditions such as PTSD may also help to address any substance use disorder. Use of screening tools in identifying substance use disorder is helpful. Treatment of PTSD includes exposure therapy, psychotherapy, and family/group therapy. Hypertension and hyperlipidemia are important but are not the priority; the risk of suicide and other safety concerns associated with PTSD are the priority for this population.

Test-Taking Strategy: Note the **strategic word**, *prioritize*. This word indicates that although all options may be important, one option is a priority due to safety considerations. Also note that options 1 and 2 are **comparable or alike** and therefore can be eliminated. Although substance abuse may be a concern, PTSD is the priority.

References: U.S. National Library of Medicine. (2017). *Veterans and military health*. Retrieved from <https://medlineplus.gov/veteransandmilitaryhealth.html>

Varcarolis, E. & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Elsevier. pp. 56-57.

9. Answer: 4

Rationale: Mental health problems are the primary concern for this population as a result of difficult events. While all other options are important for all clients, they do not address the specific needs of this population.

Test-Taking Strategy: Note the **strategic word**, *priority*. This indicates that all options are important and are most likely correct. It is necessary to recall that due to the potential trauma experienced by refugees, mental health is a priority.

References: Global Citizen. (2014). *7 of the biggest challenges immigrants and refugees face in the US*. Retrieved from <https://www.globalcitizen.org/en/content/the-7-biggest-challenges-facing-refugees-and-immig/>

Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 36.

10. Answer: 1

Rationale: Nursing follow-up visits are important in promoting health for individuals with chronic illness; therefore, arranging for home health care is an important strategy. Focusing on a

single illness does not effectively manage an individual with multiple chronic diseases—rather, the “big picture” needs to be understood in managing these clients. Interprofessional collaboration is important in safely managing individuals with chronic diseases and often involves consulting with specialist providers. Nurses play a key role in facilitating communication between providers and specialists. Inclusion of the client and support persons in health care decisions helps to increase adherence to a complex health care regimen. The nurse should be the facilitator of this communication.

Test-Taking Strategy: Note the **strategic word**, *best*. Recalling that these clients often have complex histories and health care needs will assist you in choosing the option that relates to nursing support services.

Ethical and Legal Issues

Contributor: Karen L. Petersen, MSN-L, RN, MNN

PRIORITY CONCEPTS Ethics; Health Care Law

I. Ethics

- A. Description: The branch of philosophy concerned with the distinction between right and wrong on the basis of a body of knowledge, not only on the basis of opinions
- B. **Morals:** Behavior in accordance with customs or tradition, usually reflecting personal or religious beliefs
- C. **Ethical principles:** Codes that direct or govern nursing actions (Box 6.1)
- D. Values: Beliefs and attitudes that may influence behavior and the process of decision making
- E. Values clarification: Process of analyzing one's own values to understand oneself more completely regarding what is truly important

BOX 6.1 Ethical Principles

Autonomy: Respect for an individual's right to self-determination and making one's own decisions

Nonmaleficence: The obligation to do or cause no harm to another; in providing care the nurse is obliged to refrain from acts that unnecessarily cause injury, harm, or suffering

Beneficence: The duty to do good to others and to maintain a balance between benefits and harms; paternalism is an *undesirable* outcome of beneficence, in which the health care provider decides what is best for the client and encourages the client to act against their own choices

Justice: The equitable distribution of potential benefits and tasks determining the order in which clients should be cared for

Veracity: The obligation to tell the truth and communicate truthfully

Fidelity: The duty to do what one has promised, to maintain loyalty and commitment to the client, to be faithful to agreements and responsibilities one has undertaken, and to do no wrong to the client

F. Ethical codes

1. Ethical codes provide broad principles for determining and evaluating client care.
2. These codes are not legally binding, but the board of nursing has authority in most states to reprimand nurses for unprofessional conduct that results from violation of the ethical codes.
3. Ethical codes describe the nurse's obligation to the client, the role of the nurse, and duties of the nurse to the profession and to society.
4. Specific ethical codes are as follows:
 - a. The Code of Ethics for Nurses developed by the International Council of Nurses; website: <https://www.icn.ch/news/international-council-nurses-launches-consultation-revise-code-ethics-nurses>.
 - b. The American Nurses Association Code of Ethics can be viewed on the American Nurses Association; website: <http://www.nursingworld.org/codeofethics>.

G. Ethical dilemma

1. An ethical dilemma occurs when there is a conflict between two or more ethical principles.
2. No correct decision exists, and the nurse must make a choice between two alternatives that are equally unsatisfactory.
3. Such dilemmas may occur as a result of differences in cultural or religious beliefs.
4. Ethical reasoning is the process of thinking through what one should do in an orderly and systematic manner to provide justification for actions based on principles; the nurse should gather all information to determine whether an ethical dilemma exists, examine their own values, verbalize the problem, consider possible courses of action, negotiate the outcome, and evaluate the action taken.

H. Advocate

1. An advocate is a person who speaks up for or acts on the behalf of the client, protects the client's right to make their own decisions, and upholds the principle of **fidelity**.
2. An advocate represents the client's viewpoint to others.
3. An advocate avoids letting personal values and beliefs influence **advocacy** for the client and supports the client's decision, even when it conflicts with the advocate's own preferences or choices.

I. Ethics committees

1. Ethics committees take an interprofessional approach to facilitate dialogue regarding ethical dilemmas.
2. These committees provide clinical ethics consultation to resolve dilemmas, develop and or revise policies and procedures (e.g., advance directives, informed consent), and facilitate education about issues in clinical ethics.

 An important nursing responsibility is to act as a client advocate and protect the client's rights.

II. Regulation of Nursing Practice

A. Nurse Practice Act

1. A nurse practice act is a series of statutes that have been enacted by a state legislature to regulate the practice of nursing within that state.
2. Nurse practice acts set educational requirements for the nurse, distinguish between nursing practice and medical practice, and define the scope of nursing practice.
3. Additional issues covered by nurse practice acts include licensure requirements for protection of the public, grounds for disciplinary action, rights of the nurse licensee if a disciplinary action is taken, and related topics.
4. All nurses are responsible for knowing the provisions of the act of the state or province in which they work.

B. Standards of care

1. Standards of care are guidelines that identify what the client can expect to receive in terms of nursing care.
2. The guidelines determine whether nurses have performed duties in an appropriate manner.
3. If the nurse does not perform duties within accepted standards of care, the nurse may be in jeopardy of legal action.
4. If the nurse is named as a defendant in a **malpractice** lawsuit and proceedings show that the nurse followed neither the accepted standards of care outlined by the state or province nurse practice act nor the policies of the employing institution,

the nurse's legal liability is clear; the nurse is liable.

C. Employee guidelines

1. **Respondeat superior**: The employer is held liable for any negligent acts of an employee if the alleged negligent act occurred during the employment relationship and was within the scope of the employee's responsibilities.
2. **Contracts**
 - a. Nurses are responsible for carrying out the terms of a contractual agreement with the employing agency and the client.
 - b. The nurse–employee relationship is governed by established employee handbooks and client care policies and procedures that create obligations, rights, and duties between those parties.
3. **Institutional policies**
 - a. Written policies and procedures of the employing institution detail how nurses are to perform their duties.
 - b. Policies and procedures are usually specific and describe the expected behavior on the part of the nurse.
 - c. Although policies are not laws, courts generally rule against nurses who violate policies.
 - d. If the nurse practices nursing according to client care policies and procedures established by the employer, functions within the job responsibility, and provides care consistently in a nonnegligent manner, the nurse minimizes the potential for liability.

 The nurse must follow the guidelines identified in the Nurse Practice Act and agency policies and procedures when delivering client care.

D. Hospital staffing

1. Charges of abandonment may be made against nurses who “walk out” when staffing is inadequate.
2. Nurses in short staffing situations are obligated to make a report to the nursing administration.

E. Floating

1. Floating is an acceptable practice used by health care facilities to alleviate understaffing and overstaffing.
2. Legally, the nurse cannot refuse to float unless the institution has a union contract guaranteeing that nurses can work only in a specified area, or the nurse can prove lack of knowledge for the performance of assigned tasks. However, client safety and client care need to be the priority, and depending on the health care facility policies and procedures, the nurse may be required to float to other agency areas to care for clients.

3. Nurses in a floating situation must not assume responsibility beyond their level of experience or qualification.
4. Nurses who float should inform the supervisor of any lack of experience in caring for the type of clients on the new nursing unit.
5. A resource nurse who is skilled in the care of clients on the unit should also be assigned to the float nurse; in addition, the float nurse should be given an orientation of the unit and the standards of care for the unit should be reviewed (the float nurse should care for clients whose acuity level most closely matches the nurse's experience). Some facilities have float teams, which help to alleviate understaffing.

F. Disciplinary action

1. Boards of nursing may deny, revoke, or suspend any license to practice as a registered nurse, according to their statutory authority; individuals could also be placed on probation.
2. Some causes for disciplinary action are as follows:
 - a. Unprofessional conduct
 - b. Conduct that could affect the health and welfare of the public adversely
 - c. Breach of client confidentiality
 - d. Failure to use sufficient knowledge, skills, or nursing judgment
 - e. Physically or verbally abusing a client
 - f. Assuming duties without sufficient preparation
 - g. Knowingly delegating to unlicensed personnel nursing care that places the client at risk for injury
 - h. Failure to maintain an accurate record for each client
 - i. Falsifying a client's record
 - j. Leaving a nursing assignment without properly notifying appropriate personnel
3. Employee assistance programs are available for individuals.

III. Legal Liability

A. Laws

1. Nurses are governed by civil and criminal law in roles as providers of services, employees of institutions, and private citizens.
2. The nurse has a personal and legal obligation to provide a standard of client care expected of a reasonably competent professional nurse.
3. Professional nurses are held responsible (liable) for harm resulting from their negligent acts or their failure to act.

B. Types of laws (Fig. 6.1)

C. Negligence and malpractice (Box 6.2)

1. Negligence is conduct that falls below the standard of care.

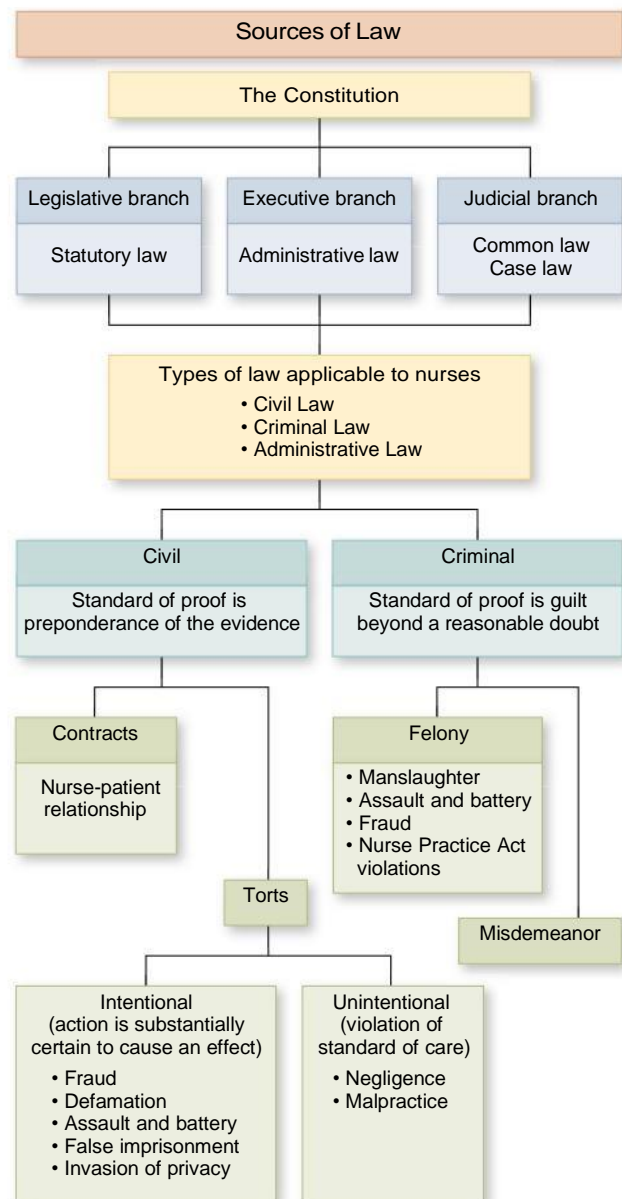

FIG. 6.1 Sources of law for nursing practice.

2. Negligence can include acts of commission and acts of omission.
3. The nurse who does not meet appropriate standards of care may be held liable.
4. Malpractice is negligence on the part of the nurse.
5. Malpractice is determined if the nurse owed a duty to the client and did not carry out the duty and the client was injured because the nurse failed to perform the duty.
6. Proof of liability
 - a. Duty: At the time of injury, a duty existed between the plaintiff and the defendant.
 - b. Breach of duty: The defendant breached duty of care to the plaintiff.

BOX 6.2 Examples of Negligent Acts

- Failure to provide a safe environment for the client
- Failure to follow policy and procedures
- Failure to respond to or correctly implement new and existing orders
- Medication errors that result in injury to the client
- Intravenous administration errors, such as incorrect flow rates or failure to monitor a flow rate, that result in injury to the client
- Failure to monitor for and take action in the event of infiltration, phlebitis, circulatory overload, or other complications following IV therapy
- Falls that occur as a result of failure to provide safety to the client
- Failure to use aseptic technique when indicated
- Failure to provide adequate care that results in altered skin integrity and pressure injuries
- Failure to check equipment for proper functioning
- Burns sustained by the client as a result of failure to monitor bath temperature or equipment, or to protect the client from spills of hot liquids or foods
- Errors in sponge, instrument, or needle counts in surgical cases, meaning that an item was left in a client
- Failure to properly delegate and supervise
- Failure to adequately monitor a client's condition
- Failure to report changes in the client's condition
- Failure to give a report or giving an incomplete report to the oncoming shift personnel
- Failure to convey discharge instructions to the client, the family, or providers who are assuming responsibility for the client

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 318.

- c. Proximate cause: The breach of the duty was the legal cause of injury to the client.
- d. Damage or injury: The plaintiff experienced injury or damages or both and can be compensated by law.

 **The nurse must meet appropriate standards of care when delivering care to the client; otherwise the nurse would be held liable if the client is harmed.**

- D. Professional liability insurance
 1. Nurses need their own liability insurance for protection against malpractice lawsuits.
 2. Having their own insurance provides nurses protection as individuals; this allows the nurse to have an attorney present, if necessary, who has only the nurse's interests in mind.
- E. Good Samaritan laws
 1. State legislatures pass Good Samaritan laws, which may vary from state to state.
 2. These laws encourage health care professionals to assist in emergency situations and limit liability and offer legal immunity for persons helping

in an emergency, provided that they give reasonable care.

3. Immunity from suit applies only when all conditions of the state law are met, such as that the health care provider (HCP) receives no compensation for the care provided and the care given is not intentionally negligent.
- F. Controlled substances 
1. The nurse should adhere to facility policies and procedures concerning administration of controlled substances, which are governed by federal and state laws.
 2. Controlled substances must be kept locked securely, and only authorized personnel should have access to them.
 3. Controlled substances must be properly signed out for administration, and a correct inventory must be maintained.

IV. Collective Bargaining

- A. Collective bargaining is a formalized decision-making process between representatives of management and representatives of labor to negotiate wages and conditions of employment.
- B. When collective bargaining breaks down because the parties cannot reach an agreement, the employees may call a strike or take other work actions.
- C. Striking presents a **moral** dilemma to many nurses, because nursing practice is a service to people.

V. Legal Risk Areas 

- A. Assault
 1. Assault occurs when a person puts another person in fear of a harmful or offensive contact; this also constitutes an unwelcome contact with another person.
 2. The victim fears and believes that harm will result because of the threat.
- B. Battery is an intentional touching of another's body without the other's **consent**.
- C. Invasion of privacy includes violating **confidentiality**, intruding on private client or family matters, and sharing client information with unauthorized persons.
- D. False imprisonment
 1. False imprisonment occurs when a client is not allowed to leave a health care facility when there is no legal justification to detain the client.
 2. False imprisonment also occurs when restraining devices are used without an appropriate clinical need.
 3. A client can sign an Against Medical Advice form when the client refuses care and is competent to make decisions.
 4. The nurse should document circumstances in the medical record to avoid allegations by the client that cannot be defended.

- E. Defamation is a false communication that causes damage to someone's reputation, either in writing (libel) or verbally (slander).
- F. Fraud results from a deliberate deception intended to produce unlawful gains.
- G. There may be exceptions to certain legal risks areas, such as assault, battery, and false imprisonment, when caring for clients with mental health disorders experiencing acute distress who pose a risk to themselves or others. In this situation, the nurse must assess the client to determine loss of control and intervene accordingly; the nurse should use the least restrictive methods initially, but then use interventions such as restraint if the client's behavior indicates the need for this intervention.

VI. Patient Care Partnership

- A. Description
 1. The document, created by the American Hospital Association, informs clients about what they should expect during their hospital stay with regard to their rights and responsibilities.
 2. The document is formerly known as the **Client's (Patient's) Bill of Rights**, and reflects acknowledgment of clients' rights to participate in their health care, with an emphasis on client autonomy.
 3. For specific information, see American Hospital Association at <https://www.aha.org/other-resources/patient-care-partnership>
 4. The Patient Care Partnership protects the client's ability to determine the level and type of care received; all health care agencies are required to have a Patient Care Partnership posted in a visible area.
 5. Several laws and standards pertain to the Patient Care Partnership and clients' rights (**Box 6.3**).
- B. Rights for the mentally ill
 1. The Mental Health Systems Act created rights for mentally ill people.
 2. The Joint Commission has developed National Patient Safety Goals® for the Behavioral Health Care and Human Services Program. Refer to: <https://www.jointcommission.org/standards/national-patient-safety-goals/behavioral-health-care-national-patient-safety-goals/>. Psychiatric facilities are required to have a Patient Care Partnership document posted in a visible area.
- C. Organ donation and transplantation
 1. A client has the right to decide to become an organ donor and a right to refuse organ transplantation as a treatment option.
 2. An individual who is at least 18 years old may indicate a wish to become a donor on the individual's driver's license (state-specific) or in an **advance directive**.
 3. The Uniform Anatomical Gift Act provides a list of individuals who can provide **informed consent**

BOX 6.3 Laws and Standards

American Hospital Association

Issued Patient Care Partnership (formerly Patient's Bill of Rights)

American Nurses Association

Developed the Code of Ethics for Nurses, which defines the nurse's responsibility for upholding clients' rights

Mental Health Systems Act

Developed rights for mentally ill clients

The Joint Commission

Developed policy statements on the rights of mentally ill individuals

Americans With Disabilities Act

Prohibits discrimination against an individual with disabilities in all areas of public life

Affordable Care Act

Characterized by consumer rights and protection, affordable health coverage, increased access to care, and quality care that meets the needs of clients

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 307-312.

for the donation of a deceased individual's organs.

4. The United Network for Organ Sharing sets the criteria for organ donations.
5. Some organs, such as the heart, lungs, and liver, can be obtained only from a person who is on mechanical ventilation and has suffered brain death, whereas other organs or tissues can be removed several hours after death.
6. A donor must be free of infectious disease and cancer.
7. Requests to the deceased's family for organ donation usually are done by the primary health care provider (PHCP) or a nurse specially trained for making such requests.
8. Donation of organs does not delay funeral arrangements. No obvious evidence that the organs were removed from the body shows when the body is dressed, and the family incurs no cost for removal of the organs donated.
9. Cultural and spiritual beliefs: Refer to **Chapter 19** for information regarding end-of-life care.

VII. Consents

- A. Description
 1. Consents, or releases, are legal documents that indicate the client's permission to perform surgery, perform a treatment or procedure, or give information to a third party.
 2. There are different types of consents (**Box 6.4**).
 3. Informed consent indicates the client's participation in the decision regarding health care. It

- is the client's approval (or that of the client's legal representative) to have the client's body touched by a specific individual.
- The client must be informed, in understandable terms, of the risks and benefits of the surgery or treatment, what the consequences are for not having the surgery or procedure performed, treatment options, and the name of the PHCP performing the surgery or procedure. If a client is deaf, illiterate, or speaks a foreign language, a professional interpreter must be present in person or remotely to explain the terms of consent.
 - A client's questions about the surgery or procedure must be answered before the client signs the consent.
 - A consent must be signed freely by the client without threat or pressure and must be witnessed (the witness must be an adult).
 - If unable to sign a consent in person, it can be signed with the next of kin over the phone with a second nurse present as the witness.
 - A client who has been medicated with sedating medications or any other medications that can

affect the client's cognitive abilities must not be asked to sign a consent.

- Legally, the client must be mentally and emotionally competent to give consent.
- If a client is declared mentally or emotionally incompetent, the next of kin, appointed guardian (appointed by the court), or durable power of attorney for health care has legal authority to give consent (Box 6.5).
- A competent client 18 years of age or older must sign the consent.
- In most states, when the nurse is involved in the informed consent process, the nurse is witnessing only the signature of the client on the informed consent form.
- An informed consent can be waived for urgent medical or surgical intervention as long as institutional policy so indicates.
- A client has the right to refuse information and waive the informed consent and undergo treatment, but this decision must be documented in the medical record.
- A client may withdraw consent at any time. (See **Clinical Judgment: Take Action Box.**)

BOX 6.4 Types of Consents

Admission Agreement

Admission agreements are obtained at the time of admission and identify the health care agency's responsibility to the client.

Immunization Consent

Immunization consent may be required before the administration of certain immunizations; the consent indicates that the client was informed of the benefits and risks of the immunization.

Blood Transfusion Consent

A blood transfusion consent indicates that the client was informed of the benefits and risks of the transfusion. Some clients hold religious beliefs that would prohibit them from receiving a blood transfusion, even in a life-threatening situation.

Surgical Consent

Surgical consent is obtained for all surgical or invasive procedures or diagnostic tests that are invasive. The primary health care provider, surgeon, or anesthesiologist who performs the operative or other procedure is responsible for explaining the procedure, its risks and benefits, and possible alternative options.

Research Consent

The research consent obtains permission from the client regarding participation in a research study. The consent informs the client about the possible risks, consequences, and benefits of the research.

Special Consents

Special consents are required for the use of restraints, photographing the client, disposal of body parts during surgery, donating organs after death, or performing an autopsy.

! An informed consent is a legal document, and the client must be informed by the PHCP (i.e., physician, surgeon), in understandable terms, of the risks and benefits of surgery, treatments, procedures, and plan of care. The client needs to be a participant in decisions regarding health care.

BOX 6.5 Mentally or Emotionally Incompetent Clients

- Declared incompetent
- Unconscious
- Under the influence of chemical agents such as alcohol or drugs
- Chronic dementia or other mental deficiency that impairs thought processes and ability to make decisions

⚡ CLINICAL JUDGMENT: TAKE ACTION

One hour before a scheduled surgical procedure, the client states to the nurse, "I have changed my mind. I don't want this surgery." Actions to take by the nurse include the following:

- Talk to the client about the request.
- Explore with the client concerns about not wanting the surgery.
- Withhold further surgical preparation, and contact the surgeon to report the client's request.
- Document the client's request and that the surgeon was notified.

Adapted from Sweet, V., & Foley, P. (2020). *Sheehy's emergency nursing: Principles and practice*. (7th ed.). St. Louis: Elsevier. (Emergency Nurses Association). pp.15-16, 38, 146.

B. Minors

1. A minor is a client under legal age as defined by state statute (usually younger than 18 years).
2. A minor may not give legal consent, and consent must be obtained from a parent or the legal guardian; agreement by the minor is important because it allows for communication of the minor's thoughts and feelings.
3. Parental or guardian consent should be obtained before treatment is initiated for a minor except in the following cases: in an emergency; in situations in which the consent of the minor is sufficient, including treatment related to substance abuse, treatment of a sexually transmitted infection, human immunodeficiency virus (HIV) testing and acquired immunodeficiency syndrome (AIDS) treatment, birth control services, pregnancy, or psychiatric services; the minor is an emancipated minor; or a court order or other legal authorization has been obtained. Refer to the Guttmacher Report on Public Policy for additional information: <http://www.guttmacher.org/pubs/tgr/03/4/gr030404.html>

C. Emancipated minor

1. An emancipated minor has established independence from the parents through marriage, pregnancy, or service in the armed forces, or by a court order.
2. An emancipated minor is considered legally capable of signing an informed consent.

3. Request a list of disclosures made regarding the PHI as specified by HIPAA.
 4. Request to restrict how the health care agency uses or discloses PHI regarding treatment, payment, or health care services, unless information is needed to provide emergency treatment.
 5. Request that the health care agency communicate with the client in a certain way or at a certain location; the request must specify how or where the client wishes to be contacted.
 6. Request a paper copy of the HIPAA notice.
- C. Health care agency use and disclosure of PHI
1. The health care agency obtains PHI in the course of providing or administering health insurance benefits.
 2. Use or disclosure of PHI may be done for the following:
 - a. Health care payment purposes
 - b. Health care operations purposes
 - c. Treatment purposes
 - d. Providing information about health care services
 - e. Data aggregation purposes to make health care benefit decisions
 - f. Administering health care benefits
 3. There are additional uses or disclosures of PHI (Box 6.6).

BOX 6.6 Uses or Disclosures of Personal Health Information

- Compliance with legal proceedings or for limited law enforcement purposes
- To a family member or significant other in a medical emergency
- To a personal representative appointed by the client or designated by law
- For research purposes in limited circumstances
- To a coroner, medical examiner, or funeral director about a deceased person
- To an organ procurement organization in limited circumstances
- To avert a serious threat to the client's health or safety or the health or safety of others
- To a governmental agency authorized to oversee the health care system or governmental programs
- To the Department of Health and Human Services for the investigation of compliance with the Health Insurance Portability and Accountability Act or to fulfill another lawful request
- To federal officials for lawful intelligence or national security purposes
- To protect health authorities for public health purposes
- To appropriate military authorities if a client is a member of the armed forces
- In accordance with a valid authorization signed by the client

Adapted from U.S. Department of Health and Human Services Office for Civil Rights: Health information privacy. Available at <http://www.hhs.gov/ocr/privacy/>

VIII. Health Insurance Portability and Accountability Act

A. Description

1. The Health Insurance Portability and Accountability Act (HIPAA) describes how personal health information (PHI) may be used and how the client can obtain access to the information.
2. PHI includes individually identifiable information that relates to the client's past, present, or future health; treatment; and payment for health care services.
3. The act requires health care agencies to keep PHI private, provides information to the client about the legal responsibilities regarding privacy, and explains the client's rights with respect to PHI.
4. The client has various rights as a consumer of health care under HIPAA, and any client requests may need to be placed in writing; a fee may be attached to certain client requests.
5. The client may file a complaint if the client believes that privacy rights have been violated.

B. Client's rights include the right to do the following:

1. Inspect a copy of PHI.
2. Ask the health care agency to amend the PHI that is contained in a record if the PHI is inaccurate.

BOX 6.7 Violations and Invasion of Client Privacy

- Taking photographs of the client
- Release of medical information to an unauthorized person, such as a member of the press, family, friend, or neighbor of the client, without the client's permission
- Use of the client's name or picture for the health care agency's sole advantage
- Intrusion by the health care agency regarding the client's affairs
- Publication of information about the client or photographs of the client, including on a social networking site
- Publication of embarrassing facts
- Public disclosure of private information
- Leaving the curtains or room door open while a treatment or procedure is being performed
- Allowing individuals to observe a treatment or procedure without the client's consent
- Leaving a confused or agitated client sitting in the nursing unit hallway
- Interviewing a client in a room with only a curtain between clients or where conversation can be overheard
- Accessing medical records when unauthorized to do so

From Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. p. 470.

BOX 6.8 Maintenance of Confidentiality

- Not discussing client issues with other clients or staff uninvolved in the client's care
- Not sharing health care information with others without the client's consent (includes family members or friends of the client and social networking sites)
- Keeping all information about a client private and not revealing it to someone not directly involved in care
- Discussing client information only in private and secluded areas
- Protecting the medical record from all unauthorized readers

From Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 369-370.

BOX 6.9 Social Networking and Health Care

- Specific social networking sites can be beneficial to health care providers (HCPs) and clients; misuse of social networking sites by the HCP can lead to Health Insurance Portability and Accountability Act (HIPAA) violations and subsequent termination of the employee.
- Nurses need to adhere to the code of ethics, confidentiality rules, and social media rules. Additional information about these codes and rules can be located at the American Nurses Association (ANA) Web site at <https://www.nursingworld.org/social/>.
- Standards of professionalism need to be maintained, and any information obtained through any nurse-client relationship cannot be shared in any way.
- The nurse is responsible for reporting any identified breach of privacy or confidentiality.

IX. Confidentiality/Information Security**A. Description**

1. In the health care system, **confidentiality/information security** refers to the protection of privacy of the client's PHI.
2. Clients have a right to privacy in the health care system.
3. A special relationship exists between the client and nurse, in which information discussed is not shared with a third party who is not directly involved in the client's care.
4. Violations of privacy occur in various ways (**Box 6.7**).

B. Nurse's responsibility

1. Nurses are bound to protect client **confidentiality** by most nurse practice acts, by **ethical principles** and standards, and by institutional and agency policies and procedures.
2. Disclosure of confidential information exposes the nurse to liability for invasion of the client's privacy.
3. The nurse needs to protect the client from indiscriminate disclosure of health care information that may cause harm (**Box 6.8**).

C. Social networking and health care (Box 6.9**)****D. Medical records**

1. Medical records are confidential.
2. The client has the right to read the medical record and have copies of the record.
3. Only staff members directly involved in care have legitimate access to a client's record; these

may include PHCPs and nurses caring for the client, technicians, therapists, social workers, unit secretaries, client advocates, and administrators (e.g., for statistical analysis, staffing, quality care review). Others must ask permission from the client to review a record.

4. Per health care facility procedures, the medical record is stored in the records or the health information department after discharge of the client from the facility.

E. Information technology/computerized medical records

1. Health care employees should have access to the client's records only in the nursing unit or work area.
2. Confidentiality/information security can be protected by the use of special computer access codes to limit what employees have access to in computer systems.
3. The use of a password or identification code is needed to enter and sign off a computer system.
4. A password or identification code should never be shared with another person.

BOX 6.10 Examples of Occurrences That Need to Be Reported

- Accidental omission of prescribed therapies
- Circumstances that led to injury or a risk for client injury
- Client falls
- Medication administration errors
- Needlestick injuries
- Procedure-related or equipment-related accidents
- A visitor injury that occurred on the health care agency premises
- A visitor who exhibits symptoms of a communicable disease
- Significant complaint by client, family, health care provider, or other hospital department

Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 318.

5. Personal passwords should be changed periodically to prevent unauthorized computer access.
- F. When conducting research, any information provided by the client is not to be reported in any manner that identifies the client and is not to be made accessible to anyone outside the research team.

 **The nurse must always protect client confidentiality.**

X. Legal Safeguards**A. Risk management**

1. Risk management is a planned method to identify, analyze, and evaluate risks, followed by a plan for reducing the frequency of accidents and injuries.
2. Programs are based on a systematic reporting system for unusual occurrences.

 **B. Occurrence reports (Box 6.10)**

1. The occurrence report is used as a means of identifying risk situations and improving client care.
2. Know the agency's policies and procedures.
3. Follow specific documentation guidelines.
4. Fill out the report completely, accurately, and factually.
5. The report form should not be copied or placed in the client's record.
6. Make no reference to the occurrence report form in the client's record.
7. The report is not a substitute for a complete entry in the client's record regarding the occurrence.
8. If a client injury or error in care occurred, assess the client frequently.

C. The PHCP must be notified of the incident and the client's condition.**D. Safeguarding valuables**

1. Client's valuables should be given to a family member or secured for safekeeping in a stored and locked designated location, such as the agency's safe; facility security may handle the

BOX 6.11 Common Telephone Prescription Guidelines

- Clearly identify the client's name and room number.
- Date and time the entry.
- Repeat the prescription to the primary health care provider (PHCP), and record the prescription.
- Sign the prescription; begin with "t.o." (telephone order), write the PHCP's name, and sign the prescription.
- If another nurse witnessed the prescription, that nurse's signature follows.
- The PHCP needs to countersign the prescription within a time frame according to agency policy.

Note: Remember to always follow state and institutional policies.

safeguarding of valuables. The location of the client's valuables should be documented per agency policy.

2. Many health care agencies require a client to sign a release to free the agency of the responsibility for lost valuables.
3. A client's wedding band can be taped in place unless a risk exists for swelling of the hands or fingers.
4. Religious items, such as medals, may be pinned to the client's gown if allowed by agency policy.
- E. PHCP's prescriptions 
 1. The nurse is obligated to carry out a PHCP's prescription except when the nurse believes a prescription to be inappropriate or inaccurate.
 2. The nurse carrying out an inaccurate prescription may be legally responsible for any harm suffered by the client.
 3. If no resolution occurs regarding the prescription in question, the nurse should contact the nurse manager or supervisor.
 4. The nurse should follow specific guidelines for telephone prescriptions set by the institutional policy where the nurse is conducting nursing practice. Common guidelines for telephone prescriptions are detailed in [Box 6.11](#).
 5. The nurse should ensure that all components of a medication prescription are documented ([Box 6.12](#)).

 **The nurse should never carry out a prescription if it is unclear or inappropriate. The person who wrote the prescription should be contacted immediately.**

F. Documentation 

1. Documentation is legally required by accrediting agencies, state licensing laws, and state nurse and medical practice acts.
2. The nurse should follow agency guidelines and procedures ([Box 6.13](#)).
3. Refer to The Joint Commission website for acceptable abbreviations and documentation

BOX 6.12 Components of a Medication Prescription

- Date and time prescription was written
- Medication name
- Medication dosage
- Route of administration
- Frequency of administration
- Primary health care provider's signature

Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp 607-609.

Note: Remember to always follow state and institutional policies.

BOX 6.13 Do's and Don'ts Documentation Guidelines: Narrative and Information Technology

- Date and time entries.
- Provide objective, factual, and complete documentation.
- Document care, medications, treatments, and procedures as soon as possible after completion.
- Document client responses to interventions.
- Document consent for or refusal of treatments.
- Document calls made to other primary health care providers.
- Use quotes as appropriate for subjective data.
- Use correct spelling, grammar, and punctuation.
- Do not use pencils, felt-tip pens, or erasable ink. Record all written entries legibly using black ink.
- Sign and title each entry.
- Do not erase or scratch out errors made while recording; follow agency policies when an error is made.
- Follow agency guidelines regarding late entries.
- Do not use any other person's identification code, name, or password for computerized documentation.
- Maintain privacy and confidentiality of documented information printed from the computer.
- Do not document for others or change documentation for other individuals.
- Do not use unacceptable abbreviations.
- Do not use judgmental or evaluative statements, such as "uncooperative client."
- Do not leave blank spaces on documentation forms.
- Do not lend access identification computer codes to another person; change password at regular intervals.

Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 367.

guidelines: http://www.jointcommission.org/standards_information/npsgs.aspx and The Joint Commission Official "Do Not Use" List at <http://www.jointcommission.org/resources/news-and-multimedia/fact-sheets/facts-about-do-not-use-list/>

G. Client and family teaching

1. Provide complete instructions in a language that the client or family can understand.
2. Document client and family teaching, what was taught, evaluation of understanding, and who was present during the teaching.

3. Inform the client of what could happen if information shared during teaching is not followed.

XI. Advance Directives**A. Patient Self-Determination Act**

1. The Patient Self-Determination Act is a law that requires clients be provided with information about their right to have written directions about the care that they wish to receive in the event that they become incapacitated and are unable to make health care decisions.
2. On admission to a health care facility, the client is asked about the existence of an advance directive, and if one exists, it must be documented and included as part of the medical record; if the client signs an advance directive at the time of admission, it must be documented in the client's medical record.
3. The two basic types of advance directives include instructional directives and durable power of attorney for health care.
 - a. Instructional directives: Lists the medical treatment that a client chooses to omit or refuse if the client becomes unable to make decisions and is terminally ill.
 - b. Durable power of attorney for health care: Appoints a person (health care proxy) chosen by the client to make health care decisions on the client's behalf when the client can no longer make decisions.

B. Do not resuscitate (DNR) prescriptions

1. The PHCP writes a DNR prescription if the client and PHCP have made the decision that the client's health is deteriorating and the client chooses not to undergo cardiopulmonary resuscitation if needed.
2. The client or legal representative must provide informed consent for the DNR status.
3. The DNR prescription must be defined clearly so that other treatment not refused by the client will be continued.
4. Some states offer DNR Comfort Care and DNR Comfort Care Arrest protocols; these protocols list specific actions that HCPs will take when providing cardiopulmonary resuscitation (CPR).
5. All health care personnel must know whether a client has a DNR prescription; if a client does not have a DNR prescription, HCPs need to make every effort to revive the client.
6. A DNR prescription needs to be reviewed regularly according to agency policy and may need to be changed if the client's status changes.
7. DNR protocols may vary from state to state, and it is important for the nurse to know the protocols in the state in which the nurse is employed.

- C. The nurse's role
1. Discussing advance directives with the client opens the communication channel to establish what is important to the client and what the client may view as promoting life versus prolonging dying.
 2. The nurse needs to ensure that the client has been provided with information about the right to identify written directions about the care that the client wishes to receive.
 3. On admission to a health care facility, the nurse determines whether an advance directive exists and ensures that it is part of the medical record; the nurse also offers information about advance directives if the client indicates that they want more information.
 4. The nurse ensures that the PHCP is aware of the presence of an advance directive.
 5. All health care workers need to follow the directions of an advance directive to be safe from liability.
 6. Some agencies have specific policies that prohibit the nurse from signing as a witness to a legal document such as an instructional directive.
 7. If allowed by the agency, when the nurse acts as a witness to a legal document, the nurse must document the event and the factual circumstances surrounding the signing in the medical record; documentation as a witness should include who was present, any significant comments by the client, and the nurse's observations of the client's conduct during this process.
3. An employee who reports unsafe working conditions cannot be retaliated against by the employer.
- D. Sexual harassment
1. Sexual harassment is prohibited by state and federal laws.
 2. Sexual harassment includes unwelcome conduct of a sexual nature.
 3. Follow agency policies and procedures to handle reporting a concern or complaint.

PRACTICE QUESTIONS

1. The nurse hears a client calling out for help, hurries down the hallway to the client's room, and finds the client lying on the floor. The nurse performs an assessment, assists the client back to bed, notifies the primary health care provider, and completes an occurrence report. Which statement would the nurse document on the occurrence report?
 1. The client fell out of bed.
 2. The client climbed over the side rails.
 3. The client was found lying on the floor.
 4. The client became restless and tried to get out of bed.
2. A client is brought to the emergency department by emergency medical services (EMS) after being hit by a car. The name of the client is unknown, and the client has sustained a severe head injury and multiple fractures and is unconscious. An emergency craniotomy is required. Regarding informed consent for the surgical procedure, which is the best action?
 1. Obtain a court order for the surgical procedure.
 2. Ask the EMS team to sign the informed consent.
 3. Transport the victim to the operating room for surgery.
 4. Call the police to identify the client and locate the family.
3. The nurse has just assisted a client back to bed after a fall. The nurse and primary health care provider (PHCP) have assessed the client and have determined that the client is not injured. After completing the occurrence report, the nurse would implement which action next?
 1. Reassess the client.
 2. Conduct a staff meeting to describe the fall.
 3. Contact the nursing supervisor to update information regarding the fall.
 4. Document in the nurse's notes that an occurrence report was completed.
4. The nurse arrives at work and is told to report float to the intensive care unit (ICU) for the day because the ICU is understaffed and needs additional nurses

XII. Reporting Responsibilities

- A. Nurses are required to report to the appropriate authorities certain communicable diseases; dog bites or other animal bites; suicides; and certain criminal activities such as child or elder abuse or domestic violence, gunshot or stab wounds, assaults, and homicides.
- B. Impaired nurse
1. If the nurse suspects that a coworker is abusing chemicals and potentially jeopardizing a client's safety, the nurse must report the individual to the nursing supervisor/nursing administration in a confidential manner. (Client safety is always the first priority.)
 2. Nursing administration notifies the board of nursing regarding the nurse's behavior.
 3. Many institutions have policies that allow for drug testing if impairment is suspected.
- C. Occupational Safety and Health Act (OSHA)
1. OSHA requires that an employer provide a safe workplace for employees according to regulations.
 2. Employees can confidentially report working conditions that violate regulations.

- to care for the clients. The nurse has never worked in the ICU. The nurse would take which best action?
1. Refuse to float to the ICU based on lack of unit orientation.
 2. Clarify the ICU client assignment with the team leader to ensure that it is a safe assignment.
 3. Ask the nursing supervisor to review the hospital policy on floating.
 4. Submit a written protest to nursing administration, and then call the hospital lawyer.
5. The nurse who works on the night shift enters the medication room and finds a coworker with a tourniquet wrapped around the upper arm. The coworker is about to insert a needle, attached to a syringe containing a clear liquid, into the antecubital area. Which is the most appropriate action by the nurse?
 1. Call security.
 2. Call the police.
 3. Call the nursing supervisor.
 4. Lock the coworker in the medication room until help is obtained.
 6. A hospitalized client tells the nurse that an instructional directive is being prepared and that the lawyer will be bringing the document to the hospital today for witness signatures. The client asks the nurse for assistance in obtaining a witness to the will. The nurse plans to make which most appropriate response to the client?
 1. "I will sign as a witness to your signature."
 2. "You will need to find a witness on your own."
 3. "Whoever is available at the time will sign as a witness for you."
 4. "I will call the nursing supervisor to seek assistance regarding your request."
 7. The nurse has made an error in documentation of the dose administered of an opioid pain medication in the client's record. The nurse draws 1 mg from the vial and another registered nurse (RN) witnesses wasting of the remaining 1 mg. When scanning the medication, the nurse entered into the medication administration record (MAR) that 2 mg of hydro-morphone was administered instead of the actual dose administered, which was 1 mg. The nurse would take which action(s) to correct the error in the MAR? Select all that apply.
 1. Complete and file an occurrence report.
 2. Right-click on the entry and modify it to reflect the correct information.
 3. Document the correct information and end with the nurse's signature and title.
 4. Obtain a cosignature from the RN who witnessed the waste of the remaining 1 mg.
 5. Document in a nurse's note in the client's record detailing the corrected information.
 8. Which notations indicate accurate nursing documentation by the nurse? Select all that apply.
 1. The client slept through the night.
 2. Abdominal wound dressing is dry and intact without drainage.
 3. The client seemed angry when awakened for measurement of vital signs.
 4. The client appears to become anxious when it is time for respiratory treatments.
 5. The client's left lower medial leg wound is 3 cm in length without redness, drainage, or edema.
 9. A nursing instructor delivers a lecture to nursing students regarding the issue of clients' rights and asks a nursing student to identify a situation that represents an example of invasion of client privacy. Which situation, if identified by the student, indicates an understanding of a violation of this client right?
 1. Performing a procedure without consent
 2. Threatening to give a client a medication
 3. Telling the client that they cannot leave the hospital
 4. Observing care provided to the client without the client's permission
 10. An older client is brought to the emergency department for treatment of a fractured arm. On physical assessment, the nurse notes old and new ecchymotic areas on the client's chest and legs and asks the client how the bruises were sustained. The client, although reluctant, tells the nurse in confidence that a family member frequently hits the client if supper is not prepared on time when the family member arrives home from work. The nurse plans to make which most appropriate response?
 1. "Oh, really? I will discuss this situation with your family member."
 2. "Let's talk about the ways you can manage your time to prevent this from happening."
 3. "Do you have any friends who can help you out until you resolve these important issues with your family member?"
 4. "As a nurse, I am legally bound to report abuse. I will stay with you while you give the report and help find a safe place for you to stay."
 11. The nurse calls the primary health care provider (PHCP) regarding a new medication prescription because the dosage prescribed is higher than the recommended dosage. The nurse is unable to locate the PHCP, and the medication is due to be administered. Which action would the nurse take?
 1. Contact the nursing supervisor.
 2. Administer the dose prescribed.

3. Hold the medication until the PHCP can be contacted.
 4. Administer the recommended dose until the PHCP can be located.
12. The nurse employed in a hospital is waiting to receive a report from the laboratory via the facsimile (fax) machine. The fax machine activates and the nurse expects the report, but instead receives a sexu-

ally oriented photograph. Which is the most appropriate initial nursing action?

1. Call the police.
2. Cut up the photograph and throw it away.
3. Call the nursing supervisor and report the occurrence.
4. Call the laboratory, and ask for the name of the individual who sent the photograph.

ANSWERS

1. Answer: 3

Rationale: The occurrence report needs to contain a factual description of the occurrence, any injuries experienced by those involved, and the outcome of the situation. The correct option is the only one that describes the facts as observed by the nurse. Options 1, 2, and 4 are interpretations of the situation and are not factual information as observed by the nurse.

Test-Taking Strategy: Focus on the **subject**, documentation of events, and note the **data in the question** to select the correct option. Remember to focus on factual information when documenting, and avoid including interpretations. This will direct you to the correct option.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 318, 376.

2. Answer: 3

Rationale: In general, there are two situations in which informed consent of an adult client is not needed. One is when an emergency is present and delaying treatment for the purpose of obtaining informed consent would result in injury or death to the client. The second is when the client waives the right to give informed consent. Option 1 will delay emergency treatment, and option 2 is inappropriate. Although option 4 may be pursued, it is not the best action because it delays necessary emergency treatment.

Test-Taking Strategy: Note the **strategic word**, *best*. Also note that an emergency is present. Recalling that a delay in treatment for the purpose of obtaining informed consent could result in injury or death will direct you to the correct option.

Reference: Sweet, V., & Foley, P. (2020). *Sheehy's emergency nursing: Principles and practice*. (7th ed.). St. Louis: Elsevier. (Emergency Nurses Association). pp. 14-15.

3. Answer: 1

Rationale: After a client's fall, the nurse must frequently reassess the client because potential complications do not always appear immediately after the fall. The client's fall needs to be treated as private information and shared on a "need to know" basis. Communication regarding the event would involve only the individuals participating in the client's care. An occurrence report is a problem-solving document; however, its completion is not documented in the nurse's notes. If the nursing supervisor has been made aware of the occurrence, the supervisor will contact the nurse if status update is necessary.

Test-Taking Strategy: Note the **strategic word**, *next*. Using the **steps of the nursing process** will direct you to the correct option. Remember that assessment is the first step. Additionally, use **Maslow's Hierarchy of Needs theory**, recalling that physiological needs are the priority. The correct option is the only option that addresses a potential physiological need of the client.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 394, 410.

4. Answer: 2

Rationale: Floating is an acceptable practice used by hospitals to solve understaffing problems. Legally, the nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove the lack of knowledge for the performance of assigned tasks. When encountering this situation, the nurse would set priorities and identify potential areas of harm to the client. That is why clarifying the client assignment with the team leader to ensure that it is a safe one is the best option. The nursing supervisor is called if the nurse is expected to perform tasks that they cannot safely perform. Submitting a written protest and calling the hospital lawyer are premature actions.

Test-Taking Strategy: Note the **strategic word**, *best*. Eliminate option 1 first because of the word *refuse*. Next, eliminate options 3 and 4 because they are premature actions.

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 612-613.

5. Answer: 3

Rationale: Nurse practice acts require the reporting of impaired nurses. The board of nursing has jurisdiction over the practice of nursing and may develop plans for treatment and supervision of the impaired nurse. This occurrence needs to be reported to the nursing supervisor, who will then report to the board of nursing and other authorities, such as the police, as required. The nurse may call security if a disturbance occurs, but no information in the question supports this need, so this is not the appropriate action. Option 4 is an inappropriate and unsafe action.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Eliminate option 4 first, because this is an inappropriate and unsafe action. Recall the lines of organizational structure to assist in directing you to the correct option.

References: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.).

St. Louis: Elsevier. p. 474; <https://americanaddictioncenters.org/medical-professionals/suspecting-a-nurse-of-substance-abuse>.

6. Answer: 4

Rationale: Instructional directives (living wills) are required to be in writing and signed by the client. The client's signature must be witnessed by specified individuals or notarized. Laws and guidelines regarding instructional directives vary from state to state, and it is the responsibility of the nurse to know the laws. Many states prohibit any employee, including the nurse of a facility where the client is receiving care, from being a witness. Option 2 is nontherapeutic and not a helpful response. The nurse would seek the assistance of the nursing supervisor.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Options 1 and 3 are **comparable or alike** and need to be eliminated first. Option 2 is eliminated because it is a nontherapeutic response.

References: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 310; Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 490-491.

7. Answer: 2, 3, 4, 5

Rationale: Electronic health records (EHR) will have a timestamp that indicates an amendment has been entered. If the nurse makes an error in the MAR, the nurse would follow agency policies to correct the error. In the MAR, the nurse can click on the entry (usually right-click) and modify it to reflect the corrected information. Since this is an opioid medication, the nurse would obtain a cosignature from the RN who witnessed the wasting of the excess medication to validate that 1 mg, rather than 2 mg, was given. A nurse's note needs to detail the event and the corrections made, and the nurse's name and title will be stamped on the entry in the EHR. An occurrence report is not necessary in this situation.

Test-Taking Strategy: Focus on the **subject**, correcting a documentation error, and use principles related to documentation. Recalling the purpose of an occurrence report will assist in eliminating option 1. From the remaining options, focusing on the **subject** of the question and using knowledge regarding the principles related to documentation will direct you to the correct options.

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. p. 614.

8. Answer: 1, 2, 5

Rationale: Factual documentation contains descriptive, objective information about what the nurse sees, hears, feels, or smells. The use of inferences without supporting factual data is not acceptable because it can be misunderstood. The use of vague terms, such as *seemed* or *appears*, is not acceptable because these words suggest that the nurse is stating an opinion.

Test-Taking Strategy: Focus on the **subject**, accurate documentation notations. Eliminate options 3 and 4 because they are **comparable or alike** and include vague terms (*seemed*, *appears*).

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 370.

9. Answer: 4

Rationale: Invasion of privacy occurs with unreasonable intrusion into an individual's private affairs. Performing a procedure without consent is an example of battery. Threatening to give a client a medication constitutes assault. Telling the client that the client cannot leave the hospital constitutes false imprisonment.

Test-Taking Strategy: Focus on the **subject**, invasion of privacy. Noting the words *without the client's permission* will direct you to this option.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 314.

10. Answer: 4

Rationale: The nurse must report situations related to child or elder abuse, gunshot wounds and other criminal acts, and certain infectious diseases. Confidential issues are not to be discussed with nonmedical personnel or the client's family or friends without the client's permission. Clients need to be assured that information is kept confidential unless it places the nurse under a legal obligation. Options 1, 2, and 3 do not address the legal implications of the situation and do not ensure a safe environment for the client.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the **data in the question** and note that an older client is receiving physical abuse by a family member. Recall the nursing responsibilities related to client safety and reporting obligations. Options 1, 2, and 3 should be eliminated because they are **comparable or alike** in that they do not protect the client from injury.

References: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 190-191, 526.

11. Answer: 1

Rationale: If the PHCP writes a prescription that requires clarification, the nurse's responsibility is to contact the PHCP. If there is no resolution regarding the prescription because the PHCP cannot be located or because the prescription remains as it was written after talking with the PHCP, the nurse would contact the nurse manager or nursing supervisor for further clarification as to what the next step needs to be. Under no circumstances would the nurse proceed to carry out the prescription until obtaining clarification.

Test-Taking Strategy: Eliminate options 2 and 4 first because they are **comparable or alike** and are unsafe actions. Holding the medication can result in client injury. The nurse needs to take action. The correct option clearly identifies the required action in this situation.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 609-610.

12. *Answer: 3*

Rationale: Ensuring a safe workplace is a responsibility of an employing institution. Sexual harassment in the workplace is prohibited by state and federal laws. Sexually suggestive jokes, touching, pressuring a coworker for a date, and open displays of or transmission of sexually oriented photographs or posters are examples of conduct that could be considered sexual harassment by another worker and are abusive behavior. If the nurse believes that they are being subjected to unwelcome sexual conduct, these concerns need to be reported to the nursing

supervisor immediately. Option 1 is unnecessary at this time. Options 2 and 4 are inappropriate initial actions.

Test-Taking Strategy: Note the **strategic words**, *most appropriate initial*. Remember that using the organizational channels of communication is best. This will assist in directing you to the correct option.

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 312, 603-604.

Prioritizing Client Care: Leadership, Delegation, and Emergency Response Planning

Contributor: Karen L. Petersen, MSN-L, RN, MNN

PRIORITY CONCEPTS: Leadership; Health Care Organizations

I. Health Care Delivery Systems

A. Managed care

1. *Managed care* is a broad term used to describe strategies used in the health care delivery system that reduce the costs of health care.
2. Client care is outcome driven and is managed by a case **management** process.
3. Managed care emphasizes the promotion of health, client education and responsible self-care, early identification of disease, and the use of health care resources.

B. Case management

1. Case management is a health care delivery strategy that supports managed care; it uses an inter-professional health care delivery approach that provides comprehensive client care throughout the client's illness, using available resources to promote high-quality and cost-effective care.
2. Case management includes assessment and development of a plan of care, coordination of all services, referral, and follow-up.
3. Critical pathways are used, and variation analysis is conducted.
4. The core functions of case management are assessment, treatment planning, linking the client to resources, advocacy, and monitoring.

! Case management involves consultation and collaboration with an interprofessional health care team.

C. Case manager

1. A case manager is a professional nurse who assumes responsibility for coordinating the client's care at admission and after discharge.

2. The case manager establishes a plan of care with the client, coordinates any interprofessional consultations and referrals, and facilitates discharge.
3. Case managers are knowledgeable in various types of health insurance, which allows them to assist clients in navigating health care options covered by insurance.
4. Case managers advocate for cost-effective care and promote maintaining independence of the client.

D. Health Insurance

1. There are state and federal insurance plans.
2. An aim of the Affordable Care Act is to reduce the amount of uncompensated care the average U.S. family pays for. Its goals are to expand access to health insurance, reduce costs, and protect clients against arbitrary actions by insurance companies.
3. Insurance companies provide state marketplace insurance. Nurses should have a general knowledge of insurance marketplace resources available to clients relative to their clinical practice.
4. Types of insurance plans include health maintenance organizations (HMOs), preferred provider organizations (PPOs), exclusive provider organizations (EPOs), point-of-service (POS) plans, high-deductible health plans (HDHPs), and health savings accounts (HSAs); these offer varying options in terms of insurance coverage and out-of-pocket costs and premiums.
5. Medicare is a federal health insurance program for persons age 65 or older, certain younger people with disabilities, and people with end-stage

renal disease (ESRD) requiring dialysis or renal transplant. Certain premiums are attached to each part.

- a. Part A: covers hospital stays, skilled nursing facility stays, hospice care, and some home health care
- b. Part B: helps pay for some services not covered by Part A. Medicare usually covers 80% for approved services; the remaining 20% is the client's responsibility, and a supplemental insurance needs to be obtained
- c. Part C: a health plan offered by a private insurance agency that contracts with Medicare to supplement coverage
- d. Part D: covers prescription medication needs

6. Medicaid is a joint federal and state program that provides health benefits to eligible low-income adults, children, pregnant individuals, elderly individuals, and people with disabilities. A concern associated with these programs is fraud and abuse; a case manager needs to know how to complete insurance, state, and federal applications and be astute enough to know if an individual is reporting incorrect information.

E. Critical pathway

1. A critical pathway is a clinical management care plan for providing client-centered care and for planning and monitoring the client's progress within an established time frame; **interprofessional collaboration** and teamwork ensure shared decision making and quality client care.
2. Critical pathways are based on evidence-based practice and include evidence-based medical practice, budgetary, organizational, and systems-wide information.
3. Variation analysis is a continuous process that the case manager and other caregivers conduct by comparing the specific client outcomes with the expected outcomes described on the critical pathway.
4. The goal of a critical pathway is to anticipate and recognize negative variance (i.e., client problems) early so that appropriate action can be taken and positive client outcomes can result.
5. Critical pathways are used to ensure that medical care is consistent within budget constraints and to allow providers to care for more complex clients. For example, some ambulatory practices have critical pathways for certain conditions such as blood pressure monitoring or urinary tract infections.

F. Care Planning and Clinical Judgment Processes

1. Nursing care plan
 - a. A written guideline and communication tool that identifies the client's pertinent assessment data, client problems, goals, interventions, and expected outcomes, providing a

framework for evaluation of the client's response to nursing actions

- b. The plan enhances continuity of care by identifying specific nursing actions necessary to achieve the goals of care.
- c. The client and family are involved in developing the plan of care, and the plan identifies short- and long-term goals.
- d. Client problems, goals, interventions, and expected outcomes are documented in the care plan, which provides a framework for evaluation of the client's response to nursing actions. The care plan is modified as the client condition changes.

2. Assessment, Diagnosis, Planning, Implementation, Evaluation, known as ADPIE. Note that nurses do not diagnose; rather, the nurse identifies client problems.

3. Assessment, Analysis, Planning, Implementation, Evaluation, known as the nursing process

4. Situation, Background, Assessment, Recommendation (SBAR): includes up-to-date information about the client's situation, associated background information, assessment data, and recommendations for care, such as treatments, medications, or services needed. Refer to XII. B. 6.

5. Subjective, objective, assessment, plan (SOAP): See Chapter 12

6. National Council of State Boards of Nursing (NCSBN) Clinical Judgment Skills: recognize cues, analyze cues, prioritize hypotheses, generate solutions, take action, evaluate outcomes

II. Nursing Delivery Systems

A. Functional nursing

1. Functional nursing involves a task approach to client care, with tasks being delegated by the charge nurse to individual members of the team.
2. This type of system is task-oriented, and the team member focuses on the delegated task rather than the total client; this results in fragmentation of care and lack of **accountability** by the team member. An advantage of functional nursing is that the nurse can care for greater numbers of clients; a disadvantage is that there can be a lack of accountability due to fragmented care.

B. Team nursing

1. The team generally is led by a registered nurse (team leader) who is responsible for assessing clients, analyzing client data, planning, and evaluating each client's plan of care.
2. The team leader determines the work assignment; each staff member works fully within the realm of their educational and clinical expertise and job description.
3. Each staff member is accountable for client care and outcomes of care delivered in accordance

with the licensing and practice scope as determined by health care agency policy and state law.

- C. Relationship-based practice (primary nursing)
 1. Relationship-based practice (primary nursing) is concerned with keeping the nurse at the bedside, actively involved in client care, while planning goal-directed, individualized care.
 2. One (primary) nurse is responsible for managing and coordinating the client's care while in the hospital and for discharge, and an associate nurse cares for the client when the primary nurse is off-duty.
- D. Client-focused care
 1. This is also known as the total care or case method; the registered nurse assumes total responsibility for planning and delivering care to a client.
 2. The client may have different nurses assigned during a 24-hour period; the nurse provides all necessary care needed for the assigned time period.

III. Professional Responsibilities

A. Accountability

1. The process in which individuals have an obligation (or duty) to act and are answerable for their choices, decisions, and actions
2. Involves assuming only the responsibilities that are within one's scope of practice and not assuming responsibility for activities in which competence has not been achieved
3. Involves admitting mistakes rather than blaming others and evaluating the outcomes of one's own actions
4. Includes a responsibility to the client to be competent and provide nursing care in accordance with standards of nursing practice while adhering to the professional ethics codes

 **Accountability is the acceptance of responsibility for one's choices, decisions, and actions. Nurses are always responsible for their actions when providing care to clients.**

B. Leadership and management

1. Leadership is the interpersonal process that involves influencing others (followers) to achieve goals.
2. Management is the accomplishment of tasks or goals by oneself or by directing others.

C. Theories of leadership and management (Box 7.1)

D. Leader and manager approaches

1. Authoritarian leadership
 - a. The leader or manager is focused and maintains strong control, makes decisions, and addresses all problems.
 - b. The leader or manager dominates the group and commands rather than seeks suggestions or input.

BOX 7.1 Theories of Leadership and Management

Charismatic: Based on personal beliefs and characteristics of influence

Quantum: Based on the concepts of chaos theory; maintaining a balance between tension and order prevents an unstable environment and promotes creativity

Relational: Based on collaboration and teamwork

Servant: Based on a desire to serve others; the leader emerges when another's needs assume priority

Shared: Based on the belief that several individuals share the responsibility for achieving the health care agency's goals

Transactional: Based on the principles of social exchange theory using a reward and punishment system

Transformational: Based on the individual's commitment to the health care agency's vision; focuses on promoting change through a shared vision

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 223-224.

2. Democratic leadership

- a. This is also called participative management.
- b. It is based on the belief that every group member should have input into problem solving and the development of goals; the leader obtains participation from the group and then makes the best decision for the organization, based on the input from the group.
- c. The democratic style is a more "talk with the members" style and much less authoritarian than the autocratic style.

3. Laissez-faire leadership

- a. A laissez-faire leader or manager assumes a passive, nondirective, and inactive approach and relinquishes part or all of the responsibilities to the members of the group.
- b. Decision making is left to the group, with the laissez-faire leader or manager providing little, if any, guidance, support, or feedback.

4. Situational leadership

- a. Situational approach uses a combination of styles based on the current circumstances and events.
- b. Situational styles are assumed according to the needs of the group and the tasks to be achieved.

5. Bureaucratic leadership

- a. The leader or manager believes that individuals are motivated by external forces.
- b. The leader or manager relies on organizational policies and procedures for decision making.

6. Transformational leadership

- a. Focused on building relationships
- b. Motivates staff members through a shared vision and mission

- c. Encourages and praises staff members and inspires them to improve performance levels while earning staff respect and loyalty
- 7. Servant leadership
 - a. Servant leaders influence and motivate others by building relationships and developing the skills of individual team members.
 - b. Servant leaders make sure to meet the needs of the individual team members and to give each person input in decisions.
- E. Effective leader and manager behaviors and qualities (Box 7.2)
- F. Functions of management (Box 7.3)
- G. Problem-solving process and decision making
 - 1. Problem solving involves obtaining information and using it to reach an acceptable solution to a problem.
 - 2. Decision making involves identifying a problem and deciding which alternatives can best achieve objectives.
 - 3. Steps of the problem-solving process are similar to the steps of the nursing process and the cognitive skills of the National Council of State Boards of Nursing (NCSBN) Clinical Judgment Measurement Model (NCJMM) (Table 7.1).
- H. Types of managers
 - 1. Front-line manager
 - a. Front-line managers function in supervisory roles of those involved with delivery of client care. Front-line managers may temporarily assume a client care role.
 - b. Front-line roles usually include charge nurse, team leader, and client care coordinator.
 - c. Front-line managers coordinate the activity of all staff who provide client care and supervise team members during the manager's period of accountability.
 - 2. Middle manager
 - a. Middle manager roles usually include unit manager and supervisor.
 - b. A middle manager's responsibilities may include supervising staff, preparing budgets, preparing work schedules, writing and implementing policies that guide client care and unit operations, and maintaining the quality of client services.
 - 3. Nurse executive
 - a. The nurse executive is a top-level nurse manager and may be the director of nursing services or the vice president for client care services that assists with carrying out the mission of a health care organization.
 - b. The nurse executive supervises numerous departments and works closely with the administrative team of the organization to ensure that nursing staff provide optimal client care.
 - c. The nurse executive ensures that all client care provided by nurses is consistent with the objectives of the health care organization.

BOX 7.2 Effective Leader and Manager Behaviors and Qualities

Behaviors

- Treats followers as unique individuals
- Inspires followers and stimulates critical thinking
- Shows followers how to think about old problems in new ways and assists with adapting to change
- Is visible to followers; is flexible; and provides guidance, assistance, and feedback
- Communicates a vision, establishes trust, and empowers followers
- Motivates followers to achieve goals

Qualities

- Effective communicator; promotes interprofessional collaboration
- Credible
- Critical thinker
- Initiator of action
- Risk taker
- Is persuasive and influences employees

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 220-221.

BOX 7.3 Functions of Management

- Planning:** Determining objectives and identifying methods that lead to achievement of objectives
- Organizing:** Using resources (human and material) to achieve predetermined outcomes
- Directing:** Guiding and motivating others to meet expected outcomes
- Controlling:** Using performance standards as criteria for measuring success and taking corrective action

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 218-219.

IV. Power

- A. Power is the ability to influence others and control their actions to achieve desired results.
- B. Powerful people are able to modify behavior and influence others to change, even when others are resistant to change.
- C. Powerful people are change agents that lead or create positive change to support or maintain high-quality care and decrease adverse effects.
- D. Effective nurse leaders use power to improve the delivery of care and to enhance the profession.
- E. There are different types of power (Box 7.4).

V. Empowerment

- A. Empowerment is an interpersonal process of enabling others to do for themselves.
- B. Empowerment occurs when individuals are able to influence what happens to them more effectively.
- C. Empowerment involves open communication, mutual goal setting, and shared decision making.

TABLE 7.1 Similarities of the Problem-Solving Process, the Nursing Process, and the NCJMM^a

Problem-Solving Process	Nursing Process	NCJMM: Cognitive Skills
Identifying a problem and collecting data about the problem	Assessment	Recognize Cues
Determining the exact nature of the problem	Analysis	Analyze Cues Prioritize Hypotheses
Deciding on a plan of action	Planning	Generate Solutions
Carrying out the plan	Implementation	Take Action
Evaluating the plan	Evaluation	Evaluate Outcomes

^aNCJMM - National Council of State Boards of Nursing Clinical Judgment Measurement Model

BOX 7.4 Types of Power

Reward: Ability to provide incentives

Coercive: Ability to punish

Referent: Based on attraction, loyalty, and respect

Expert: Based on having an expert knowledge foundation and skill level

Legitimate: Based on a position in society

Personal: Derived from a high degree of self-confidence

Informational: When one person provides explanations as to why another should behave in a certain way

- D. Nurses can empower clients and others through teaching and **advocacy**.

VI. Formal Organizations

- A. An organization's mission statement communicates in broad terms its reason for existence and the attitudes, beliefs, and values by which the organization functions.
- B. Goals and objectives are measurable activities specific to the development of designated services and programs of an organization.
- C. The organizational chart depicts and communicates how activities are arranged, how authority relationships are defined, and how communication channels are established.
-  D. Policies, procedures, and protocols
1. Policies are guidelines that define the organization's directives on courses of action.
 2. Procedures are based on policy and define methods for tasks.
 3. Protocols prescribe a specific course of action for a specific type of client or problem.
 - a. Centralization is the making of decisions by a few individuals at the top of the organization or by managers of a department or unit, and decisions are communicated thereafter to the employees.
 - b. Decentralization is the distribution of authority throughout the organization to allow for increased responsibility and **delegation** in decision making; decentralization tries to move the decision making as close to the client as possible.

 The nurse must follow policies, procedures, and protocols of the health care agency in which he or she is employed.

VII. Evidence-Based Practice

- A. Research is an important role of the professional nurse. Research provides a foundation for improvement in nursing practice.
- B. Evidence-based practice is an approach to client care in which the nurse integrates the client's preferences, clinical expertise, and the best research evidence to deliver quality care.
- C. Determining the client's personal, social, cultural, and religious preferences ensures individualization and is a component of implementing evidence-based practice.
- D. The nurse needs to be an observer and to identify and question situations that require change or result in a less than desirable outcome.
- E. Use of information technology such as online resources, including research publications, provides current research findings related to areas of practice.
- F. The nurse needs to follow evidence-based practice protocols developed by the institution and question the rationale for nursing approaches identified in the protocols as necessary. The nurse should use appropriate evaluation criteria when determining areas in need of research (Table 7.2).

 Evidence-based practice requires that the nurse base nursing practice on the best and most applicable evidence from clinical research studies. The nurse should also be alert to clinical issues that warrant investigation and develop a researchable question about the problem.

VIII. Quality Improvement

- A. Also known as performance improvement, quality improvement focuses on processes or systems that significantly contribute to client safety and effective client care outcomes; criteria are used to monitor

TABLE 7.2 Evaluation Criteria for Evidence for Clinical Questions

Level	Definition
Level I	Evidence comes from a review of a number of randomized controlled trials (RCTs) or from clinical practice guidelines that are based on such a review.
Level II	Evidence comes from at least one well-designed RCT.
Level III	Evidence comes from well-designed controlled studies that are not randomized.
Level IV	Evidence comes from well-designed case-controlled and cohort studies.
Level V	Evidence comes from a number of descriptive or qualitative studies.
Level VI	Evidence comes from a single descriptive or qualitative study.
Level VII	Evidence comes from the opinion of authorities and/or reports of expert committees.

References: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 56; Zerwekh, J., & Zerwekh Gameau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. p. 582.

outcomes of care and to determine the need for change to improve the quality of care.

- B. Quality improvement processes or systems may be named quality assurance, continuous quality management, or continuous quality improvement.
- C. When quality improvement is part of the philosophy of a health care agency, every staff member becomes involved in ways to improve client care and outcomes.
- D. A retrospective (“looking back”) audit is an evaluation method used to inspect the medical record after the client’s discharge for documentation of compliance with the standards.
- E. A concurrent (“at the same time”) audit is an evaluation method used to inspect compliance of nurses with predetermined standards and criteria while the nurses are providing care during the client’s stay.
- F. Peer review is a process in which nurses employed within an organization evaluate the quality of nursing care delivered to the client.
- G. The quality improvement process is similar to the nursing process and involves an interprofessional approach.
- H. An outcome describes the response to care; comparison of client responses with the expected outcomes indicates whether the interventions are effective, whether the client has progressed, how well standards are met, and whether changes are necessary.
- I. The nurse is responsible for recognizing trends in nursing practice, identifying recurrent problems, and initiating opportunities to improve the quality of care.

! Quality improvement processes improve the quality of care delivery to clients and the safety of health care agencies.

**FIG. 7.1** Elements of a successful change.

IX. Change Process

- A. Change is a dynamic process that leads to an alteration in behavior.
- B. A change agent can be used to effectively facilitate change. Change agents appropriately assess and manage the reactions of staff members. They can connect and balance all aspects of the organization that will be affected by change.
- C. Leadership style influences the approach to initiating the change process.
- D. Lewin’s basic concept of the change process includes three elements for successful change: unfreezing, moving and changing, and refreezing (Fig. 7.1).
 1. Unfreezing is the first phase of the process, during which the problem is identified and individuals involved gather facts and evidence supporting a basis for change.
 2. During the moving and changing phase, change is planned and implemented.
 3. Refreezing is the last phase of the process, during which the change becomes stabilized.
- E. Types of change
 1. Planned change: A deliberate effort to improve a situation
 2. Unplanned change: A reactive response that is required because of a disruption. The change is beneficial and may go unnoticed.
- F. Resistance to change (Box 7.5)
 1. Resistance to change occurs when an individual rejects proposed new ideas without critically thinking about the proposal.
 2. Common factors causing resistance include lack of understanding regarding the nature of change.
 3. Change requires energy.
 4. The change process does not guarantee positive outcomes.
- G. Overcoming barriers
 1. Create a flexible and adaptable environment.
 2. Encourage the people involved to plan and set goals for change.
 3. Include all involved in the plan for change.
 4. Focus on the benefits of the change.

BOX 7.5 Reasons for Resisting Change**Conformity**

One goes along with others to avoid conflict.

Dissimilar Beliefs and Values

Differences can impede positive change.

Habit

Routine, set behaviors are often hard to change.

Secondary Gains

Benefits or payoff are present, so there is no incentive to change.

Threats to Satisfying Basic Needs

Change may be perceived as a threat to self-esteem, security, or survival.

Fear

One fears failure or has fear of the unknown.

5. Delineate the drawbacks from failing to make the change in relation to client care.
6. Evaluate the change process on an ongoing basis, and keep everyone informed of progress.
7. Provide positive feedback to all involved.
8. Commit to the time it takes to change.

X. Conflict

A. Conflict is an internal or external friction that arises from a perception of incompatibility or difference in beliefs, attitudes, values, goals, priorities, or decisions.

B. Types of conflict

1. Intrapersonal: Occurs within a person
2. Interpersonal: Occurs between and among clients, nurses, or other staff members
3. Organizational: Occurs when an employee confronts the policies and procedures of the organization

C. Modes of conflict resolution

1. Avoidance
 - a. Avoiders are unassertive and uncooperative.
 - b. Avoiders do not pursue their own needs, goals, or concerns, and they do not assist others to pursue theirs.
 - c. Avoiders postpone dealing with the issue.
2. Accommodation
 - a. Accommodators neglect their own needs, goals, or concerns (unassertive) while trying to satisfy those of others.
 - b. Accommodators obey and serve others and often feel resentment and disappointment because they “get nothing in return.”
3. Competition
 - a. Competitors pursue their own needs and goals at the expense of others.

b. Competitors also may stand up for rights and defend important principles.

4. Compromise

- a. Compromisers are assertive and cooperative.
- b. Compromisers work creatively and openly to find the solution that most fully satisfies all important objectives and goals to be achieved.

XI. Roles of Health Care Team Members

A. Nurse roles are as follows:

1. Promote health and prevent disease
2. Provide comfort and care to clients
3. Make decisions
4. Act as client advocate
5. Lead and manage the nursing team; recognize the contributions of all team members
6. Serve as case manager
7. Communicate effectively
8. Educate clients, families, and communities and health care team members
9. Act as a resource person
10. Allocate resources in a cost-effective manner
11. Ensure client-centered care
12. Recognize own limitations and seek help as needed
13. Work effectively in interprofessional teams

B. Primary health care provider (PHCP): A PHCP or specialist diagnoses and treats disease.

C. Physician’s assistant

1. A physician’s assistant (PA) acts to a limited extent in the role of the physician during the physician’s absence.
2. The PA conducts physical examinations, performs diagnostic procedures, assists in the operating room and emergency department, and performs treatments.
3. Certified and licensed PAs in some states have prescriptive powers.

D. Nurse practitioner: an advanced practice registered nurse (APRN) who is educated to diagnose and treat acute illness and chronic conditions; another focus of the APRN is health promotion and maintenance.

1. An APRN may work in a variety of specialty areas, including family practice, internal medicine, acute gerontology, women’s health or obstetrics, acute care, pediatrics, or other specialty areas.
2. APRNs have independent practice authority in most states.
3. Some states require APRNs to have a collaborative agreement with an agency or physician/physician group.

E. Physical therapist: A physical therapist assists in examining, testing, and treating clients recuperating from injuries, illness, or surgery and physically disabled clients. In some settings, physical therapists play a major role in providing wound care. Physical

therapy assistants may be employed to help the physical therapist.

- F. Occupational therapist: An occupational therapist develops adaptive devices that help chronically ill clients or clients with a disability perform activities of daily living. The focus is on coordination retraining. Occupational therapy assistants may be available to help the occupational therapist.
- G. Respiratory therapist: A respiratory therapist delivers treatments designed to improve the client's ventilation and oxygenation status.
- H. Speech therapist: A speech therapist evaluates a client's ability to swallow safely and evaluates speech and communication ability. The speech therapist develops a plan to treat communication and swallowing disorders. These therapists also work to prevent, assess, diagnose, and treat speech, language, social communication, and cognitive communication disorders in children and adults. They use exercises to develop new speech habits.
- I. Nutritionist: A nutritionist or dietitian assists in planning dietary measures to improve or maintain a client's nutritional status.
- J. Continuing care nurse: This nurse coordinates discharge plans for the client.
- K. Assistive personnel help the registered nurse with specified tasks and functions.
- L. Pharmacist: A pharmacist formulates and dispenses medications. Pharmacists also check medication safety, interactions, and side effects.
- M. Social worker: A social worker counsels clients and families about home care services and assists the continuing care nurse with planning and facilitating discharge.
- N. Chaplain: A chaplain (or trained layperson) offers spiritual support and guidance to clients and families.
- O. Administrative staff: Administrative or support staff members organize and schedule diagnostic tests and procedures and arrange for services needed by the client and family.

XII. Interprofessional Collaboration

- A. Client care planning can be accomplished through referrals, consultations, or interprofessional collaborations with other health care specialists and through client care conferences, which involve members from all health care disciplines. This approach helps ensure continuity of care.
- B. Reports
 - 1. Reports should be factual, accurate, current, complete, and organized.
 - 2. Reports should include essential background information, subjective data, objective data, any changes in the client's status, client problems or nursing diagnoses as appropriate, treatments and procedures, medication administration, client

teaching, discharge planning, family information, the client's response to treatments and procedures, and the client's priority needs.

- 3. Change-of-shift (hand-off) report
 - a. The report facilitates continuity of care among nurses who are responsible for a client.
 - b. The report may be written, oral, audiotaped, or provided during walking rounds at the client's bedside.
 - c. The report describes the client's health status and informs the nurse who assumes care about the client's needs and priorities for care.
 - d. The report may be done at the client's bedside to allow the client to participate in care planning, as well as to establish the stability of the client before the oncoming nurse assumes care.
- 4. Telephone reports
 - a. Purposes include informing a PHCP of a client's change in status, communicating information about a client's transfer to or from another unit or facility, and obtaining results of laboratory or diagnostic tests.
 - b. The telephone report should be documented and should include when the call was made, who made the call, who was called, to whom information was given, what information was given, and what information was received.
- 5. Transfer reports
 - a. Transferring nurse reports provide continuity of care and may be given by telephone or in person (Box 7.6).
 - b. The receiving nurse should repeat transfer information to ensure client safety and ask questions to clarify information about the client's status.
- 6. Situation, Background, Assessment, Recommendation (SBAR)
 - a. SBAR, a communication model, is a structured and standardized communication technique that improves communication among team members when sharing information on a client.
 - b. SBAR includes up-to-date information about the client's situation, associated background information, assessment data, and recommendations for care, such as treatments, medications, or services needed.

XIII. Interprofessional Consultation

- A. Consultation is a process in which a specialist is sought to identify methods of care or treatment plans to meet the needs of a client.
- B. Consultation is needed when the nurse encounters a problem that cannot be solved using nursing knowledge, skills, and available resources.

BOX 7.6 Transfer Reports

- Client's name, age, health care provider, and diagnoses
- Current health status and plan of care
- Client's needs and priorities for care
- Any assessments or interventions that need to be performed after transfer, such as laboratory tests, medication administration, or dressing changes
- Need for any special equipment
- Additional considerations such as allergies, resuscitation status, precautionary considerations, cultural or religious issues, or family issues

- C. Consultation also is needed when the exact problem remains unclear; a consultant can objectively and more clearly assess and identify the exact nature of the problem.
- D. Rapid-response teams exist within hospitals to provide nursing staff with internal consultative services provided by expert clinicians.
- E. Rapid-response teams are used to assist nursing staff with early detection and resolution of client problems.
- F. Rapid-response teams are also teams of health care providers that respond to hospitalized clients with early signs of deterioration on non-intensive care units to prevent respiratory or cardiac arrest.
- G. Medication reconciliation includes collaboration among the client, PHCPs, nurses, and pharmacists to ensure medication accuracy when clients experience changes in health care settings or levels of care or are transferred from one care unit to another, and upon discharge (Box 7.7).

BOX 7.7 Process for Medication Reconciliation

1. Obtain a list of current medications from the client.
2. Develop an accurate list of newly prescribed medications.
3. Compare new medications to the list of current medications.
4. Identify and investigate any discrepancies and collaborate with the health care provider as necessary.
5. Communicate the finalized list with the client, caregivers, primary health care provider (PHCP), and other team members.

Reference: Rosenthal, L., & Burchum, J. (2019). *Lehne's pharmacology for nursing care*. (10th ed). St. Louis: Elsevier. p. 71.

BOX 7.8 Discharge Teaching

- Use the teach-back method to ensure client understanding.
- Encourage the client to ask questions.
- Instruct the client on essential points, such as:
 - How to administer prescribed medications
 - Side and adverse effects of medications that need to be reported to the primary health care provider (PHCP)
 - Prescribed dietary and activity measures
 - Complications of the medical condition that need to be reported to the PHCP
 - How to perform prescribed treatments
 - How to use special equipment prescribed for the client
 - The schedule for home care services that are planned
 - How to access available community resources
 - When to obtain follow-up care

XIV. Discharge Planning

- A. Discharge planning begins when the client is admitted to the hospital or health care facility.
- B. Discharge planning is an interprofessional process that ensures that the client has a plan for continuing care after leaving the health care facility and assists in the client's transition from one environment to another.
- C. All caregivers need to be involved in discharge planning, and referrals to other PHCPs or agencies may be needed. A PHCP's prescription may be needed for the referral, and the referral needs to be approved by the client's health care insurer.
- D. The nurse should anticipate the client's discharge needs and make the required referral as soon as possible (involving the client and family in the referral process).
- E. The nurse needs to educate the client and family regarding care at home (Box 7.8).

XV. Delegation and Assignments**A. Delegation**

1. Delegation is the process of transferring performance of a selected nursing task in a situation to an individual who is competent and has the authority to perform that specific task.

2. Delegation involves achieving outcomes and sharing activities with other individuals who have the authority to accomplish the task.
3. The nurse practice act and any practice limitations (institutional policies and procedures, and job descriptions of personnel provided by the institution) define which aspects of care can be delegated and which must be performed by a registered nurse.
4. Even though a task may be delegated to someone, the nurse who delegates maintains ultimate accountability for the task.
5. The knowledge and skills of the person being delegated to need to be assessed, and tasks need to match the person's skills and abilities.
6. The nurse cannot delegate any activity that involves nursing judgment or critical decision making.
7. The five rights of delegation include the right task, right circumstances, right person, right direction/communication, and right supervision/evaluation.

 The nurse delegates only tasks for which he or she is responsible. The nurse who delegates is accountable for the task; the person who assumes responsibility for the task is also accountable.

- B. Principles and guidelines of delegating (Box 7.9)
- C. Client Care Task Assignments
 1. Task assignment is the transfer of performance of client care activities to specific staff members.
 2. Guidelines for client care task assignments
 - a. Always ensure client safety.
 - b. Be aware of individual variations in work abilities.
 - c. Determine which tasks can be delegated and to whom.
 - d. Match the task to the delegatee on the basis of the nurse practice act and any practice limitations (institutional policies and procedures, and job descriptions of personnel provided by the institution).
 - e. Provide directions that are clear, concise, accurate, and complete.
 - f. Validate the delegatee's understanding of the directions.
 - g. Communicate a feeling of confidence to the delegatee, and provide feedback promptly after the task is performed.
 - h. Maintain continuity of care as much as possible when assigning client care.

BOX 7.9 Principles and Guidelines of Delegating

- Delegate the right task to the right delegatee. Be familiar with the experience of the delegates, their scopes of practice, their job descriptions, agency policy and procedures, and the state nurse practice act.
- Provide clear directions about the task and ensure that the delegatee understands the expectations.
- Determine the degree of supervision that may be required.
- Provide the delegatee with the authority to complete the task; provide a deadline for completion of the task.
- Evaluate the outcome of the care that has been delegated.
- Provide feedback to the delegatee regarding their performance.
- *In general*, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to the assistive personnel (AP).
- *In general*, a licensed practical nurse (LPN) or vocational nurse (VN) can perform not only the tasks that an AP can perform, but also certain invasive tasks, such as dressing changes, suctioning, urinary catheterization, and medication administration (oral, subcutaneous, intramuscular, and selected piggyback medications), according to the education and job description of the LPN or VN. The LPN or VN can collect data and also review with the client teaching plans that were initiated by the registered nurse.
- A registered nurse (RN) can perform the tasks that an LPN or VN can perform and is responsible for assessment and planning care, initiating teaching, and administering medications intravenously.
- An RN can care for stable and unstable clients.
- An LPN or VN can care for stable clients.
- An AP provides basic care that does not require any type of assessment; APs can perform routine tasks in client care.

XVI. Time Management

- A. Description
 1. Time management is a technique designed to assist in completing tasks within a definite time period.
 2. Learning how, when, and where to use one's time and establishing personal goals and time frames are part of time management.
 3. Time management requires an ability to anticipate the day's activities, to combine activities when possible, and to not be interrupted by nonessential activities.
 4. Time management involves efficiency in completing tasks as quickly as possible and effectiveness in deciding on the most important task to do (i.e., **prioritizing**) and doing it correctly.
- B. Principles and guidelines
 1. Identify tasks, obligations, and activities and write them down.
 2. Organize the workday; identify which tasks must be completed in specified time frames.
 3. Prioritize client needs according to importance.
 4. Anticipate the needs of the day, and provide time for unexpected and unplanned tasks that may arise.
 5. Focus on beginning the daily tasks, working on the most important first while keeping goals in mind; look at the final goal for the day to help break down tasks into manageable parts.
 6. Begin client rounds at the beginning of the shift, collecting data on each assigned client.
 7. Delegate tasks when appropriate.
 8. Keep a daily hour-by-hour log to assist in providing structure to the tasks that must be accomplished, and cross tasks off the list as they are accomplished.
 9. Use health care agency resources wisely, anticipating resource needs, and gather the necessary supplies before beginning the task.
 10. Organize paperwork and continuously document task completion and necessary client data throughout the day (i.e., documentation should be concurrent with completion of a task or observation of pertinent client data).
 11. At the end of the day, evaluate the effectiveness of time management.

XVII. Prioritizing Care

- A. Prioritizing is deciding which needs or problems require immediate action and which ones could tolerate a delay in response until a later time because they are not urgent.
- B. Guidelines for prioritizing (Box 7.10)

BOX 7.10 Guidelines for Prioritizing

- The nurse and the client mutually rank the client's needs in order of importance based on the client's preferences and expectations, safety, and physical and psychological needs; what the client sees as their priority needs may be different from what the nurse sees as the priority needs.
- Priorities are classified as high, intermediate, or low.
- Client needs that are life-threatening or that could result in harm to the client if they are left untreated are high priorities.
- Nonemergency and non-life-threatening client needs are intermediate priorities.
- Client needs that are not related directly to the client's illness or prognosis are low priorities.
- The nurse can use the ABCs—airway, breathing, and circulation—as a guide when determining priorities; client needs related to maintaining a patent airway are always the priority.
- Consider vital signs and laboratory results and respond immediately to critically abnormal values.
- If cardiopulmonary resuscitation (CPR) is necessary, the order of priority is CAB—compressions, airway, and breathing—this is the exception to using the ABCs when determining priorities.
- When providing care, the nurse needs to decide which needs or problems require immediate action and which ones could be delayed until a later time because they are not urgent.
- The nurse considers client problems that involve actual or life-threatening concerns before potential health-threatening concerns.
- The nurse can use Maslow's Hierarchy of Needs theory as a guide to determine priorities and to identify the levels of physiological needs, safety, love and belonging, self-esteem, and self-actualization (basic needs are met before moving to other needs in the hierarchy).
- When prioritizing care, the nurse must consider time constraints and available resources.
- Problems identified as important by the client must be given high priority.
- The nurse can use the steps of the nursing process as a guide to determine priorities, remembering that assessment is the first step of the nursing process.
- Prioritization may be different in a disaster or emergency situation, where an action should be taken before gathering further information.

C. Setting priorities for client teaching

1. Determine the client's immediate learning needs.
2. Identify the type of learning needs for the individual; for example, consider the client's age, cognitive age, language needs, and generational concerns.
3. Review the learning objectives established for the client.
4. Determine what the client perceives as important.
5. Assess the client's anxiety level and the time available to teach.

D. Prioritizing when caring for a group of clients

1. Identify the problems of each client.
2. Review the problems and any nursing diagnoses.
3. Determine which client problems are most urgent based on basic needs, the client's changing or unstable status, and complexity of the client's problems.
4. Anticipate the time that it may take to care for the priority needs of the clients.
5. Combine activities, if possible, to resolve more than one problem at a time.
6. Involve the client in their care as much as possible (see **Clinical Judgment: Take Action Box**).

⚠ Use the ABCs—airway, breathing, and circulation; Maslow's Hierarchy of Needs theory; and the steps of the nursing process (assessment is first) to prioritize. Also consider the acuity level of clients when applying these guidelines. If cardiopulmonary resuscitation (CPR) needs to be initiated, use CAB—compressions, airway, breathing—as the priority guideline.

⚡ CLINICAL JUDGMENT: TAKE ACTION

Assessing a Group of Clients in Order of Priority

The nurse is assigned to the following clients. The order of priority in assessing the clients is as follows:

1. A client with heart failure who has a 4-lb weight gain since yesterday and is experiencing shortness of breath
2. A 24-hour postoperative client who had a wedge resection of the lung and has a closed chest tube drainage system
3. A client admitted to the hospital for observation who has absent bowel sounds
4. A client who is undergoing surgery for a hysterectomy on the following day

XVIII. Disasters and Emergency Response Planning

A. Description

1. A disaster is any human-made or natural event that causes destruction and devastation that cannot be alleviated without assistance (**Box 7.11**).
2. Internal disasters are disasters that occur within a health care agency (e.g., health care agency fire, structural collapse, radiation spill), whereas external disasters are disasters that occur outside the health care agency (e.g., mass transit accident that could send hundreds of victims to emergency departments).
3. A **multicasualty event** involves a limited number of victims or casualties and can be managed by a hospital with available resources; a **mass casualty event** involves a number of casualties that

BOX 7.11 Types of Disasters**Human-Made Disasters**

Dam failures resulting in flooding
 Hazardous substance accidents such as pollution, chemical spills, or toxic gas leaks
 Accidents involving release of radioactive material
 Resource shortages such as food, water, and electricity
 Structural collapse, fire, or explosions
 Terrorist attacks such as bombing, riots, and bioterrorism
 Mass transportation accidents

Natural Disasters

Avalanches
 Blizzards
 Communicable disease
 Cyclones
 Droughts
 Earthquakes
 Epidemics and pandemics
 Floods
 Forest fires
 Hailstorms
 Hurricanes
 Landslides
 Mudslides
 Tidal waves
 Tornadoes
 Volcanic eruptions

exceeds the resource capabilities of the hospital, and is also known as a disaster.

4. An emergency response plan is a formal plan of action for coordinating the response of the health care agency staff in the event of a disaster in the health care agency or surrounding community.
- B. American Red Cross (ARC)**
1. The ARC has been given authority by the federal government to provide disaster relief.
 2. All ARC disaster relief assistance is free, and local offices are located across the United States.
 3. The ARC participates with the government in developing and testing community disaster plans.
 4. The ARC identifies and trains personnel for emergency response.
 5. The ARC works with businesses and labor organizations to identify resources and individuals for disaster work.
 6. The ARC educates the public about ways to prepare for a disaster.
 7. The ARC operates shelters, provides assistance to meet immediate emergency needs, and provides disaster health services, including crisis counseling.
 8. The ARC handles inquiries from family members.
 9. The ARC coordinates relief activities with other agencies.
10. Nurses are involved directly with the ARC and assume functions such as managers, supervisors, and educators of first aid; they also participate in emergency response plans and disaster relief programs and provide services, such as blood collection drives and immunization programs.
- C. HAZMAT (hazardous materials) team**
1. HAZMAT teams are typically composed of emergency department health care providers and nursing staff, because they will be the first individuals to encounter the potential exposure.
 2. Members of HAZMAT teams and health care providers in emergency settings have been educated on how to recognize patterns of illness that may be indicative of nuclear, biological, and chemical exposure; protocols for pharmacological treatment of infectious disease agents; availability of decontamination facilities and personal protective gear; safety measures; and the methods of responding to an exposure.
- D. Phases of disaster management**
1. The Federal Emergency Management Agency (FEMA) identifies four disaster management phases: mitigation, preparedness, response, and recovery.
 2. Mitigation encompasses the following:
 - a. Actions or measures that can prevent the occurrence of a disaster or reduce the damaging effects of a disaster
 - b. Determination of the community hazards and community risks (actual and potential threats) before a disaster occurs
 - c. Awareness of available community resources and community health personnel to facilitate mobilization of activities and minimize chaos and confusion if a disaster occurs
 - d. Determination of the resources available for care to infants, older adults, disabled individuals, and individuals with chronic health problems
 3. Preparedness encompasses the following:
 - a. Plans for rescue, evacuation, and caring for disaster victims
 - b. Plans for training disaster personnel and gathering resources, equipment, and other materials needed for dealing with the disaster
 - c. Identification of specific responsibilities for various emergency response personnel
 - d. Establishment of a community emergency response plan and an effective public communication system
 - e. Development of an emergency medical system and a plan for activation
 - f. Verification of proper functioning of emergency equipment
 - g. Collection of anticipatory provisions and creation of a location for providing food, water, clothing, shelter, other supplies, and needed medicine

- h. Inventory of supplies on a regular basis and replenishment of outdated supplies
 - i. Practice of community emergency response plans (mock disaster drills)
4. Response encompasses the following:
 - a. Putting disaster planning services into action and the actions taken to save lives and prevent further damage
 - b. Primary concerns include safety and the physical and mental health of victims and members of the disaster response team.
 5. Recovery encompasses the following:
 - a. Actions taken to return to a normal situation after the disaster
 - b. Preventing debilitating effects and restoring personal, economic, and environmental health and stability to the community
 - c. Acute stress disorder or post-traumatic stress disorder is a concern for disaster survivors.
- E. Levels of disaster
1. FEMA identifies three levels of disaster with FEMA response (Box 7.12).
 2. When a federal emergency has been declared, the federal response plan may take effect and activate emergency support functions.
 3. The emergency support functions of the ARC include performing emergency first aid, sheltering, feeding, providing a disaster welfare information system, and coordinating bulk distribution of emergency relief supplies.
 4. Disaster medical assistant teams (teams of specially trained personnel) can be activated and sent to a disaster site to provide triage and medical care to victims until they can be evacuated to a hospital.
- F. Nurse's role in disaster planning
1. Personal and professional preparedness
 - a. Make personal and family preparations (Box 7.13).
 - b. Be aware of the disaster plan at the place of employment and in the community.
 - c. Maintain certification in disaster training and in CPR.
 - d. Participate in mock disaster drills, including bomb threat and active shooter drills.
 - e. Prepare professional emergency response items, such as a copy of nursing license, personal health care equipment such as a stethoscope, cash, warm clothing, recordkeeping materials, and other nursing care supplies.
 2. Disaster response
 - a. In the health care agency setting, if a disaster occurs, the agency disaster preparedness plan (emergency response plan) is activated immediately, and the nurse responds by following the directions identified in the plan.
 - b. In the community setting, if the nurse is the first responder to a disaster, the nurse cares

BOX 7.12 Federal Emergency Management Agency (FEMA) Levels of Disaster

Level I Disaster

Massive disaster that involves significant damage and results in a presidential disaster declaration, with major federal involvement and full engagement of federal, regional, and national resources

Level II Disaster

Moderate disaster that is likely to result in a presidential declaration of an emergency, with moderate federal assistance

Level III Disaster

Minor disaster that involves a minimal level of damage but could result in a presidential declaration of an emergency

BOX 7.13 Emergency Plans and Supplies

- Plan a meeting place for family members.
- Identify where to go if an evacuation is necessary.
- Determine when and how to turn off water, gas, and electricity at main switches.
- Locate the safe spots in the home for each type of disaster.
- Replace stored water supply every 3 months and stored food supply every 6 months.
- Include the following supplies:
 - Backpack, clean clothing, sturdy footwear
 - Pocketknife or multi-tool
 - A 3-day supply of water (1 gallon per person per day)
 - A 3-day supply of nonperishable food
 - Blankets/sleeping bags/pillows
 - First-aid kit with over-the-counter medications and vitamins
 - Adequate supply of prescription medication
 - Battery-operated radio
 - Flashlight and batteries
 - Credit card, cash, or traveler's checks
 - Personal ID card, list of emergency contacts, allergies, medical information, list of credit card numbers and bank accounts (all sealed in a watertight package)
 - Extra set of car keys and a full tank of gas in the car
 - Sanitation supplies for washing, toileting, and disposing of trash; hand sanitizer
 - Extra pair of eyeglasses/sunglasses
 - Special items for infants, older adults, or disabled individuals
 - Items needed for a pet such as food, water, and leash
 - Paper, pens, pencils, maps
 - Cell phone
 - Work gloves
 - Rain gear
 - Roll of duct tape and plastic sheeting
 - Radio and extra batteries
 - Toiletries (basic daily needs, sunscreen, insect repellent, toilet paper)
 - Plastic garbage bags and resealable bags
 - Household bleach for disinfection
 - Whistle
 - Matches in a waterproof container

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 233.

for the victims by attending to the victims with life-threatening problems first; when rescue workers arrive at the scene, immediate plans for triage should begin.

 **In the event of a disaster, activate the emergency response plan immediately.**

G. Triage

1. In a disaster or war, triage consists of a brief assessment of victims that allows the nurse to classify victims according to the severity of the injury, urgency of treatment, and place for treatment (see **Clinical Judgment: Take Action Box**).
2. Simple Triage and Rapid Treatment (START) is a strategy used to evaluate the severity of injury of each victim as quickly as possible and to tag the victims in about 30 to 60 seconds.
3. In an emergency department, triage consists of a brief assessment of clients that allows the nurse to classify clients according to their need for care and establish priorities of care; the type of illness or injury, the severity of the problem, and the resources available govern the process.

H. Emergency department triage system

1. A commonly used rating system in an emergency department is a three-tiered system that uses the categories of emergent, urgent, and nonurgent; these categories may be identified by color coding or numbers (**Box 7.14**).
2. The nurse needs to be familiar with the triage system of the health care agency.
3. When caring for a client who has died, the nurse needs to recognize the importance of family and cultural and religious rituals and provide support to loved ones.
4. Organ donation procedures of the health care agency need to be addressed if appropriate.

BOX 7.14 Emergency Department Triage

Emergent (Red): Priority 1 (Highest)

This classification is assigned to clients who have life-threatening injuries and need immediate attention and continuous evaluation but have a high probability for survival when stabilized.

Such clients include trauma victims, clients with chest pain, clients with severe respiratory distress or cardiac arrest, clients with limb amputation, clients with acute neurological deficits, and clients who have sustained chemical splashes to the eyes.

Urgent (Yellow): Priority 2

This classification is assigned to clients who require treatment and whose injuries have complications that are not life-threatening, provided that they are treated within 30 minutes to 2 hours; these clients require continuous evaluation every 30 to 60 minutes thereafter.

Such clients include clients with an open fracture with a distal pulse and large wounds.

Nonurgent (Green): Priority 3

This classification is assigned to clients with local injuries who do not have immediate complications and who can wait at least 2 hours for medical treatment; these clients require evaluation every 1 to 2 hours thereafter.

Such clients include clients with conditions such as a closed fracture, minor lacerations, sprains, strains, or contusions.

Note: Some triage systems include tagging a client “Black” if the victim is dead or soon will be deceased because of severe injuries; these are victims that would not benefit from any care because of the severity of injuries.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 228; Zerwekh, J., & Zerwekh Gameau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 629-630.

 **Think survivability. If you are the first responder to a scene of a disaster, such as a train crash, a priority victim is one whose life can be saved.**

CLINICAL JUDGMENT: TAKE ACTION

Triaging Victims at the Site of an Accident

The nurse is the first responder at the scene of a school bus accident. The nurse triages the victims from highest to lowest priority as follows:

1. Confused child with bright red blood pulsating from a leg wound
2. Child with a closed head wound and multiple compound fractures of the arms and legs
3. Child with a simple fracture of the arm complaining of arm pain
4. Sobbing child with several minor lacerations on the face, arms, and legs

I. Client assessment in the emergency department

1. Primary assessment
 - a. The purpose of primary assessment is to identify any client problem that poses an immediate or potential threat to life.
 - b. The nurse gathers information primarily through objective data and, on finding any abnormalities, immediately initiates interventions.
 - c. The nurse uses the ABCs—airway, breathing, and circulation—as a guide in assessing a client’s needs and assesses a client who has sustained a traumatic injury for signs of a head injury or cervical spine injury. If CPR needs to be initiated, use CAB—compressions, airway, breathing—as the priority guideline.

- d. Agonal breathing does not provide effective respiration and ventilation and indicates a need for ventilatory support.
 - e. Only central pulses, such as the carotid or femoral pulses, should be used to assess circulation; they should be checked for at least 5 seconds but no longer than 10 seconds so as to not delay chest compressions.
2. Secondary assessment
 - a. The nurse performs secondary assessment after the primary assessment and after treatment for any primary problems is identified.
 - b. Secondary assessment identifies any other life-threatening problems that a client might be experiencing.
 - c. The nurse obtains subjective and objective data, including a history, general overview, vital sign measurements, neurological assessment, pain assessment, and complete or focused physical assessment.

PRACTICE QUESTIONS

1. The nurse is assigned to care for four clients. In planning client rounds, which client would the nurse assess first?
 1. A postoperative client preparing for discharge with a new medication
 2. A client requiring daily dressing changes of a recent surgical incision
 3. A client scheduled for a chest x-ray after insertion of a nasogastric tube
 4. A client with asthma who requested a breathing treatment during the previous shift
2. The nurse employed in an emergency department is assigned to triage clients coming to the emergency department for treatment on the evening shift. The nurse would assign priority to which client?
 1. A client complaining of muscle aches, a headache, and history of seizures
 2. A client who twisted their ankle when rollerblading and is requesting medication for pain
 3. A client with a minor laceration on the index finger sustained while cutting an eggplant
 4. A client with chest pain who states that they just ate pizza that was made with a very spicy sauce
3. A nursing graduate is attending an agency orientation regarding the nursing model of practice implemented in the health care facility. The nurse is told that the nursing model is a team nursing approach. The nurse determines that which scenario is characteristic of the team-based model of nursing practice?
 1. Each staff member is assigned a specific task for a group of clients.
 2. A staff member is assigned to determine the client's needs at home and begin discharge planning.
 3. A single registered nurse (RN) is responsible for providing care to a group of six clients with the aid of an assistive personnel (AP).
 4. An RN leads two licensed practical nurses (LPNs) and three APs in providing care to a group of 12 clients.
4. The nurse has received the assignment for the day shift. After making initial rounds and checking all of the assigned clients, which client would the nurse plan to care for first?
 1. A client who is ambulatory, demonstrating steady gait
 2. A postoperative client who has just received an opioid pain medication
 3. A client scheduled for physical therapy for the first crutch-walking session
 4. A client with a white blood cell count of 14,000 mm³ (14 × 10⁹/L) and a temperature of 38.4° C
5. The nurse is giving a bed bath to an assigned client when an assistive personnel (AP) enters the client's room and tells the nurse that another assigned client is in pain and needs pain medication. Which is the most appropriate nursing action?
 1. Finish the bed bath and then administer the pain medication to the other client.
 2. Ask the AP to find out when the last pain medication was given to the client.
 3. Ask the AP to tell the client in pain that medication will be administered as soon as the bed bath is complete.
 4. Cover the client, raise the side rails, tell the client that you will return shortly, and administer the pain medication to the other client.
6. The nurse manager has implemented a change in the method of the nursing delivery system from functional to team nursing. An assistive personnel (AP) is resistant to the change and is not taking an active part in facilitating the process of change. Which is the best approach in dealing with the AP?
 1. Ignore the resistance.
 2. Exert coercion on the AP.
 3. Provide a positive reward system for the AP.
 4. Confront the AP to encourage verbalization of feelings regarding the change.
7. The registered nurse is planning the client assignments for the day. Which is the most appropriate assignment for an assistive personnel (AP)?
 1. A client requiring a colostomy irrigation
 2. A client receiving continuous tube feedings
 3. A client who requires urine specimen collections
 4. A client with difficulty swallowing food and fluids

8. The nurse manager is discussing with the staff the facility's protocol in the event of a tornado. Which instructions would the nurse manager include in the discussion? Select all that apply.
- Open doors to client rooms.
 - Move beds away from windows.
 - Close window shades and curtains.
 - Place blankets over clients who are confined to bed.
 - Relocate ambulatory clients from the hallways back into their rooms.
9. The nurse employed in a long-term care facility is planning assignments for the clients on a nursing unit. The nurse needs to assign four clients and has a licensed practical nurse and three assistive personnel (APs) on a nursing team. Which client would the nurse most appropriately assign to the licensed practical nurse?
1. A client who requires a bed bath
 2. An older client requiring frequent ambulation
 3. A client who requires hourly measurement of vital signs
 4. A client requiring abdominal wound irrigations and dressing changes every 3 hours
10. The charge nurse is planning the assignment for the day. Which factors would the nurse remain mindful of when delegating tasks? Select all that apply.
- The acuity level of the clients
 - Specific requests from the staff
 - The clustering of the rooms on the unit
 - The number of anticipated client discharges
 - Client needs and workers' needs and abilities

ANSWERS

1. Answer: 4

Rationale: Airway is always the highest priority, and the nurse would attend to the client with asthma who requested a breathing treatment during the previous shift. This could indicate that the client was experiencing difficulty breathing. The clients described in options 1, 2, and 3 have needs that would be identified as intermediate priorities.

Test-Taking Strategy: Note the **strategic word**, *first*. Use the **ABCs—airway, breathing, and circulation**—to answer the question. Remember that airway is always the highest priority. This will direct you to the correct option.

Reference: Sweet, V., & Foley, P. (2020). *Sheehy's emergency nursing: Principles and practice*. (7th ed.). St. Louis: Elsevier. (Emergency Nurses Association). pp. 68-69.

2. Answer: 4

Rationale: In an emergency department, triage involves brief client assessment to classify clients according to their need for care and includes establishing priorities of care. The type of illness or injury, the severity of the problem, and the resources available govern the process. Clients with trauma, chest pain, severe respiratory distress or cardiac arrest, limb amputation, or acute neurological deficits and those who have sustained chemical splashes to the eyes are classified as emergent and are the highest priority. Clients with conditions such as a simple fracture, asthma without respiratory distress, fever, hypertension, abdominal pain, or a renal stone have urgent needs and are classified as a second priority. Clients with conditions such as a minor laceration, sprain, or cold symptoms are classified as nonurgent and are a third priority.

Test-Taking Strategy: Note the **strategic word**, *priority*. Use the **ABCs—airway, breathing, and circulation**—to direct you to the correct option. A client experiencing chest pain is always classified as priority one until a myocardial infarction has been ruled out.

Reference: Sweet, V., & Foley, P. (2020). *Sheehy's emergency nursing: Principles and practice*. (7th ed.). St. Louis: Elsevier. (Emergency Nurses Association). pp. 68-69.

3. Answer: 4

Rationale: In team nursing, nursing personnel are led by a registered nurse leader in providing care to a group of clients. Option 1 identifies functional nursing. Option 2 identifies a component of case management. Option 3 identifies primary nursing (relationship-based practice).

Test-Taking Strategy: Focus on the **subject**, team nursing. Keep this **subject** in mind and select the option that best describes a team approach. The correct option is the only one that identifies the concept of a team approach.

Reference: Zerwekh, J. & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 359-360.

4. Answer: 4

Rationale: The nurse would plan to care for the client who has an elevated white blood cell count and a fever first, because this client's needs are the priority. The client who is ambulatory with steady gait and the client scheduled for physical therapy for a crutch-walking session do not have priority needs. Waiting for pain medication to take effect before providing care to the postoperative client is best.

Test-Taking Strategy: Note the **strategic word**, *first*, and use principles related to prioritizing. Recalling that the normal white blood cell count is 5000 to 10,000 mm³ (5 to 10 × 10⁹/L) and that the normal temperature range is 97.5° F to 98.6° F (36.4° C to 37° C) will direct you to the correct option.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 241, 286-287.

5. Answer: 4

Rationale: The nurse is responsible for the care provided to assigned clients. The appropriate action in this situation is to provide safety to the client who is receiving the bed bath and prepare to administer the pain medication. Options 1 and 3 delay the administration of medication to the client in pain. Option 2 is not a responsibility of the AP.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and use principles related to priorities of care. Options 1 and 3 are **comparable or alike** and delay the administration of pain medication, and option 2 is not a responsibility of the AP. The most appropriate action is to plan to administer the medication.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 894, 896.

6. Answer: 4

Rationale: Confrontation is an important strategy to meet resistance head-on. Face-to-face meetings to confront the issue at hand will allow verbalization of feelings, identification of problems and issues, and development of strategies to solve the problem. Option 1 will not address the problem. Option 2 may produce additional resistance. Option 3 may provide a temporary solution to the resistance but will not address the concern specifically.

Test-Taking Strategy: Note the **strategic word**, *best*. Options 1 and 2 can be eliminated first because of the words *ignore* in option 1 and *coercion* in option 2. From the remaining options, select the correct option over option 3 because the correct option specifically addresses problem-solving measures.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 336.

7. Answer: 3

Rationale: The nurse must determine the most appropriate assignment based on the skills of the staff member and the needs of the client. In this case, the most appropriate assignment for the AP would be to care for the client who requires urine specimen collections. The AP is skilled in this procedure. Colostomy irrigations and tube feedings are not performed by APs because these are invasive procedures. The client with difficulty swallowing food and fluids is at risk for aspiration.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and note the **subject**, an assignment to the AP. Eliminate option 4 first because of the words *difficulty swallowing*. Next, eliminate options 1 and 2 because they are **comparable or alike** and are both invasive procedures; as such, an AP cannot perform these procedures.

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 264-265.

8. Answer: 2, 3, 4

Rationale: In this weather event, the appropriate nursing actions focus on protecting clients from flying debris or glass.

The nurse would close doors to each client's room and move beds away from windows, and close window shades and curtains to protect clients, visitors, and staff from shattering glass and flying debris. Blankets need to be placed over clients confined to bed. Ambulatory clients need to be moved into the hallways from their rooms, away from windows.

Test-Taking Strategy: Focus on the **subject**, protecting the client in the event of a tornado. Visualize each of the actions in the options to determine whether these actions would assist in protecting the client and preventing an accident or injury.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 387-388.

9. Answer: 4

Rationale: When delegating nursing assignments, the nurse needs to consider the skills and educational level of the nursing staff. Giving a bed bath, assisting with frequent ambulation, and taking vital signs can be assigned most appropriately to an AP. The licensed practical nurse is skilled in wound irrigations and dressing changes and most appropriately would be assigned to the client who needs this care.

Test-Taking Strategy: Focus on the **subject**, assignment to a licensed practical nurse, and note the **strategic words**, *most appropriately*. Recall that education and job position as described by the nurse practice act and employee guidelines need to be considered when delegating activities and making assignments. Options 1, 2, and 3 can be eliminated because they are noninvasive tasks that the AP can perform.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 267-268.

10. Answer: 1, 5

Rationale: There are guidelines that the nurse would use when delegating tasks. These include the following: ensure client safety; be aware of individual variations in work abilities; determine which tasks can be delegated and to whom; match the task to the delegatee on the basis of the nurse practice act and appropriate position descriptions; provide directions that are clear, concise, accurate, and complete; validate the delegatee's understanding of the directions; communicate a feeling of confidence to the delegatee and provide feedback promptly after the task is performed; and maintain continuity of care as much as possible when assigning client care. Staff requests, convenience (as in clustering of client rooms), and anticipated changes in unit census are not specific guidelines to use when delegating tasks, but may be considered when making assignments.

Test-Taking Strategy: Focus on the **subject**, guidelines to use when delegating and planning assignments. Read each option carefully and use **Maslow's Hierarchy of Needs theory**. Note that the correct options directly relate to the clients' needs and safety.

Reference: Zerwekh, J., & Zerwekh Garneau, A. (2021). *Nursing today: Transition and trends*. (9th ed.). St. Louis: Elsevier. pp. 264, 322-324.

UNIT III

Foundations of Care

Pyramid to Success

Pyramid Points focus on fluids and electrolytes, acid-base balance, vital signs, laboratory reference intervals, and nutrition. Mobility, elimination needs, and skin integrity are also a focus. Fluids and electrolytes and acid-base balance constitute a content area that is sometimes complex and difficult to understand. For a client who is experiencing these imbalances, it is important to remember that maintenance of a patent airway is a priority, and the nurse needs to monitor vital signs, physiological status, intake and output, laboratory reference intervals, and arterial blood gas values. Be certain to know the normal vital sign values and the baseline values for each client that you are caring for so that you are able to recognize cues that indicate a change in client status. Remember that pain is also a vital sign, and to assess each client for verbal and nonverbal signs of pain. It is also important to remember that normal laboratory reference levels may vary slightly, depending on the laboratory setting and equipment used in testing. If you are familiar with the normal reference intervals, you will be able to determine whether an abnormality exists when a laboratory value is presented in a question. The specific laboratory reference levels identified in the NCLEX® test plan that you need to know include arterial blood gases known as ABGs (pH, PO₂, PCO₂, SaO₂, HCO₃), blood urea nitrogen (BUN), cholesterol (total), glucose, hematocrit, hemoglobin, glycosylated hemoglobin (HgbA1C), platelets, potassium, sodium, white blood cell (WBC) count, creatinine, prothrombin time (PT), activated partial thromboplastin time (aPTT), and international normalized ratio (INR). The questions on the NCLEX-RN examination related to laboratory reference intervals will require that you analyze cues and think critically about the effects of the laboratory value in terms of the client. Note the disorder presented in the question and the associated body organ affected as a result of the disorder. This process will assist you in determining the correct answer.

Nutrition is a basic need that must be met for all clients. The NCLEX-RN examination addresses the dietary measures required for basic needs and for particular body system alterations. When presented with a question related to nutrition, consider the client's diagnosis and the particular requirement or restriction necessary for treatment of the disorder.

On the NCLEX-RN, safety and infection control concepts, including standard precautions and transmission-based precautions related to client care, are a priority focus. Medication or intravenous (IV) calculation questions are also a focus to ensure safe client care. Fill-in-the-blank questions may require that you calculate a medication dose or an IV flow rate. Use the on-screen calculator for these medications and IV problems, and then recheck the calculation before selecting an option or typing the answer.

Mobility needs, especially for the client with limitations, are a priority to ensure safety and the nurse needs to recognize cues that indicate the need for assistance or assistive devices. Elimination is a basic need and maintaining and promoting normal elimination patterns are a focus.

The skin provides a first line of defense against infection. Recognizing cues that place the client at risk for an alteration in skin integrity is an essential role of the nurse.

The Pyramid to Success also focuses on the assessment techniques for a health and physical assessment of the adult client and collecting both subjective and objective data. Perioperative nursing care and monitoring for postoperative complications is also a priority. Because many surgical procedures are performed through ambulatory care units (1-day-stay units), Pyramid Points also focus on preparing the client for discharge, assisting with teaching related to the prescribed treatments and medications, follow-up care, and the mobilization of home care support services.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

Acting as an advocate regarding the client's wishes
Applying principles of infection control

Collaborating with interprofessional teams
 Ensuring environmental, personal, and home safety
 Ensuring that the client's rights, including informed consent, are upheld
 Establishing priorities of care based on client needs
 Following advance directives regarding the client's documented requests
 Following guidelines regarding the use of safety devices
 Handling hazardous and infectious materials safely to prevent injury to health care personnel and others
 Identifying the client with at least two identifiers (e.g., name and identification number)
 Informing the client of the surgical process and ensuring that informed consent for a surgical procedure and other procedures has been obtained
 Knowing the emergency response plan and actions to take for exposure to biological and chemical warfare agents
 Maintaining confidentiality
 Maintaining continuity of care and initiating referrals to home care and other support services
 Maintaining asepsis and preventing infection in the client when samples for laboratory studies are obtained
 Maintaining precautions to prevent errors, accidents, and injury
 Positioning the client appropriately and safely
 Preventing a surgical infection
 Protecting the medicated client from injury
 Providing information to the client about community classes for nutrition education
 Providing safety for the client during implementation of treatments
 Recognizing cues that present a safety risk
 Upholding client rights
 Using equipment such as electronic IV infusion devices safely
 Using ergonomic principles and body mechanics when moving a client
 Using special equipment safely
 Using standard, transmission-based precautions and surgical asepsis procedures to prevent infection and the transmission of infection to self and others

Health Promotion and Maintenance

Assessing the client's ability to perform self-care
 Assisting clients and families to identify environmental hazards in the home
 Assessing home safety and generating solutions if modifications are necessary
 Discussing high-risk behaviors and lifestyle choices
 Evaluating the client's home environment for self-care modifications
 Identifying clients at risk for an acid–base imbalance
 Identifying community resources available for follow-up
 Implementing health screening and monitoring for the potential risk for a fluid and electrolyte imbalance

Performing physical assessment techniques
 Providing education related to medication and diet management
 Providing education related to the potential risk for a fluid and electrolyte imbalance, measures to prevent an imbalance, signs and symptoms of an imbalance, and actions to take if signs and symptoms develop
 Respecting lifestyle choices and health care beliefs and preferences
 Teaching clients and families about accident prevention
 Teaching clients and families about measures to be implemented in an emergency or disaster
 Teaching clients and families about preventing the spread of infection and preventing diseases
 Teaching the client and family about prevention, early detection, and treatment measures for health disorders
 Teaching the client to monitor for signs and symptoms that indicate the need to notify the primary health care provider

Psychosocial Integrity

Assessing the client's emotional response to treatment
 Considering cultural, religious, and spiritual preferences related to nutritional patterns and lifestyle choices and other factors influencing health
 Promoting an environment that will allow the client to express concerns
 Providing emotional support to the client during testing
 Providing reassurance to the client who is experiencing a fluid or electrolyte imbalance
 Providing support and continuously informing the client of the purposes for prescribed interventions

Physiological Integrity

Assessing for expected and unexpected responses to therapeutic interventions and documenting findings
 Assessing the mobility level of the client
 Assisting the client with activities of daily living
 Assisting with obtaining an ABG specimen and analyzing the results
 Calculating medication doses and IV flow rates
 Evaluating outcomes of care
 Handling medical or surgical emergencies
 Managing and providing care to clients with infectious diseases
 Managing and providing care to clients with alterations in elimination patterns
 Monitoring laboratory reference intervals; analyzing cues and determining the significance of an abnormal laboratory value and the need to implement specific actions based on the laboratory results
 Monitoring nutritional intake and oral hydration
 Monitoring for surgical complications
 Monitoring for wound infection
 Preparing and administering medications, using the rights of medication administration

Preventing accidents and ensuring safety of the client when a fluid or electrolyte imbalance exists, particularly when changes in cardiovascular, respiratory, gastrointestinal, neuromuscular, renal, or central nervous systems occur, or when the client is at risk for complications such as seizures, respiratory depression, or dysrhythmias

Preventing alterations in skin integrity and complications of immobility

Providing comfort and assistance to the client

Providing nutrition and oral intake

Providing interventions compatible with the client's age; cultural, religious, spiritual, and health care beliefs; education level; and language

Providing personal hygiene as needed

Providing site care following arterial blood draw

Recognizing cues that indicate changes in the client's condition that indicate a potential complication and taking action appropriately

Recognizing cues that indicate a client is at risk for a fluid or electrolyte imbalance

Reducing the likelihood that an acid–base imbalance will occur

Taking action in an emergency or disaster

Taking action when surgical complications arise

Using assistive devices to prevent injury

CHAPTER 8

Fluids and Electrolytes

Linda A. Silvestri, PhD, RN, FAAN

Angela E. Silvestri PhD, APRN, FNP-BC, CNE

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS: Cellular Regulation; Fluid and Electrolytes

I. Concepts of Fluid and Electrolyte Balance

A. Electrolytes

1. Description: An electrolyte is a substance that, on dissolving in solution, ionizes; that is, some of its molecules split or dissociate into electrically charged atoms or ions (Box 8.1).
2. Measurement
 - a. The metric system is used to measure volumes of fluids—liters (L) or milliliters (mL).
 - b. The unit of measure that expresses the combining activity of an electrolyte is the milliequivalent (mEq).
 - c. One milliequivalent (1 mEq) of any cation always reacts chemically with 1 mEq of an anion.
 - d. Milliequivalents provide information about the number of anions or cations available to combine with other anions or cations.

B. Body Fluid Compartments (Fig. 8.1)

1. Description
 - a. Fluid in each of the body compartments contains electrolytes.
 - b. Each compartment has a particular composition of electrolytes, which differs from that of other compartments.
 - c. To function normally, body cells must have fluids and electrolytes in the right compartments and in the right amounts.
 - d. Whenever an electrolyte moves out of a cell, another electrolyte moves in to take its place.
 - e. The numbers of cations and anions must be the same for homeostasis to exist.
 - f. Compartments are separated by semipermeable membranes.

2. Intravascular compartment: Refers to fluid inside a blood vessel
3. Intracellular compartment
 - a. The intracellular compartment refers to all fluid inside the cells.
 - b. Most bodily fluids are inside the cells.
4. Extracellular compartment
 - a. Refers to fluid outside the cells
 - b. The extracellular compartment includes the interstitial fluid, which is fluid between cells (sometimes called the *third space*), blood, lymph, bone, connective tissue, water, and transcellular fluid.

C. Third-spacing

1. Third-spacing is the accumulation and sequestration of trapped extracellular fluid in an actual or potential body space as a result of disease or injury.
2. The trapped fluid represents a volume loss and is unavailable for normal physiological processes.
3. Fluid may be trapped in body spaces such as the pericardial, pleural, peritoneal, or joint cavities; the bowel; the abdomen; or within soft tissues after trauma or burns.
4. Assessing the intravascular fluid loss caused by third-spacing is difficult. The loss may not be reflected in weight changes or intake and output records and may not become apparent until after organ malfunction occurs.

D. Edema

1. Edema is an excess accumulation of fluid in the interstitial space; it occurs as a result of alterations in oncotic pressure, hydrostatic pressure, capillary permeability, and lymphatic obstruction (see F. Body fluid transport, for descriptions).

BOX 8.1 Properties of Electrolytes and Their Components**Atom**

An atom is the smallest part of an element that still has the properties of the element.

The atom is composed of particles known as the *proton* (positive charge), *neutron* (neutral), and *electron* (negative charge).

Protons and neutrons are in the nucleus of the atom; therefore, the nucleus is positively charged.

Electrons carry a negative charge and revolve around the nucleus.

As long as the number of electrons is the same as the number of protons, the atom has no net charge; that is, it is neither positive nor negative.

Atoms that gain, lose, or share electrons are no longer neutral.

Molecule

A molecule is two or more atoms that combine to form a substance.

Ion

An ion is an atom that carries an electrical charge because it has gained or lost electrons.

Some ions carry a negative electrical charge, and some carry a positive charge.

Cation

A cation is an ion that has given away or lost electrons and therefore carries a positive charge.

The result is fewer electrons than protons, and the result is a positive charge.

Anion

An anion is an ion that has gained electrons and therefore carries a negative charge.

When an atom has gained or taken on electrons, it assumes a negative charge and the result is a negatively charged ion.

FIG. 8.1 Distribution of fluid by compartments in the average adult.

2. Localized edema occurs as a result of traumatic injury from accidents or surgery, local inflammatory processes, or burns.
3. Generalized edema, also called *anasarca*, is an excessive accumulation of fluid in the interstitial space throughout the body and occurs as a result of cardiac or renal conditions, or liver failure.

E. Body fluid**1. Description**

- a. Body fluids transport **nutrients** to the cells and carry waste products from the cells.
- b. Total body fluid (intracellular and extracellular) amounts to about 60% of body weight in the adult, 55% in the older adult, and 80% in the infant.
- c. Thus infants and older adults are at a higher risk for fluid-related problems than younger adults; children have a greater proportion of body water than adults, and the older adult has the least proportion of body water.

2. Constituents of body fluids

- a. Body fluids consist of water and dissolved substances.
- b. The largest single fluid constituent of the body is water.
- c. Some substances, such as glucose, urea, and creatinine, do not dissociate in solution; that is, they do not separate from their complex forms into simpler substances when they are in solution.
- d. Other substances do dissociate; for example, when sodium chloride is in a solution, it dissociates, or separates, into two parts or elements.

Infants and older adults need to be monitored closely for fluid imbalances.

F. Body fluid transport**1. Diffusion**

- a. Diffusion is the process whereby a solute (substance that is dissolved) may spread through a solution or solvent (solution in which the solute is dissolved).
- b. Diffusion of a solute spreads the molecules from an area of higher concentration to an area of lower concentration.
- c. A permeable membrane allows substances to pass through it without restriction.
- d. A selectively permeable membrane allows some solutes to pass through without restriction but prevents other solutes from passing freely.
- e. Diffusion occurs within fluid compartments and from one compartment to another if the barrier between the compartments is permeable to the diffusing substances.

2. Osmosis
 - a. Osmosis is the movement of solvent molecules across a membrane in response to a concentration gradient, usually from a solution of lower to one of higher solute concentration.
 - b. Osmotic pressure is the force that draws the solvent from a less concentrated solute through a selectively permeable membrane into a more concentrated solute, thus tending to equalize the concentration of the solvent.
 - c. If a membrane is permeable to water but not to all solutes present, the membrane is a selective or semipermeable membrane.
 - d. When a more concentrated solution is on one side of a selectively permeable membrane and a less concentrated solution is on the other side, a pull called *osmotic pressure* draws the water through the membrane to the more concentrated side, or the side with more solute.
 3. Filtration
 - a. Filtration is the movement of solutes and solvents by hydrostatic pressure.
 - b. The movement is from an area of higher pressure to an area of lower pressure.
 4. Hydrostatic pressure
 - a. Hydrostatic pressure is the force exerted by the weight of a solution.
 - b. When a difference exists in the hydrostatic pressure on two sides of a membrane, water and diffusible solutes move out of the solution that has the higher hydrostatic pressure by the process of *filtration*.
 - c. At the arterial end of the capillary, the hydrostatic pressure is higher than the osmotic pressure; therefore, fluids and diffusible solutes move out of the capillary.
 - d. At the venous end, the osmotic pressure, or pull, is higher than the hydrostatic pressure, and fluids and some solutes move into the capillary.
 - e. The excess fluid and solutes remaining in the interstitial spaces are returned to the intravascular compartment by the lymph channels.
 5. Osmolality
 - a. Osmolality refers to the number of osmotically active particles per kilogram of water; it is the concentration of a solution.
 - b. In the body, osmotic pressure is measured in milliosmoles (mOsm).
 - c. The normal osmolality of **plasma** is 275 to 295 mOsm/kg (275 to 295 mmol/kg).
- G. Movement of body fluid
1. Description
 - a. Cell membranes and capillary walls separate body compartments.
 - b. Cell membranes are selectively permeable; that is, the cell membrane and the capillary wall allow water and some solutes free passage through them.
 - c. Several forces affect the movement of water and solutes through the walls of cells and capillaries; for example, the greater the number of particles within the cell, the more pressure exists to force the water through the cell membrane out of the cell.
 - d. If the body loses more electrolytes than fluids, as can happen in diarrhea, then the extracellular fluid contains fewer electrolytes or less solute than the intracellular fluid.
 - e. Fluids and electrolytes must be kept in balance for health; when they remain out of balance, death can occur.
 2. Isotonic solutions
 - a. When the solutions on both sides of a selectively permeable membrane have established equilibrium or are equal in concentration, they are isotonic.
 - b. Isotonic solutions are isotonic to human cells; thus, very little osmosis occurs. Isotonic solutions have the same osmolality as body fluids.
 - c. Refer to Chapter 70, Table 70.1, for a list of solutions, types, and uses.
 3. Hypotonic solutions
 - a. When a solution contains a lower concentration of salt or solute than another, more concentrated solution, it is considered hypotonic.
 - b. A hypotonic solution has less salt or more water than an isotonic solution; these solutions have lower osmolality than body fluids.
 - c. Hypotonic solutions are hypotonic to the cells; therefore, osmosis would continue in an attempt to bring about balance or equality.
 - d. Refer to Chapter 70, Table 70.1, for a list of solutions, types, and uses.
 4. Hypertonic solutions
 - a. A solution that has a higher concentration of solutes than another, less concentrated solution is hypertonic; these solutions have a higher osmolality than body fluids.
 - b. Refer to Chapter 70, Table 70.1, for a list of solutions, types, and uses.
 5. Osmotic pressure
 - a. The amount of osmotic pressure is determined by the concentration of solutes in solution.
 - b. When the solutions on each side of a selectively permeable membrane are equal in concentration, they are isotonic.
 - c. A hypotonic solution has less solute than an isotonic solution, whereas a hypertonic solution contains more solute.

Fluid intake		Fluid output	
Ingested water	1200-1500 mL	Kidneys	1500 mL
Ingested food	800-1100 mL	Insensible loss through skin	600-800 mL
Metabolic oxidation	300 mL	Insensible loss through lungs	400-600 mL
		Gastrointestinal tract	100 mL
TOTAL	2300-2900 mL	TOTAL	2600-3000 mL

FIG. 8.2 Sources of fluid intake and fluid output (approximates).

6. Active transport

- If an ion is to move through a membrane from an area of lower concentration to an area of higher concentration, an active transport system is necessary.
- An active transport system moves molecules or ions against concentration and osmotic pressure.
- Metabolic processes in the cell supply the energy for active transport.
- Substances that are transported actively through the cell membrane include ions of **sodium, potassium, calcium**, iron, and hydrogen; some of the sugars; and the amino acids.

H. Body fluid intake and output (Fig. 8.2)

- Body fluid intake
 - Water enters the body through three sources—orally ingested liquids, water in foods, and water formed by oxidation of foods.
 - About 10 mL of water is released by the **metabolism** of each 100 calories of fat, carbohydrates, or proteins.
- Body fluid output
 - The kidneys play a major role in regulating fluid and electrolyte balance and excrete the largest quantity of fluid.
 - Normal kidneys can adjust the amount of water and electrolytes leaving the body.
 - The quantity of fluid excreted by the kidneys is determined by the amount of water ingested and the amount of waste and solutes excreted.
 - Water lost through the skin is called *insensible loss* (the individual is unaware of losing that water).
 - The amount of water lost by perspiration varies according to the temperature of the environment and of the body.
 - Water lost from the lungs is called *insensible loss* and is lost through expired air that is saturated with water vapor.

- The amount of water lost from the lungs varies with the rate and the depth of respiration.
- Large quantities of water are secreted into the gastrointestinal tract, but almost all of this fluid is reabsorbed.
- A large volume of electrolyte-containing liquids moves into the gastrointestinal tract and then returns again to the extracellular fluid.
- Severe diarrhea results in the loss of large quantities of fluids and electrolytes.
- As long as all organs are functioning normally, the body is able to maintain balance in its fluid content.

▲ The client with diarrhea is at high risk for a fluid and electrolyte imbalance.

II. Maintaining Fluid and Electrolyte Balance

A. Description

- Homeostasis is a term that indicates the relative stability of the internal environment.
- Concentration and composition of body fluids must be nearly constant.
- When one of the substances in a client is deficient—either fluids or electrolytes—the substance must be replaced normally by the intake of food and water or by therapy such as intravenous (IV) solutions and medications.
- When the client has an excess of fluid or electrolytes, therapy is directed toward assisting the body to eliminate the excess.

- The kidneys play a major role in controlling balance in fluid and electrolytes.
- The adrenal glands, through the secretion of aldosterone, also aid in controlling extracellular fluid volume by regulating the amount of sodium reabsorbed by the kidneys.
- Antidiuretic hormone from the pituitary gland regulates the osmotic pressure of extracellular fluid by regulating the amount of water reabsorbed by the kidneys.

▲ If the client has a fluid or an electrolyte imbalance, the nurse must closely monitor the client's cardiovascular, respiratory, neurological, musculoskeletal, renal, integumentary, and gastrointestinal status.

III. Fluid Volume Deficit

A. Description

- Dehydration occurs when the fluid intake of the body is insufficient to meet the fluid needs of the body.
- The goal of treatment is to restore fluid volume, replace electrolytes as needed, and eliminate the cause of the fluid volume deficit.

B. Types of fluid volume deficits

1. Isotonic dehydration
 - a. Water and dissolved electrolytes are lost in equal proportions.
 - b. Known as *hypovolemia*, isotonic dehydration is the most common type of dehydration.
 - c. Isotonic dehydration results in decreased circulating blood volume and inadequate tissue perfusion.
2. Hypertonic dehydration
 - a. Water loss exceeds electrolyte loss.
 - b. The clinical problems that occur result from alterations in the concentrations of specific plasma electrolytes.
 - c. Fluid moves from the intracellular compartment into the plasma and interstitial fluid spaces, causing cellular dehydration and shrinkage.
3. Hypotonic dehydration
 - a. Electrolyte loss exceeds water loss.
 - b. The clinical problems that occur result from fluid shifts between compartments, causing a decrease in plasma volume.
 - c. Fluid moves from the plasma and interstitial fluid spaces into the cells, causing a plasma volume deficit and causing the cells to swell.

C. Causes of fluid volume deficits

1. Isotonic dehydration
 - a. Inadequate intake of fluids and solutes
 - b. Fluid shifts between compartments
 - c. Excessive losses of isotonic body fluids
2. Hypertonic dehydration—conditions that increase fluid loss, such as excessive perspiration, hyperventilation, ketoacidosis, prolonged fevers, diarrhea, early-stage kidney disease, and diabetes insipidus
3. Hypotonic dehydration
 - a. Chronic illness
 - b. Excessive fluid replacement (hypotonic)
 - c. Kidney disease
 - d. Chronic **malnutrition**

D. Assessment (Table 8.1)

E. Interventions

1. Prevent further fluid losses and increase fluid compartment volumes to normal ranges.
2. Provide oral rehydration therapy if possible and IV fluid replacement if the dehydration is severe; monitor intake and output.
3. In general, isotonic dehydration is treated with isotonic fluid solutions, hypertonic dehydration with hypotonic fluid solutions, and hypotonic dehydration with hypertonic fluid solutions.
4. Administer medications, such as antidiarrheal, antimicrobial, antiemetic, and antipyretic medications, as prescribed to correct the cause and treat any symptoms.

5. Monitor electrolyte values and prepare to administer medication to treat an imbalance, if present.

IV. Fluid Volume Excess

A. Description

1. Fluid intake or fluid retention exceeds the fluid needs of the body.
2. Fluid volume excess is also called *overhydration* or *fluid overload*.
3. The goal of treatment is to restore fluid balance, correct electrolyte imbalances if present, and eliminate or control the underlying cause of the overload.

B. Types

1. Isotonic overhydration
 - a. Known as *hypervolemia*, isotonic overhydration results from excessive fluid in the extracellular fluid compartment.
 - b. Only the extracellular fluid compartment is expanded, and fluid does not shift between the extracellular and intracellular compartments.
 - c. Isotonic overhydration causes **circulatory overload** and interstitial edema; when severe or when it occurs in a client with poor cardiac function, heart failure and pulmonary edema can result.
2. Hypertonic overhydration
 - a. The occurrence of hypertonic overhydration is rare and is caused by an excessive sodium intake.
 - b. Fluid is drawn from the intracellular fluid compartment; the extracellular fluid volume expands, and the intracellular fluid volume contracts.
3. Hypotonic overhydration
 - a. Hypotonic overhydration is known as *water intoxication*.
 - b. The excessive fluid moves into the intracellular space, and all body fluid compartments expand.
 - c. Electrolyte imbalances occur as a result of dilution.

C. Causes

1. Isotonic overhydration
 - a. Inadequately controlled IV therapy
 - b. Kidney disease
 - c. Long-term corticosteroid therapy
2. Hypertonic overhydration
 - a. Excessive sodium ingestion
 - b. Rapid infusion of hypertonic saline
 - c. Excessive sodium bicarbonate therapy
3. Hypotonic overhydration
 - a. Early kidney disease
 - b. Heart failure

TABLE 8.1 Assessment Findings: Fluid Volume Deficit and Fluid Volume Excess

Fluid Volume Deficit	Fluid Volume Excess
Cardiovascular	
- Thready, increased pulse rate; diminished peripheral pulses	- Bounding, increased pulse
- Decreased blood pressure and orthostatic (postural) hypotension	- Elevated blood pressure
- Flat neck and hand veins in dependent positions	- Distended neck and hand veins
- Decreased central venous pressure	- Elevated central venous pressure
- Dysrhythmias	- Dysrhythmias
Respiratory	
- Increased rate and depth of respirations	- Increased respiratory rate (shallow respirations)
- Dyspnea	- Dyspnea
	- Moist crackles on auscultation
Neuromuscular	
- Decreased central nervous system activity, from lethargy to coma	- Altered level of consciousness
- Skeletal muscle weakness	- Skeletal muscle weakness
- Fever, depending on the amount of fluid loss	- Headache, visual disturbances
	- Paresthesias
Renal	
- Decreased urine output	- Increased urine output if kidneys can compensate; decreased urine output if kidney damage is the cause
Integumentary	
- Dry skin	- Pale, cool skin
- Poor turgor, tenting	- Pitting edema in dependent areas
- Dry mouth	
Gastrointestinal	
- Decreased motility and diminished bowel sounds	- Increased motility in the gastrointestinal tract
- Constipation	- Diarrhea
- Decreased body weight	- Increased body weight
- Thirst	- Liver enlargement
	- Ascites
Laboratory Findings	
- Increased serum osmolality	- Decreased serum osmolality
- Increased hematocrit	- Decreased hematocrit
- Increased blood urea nitrogen (BUN) level	- Decreased BUN level
- Increased serum sodium level	- Decreased serum sodium level
- Increased urinary specific gravity	- Decreased urine specific gravity

- c. Syndrome of inappropriate antidiuretic hormone secretion
- d. Inadequately controlled IV therapy
- e. Replacement of isotonic fluid loss with hypotonic fluids
- f. Irrigation of wounds and body cavities with hypotonic fluids

 D. Assessment (Table 8.1)

 A client with acute kidney injury, chronic kidney disease, and heart failure is at high risk for fluid volume excess.

E. Interventions

1. Prevent further fluid overload and restore normal fluid balance.
2. Administer diuretics; osmotic diuretics may be prescribed initially to prevent severe electrolyte imbalances. 
3. Restrict fluid and sodium intake as prescribed.
4. Monitor intake and output; monitor weight.
5. Monitor electrolyte values and prepare to administer medication to treat an imbalance if present. 

V. Hypokalemia

 The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L).

A. Description

1. Hypokalemia is a **serum potassium** level lower than 3.5 mEq/L (3.5 mmol/L).
2. Potassium deficit is potentially life-threatening because every body system is affected.

B. Causes

1. Actual total body potassium loss
 - a. Excessive use of medications such as diuretics, corticosteroids, or inhaled albuterol
 - b. Increased secretion of aldosterone, such as in Cushing's syndrome
 - c. Vomiting, diarrhea
 - d. Wound drainage, particularly gastrointestinal
 - e. Prolonged nasogastric suction
 - f. Excessive diaphoresis
 - g. Kidney disease impairing reabsorption of potassium
2. Inadequate potassium intake: Fasting; nothing by mouth status
3. Movement of potassium from the extracellular fluid to the intracellular fluid
 - a. Alkalosis
 - b. Hyperinsulinism
4. Dilution of serum potassium
 - a. Water intoxication
 - b. IV therapy with potassium-deficient solutions

C. Assessment (Tables 8.2 and 8.3)

D. Interventions

1. Monitor electrolyte values.
2. Administer potassium supplements orally or intravenously, as prescribed.
3. Oral potassium supplements
 - a. Oral potassium supplements may cause nausea and vomiting and should not be taken on an empty stomach; if the client complains of abdominal pain, distention, nausea, vomiting, diarrhea, or gastrointestinal bleeding, the supplement may need to be discontinued.
 - b. Liquid potassium chloride has an unpleasant taste and should be taken with juice or another liquid.
4. Intravenously administered potassium (Box 8.2)
5. Institute safety measures for the client experiencing muscle weakness.
6. If the client is taking a potassium-losing diuretic, it may be discontinued; a potassium-sparing (retaining) diuretic may be prescribed.
7. Instruct the client about foods that are high in potassium content (see Box 11.2).

TABLE 8.2 Assessment Findings: Hypokalemia and Hyperkalemia

Hypokalemia	Hyperkalemia
Cardiovascular	
<ul style="list-style-type: none"> - Thready, weak, irregular pulse; weak peripheral pulses - Orthostatic hypotension - Dysrhythmias 	<ul style="list-style-type: none"> - Slow, weak, irregular heart rate - Decreased blood pressure - Dysrhythmias
Respiratory	
<ul style="list-style-type: none"> - Shallow, ineffective respirations that result from profound weakness of the skeletal muscles of respiration - Diminished breath sounds 	<ul style="list-style-type: none"> - Profound weakness of the skeletal muscles leading to respiratory failure
Neuromuscular	
<ul style="list-style-type: none"> - Anxiety, lethargy, confusion, coma - Skeletal muscle weakness, leg cramps - Deep tendon hyporeflexia - Loss of tactile discrimination - Paresthesias 	<ul style="list-style-type: none"> - <i>Early:</i> Muscle twitches, cramps, paresthesias (tingling and burning followed by numbness in the hands and feet and around the mouth) - <i>Late:</i> Profound weakness, ascending flaccid paralysis in the arms and legs (trunk, head, and respiratory muscles become affected when the serum potassium level reaches a lethal level)
Gastrointestinal	
<ul style="list-style-type: none"> - Decreased motility, hypoactive to absent bowel sounds; paralytic ileus - Nausea, vomiting, constipation, abdominal distention 	<ul style="list-style-type: none"> - Increased motility, hyperactive bowel sounds - Diarrhea
Laboratory Findings	
<ul style="list-style-type: none"> - Serum potassium level lower than 3.5 mEq/L (3.5 mmol/L) - Electrocardiogram changes: ST depression; shallow, flat, or inverted T waves; and prominent U waves 	<ul style="list-style-type: none"> - Serum potassium level that exceeds 5.0 mEq/L (5.0 mmol/L) - Electrocardiographic changes: Tall peaked T waves, flat P waves, widened QRS complexes, and prolonged PR intervals

 Potassium replacement is safest infused through a central line due to the high incidence of IV infiltration. Potassium is never administered by IV push, intramuscular, or subcutaneous routes. IV potassium is always diluted and administered using an infusion device!

VI. Hyperkalemia

A. Description

1. Hyperkalemia is a serum potassium level that exceeds 5.0 mEq/L (5.0 mmol/L).
2. Pseudohyperkalemia: a condition that can occur due to methods of blood specimen collection and cell lysis; if an increased serum value is obtained in the absence of clinical symptoms, the specimen should be redrawn and evaluated.

TABLE 8.3 Electrocardiographic Changes in Electrolyte Imbalances

Electrolyte Imbalance	Electrocardiographic Changes
Hypokalemia	ST depression
	Shallow, flat, or inverted T wave
	Prominent U wave
Hyperkalemia	Tall peaked T waves
	Flat P waves
	Widened QRS complexes
	Prolonged PR interval
Hypocalcemia	Prolonged ST segment
	Prolonged QT interval
Hypercalcemia	Shortened ST segment
	Widened T wave
	Heart block
Hypomagnesemia	Tall T waves
	Depressed ST segment
Hypermagnesemia	Prolonged PR interval
	Widened QRS complexes

BOX 8.2 Precautions With Intravenously Administered Potassium

- Potassium is never given by intravenous (IV) push or by the intramuscular or subcutaneous route.
- A dilution of no more than 1 mEq/10 mL (1 mmol/10 mL) of solution is recommended.
- Many health care agencies supply prepared IV solutions containing potassium; before administering and frequently during infusion of the IV solution, rotate and invert the bag to ensure that the potassium is distributed evenly throughout the IV solution.
- Ensure that the IV bag containing potassium is properly labeled.
- The maximum recommended infusion rate is 5 to 10 mEq/hr (5 to 10 mmol/hr), never to exceed 20 mEq/hr (20 mmol/hr) under any circumstances.
- A client receiving more than 10 mEq/hr (10 mmol/hr) should be placed on a cardiac monitor and monitored for cardiac changes, and the infusion should be controlled by an infusion device.
- Potassium infusion can cause phlebitis; therefore, the nurse should assess the IV site frequently for signs of phlebitis or infiltration. If either occurs, the infusion should be stopped immediately.
- The nurse should assess renal function before administering potassium and monitor intake and output during administration.

B. Causes

1. Excessive potassium intake
 - a. Overingestion of potassium-containing foods or medications, such as potassium chloride or salt substitutes

- b. Rapid infusion of potassium-containing IV solutions
2. Decreased potassium excretion
 - a. Potassium-sparing (retaining) diuretics
 - b. Kidney disease
 - c. Adrenal insufficiency, such as in Addison's disease
3. Movement of potassium from the intracellular fluid to the extracellular fluid
 - a. Tissue damage
 - b. Acidosis
 - c. Hyperuricemia
 - d. Hypercatabolism
- C. Assessment (see Tables 8.2 and 8.3 and Clinical Judgment: Analyze Cues Box)

 **Monitor the client closely for signs of a potassium imbalance. A potassium imbalance can cause cardiac dysrhythmias that can be life-threatening, leading to cardiac arrest!**

D. Interventions

1. Discontinue IV potassium (keep the IV catheter patent) and withhold oral potassium supplements.
2. Initiate a potassium-restricted diet.
3. Prepare to administer potassium-excreting diuretics if renal function is not impaired.
4. If renal function is impaired, prepare to administer sodium polystyrene sulfonate (oral or rectal route) as prescribed, a cation-exchange resin that promotes gastrointestinal sodium absorption and potassium excretion.
5. Prepare the client for dialysis if potassium levels are critically high.
6. Prepare for the administration of IV calcium if hyperkalemia is severe, to avert myocardial excitability.
7. Prepare for the IV administration of hypertonic glucose with regular insulin to move excess potassium into the cells.
8. When blood transfusions are prescribed for a client with a potassium imbalance, the client should receive fresh blood, if possible; transfusions of stored blood may elevate the potassium level because the breakdown of older blood cells releases potassium.
9. Teach the client to avoid foods high in potassium (see Box 11.2).
10. Instruct the client to avoid the use of salt substitutes or other potassium-containing substances.
11. Monitor the serum potassium level closely when a client is receiving a potassium-sparing (retaining) diuretic.

⚡ CLINICAL JUDGMENT: ANALYZE CUES

A client with gastroenteritis has been vomiting and having diarrhea for the past 3 days. On admission to the hospital, the client complains of weakness and some leg and abdominal cramping. The client's respirations are shallow and the pulse is thready. The client's cardiac rhythm on the monitor screen shows an additional prominent wave following each T wave, indicating the presence of U waves. The nurse considers the client's health problem, the effects and implications of losing fluid through vomiting and diarrhea for 3 days, analyzes the client cues, and interprets these cues as indicating an electrolyte imbalance, specifically *hypokalemia*.

VII. Hyponatremia

⚠ The normal sodium level is 135 to 145 mEq/L (135 to 145 mmol/L).

A. Description

1. Hyponatremia is a **serum sodium** level lower than 135 mEq/L (135 mmol/L).
2. Sodium imbalances usually are associated with fluid volume imbalances.

B. Causes

1. Increased sodium excretion
 - a. Excessive diaphoresis
 - b. Diuretics
 - c. Vomiting
 - d. Diarrhea
 - e. Wound drainage, especially gastrointestinal
 - f. Kidney disease
 - g. Decreased secretion of aldosterone
2. Inadequate sodium intake
 - a. Fasting; nothing by mouth status
 - b. Low-salt diet
3. Dilution of serum sodium
 - a. Excessive ingestion of hypotonic fluids or irrigation with hypotonic fluids
 - b. Kidney disease
 - c. Freshwater drowning
 - d. Syndrome of inappropriate antidiuretic hormone secretion
 - e. Hyperglycemia
 - f. Heart failure

C. Assessment (Table 8.4)

D. Interventions

1. If hyponatremia is accompanied by a fluid volume deficit (hypovolemia), IV sodium chloride infusions are administered to restore sodium content and fluid volume.

2. If hyponatremia is accompanied by fluid volume excess (hypervolemia), osmotic diuretics may be prescribed to promote the excretion of water rather than sodium.
3. Prescribed treatment will depend on whether the hyponatremia is considered chronic or if it has occurred acutely. If severe hyponatremia is present, hospitalization may be required to closely monitor sodium levels, avoid rapid serum sodium shifts, and monitor the neurological status closely. The client is at risk for osmotic demyelination injury if hyponatremia is corrected too quickly.
4. If hyponatremia is caused by inappropriate or excessive secretion of antidiuretic hormone, medications that antagonize antidiuretic hormone may be administered.
5. Instruct the client to increase oral sodium intake as prescribed, and inform the client about the foods to include in the diet (see Box 11.2).
6. If the client is taking lithium, monitor the lithium level, because hyponatremia can cause diminished lithium excretion, resulting in toxicity.

⚠ Hyponatremia precipitates lithium toxicity in a client taking this medication.

VIII. Hypernatremia

A. Description: Hypernatremia is a serum sodium level that exceeds 145 mEq/L (145 mmol/L).

B. Causes

1. Decreased sodium excretion
 - a. Corticosteroids
 - b. Cushing's syndrome
 - c. Kidney disease
 - d. Hyperaldosteronism
2. Increased sodium intake: Excessive oral sodium ingestion or excessive administration of sodium-containing IV fluids
3. Decreased water intake: Fasting; nothing-by-mouth status
4. Increased water loss: Increased rate of metabolism, fever, hyperventilation, infection, excessive diaphoresis, watery diarrhea, diabetes insipidus

C. Assessment (Table 8.4)

D. Interventions

1. If the cause is fluid loss, prepare to administer IV infusions.
2. If the cause is inadequate renal excretion of sodium, prepare to administer diuretics that promote sodium loss.
3. Restrict sodium and fluid intake as prescribed.
4. In some situations, IV fluid of D₅W will be prescribed to lower the sodium level. If the client has diabetes, monitor glucose closely as this may result in hyperglycemia.

TABLE 8.4 Assessment Findings: Hyponatremia and Hypernatremia

Hyponatremia	Hypernatremia
Cardiovascular	
<ul style="list-style-type: none"> Symptoms vary with changes in vascular volume <i>Normovolemic</i>: Rapid pulse rate, normal blood pressure <i>Hypovolemic</i>: Thready, weak, rapid pulse rate; hypotension; \square at neck veins; normal or low central venous pressure <i>Hypervolemic</i>: Rapid, bounding pulse; blood pressure normal or elevated; normal or elevated central venous pressure 	<ul style="list-style-type: none"> Heart rate and blood pressure respond to vascular volume status
Respiratory	
<ul style="list-style-type: none"> Shallow, ineffective respiratory movement is a late manifestation related to skeletal muscle weakness 	<ul style="list-style-type: none"> Pulmonary edema if hypervolemia is present
Neuromuscular	
<ul style="list-style-type: none"> Generalized skeletal muscle weakness that is worse in the extremities Diminished deep tendon reflexes 	<ul style="list-style-type: none"> <i>Early</i>: Spontaneous muscle twitches; irregular muscle contractions <i>Late</i>: Skeletal muscle weakness; deep tendon reflexes diminished or absent
Central Nervous System	
<ul style="list-style-type: none"> Headache Personality changes Confusion Seizures Coma 	<ul style="list-style-type: none"> Altered cerebral function is the most common manifestation of hypernatremia <i>Normovolemia or hypovolemia</i>: Agitation, confusion, seizures <i>Hypervolemia</i>: Lethargy, stupor, coma
Gastrointestinal	
<ul style="list-style-type: none"> Nausea Increased motility and hyperactive bowel sounds Abdominal cramping and diarrhea 	<ul style="list-style-type: none"> Extreme thirst
Renal	
<ul style="list-style-type: none"> Increased urinary output 	<ul style="list-style-type: none"> Decreased urinary output
Integumentary	
<ul style="list-style-type: none"> Dry mucous membranes 	<ul style="list-style-type: none"> Dry and sticky tongue and mucous membranes Dry and flushed skin Presence or absence of edema, depending on fluid volume changes
Laboratory Findings	
<ul style="list-style-type: none"> Serum sodium level less than 135 mEq/L (135 mmol/L) Decreased urinary specific gravity 	<ul style="list-style-type: none"> Serum sodium level that exceeds 145 mEq/L (145 mmol/L) Increased urinary specific gravity

IX. Hypocalcemia

 The normal calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L).

A. Description: Hypocalcemia is a serum calcium level lower than 9.0 mg/dL (2.25 mmol/L).

B. Causes

1. Inhibition of calcium absorption from the gastrointestinal tract
 - a. Inadequate oral intake of calcium
 - b. Lactose intolerance
 - c. Malabsorption syndromes such as celiac sprue or Crohn's disease

- d. Inadequate intake of vitamin D
- e. End-stage kidney disease
2. Increased calcium excretion
 - a. Kidney disease, polyuric phase
 - b. Diarrhea
 - c. Steatorrhea
 - d. Wound drainage, especially gastrointestinal
3. Conditions that decrease the ionized fraction of calcium
 - a. Hyperproteinemia
 - b. Alkalosis
 - c. Medications such as calcium chelators or binders
 - d. Acute pancreatitis

TABLE 8.5 Assessment Findings: Hypocalcemia and Hypercalcemia

Hypocalcemia	Hypercalcemia
Cardiovascular	
<ul style="list-style-type: none"> Decreased heart rate Hypotension Diminished peripheral pulses 	<ul style="list-style-type: none"> Increased heart rate in the early phase; bradycardia that can lead to cardiac arrest in late phases Increased blood pressure Bounding, full peripheral pulses
Respiratory	
<ul style="list-style-type: none"> Not directly affected; however, respiratory failure or arrest can result from decreased respiratory movement because of muscle tetany or seizures 	<ul style="list-style-type: none"> Ineffective respiratory movement as a result of profound skeletal muscle weakness
Neuromuscular	
<ul style="list-style-type: none"> Anxiety, irritability Irritable skeletal muscles: Twitches, cramps, tetany, seizures Hyperactive deep tendon reflexes Paresthesias followed by numbness that may affect the lips, nose, and ears in addition to the limbs Positive Trousseau's and Chvostek's signs 	<ul style="list-style-type: none"> Disorientation, lethargy, coma Profound muscle weakness Diminished or absent deep tendon reflexes
Renal	
<ul style="list-style-type: none"> Urinary output varies depending on the cause 	<ul style="list-style-type: none"> Urinary output varies depending on the cause
Gastrointestinal	
<ul style="list-style-type: none"> Increased gastric motility; hyperactive bowel sounds Cramping, diarrhea 	<ul style="list-style-type: none"> Decreased motility and hypoactive bowel sounds Anorexia, nausea, abdominal distention, constipation
Laboratory Findings	
<ul style="list-style-type: none"> Serum calcium level less than 9.0 mg/dL (2.25 mmol/L) Electrocardiographic changes: Prolonged ST interval, prolonged QT interval 	<ul style="list-style-type: none"> Serum calcium level that exceeds 10.5 mg/dL (2.75 mmol/L) Electrocardiographic changes: Shortened ST segment, widened T wave, heart block

- e. Hyperphosphatemia
- f. Removal or destruction of the parathyroid glands

C. Assessment (Table 8.5 and Fig. 8.3 also see Table 8.3)

D. Interventions

1. Check albumin levels. If the client also has a low albumin level, the calcium level should be corrected. Calculators are available and the formula is: corrected calcium = serum calcium + 0.8(4 - serum albumin). Alternatively, the ionized calcium level can be checked, which has a normal value of 4.64 to 5.28 in adults.
2. Administer calcium supplements orally or calcium intravenously.
3. When administering calcium intravenously, warm the injection solution to body temperature before administration and administer slowly; monitor for electrocardiographic changes, observe for **infiltration**, and monitor for hypercalcemia.
4. Administer medications that increase calcium absorption.
 - a. Aluminum hydroxide reduces **phosphorus** levels, causing the countereffect of increasing calcium levels.

- b. Vitamin D aids in the absorption of calcium from the intestinal tract.

5. Provide a quiet environment to reduce environmental stimuli.
6. Initiate seizure precautions.
7. Move the client carefully, and monitor for signs of a pathological fracture.
8. Keep 10% calcium gluconate available for treatment of acute calcium deficit.
9. Instruct the client to consume foods high in calcium (see Box 11.2).

X. Hypercalcemia

A. Description: Hypercalcemia is a serum calcium level that exceeds 10.5 mg/dL (2.75 mmol/L).

B. Causes

1. Increased calcium absorption
 - a. Excessive oral intake of calcium
 - b. Excessive oral intake of vitamin D
2. Decreased calcium excretion
 - a. Kidney disease
 - b. Use of thiazide diuretics
3. Increased bone resorption of calcium
 - a. Hyperparathyroidism
 - b. Hyperthyroidism

FIG. 8.3 Tests for hypocalcemia. A, Chvostek's sign is contraction of facial muscles in response to a light tap over the facial nerve in front of the ear. B, Trousseau's sign is a carpal spasm induced by inflating a blood pressure cuff (C) above the systolic pressure for a few minutes.

- c. Malignancy (bone destruction from metastatic tumors)
 - d. Immobility
4. Hemoconcentration
- a. Dehydration
 - b. Use of lithium
 - c. Adrenal insufficiency

C. Assessment (Tables 8.3 and 8.5)

D. Interventions

⚠️ A client with a calcium imbalance is at risk for a pathological fracture. Move the client carefully and slowly; assist the client with ambulation.

1. Administer isotonic saline solutions as prescribed. Discontinue IV infusions of solutions containing calcium and oral medications containing calcium or vitamin D.
2. Thiazide diuretics may be discontinued and replaced with diuretics that enhance the excretion of calcium.
3. Administer medications as prescribed that inhibit calcium resorption from the bone, such as phosphorus, calcitonin, bisphosphonates, and prostaglandin synthesis inhibitors (acetylsalicylic acid, nonsteroidal antiinflammatory medications).
4. Prepare the client with severe hypercalcemia for dialysis if medications fail to reduce the serum calcium level.
5. Move the client carefully and monitor for signs of a pathological fracture.
6. Monitor for flank or abdominal pain, and strain the urine to check for the presence of urinary stones.
7. Instruct the client to avoid foods high in calcium (see Box 11.2).

XI. Hypomagnesemia

⚠️ The normal magnesium level is 1.8 to 2.6 mEq/L (0.74 to 1.07 mmol/L).

A. Description: Hypomagnesemia is a serum magnesium level lower than 1.8 mEq/L (0.74 mmol/L).

B. Causes

1. Insufficient magnesium intake
 - a. Malnutrition and starvation
 - b. Vomiting or diarrhea
 - c. Malabsorption syndrome
 - d. Celiac disease
 - e. Crohn's disease
2. Increased magnesium excretion
 - a. Medications such as diuretics
 - b. Chronic alcoholism
3. Intracellular movement of magnesium
 - a. Hyperglycemia
 - b. Insulin administration
 - c. Sepsis

C. Assessment (Table 8.6; also see Table 8.3)

D. Interventions

1. Because hypocalcemia frequently accompanies hypomagnesemia, interventions also aim to restore normal serum calcium levels.
2. Oral preparations of magnesium may cause diarrhea and increase magnesium loss.
3. Magnesium sulfate by the IV route may be prescribed in ill clients when the magnesium level is low (intramuscular injections cause pain and tissue damage); initiate seizure precautions, monitor serum magnesium levels frequently, and monitor for diminished deep tendon reflexes, suggesting hypermagnesemia, during the administration of magnesium.
4. Instruct the client to increase the intake of foods that contain magnesium (see Box 11.2).

XII. Hypermagnesemia

A. Description: Hypermagnesemia is a serum magnesium level that exceeds 2.6 mEq/L (1.07 mmol/L).

B. Causes

1. Increased magnesium intake
 - a. Magnesium-containing antacids and laxatives
 - b. Excessive administration of magnesium intravenously
2. Decreased renal excretion of magnesium as a result of renal insufficiency

C. Assessment (see Tables 8.3 and 8.6)

TABLE 8.6 Assessment Findings: Hypomagnesemia and Hypermagnesemia

Hypomagnesemia	Hypermagnesemia
Cardiovascular	
- Tachycardia	- Bradycardia, dysrhythmias (cardiac arrest if severe)
- Hypertension	- Hypotension
Respiratory	
- Shallow respirations	- Respiratory insufficiency when the skeletal muscles of respiration are involved
Neuromuscular	
- Hyperreflexia	- Diminished or absent deep tendon reflexes
- Twitches, paresthesias	- Skeletal muscle weakness
- Positive Trousseau's and Chvostek's signs	
- Tetany, seizures	
Central Nervous System	
- Irritability	- Drowsiness and lethargy that progresses to coma
- Confusion	
Laboratory Findings	
- Serum magnesium level less than 1.8 mEq/L (0.74 mmol/L)	- Serum magnesium level that exceeds 2.6 mEq/L (1.07 mmol/L)
- Electrocardiographic changes: Tall T waves, depressed ST segments	- Electrocardiographic changes: Prolonged PR interval, widened QRS complexes

D. Interventions

 **Calcium gluconate is the antidote for magnesium overdose.**

1. Diuretics are prescribed to increase renal excretion of magnesium.
2. Intravenously administered calcium chloride or calcium gluconate may be prescribed to reverse the effects of magnesium on cardiac muscle.
3. Instruct the client to restrict dietary intake of magnesium-containing foods (see Box 11.2).
4. Instruct the client to avoid the use of laxatives and antacids containing magnesium.

XIII. Hypophosphatemia

 **The normal phosphorus level is 3.0 to 4.5 mg/dL (0.97 to 1.45 mmol/L).**

A. Description

1. Hypophosphatemia is a **serum phosphorus** (phosphate) level lower than 3.0 mg/dL (0.97 mmol/L).
2. A decrease in the serum phosphorus level is accompanied by an increase in the serum calcium level.

B. Causes

1. Insufficient phosphorus intake: Malnutrition and starvation
2. Increased phosphorus excretion
 - a. Hyperparathyroidism
 - b. Malignancy
 - c. Use of **magnesium**-based or aluminum hydroxide-based antacid
3. Intracellular shift
 - a. Hyperglycemia
 - b. **Respiratory alkalosis**

C. Assessment (see Table 8.5)

 **An individual with mild hypophosphatemia may not experience symptoms. Symptoms may not appear until the phosphorus (phosphate) level drops very low.**

D. Interventions

1. Discontinue medications that contribute to hypophosphatemia.
2. Administer phosphorus orally along with a vitamin D supplement.
3. Prepare to administer phosphorus intravenously when serum phosphorus levels fall below 1 mg/dL and when the client experiences critical clinical manifestations; administer IV phosphorus slowly because of the risks associated with hyperphosphatemia.
4. Assess the renal system before administering phosphorus.
5. Move the client carefully, and monitor for signs of a pathological fracture.
6. Instruct the client to increase the intake of phosphorus-containing foods while decreasing the intake of any calcium-containing foods (see Box 11.2).

 **A decrease in the serum phosphorus level is accompanied by an increase in the serum calcium level, and an increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level. This is called a reciprocal relationship.**

XIV. Hyperphosphatemia

A. Description

1. Hyperphosphatemia is a serum phosphorus level that exceeds 4.5 mg/dL (1.45 mmol/L).
2. Most body systems tolerate elevated serum phosphorus levels well.
3. An increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level.
4. The problems that occur in hyperphosphatemia center on the hypocalcemia that results when serum phosphorus levels increase.

B. Causes

1. Decreased renal excretion resulting from renal insufficiency

2. Tumor lysis syndrome
 3. Increased intake of phosphorus, including dietary intake or overuse of phosphate-containing laxatives or enemas
 4. Hypoparathyroidism
- C. Assessment: (see Table 8.5)
- D. Interventions
1. Interventions entail the management of hypocalcemia.
 2. Administer phosphate-binding medications that increase fecal excretion of phosphorus by binding phosphorus from food in the gastrointestinal tract.
 3. Instruct the client to avoid phosphate-containing medications, including laxatives and enemas.
 4. Instruct the client to decrease the intake of food that is high in phosphorus (see Box 11.2).
 5. Instruct the client in medication administration: Take phosphate-binding medications, emphasizing that they should be taken with meals or immediately after meals.

PRACTICE QUESTIONS

1. The nurse is caring for a client with heart failure. On assessment, the nurse notes that the client is dyspneic, and crackles are audible on auscultation. What additional manifestations would the nurse expect to note in this client if excess fluid volume is present?
 1. Weight loss and dry skin
 2. Flat neck and hand veins and decreased urinary output
 3. An increase in blood pressure and increased respirations
 4. Weakness and decreased central venous pressure (CVP)
2. The nurse reviews a client's record and determines that the client is at risk for developing a potassium deficit if which situation is documented?
 1. Sustained tissue damage
 2. Requires nasogastric suction
 3. Has a history of Addison's disease
 4. Uric acid level of 9.4 mg/dL (557 mcmol/L)
3. The nurse reviews a client's electrolyte laboratory report and notes that the potassium level is 2.5 mEq/L (2.5 mmol/L). Which patterns would the nurse watch for on the electrocardiogram (ECG) as a result of the laboratory value? Select all that apply.
 - 1. U waves
 - 2. Absent P waves
 - 3. Inverted T waves
 - 4. Depressed ST segment
 - 5. Widened QRS complex
4. Potassium chloride intravenously is prescribed for a client with heart failure experiencing hypokalemia. Which actions would the nurse take to plan for preparation and administration of the potassium? Select all that apply.
 - 1. Obtain an intravenous (IV) infusion pump.
 - 2. Monitor urine output during administration.
 - 3. Prepare the medication for bolus administration.
 - 4. Monitor the IV site for signs of infiltration or phlebitis.
 - 5. Ensure that the medication is diluted in the appropriate volume of fluid.
 - 6. Ensure that the bag is labeled with the volume of potassium in the solution.
5. The nurse is assessing a client with a lactose intolerance disorder for a suspected diagnosis of hypocalcemia. Which clinical manifestation would the nurse expect to note in the client?
 1. Twitching
 2. Hypoactive bowel sounds
 3. Negative Trousseau's sign
 4. Hypoactive deep tendon reflexes
6. The nurse is caring for a client with Crohn's disease who has a calcium level of 8 mg/dL (2 mmol/L). Which patterns would the nurse watch for on the electrocardiogram? Select all that apply.
 - 1. Peaked T wave
 - 2. Widened T wave
 - 3. Prominent U wave
 - 4. Prolonged QT interval
 - 5. Prolonged ST segment
7. The nurse reviews the electrolyte results of a client with chronic kidney disease and notes that the potassium level is 5.7 mEq/L (5.7 mmol/L). Which patterns would the nurse watch for on the cardiac monitor as a result of the laboratory value? Select all that apply.
 - 1. ST depression
 - 2. Prominent U wave
 - 3. Tall peaked T waves
 - 4. Prolonged ST segment
 - 5. Widened QRS complexes
8. Which client is at risk for the development of a sodium level at 130 mEq/L (130 mmol/L)?
 1. The client who is taking diuretics
 2. The client with hyperaldosteronism
 3. The client with Cushing's syndrome
 4. The client who is taking corticosteroids
9. The nurse is caring for a client with heart failure who is receiving high doses of a diuretic. On assessment, the nurse notes that the client has flat neck veins, generalized muscle weakness, and diminished deep

- tendon reflexes. The nurse suspects hyponatremia. What additional sign would the nurse expect to note in a client with hyponatremia?
1. Muscle twitches
 2. Decreased urinary output
 3. Hyperactive bowel sounds
 4. Increased specific gravity of the urine
10. The nurse reviews a client's laboratory report and notes that the client's serum phosphorus (phosphate) level is 1.8 mg/dL (0.58 mmol/L). Which condition most likely caused this serum phosphorus level?
1. Malnutrition
 2. Renal insufficiency
 3. Hypoparathyroidism
 4. Tumor lysis syndrome
11. The nurse is reading a physician's progress notes in the client's record and reads that the physician has documented "insensible fluid loss of approximately 800 mL daily." The nurse plans to monitor the client, knowing that insensible fluid loss occurs through which type of excretion?
1. Urinary output
 2. Wound drainage
 3. Integumentary output
 4. The gastrointestinal tract
12. The nurse is assigned to care for a group of clients. On review of the clients' medical records, the nurse determines that which client is most likely at risk for a fluid volume deficit?
1. A client with an ileostomy
 2. A client with heart failure
 3. A client on long-term corticosteroid therapy
 4. A client receiving frequent wound irrigations
13. The nurse caring for a client with heart failure who has been receiving intravenous (IV) diuretics suspects that the client is experiencing a fluid volume deficit. Which assessment finding would the nurse note in a client with this condition?
1. Weight loss and poor skin turgor
 2. Lung congestion and increased heart rate
 3. Decreased hematocrit and increased urine output
 4. Increased respirations and increased blood pressure
14. On review of the clients' medical records, the nurse determines that which client is at risk for fluid volume excess?
1. The client taking diuretics who has tenting of the skin
 2. The client with an ileostomy from a recent abdominal surgery
 3. The client who requires intermittent gastrointestinal suctioning
 4. The client with kidney disease that developed as a complication of diabetes mellitus
15. Which client is at risk for the development of a potassium level of 5.5 mEq/L (5.5 mmol/L)?
1. The client with colitis
 2. The client with Cushing's syndrome
 3. The client who has been overusing laxatives
 4. The client who has sustained a traumatic burn

ANSWERS

1. Answer: 3

Rationale: A fluid volume excess is also known as *overhydration* or *fluid overload* and occurs when fluid intake or fluid retention exceeds the fluid needs of the body. Assessment findings associated with fluid volume excess include cough, dyspnea, crackles, tachypnea, tachycardia, elevated blood pressure, bounding pulse, elevated CVP, weight gain, edema, neck and hand vein distention, altered level of consciousness, and decreased hematocrit. Dry skin, flat neck and hand veins, decreased urinary output, and decreased CVP are noted in fluid volume deficit. Weakness can be present in either fluid volume excess or deficit.

Test-Taking Strategy: Focus on the **subject**, fluid volume excess. Remember that when there is more than one part to an option,

all parts need to be correct in order for the option to be correct. Think about the pathophysiology associated with a fluid volume excess to assist in directing you to the correct option. Also, note that the incorrect options are **comparable or alike** in that each includes manifestations that reflect a decrease.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 740-741.

2. Answer: 2

Rationale: The normal serum potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A potassium deficit is known as *hypokalemia*. Potassium-rich gastrointestinal fluids are lost through gastrointestinal suction, placing the client at risk for hypokalemia. The client with tissue damage or Addison's

disease and the client with hyperuricemia are at risk for hyperkalemia. The normal uric acid level ranges from 2.7 to 8.5 mg/dL (160 to 501 mcmol/L).

Test-Taking Strategy: Note the **subject**, causes of potassium deficit. First recall the normal uric acid levels and the causes of hyperkalemia to assist in eliminating option 4. For the remaining options, note that the correct option is the only one that identifies a loss of body fluid.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 254-255.

3. Answer: 1, 3, 4

Rationale: The normal serum potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level lower than 3.5 mEq/L (3.5 mmol/L) indicates hypokalemia. Potassium deficit is an electrolyte imbalance that can be potentially life-threatening. Electrocardiographic changes include shallow, flat, or inverted T waves; ST segment depression; and prominent U waves. Absent P waves are not a characteristic of hypokalemia but may be noted in a client with atrial fibrillation, junctional rhythms, or ventricular rhythms. A widened QRS complex may be noted in hyperkalemia and in hypermagnesemia.

Test-Taking Strategy: Focus on the **subject**, the ECG patterns that may be noted in a client with a potassium level of 2.5 mEq/L (2.5 mmol/L). From the information in the question, you need to determine that the client is experiencing severe hypokalemia. From this point, you must know the electrocardiographic changes that are expected when severe hypokalemia exists.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 253-254.

4. Answer: 1, 2, 4, 5, 6

Rationale: Potassium chloride administered intravenously must always be diluted in IV fluid and infused via an infusion pump. Potassium chloride is never given by bolus (IV push). Giving potassium chloride by IV push can result in cardiac arrest. The nurse should ensure that the potassium is diluted in the appropriate amount of diluent or fluid. The IV bag containing the potassium chloride is always labeled with the volume of potassium it contains. The IV site is monitored closely, because potassium chloride is irritating to the veins and there is risk of phlebitis. In addition, the nurse needs to monitor for infiltration. The nurse monitors urinary output during administration and contacts the physician if the urinary output is less than 30 mL/hr.

Test-Taking Strategy: Focus on the **subject**, the preparation and administration of potassium chloride intravenously. Think about this procedure and the effects of potassium. Note the word *bolus* in option 3 to assist in eliminating this option.

References: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 279-280.

5. Answer: 1

Rationale: A client with lactose intolerance is at risk for developing hypocalcemia, because food products that contain calcium also contain lactose. The normal serum calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L). A serum calcium level lower than 9 mg/dL (2.25 mmol/L) indicates hypocalcemia. Signs of hypocalcemia include paresthesias followed by numbness, hyperactive deep tendon reflexes, and a positive Trousseau's or Chvostek's sign. Additional signs of hypocalcemia include increased neuromuscular excitability, muscle cramps, twitching, tetany, seizures, irritability, and anxiety. Gastrointestinal symptoms include increased gastric motility, hyperactive bowel sounds, abdominal cramping, and diarrhea.

Test-Taking Strategy: Focus on the **subject**, a suspected diagnosis of hypocalcemia. Note that the incorrect options are **comparable or alike** in that they reflect a hypoactivity or are associated with myocardial infarction. The option that is different is the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 256-257.

6. Answer: 4, 5

Rationale: A client with Crohn's disease is at risk for hypocalcemia. The normal serum calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L). A serum calcium level lower than 9 mg/dL (2.25 mmol/L) indicates hypocalcemia. Electrocardiographic changes that occur in a client with hypocalcemia include a prolonged QT interval and prolonged ST segment. Peaked T waves occur with myocardial infarction. A shortened ST segment and a widened T wave occur with hypercalcemia. ST depression and prominent U waves occur with hypokalemia.

Test-Taking Strategy: Focus on the **subject**, the electrocardiographic patterns that occur in a client with Crohn's disease who has a calcium level of 8 mg/dL (2 mmol/L). It is necessary to know that this client is at risk for hypocalcemia and that a level of 8 mg/dL (2 mmol/L) is low. Then it is necessary to recall the electrocardiographic changes that occur in hypocalcemia. Remember that hypocalcemia causes a prolonged ST segment and prolonged QT interval.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 279-280.

7. Answer: 3, 5

Rationale: The client with chronic kidney disease is at risk for hyperkalemia. The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level greater than 5.0 mEq/L (5.0 mmol/L) indicates hyperkalemia. Electrocardiographic changes associated with hyperkalemia include flat P waves, prolonged PR intervals, widened QRS complexes, and tall peaked T waves. ST depression and a prominent U wave occur in hypokalemia. A prolonged ST segment occurs in hypocalcemia.

Test-Taking Strategy: Focus on the **subject**, a client with chronic kidney disease and the electrocardiographic changes that occur in a potassium imbalance. From the information in the question you need to determine that this condition is a hyperkalemic one. From this point, you must know the elec-

trocardiographic changes that are expected when hyperkalemia exists. Remember that tall peaked T waves, flat P waves, widened QRS complexes, and prolonged PR interval are associated with hyperkalemia.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 279-280.

8. Answer: 1

Rationale: The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). A serum sodium level of 130 mEq/L (130 mmol/L) indicates hyponatremia. Hyponatremia can occur in the client taking diuretics. The client taking corticosteroids and the client with hyperaldosteronism or Cushing's syndrome are at risk for hypernatremia.

Test-Taking Strategy: Focus on the **subject**, the causes of a sodium level of 130 mEq/L (130 mmol/L). First, determine that the client is experiencing hyponatremia. Next, you must know the causes of hyponatremia to direct you to the correct option. Also, recall that when a client takes a diuretic, the client loses fluid and electrolytes.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 251-252.

9. Answer: 3

Rationale: The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). Hyponatremia is evidenced by a serum sodium level lower than 135 mEq/L (135 mmol/L). Hyperactive bowel sounds indicate hyponatremia. The remaining options are signs of hypernatremia. In hyponatremia, muscle weakness, increased urinary output, and decreased specific gravity of the urine would be noted.

Test-Taking Strategy: Focus on the **data in the question** and the **subject** of the question, signs of hyponatremia. It is necessary to know the signs of hyponatremia to answer correctly. Also, think about the action and effects of sodium on the body to answer correctly. Remember that increased bowel motility and hyperactive bowel sounds indicate hyponatremia.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 252.

10. Answer: 1

Rationale: The normal serum phosphorus (phosphate) level is 3.0 to 4.5 mg/dL (0.97 to 1.45 mmol/L). The client is experiencing hypophosphatemia. Causative factors relate to malnutrition or starvation and the use of aluminum hydroxide-based or magnesium-based antacids. Renal insufficiency, hypoparathyroidism, and tumor lysis syndrome are causative factors of hyperphosphatemia.

Test-Taking Strategy: Note the **strategic words, most likely**. Focus on the **subject**, a serum phosphorus level of 1.8 mg/dL (0.58 mmol/L). First, you must determine that the client is experiencing hypophosphatemia. From this point, think about the effects of phosphorus on the body and recall the causes of hypophosphatemia in order to answer correctly.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 283-284.

11. Answer: 3

Rationale: Insensible losses may occur without the person's awareness. Insensible losses occur daily through the skin and the lungs. Sensible losses are those of which the person is aware, such as through urination, wound drainage, and gastrointestinal tract losses.

Test-Taking Strategy: Note that the **subject** of the question is insensible fluid loss. Note that urination, wound drainage, and gastrointestinal tract losses are **comparable or alike** in that they can be measured for accurate output. Fluid loss through the skin cannot be measured accurately; it can only be approximated.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 272.

12. Answer: 1

Rationale: A fluid volume deficit occurs when the fluid intake is insufficient to meet the fluid needs of the body. Causes of a fluid volume deficit include vomiting, diarrhea, conditions that cause increased respirations or increased urinary output, insufficient intravenous fluid replacement, draining fistulas, and the presence of an ileostomy or colostomy. A client with heart failure or on long-term corticosteroid therapy or a client receiving frequent wound irrigations is most at risk for fluid volume excess.

Test-Taking Strategy: Note the **strategic words, most likely**. Read the question carefully, noting the **subject**, the client at risk for a deficit. Read each option and think about the fluid imbalance that can occur in each. The clients with heart failure, on long-term corticosteroid therapy, and receiving frequent wound irrigations retain fluid. The only condition that can cause a deficit is the condition noted in the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 274.

13. Answer: 1

Rationale: A fluid volume deficit occurs when the fluid intake is insufficient to meet the fluid needs of the body. Assessment findings in a client with a fluid volume deficit include increased respirations and heart rate, decreased central venous pressure (CVP), weight loss, poor skin turgor, dry mucous membranes, decreased urine volume, increased specific gravity of the urine, increased hematocrit, and altered level of consciousness. Lung congestion, increased urinary output, and increased blood pressure are all associated with fluid volume excess.

Test-Taking Strategy: Focus on the **subject**, assessment findings in fluid volume deficit. Think about the pathophysiology for fluid volume deficit and fluid volume excess to answer correctly. Note that options 2, 3, and 4 are **comparable or alike** and are manifestations associated with fluid volume excess.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 274.

14. Answer: 4

Rationale: A fluid volume excess is also known as *overhydration* or *fluid overload* and occurs when fluid intake or fluid retention exceeds the fluid needs of the body. The causes of fluid volume excess include decreased kidney function, heart failure, use of hypotonic fluids to replace isotonic fluid losses, excessive irrigation of wounds and body cavities, and excessive ingestion of sodium. Kidney disease is a complication of diabetes mellitus and as a result of the kidney disease, the elimination of fluid is affected and the client retains fluid. The client taking diuretics, the client with an ileostomy, and the client who requires gastrointestinal suctioning are at risk for fluid volume deficit.

Test-Taking Strategy: Focus on the **subject**, fluid volume excess. Think about the pathophysiology associated with fluid volume excess. Read each option, and think about the fluid imbalance that can occur in each. Clients taking diuretics or having ileostomies or gastrointestinal suctioning all lose fluid. The only condition that can cause an excess is the condition noted in the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 250.

15. Answer: 4

Rationale: The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level higher than 5.0 mEq/L (5.0 mmol/L) indicates hyperkalemia. Clients who experience cellular shifting of potassium in the early stages of massive cell destruction, such as with trauma, burns, sepsis, or metabolic or respiratory acidosis, are at risk for hyperkalemia. The client with Cushing's syndrome or colitis and the client who has been overusing laxatives are at risk for hypokalemia.

Test-Taking Strategy: Eliminate the client with colitis and the client overusing laxatives first, because they are **comparable or alike**, with both reflecting a gastrointestinal loss. From the remaining options, recalling that cell destruction causes potassium shifts will assist in directing you to the correct option. Also, remember that Cushing's syndrome presents a risk for hypokalemia and that Addison's disease presents a risk for hyperkalemia.

CHAPTER 9

Acid-Base Balance

Linda A. Silvestri, PhD, RN, FAAN

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE

PRIORITY CONCEPTS Acid-Base Balance; Oxygenation

I. Hydrogen Ions, Acids, and Bases

A. Hydrogen ions

1. Vital to life because hydrogen ions determine the pH of the body, which must be maintained in a narrow range
2. Expressed as pH; the pH scale is determined by the number of hydrogen ions and goes from 1 to 14; 7 is considered neutral.
3. The number of hydrogen ions in the body fluid determines whether it is acid (acidosis), alkaline (alkalosis), or neutral.
4. The pH of body fluid is between 7.35 and 7.45.

B. Acids

1. Produced as end products of **metabolism**
2. Contain hydrogen ions
3. Considered hydrogen ion donors; they give up hydrogen ions to neutralize or decrease the strength of an acid or to form a weaker base.

C. Bases

1. Contain no hydrogen ions
2. Considered hydrogen ion acceptors; they accept hydrogen⁺ ions from acids to neutralize or decrease the strength of a base or to form a weaker acid.
3. Normal serum levels of bicarbonate (HCO_3^-) are 21 to 28 mEq/L (21 to 28 mmol/L).

II. Regulatory Systems for Hydrogen Ion Concentration in the Blood

A. Buffers

1. Buffers are the fastest-acting regulatory system.
2. Buffers provide immediate protection against changes in hydrogen ion concentration in the extracellular fluid.
3. Buffers are reactors that function only to keep the pH within the narrow limits of stability

when too much acid or base is released into the system, and buffers absorb or release hydrogen ions as needed.

4. Buffers serve as a transport mechanism that carries excess hydrogen ions to the lungs.
5. Once the primary buffer systems react, they are consumed, leaving the body less able to withstand further stress until the buffers are replaced.

! The underlying cause of an acid-base imbalance needs to be identified and the cause needs to be treated to resolve the imbalance.

B. Primary buffer systems in extracellular fluid

1. Hemoglobin system

- a. System maintains acid-base balance by a process called *chloride shift*.
- b. Chloride shifts in and out of the cells in response to the level of oxygen (O_2) in the blood.
- c. For each chloride ion that leaves a red blood cell, a bicarbonate ion enters.
- d. For each chloride ion that enters a red blood cell, a bicarbonate ion leaves.

2. Plasma protein system

- a. The system functions along with the liver to vary the amount of hydrogen ions in the chemical structure of plasma proteins.
- b. Plasma proteins have the ability to attract or release hydrogen ions.

3. Carbonic acid–bicarbonate system

- a. Primary buffer system in the body
- b. The system maintains a pH of 7.4 with a ratio of 20 parts bicarbonate (HCO_3^-) to 1 part carbonic acid (H_2CO_3) (Fig. 9.1).

FIG. 9.1 Acid-base balance. In the healthy state, a ratio of 1 part carbonic acid to 20 parts bicarbonate provides a normal serum pH between 7.35 and 7.45. Any deviation to the left of 7.35 results in an acidotic state. Any deviation to the right of 7.45 results in an alkalotic state.

- c. This ratio (20:1) determines the hydrogen ion concentration of body fluids.
- d. Carbonic acid concentration is controlled by the excretion of CO_2 by the lungs; the rate and depth of respiration change in response to changes in the CO_2 .
- e. The kidneys control the bicarbonate concentration and selectively retain or excrete bicarbonate in response to bodily needs.

4. Phosphate buffer system

- a. System is present in cells and body fluids and is especially active in the kidneys.
- b. System acts like bicarbonate and neutralizes excess hydrogen ions.

C. Lungs

1. The lungs are the second defense of the body; they interact with the buffer system to maintain acid-base balance.
2. During acidosis, the pH decreases and the respiratory rate and depth increase in an attempt to exhale acids. The carbonic acid created by the neutralizing action of bicarbonate can be carried to the lungs, where it is reduced to CO_2 and water and is exhaled; thus, hydrogen ions are inactivated and exhaled.
3. During alkalosis, the pH increases and the respiratory rate and depth decrease; CO_2 is retained and carbonic acid increases to neutralize and decrease the strength of excess bicarbonate.
4. The action of the lungs is reversible in controlling an excess or deficit.
5. The lungs can hold hydrogen ions until the deficit is corrected or can inactivate hydrogen ions, changing the ions to water molecules to be exhaled along with CO_2 , thus correcting the excess.
6. The process of correcting a deficit or excess takes 10 to 30 seconds to complete.
7. The lungs are capable of inactivating only hydrogen ions carried by carbonic acid; excess

hydrogen ions created by other mechanisms must be excreted by the kidneys.

! Monitor the client's respiratory status closely. During compensated acidosis, the respiratory rate and depth increase in an attempt to exhale acids. During compensated alkalosis, the respiratory rate and depth decrease; CO_2 is retained to neutralize and decrease the strength of excess bicarbonate.

D. Kidneys

1. The kidneys provide a more inclusive corrective response to acid-base disturbances than other corrective mechanisms, even though the renal excretion of acids and alkalis occurs more slowly.
2. **Compensation** requires a few hours to several days; however, the compensation is more thorough and selective than that of other regulators, such as the buffer systems and lungs.
3. During acidosis, the pH decreases and excess hydrogen ions are secreted into the tubules and combine with buffers for excretion in the urine.
4. During alkalosis, the pH increases and excess bicarbonate ions move into the tubules, combine with **sodium**, and are excreted in the urine.
5. Selective regulation of bicarbonate occurs in the kidneys.
 - a. The kidneys restore bicarbonate by excreting hydrogen ions and retaining bicarbonate ions.
 - b. Excess hydrogen ions are excreted in the urine in the form of phosphoric acid.
 - c. The alteration of certain amino acids in the renal tubules results in a diffusion of ammonia into the kidneys; the ammonia combines with excess hydrogen ions and is excreted in the urine.

E. Potassium (K^+)

1. Potassium plays an exchange role in maintaining acid-base balance.
2. The body changes the potassium level by drawing hydrogen ions into the cells or by pushing them out of the cells (potassium movement across cell membranes is facilitated by transcellular shifting in response to acid-base patterns).
3. The potassium level changes to compensate for hydrogen ion-level changes (Fig. 9.2).
 - a. During acidosis, the body protects itself from the acidic state by moving hydrogen ions into the cells. Therefore, potassium moves out to make room for hydrogen ions and the potassium level increases.

FIG. 9.2 Movement of potassium in response to changes in the extracellular fluid hydrogen ion concentration.

- b. During alkalosis, the cells release hydrogen ions into the blood in an attempt to increase the acidity of the blood; this forces the potassium into the cells and potassium levels decrease.

⚠ When the client experiences an acid-base imbalance, monitor the potassium level closely, because the potassium moves in or out of the cells in an attempt to maintain an acid-base balance. The resulting hypokalemia or hyperkalemia predisposes the client to associated complications.

III. Respiratory Acidosis

A. Description: The total concentration of buffer base is lower than normal, with a relative increase in hydrogen ion concentration; thus, a greater number of hydrogen ions are circulating in the blood than can be absorbed by the buffer system.

B. Causes (Box 9.1)

1. Respiratory acidosis is caused by primary defects in the function of the lungs or changes in normal respiratory patterns.
2. Any condition that causes an obstruction of the airway leading to hypoventilation or depresses the respiratory system can cause respiratory acidosis.

C. Assessment (Table 9.1 and Clinical Judgment: Analyze Cues Box)

⚠ For any acid-base imbalance, it is important to closely monitor the client's level of consciousness, use protective measures to ensure safety, and monitor electrolyte levels and follow-up ABG test results.

BOX 9.1 Causes of Respiratory Acidosis

- **Asthma:** Spasms resulting from allergens, irritants, or emotions cause the smooth muscles of the bronchioles to constrict, resulting in ineffective gas exchange.
- **Atelectasis:** Excessive collection of mucus, with the collapse of alveolar sacs caused by mucous plugs, infectious drainage, or anesthetic medications, results in ineffective gas exchange.
- **Brain trauma:** Excessive pressure on the respiratory center or medulla oblongata depresses respirations.
- **Bronchiectasis:** Bronchi become dilated as a result of inflammation, and destructive changes and weakness in the walls of the bronchi occur.
- **Bronchitis:** Inflammation causes airway obstruction, resulting in inadequate gas exchange.
- **Central nervous system depressants:** Depressants such as sedatives, opioids, and anesthetics depress the respiratory center, leading to hypoventilation (excessive sedation from medications may require reversal by opioid antagonist medications); carbon dioxide (CO₂) is retained, and the hydrogen ion concentration increases.
- **Emphysema and chronic obstructive pulmonary disease:** Loss of elasticity of alveolar sacs restricts air flow in and out, primarily out, leading to an increased CO₂ level.
- **Hypoventilation:** CO₂ is retained and the hydrogen ion concentration increases, leading to the acidotic state; carbonic acid is retained and the pH decreases.
- **Pneumonia:** Excess production of mucus and lung congestion cause airway obstruction, resulting in inadequate gas exchange.
- **Pulmonary edema:** Extracellular accumulation of fluid in pulmonary tissue causes disturbances in alveolar diffusion and perfusion.
- **Pulmonary emboli:** Emboli cause obstruction in a pulmonary artery, resulting in airway obstruction and inadequate gas exchange.

TABLE 9.1 Clinical Manifestations of Acidosis

Respiratory Acidosis (↓ pH, ↑ PaCO ₂)	Metabolic Acidosis (↓ pH, ↓ HCO ₃ ⁻)
Neurological	
Lethargy	Lethargy
Confusion	Confusion
Dizziness	Dizziness
Headache	Headache
Coma	Coma
Cardiovascular	
Decreased blood pressure	Decreased blood pressure
Dysrhythmias (related to hyperkalemia from compensation)	Dysrhythmias (related to hyperkalemia from compensation) C, D,
Warm, flushed skin (related to peripheral vasodilation)	Clammy skin
Gastrointestinal	
No significant findings	Nausea, vomiting, diarrhea, abdominal pain
Neuromuscular	
Muscle weakness, seizures	Muscle weakness, seizures
Respiratory	
The respiratory rate and depth increase in an attempt to exhale acids. However, when there is a respiratory problem and the lungs are unable to compensate, hypoventilation with hypoxia occurs.	Deep, rapid respirations (compensatory attempt by the lungs); known as Kussmaul's respirations

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby.

D. Interventions

1. Monitor for signs of respiratory distress.
2. Administer O₂ as prescribed.
3. Place the client in a semi-Fowler's position.
4. Encourage and assist the client to turn, cough, and deep-breathe.
5. Reduce restlessness by improving ventilation rather than by administering tranquilizers, sedatives, or opioids, because these medications further depress respirations.
6. Prepare to administer respiratory treatments as prescribed; suction the client's airway, if necessary.
7. Prepare for endotracheal intubation and mechanical ventilation if the client has severe acidosis and CO₂ levels rise above 50 mm Hg and signs of acute respiratory distress are present.

 If the client has a condition that causes an obstruction of the airway or depresses the respiratory system, monitor the client for respiratory acidosis.

IV. Respiratory Alkalosis

- A. Description: A decrease of carbonic acid and a decrease in hydrogen ion concentration that results from the

BOX 9.2 Causes of Respiratory Alkalosis

- **Fever:** Causes increased metabolism, resulting in overstimulation of the respiratory system.
- **Hyperventilation:** Rapid respirations cause the blowing off of carbon dioxide (CO₂), leading to a decrease in carbonic acid.
- **Hypoxia:** Stimulates the respiratory center in the brainstem, which causes an increase in the respiratory rate in order to increase oxygen (O₂); this causes hyperventilation, which results in a decrease in the CO₂ level.
- **Overventilation by mechanical ventilators:** The administration of O₂ and the depletion of CO₂ can occur from mechanical ventilation, causing the client to be hyperventilated.
- **Pain:** Overstimulation of the respiratory center in the brainstem results in a carbonic acid deficit.
- **Severe anxiety and hysteria:** Often is neurogenic and related to a psychoneurosis; however, this condition leads to vigorous breathing and excessive exhaling of CO₂.

⚡ CLINICAL JUDGMENT: ANALYZE CUES

A client with emphysema is hospitalized because of difficulty breathing. The client complains of headache and dizziness and is lethargic and disoriented. Arterial blood gas (ABG) results reveal the following: pH is 7.21, PaCO₂ is 70 mm Hg, and HCO₃⁻ is 23 mEq/L (23 mmol/L). The nurse considers the client's health problem, the effects of the health problem on the respiratory system, analyzes the client cues including the ABG results, and interprets these cues as indicating an acid-base disturbance of *respiratory acidosis without compensation*.

accumulation of base or from a loss of acid without a comparable loss of base in the body fluids

- B. Causes: Respiratory alkalosis results from conditions that cause overstimulation of the respiratory system (Box 9.2).
- C. Assessment (Table 9.2)
- D. Interventions
1. Monitor for signs of respiratory distress.
 2. Provide emotional support and reassurance to the client.
 3. Encourage appropriate breathing patterns.
 4. Assist with breathing techniques and breathing aids if needed and as prescribed (voluntary holding of breath, using a rebreathing mask, CO₂ breaths with rebreathing into a paper bag).
 5. Provide cautious care with ventilator clients so that they are not forced to take breaths too deeply or rapidly.
 6. Prepare to administer calcium gluconate for tetany as prescribed.

V. Metabolic Acidosis

- A. Description: A total concentration of buffer base that is lower than normal, with a relative increase in the hydrogen ion concentration, resulting from loss

TABLE 9.2 Clinical Manifestations of Alkalosis

Respiratory Alkalosis (↑ pH, ↓ PaCO ₂)	Metabolic Alkalosis (↑ pH, ↑ HCO ₃ ⁻)
Neurological	
Dizziness	Lethargy
Light-headedness	Irritability
Confusion	Confusion
Headache	Headache
Cardiovascular	
Low blood pressure	Low blood pressure
Tachycardia	Tachycardia
Dysrhythmias	Dysrhythmias
Gastrointestinal	
Nausea, vomiting, diarrhea	Anorexia
Epigastric pain	Nausea, vomiting
Neuromuscular	
Tetany	Tetany
Numbness	Tremors
Tingling of extremities	Tingling of extremities
Hyperreflexia	Muscle cramps, hyperreflexes
Seizures	Seizures
Respiratory	
Respiratory rate and depth decrease as a compensatory action by the lungs. However, when there is a respiratory problem and lungs are unable to compensate, hyperventilation can occur.	Respiratory rate and depth decrease as a compensatory action by the lungs (hyperventilation)

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby.

B. Causes (Box 9.3)

 An insufficient supply of insulin in a client with diabetes mellitus can result in metabolic acidosis known as diabetic ketoacidosis.

C. Assessment (see Table 9.1)

D. Interventions

1. Monitor for signs of respiratory distress.
2. Monitor intake and output and assist with fluid and electrolyte replacement as prescribed.
3. Prepare to administer solutions intravenously as prescribed to increase the buffer base.

E. Interventions in diabetes mellitus and diabetic ketoacidosis

1. Give insulin as prescribed to hasten the movement of glucose into the cells, thereby decreasing the concurrent ketosis.
2. When glucose is being properly metabolized, the body will stop converting fats to glucose.

BOX 9.3 Causes of Metabolic Acidosis

- **Diabetes mellitus or diabetic ketoacidosis:** An insufficient supply of insulin causes increased fat metabolism, leading to an excess accumulation of ketones or other acids; the bicarbonate then ends up being depleted.
- **Excessive ingestion of acetylsalicylic acid:** Causes an increase in the hydrogen ion concentration.
- **High-fat diet:** Causes a much too rapid accumulation of the waste products of fat metabolism, leading to a buildup of ketones and acids.
- **Insufficient metabolism of carbohydrates:** When the oxygen supply is not sufficient for the metabolism of carbohydrates, lactic acid is produced and lactic acidosis results.
- **Malnutrition:** Improper metabolism of nutrients causes fat catabolism, leading to an excess buildup of ketones and acids.
- **Renal insufficiency, acute kidney injury, or chronic kidney disease:** Increased waste products of protein metabolism are retained; acids increase, and bicarbonate is unable to maintain acid-base balance.
- **Severe diarrhea:** Intestinal and pancreatic secretions are normally alkaline; therefore, excessive loss of base leads to acidosis.

3. Monitor for circulatory collapse caused by polyuria, which may result from the hyperglycemic state; osmotic diuresis may lead to extracellular volume deficit.
4. If diabetic ketoacidosis is present, establish IV access and prepare to administer fluid volume resuscitation. Monitor electrolytes, glucose levels, and urinary output.

 Monitor the client experiencing severe diarrhea for manifestations of metabolic acidosis.

F. Interventions in kidney disease

1. Dialysis may be necessary to remove protein and waste products, thereby lessening the acidotic state.
2. A diet low in protein and high in calories decreases the amount of protein waste products, which in turn lessens the acidosis.

VI. Metabolic Alkalosis

- A. Description: A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids
- B. Causes: Metabolic alkalosis results from a dysfunction of metabolism that causes an increased amount of available base solution in the blood or a decrease in available acids in the blood (Box 9.4).
- C. Assessment (see Table 9.2)

 Monitor the client experiencing excessive vomiting or the client with gastrointestinal suctioning for manifestations of metabolic alkalosis.

BOX 9.4 Causes of Metabolic Alkalosis

- **Diuretics:** The loss of hydrogen ions and chloride from diuresis causes a compensatory increase in the amount of bicarbonate in the blood.
- **Excessive vomiting or gastrointestinal suctioning:** Leads to an excessive loss of hydrochloric acid.
- **Hyperaldosteronism:** Increased renal tubular reabsorption of sodium occurs, with the resultant loss of hydrogen ions.
- **Ingestion of and/or infusion of excess sodium bicarbonate:** Causes an increase in the amount of base in the blood.
- **Massive transfusion of whole blood:** The citrate anticoagulant used for the storage of blood is metabolized to bicarbonate.

TABLE 9.3 Normal Arterial Blood Gas Values

Laboratory Test	Normal Range	
	Conventional Units	SI Units
Arterial		
pH (arterial)	7.35-7.45	7.35-7.45
Paco ₂	35-45 mm Hg	35-45 mm Hg
Bicarbonate (HCO ₃ ⁻)	21-28 mEq/L	21-28 mmol/L
Pao ₂	80-100 mm Hg	80-100 mm Hg
Venous		
pH (venous)	7.31-7.41	7.31-7.41
Pv O ₂	40-50 mm Hg	40-50 mm Hg

mmol, Millimole (10^{-3} mole); Paco₂, partial pressure of carbon dioxide in arterial blood; Pao₂, partial pressure of oxygen in arterial blood; PvO₂, partial pressure of oxygen in venous blood. Note: Because arterial blood gases are influenced by altitude, the value for Pao₂ decreases as altitude increases.

D. Interventions

1. Monitor for signs of respiratory distress.
2. Prepare to administer medications and intravenous fluids as prescribed to promote the kidney excretion of bicarbonate.
3. Prepare to replace potassium as prescribed.

VII. Arterial Blood Gases (ABGs) (Table 9.4)**A. Collection of an ABG specimen**

1. Obtain vital signs.
2. Determine whether the client has an arterial line in place (allows for arterial blood sampling without further puncture to the client).
3. The **Allen's test** is performed to determine the presence of collateral circulation; note that in most facilities, an ABG blood draw is performed by a respiratory therapist (**Box 9.5**).
4. Assess factors that may affect the accuracy of the results, such as changes in the O₂ settings, suctioning within the past 20 minutes, and the client's activities.
5. Provide emotional support to the client.

BOX 9.5 Procedure for Performing the Allen's Test Before Radial Artery Puncture^a

- The procedure is explained to the client, including that its purpose is to assess collateral circulation.
- Pressure is applied over the ulnar and radial arteries simultaneously.
- The client is asked to open and close the hand repeatedly.
- Pressure is released from the ulnar artery while compressing the radial artery.
- The color of the extremity distal to the pressure point is assessed. If flow through the ulnar artery is good, flushing will be seen immediately. The Allen test is then positive, and the radial artery can be used for puncture.
- If the Allen test is negative (no flushing seen), the test is repeated on the other arm. If both arms give a negative result, another artery is selected for puncture.
- Findings are documented.

^a Note: In most facilities, an ABG blood draw is performed by a respiratory therapist. Pagana, K., Pagana, T., & Pagana, T.N. (2021). *Mosby's diagnostic and laboratory test reference*. (15th ed.). St. Louis: Elsevier, p. 109.

6. Assist with the specimen draw; prepare a heparinized syringe (if not already prepackaged). After obtaining a specimen, prevent any air from entering the syringe, because air can cause a blood gas analysis alteration.
 7. Apply pressure immediately to the puncture site following the blood draw; maintain pressure for 5 minutes or for 10 minutes if the client is taking an anticoagulant to decrease the risk of hematoma. Reassess the radial pulse after removing the pressure.
 8. Appropriately label the specimen and transport it on ice to the laboratory.
 9. On the laboratory form, record the client's temperature and the type of supplemental O₂ that the client is receiving.
- B. Respiratory acid-base imbalances (Table 9.4)**
1. Remember that the respiratory function indicator is the Paco₂.
 2. In a respiratory imbalance, you will find an opposite relationship between the pH and the Paco₂; in other words, the pH will be elevated with a decreased Paco₂ (alkalosis) or the pH will be decreased with an elevated Paco₂ (acidosis).
 3. Look at the pH and the Paco₂ to determine whether the condition is a respiratory problem.
 4. Respiratory acidosis: The pH is decreased; the Paco₂ is elevated.
 5. Respiratory alkalosis: The pH is elevated; the Paco₂ is decreased.
- C. Metabolic acid-base imbalances (see Table 9.4)**
1. Remember, the metabolic function indicator is the bicarbonate ion (HCO₃⁻).
 2. In a metabolic imbalance, there is a corresponding relationship between the pH and the HCO₃⁻;

TABLE 9.4 Acid-Base Imbalances: Usual Laboratory Value Changes

Imbalance	pH	HCO ₃ ⁻	Pao ₂	Paco ₂	K ⁺
Respiratory acidosis	U: Decreased PC: Decreased C: Normal	U: Normal PC: Increased C: Increased	Usually decreased	U: Increased PC: Increased C: Increased	Increased
Respiratory alkalosis	U: Increased PC: Increased C: Normal	U: Normal PC: Decreased C: Decreased	Usually normal but depends on other accompanying conditions	U: Decreased PC: Decreased C: Decreased	Decreased
Metabolic acidosis	U: Decreased PC: Decreased C: Normal	U: Decreased PC: Decreased C: Decreased	Usually normal but depends on other accompanying conditions	U: Normal PC: Decreased C: Decreased	Increased
Metabolic alkalosis	U: Increased PC: Increased C: Normal	U: Increased PC: Increased C: Increased	Usually normal but depends on other accompanying conditions	U: Normal PC: Increased C: Increased	Decreased

C, Compensated; PC, partially compensated; U, uncompensated.

in other words, the pH will be elevated and HCO₃⁻ will be elevated (alkalosis), or the pH will be decreased and HCO₃⁻ will be decreased (acidosis).

- Look at the pH and the HCO₃⁻ to determine whether the condition is a metabolic problem.
- Metabolic acidosis: The pH is decreased; the HCO₃⁻ is decreased.
- Metabolic alkalosis: The pH is elevated; the HCO₃⁻ is elevated.

! In a respiratory imbalance, the ABG result indicates an opposite relationship between the pH and the PaO₂. In a metabolic imbalance, the ABG result indicates a corresponding relationship between the pH and the (HCO₃⁻).

D. Compensation (see Table 9.4)

- Compensation refers to the body processes that occur to counterbalance the acid-base disturbance.
- When full compensation has occurred, the pH is within normal limits.

E. Steps for analyzing ABG results (Box 9.6)

F. Mixed acid-base disorders

- Occurs when two or more disorders are present at the same time
- The pH will depend on the type and severity of the disorders involved, including any compensatory mechanisms at work (e.g., respiratory acidosis combined with metabolic acidosis will result in a greater decrease in pH than either imbalance occurring alone).
- Example: Mixed alkalosis can occur if a client begins to hyperventilate due to postoperative pain (respiratory alkalosis) and is also losing acid due to gastric suctioning (metabolic alkalosis).

BOX 9.6 Analyzing Arterial Blood Gas Results

If you can remember the following Pyramid Points and Pyramid Steps, you will be able to analyze any blood gas report.

Pyramid Points

In acidosis, the pH is decreased.

In alkalosis, the pH is elevated.

The respiratory function indicator is the Paco₂.

The metabolic function indicator is the bicarbonate ion (HCO₃⁻).

Pyramid Steps

Pyramid Step 1

Look at the arterial blood gas results. Look at the pH. Is the pH elevated or decreased? If the pH is elevated, it reflects alkalosis. If the pH is decreased, it reflects acidosis.

Pyramid Step 2

Look at the Paco₂. Is the Paco₂ elevated or decreased? If the Paco₂ reflects an opposite relationship to the pH, the condition is a respiratory imbalance. If the Paco₂ does not reflect an opposite relationship to the pH, go to Pyramid Step 3.

Pyramid Step 3

Look at the HCO₃⁻. Does the HCO₃⁻ reflect a corresponding relationship with the pH? If it does, the condition is a metabolic imbalance.

Pyramid Step 4

Full compensation has occurred if the pH is in a normal range of 7.35 to 7.45. If the pH is not within normal range, look at the respiratory or metabolic function indicators.

If the condition is a respiratory imbalance, look at the HCO₃⁻ to determine the state of compensation.

If the condition is a metabolic imbalance, look at the Paco₂ to determine the state of compensation.

Refer to Table 9.4 for laboratory results in partially compensated and uncompensated conditions.

PRACTICE QUESTIONS

- The nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45, Paco_2 of 30 mm Hg, and HCO_3^- of 20 mEq/L (20 mmol/L). The nurse analyzes these results as indicating which condition?
 - Metabolic acidosis, compensated
 - Respiratory alkalosis, compensated
 - Metabolic alkalosis, uncompensated
 - Respiratory acidosis, uncompensated
- The nurse is caring for a client with a nasogastric tube that is attached to low suction. The nurse monitors the client for manifestations of which disorder that the client is at risk for?
 - Metabolic acidosis
 - Metabolic alkalosis
 - Respiratory acidosis
 - Respiratory alkalosis
- A client with a 3-day history of nausea and vomiting and suspected gastroenteritis presents to the emergency department. The client is hypoventilating and has a respiratory rate of 10 breaths per minute. The electrocardiogram (ECG) monitor displays tachycardia, with a heart rate of 120 beats per minute. Arterial blood gases are drawn, and the nurse reviews the results, expecting to note which finding?
 - A decreased pH and an increased Paco_2
 - An increased pH and a decreased Paco_2
 - A decreased pH and a decreased HCO_3^-
 - An increased pH and an increased HCO_3^-
- The nurse is caring for a client having respiratory distress related to an anxiety attack. Recent arterial blood gas (ABG) values are pH = 7.53, PaO_2 = 72 mm Hg, Paco_2 = 32 mm Hg, and HCO_3^- = 28 mEq/L (28 mmol/L). Which conclusion about the client would the nurse make?
 - The client has acidotic blood.
 - The client is probably overreacting.
 - The client is fluid volume overloaded.
 - The client is probably hyperventilating.
- The nurse is caring for a client with diabetic ketoacidosis and documents that the client is experiencing Kussmaul's respirations. Which patterns did the nurse observe? Select all that apply.
 1. Respirations that are shallow
 2. Respirations that are increased in rate
 3. Respirations that are abnormally slow
 4. Respirations that are abnormally deep
 5. Respirations that cease for several seconds
- A client who is found unresponsive has arterial blood gases drawn, and the results indicate the following: pH is 7.12, Paco_2 is 90 mm Hg, and HCO_3^- is 22 mEq/L (22 mmol/L). The nurse interprets the results as indicating which condition?
 - Metabolic acidosis with compensation
 - Respiratory acidosis with compensation
 - Metabolic acidosis without compensation
 - Respiratory acidosis without compensation
- The nurse notes that a client's arterial blood gas (ABG) results reveal a pH of 7.50 and a Paco_2 of 30 mm Hg. The nurse monitors the client for which clinical manifestations associated with these ABG results? Select all that apply.
 1. Nausea
 2. Confusion
 3. Bradypnea
 4. Tachycardia
 5. Hyperkalemia
 6. Light-headedness
- The nurse reviews the blood gas results of a client with atelectasis. The nurse analyzes the results and determines that the client is experiencing respiratory acidosis. Which result validates the nurse's findings?
 - pH 7.25, Paco_2 50 mm Hg
 - pH 7.35, Paco_2 40 mm Hg
 - pH 7.50, Paco_2 52 mm Hg
 - pH 7.52, Paco_2 28 mm Hg
- The nurse is caring for a client who is on a mechanical ventilator. Blood gas results indicate a pH of 7.50 and a Paco_2 of 30 mm Hg. The nurse has determined that the client is experiencing respiratory alkalosis. Which laboratory value would most likely be noted in this condition?
 - Magnesium level of 1.8 (0.74 mmol/L)
 - Sodium level of 145 mEq/L (145 mmol/L)
 - Potassium level of 3.0 mEq/L (3.0 mmol/L)
 - Phosphorus level of 3.0 mg/dL (0.97 mmol/L)
- The nurse is caring for a client with several broken ribs. The client is most likely to experience what type of acid-base imbalance?
 - Respiratory acidosis from inadequate ventilation
 - Respiratory alkalosis from anxiety and hyperventilation
 - Metabolic acidosis from calcium loss due to broken bones
 - Metabolic alkalosis from taking analgesics containing base products

ANSWERS

1. Answer: 2

Rationale: The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the P_{CO_2} . In this situation, the pH is at the high end of the normal value and the P_{CO_2} is low. In an alkalotic condition, the pH is elevated. Therefore, the values identified in the question indicate a respiratory alkalosis that is compensated by the kidneys through the renal excretion of bicarbonate. Because the pH has returned to a normal value, compensation has occurred.

Test-Taking Strategy: Focus on the **data in the question**, noting the arterial blood gas results. Remember that in a respiratory imbalance you will find an opposite response between the pH and the P_{CO_2} , as indicated in the question. Therefore, you can eliminate the options reflective of a primary metabolic problem. Also, remember that the pH increases in an alkalotic condition and compensation can be evidenced by a normal pH. The correct option reflects a respiratory alkalotic condition and compensation and describes the blood gas values as indicated in the question.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 289.

2. Answer: 2

Rationale: *Metabolic alkalosis* is defined as a deficit or loss of hydrogen ions or acids or an excess of base (bicarbonate) that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions resulting in hypovolemia, the loss of gastric fluid, excessive bicarbonate intake, the massive transfusion of whole blood, and hyperaldosteronism. Loss of gastric fluid via nasogastric suction or vomiting causes metabolic alkalosis as a result of the loss of hydrochloric acid. The remaining options are incorrect interpretations.

Test-Taking Strategy: Focus on the **data in the question**, a client with a nasogastric tube attached to suction. Remembering that a client receiving nasogastric suction loses hydrochloric acid will direct you to the option identifying an alkalotic condition. Because the question addresses a situation other than a respiratory one, the acid-base disorder would be a metabolic condition.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 272.

3. Answer: 4

Rationale: Clients experiencing nausea and vomiting would most likely present with metabolic alkalosis resulting from loss of gastric acid, thus causing the pH and HCO_3^- to increase. Symptoms experienced by the client would include a decrease in the respiratory rate and depth, and tachycardia. Option 1 reflects a respiratory acidotic condition. Option 2 reflects a respiratory alkalotic condition, and option 3 reflects a metabolic acidotic condition.

Test-Taking Strategy: Focus on the **subject**, expected arterial blood gas findings. Note the **data in the question** and

that the client is vomiting. Recalling that vomiting most likely causes metabolic alkalosis will assist in directing you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 287.

4. Answer: 4

Rationale: The ABG values are abnormal, which supports a physiological problem. The ABGs indicate respiratory alkalosis, not acidosis, as a result of hyperventilating. Concluding that the client is overreacting is an inaccurate analysis. No conclusion can be made about a client's fluid volume status from the information provided.

Test-Taking Strategy: Focus on the **data in the question**. Note the ABG values and use knowledge to interpret them. Note that the pH is elevated and the P_{CO_2} is decreased from normal. This will assist you in determining that the client is experiencing respiratory alkalosis. Next, think about the causes of respiratory alkalosis to answer correctly.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 287.

5. Answer: 2, 4

Rationale: Kussmaul's respirations are abnormally deep and increased in rate. These occur as a result of the compensatory action by the lungs. In bradypnea, respirations are regular but abnormally slow. Apnea is described as respirations that cease for several seconds.

Test-Taking Strategy: Focus on the **subject**, the characteristics of Kussmaul's respirations. Use knowledge of the description of Kussmaul's respirations. Recalling that this type of respiration occurs in diabetic ketoacidosis will assist you in answering correctly.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 269, 1268.

6. Answer: 4

Rationale: The acid-base disturbance is respiratory acidosis without compensation. The normal pH is 7.35 to 7.45. The normal P_{CO_2} is 35 to 45 mm Hg. In respiratory acidosis the pH is decreased and the P_{CO_2} is elevated. The normal bicarbonate HCO_3^- level is 21 to 28 mEq/L (21 to 28 mmol/L). Because the bicarbonate is still within normal limits, the kidneys have not had time to adjust for this acid-base disturbance. In addition, the pH is not within normal limits. Therefore, the condition is without compensation. The remaining options are incorrect interpretations.

Test-Taking Strategy: Focus on the **data in the question** and the **subject**, interpretation of arterial blood gas results. Remember that in a respiratory imbalance you will find an opposite response between the pH and the P_{CO_2} . Also, remember that the pH is decreased in an acidotic condition and that compensation is reflected by a normal pH.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing:*

Assessment and management of clinical problems. (11th ed.). St. Louis: Elsevier. pp. 286-287.

7. Answer: 1, 2, 4, 6

Rationale: Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Clinical manifestations of respiratory alkalosis include lethargy, light-headedness, confusion, tachycardia, dysrhythmias related to hypokalemia, nausea, vomiting, epigastric pain, and numbness and tingling of the extremities. Hyperventilation (tachypnea) occurs. Bradypnea describes respirations that are regular but abnormally slow. Hyperkalemia is associated with acidosis.

Test-Taking Strategy: Focus on the **subject**, the interpretation of ABG values. Note the **data in the question** to determine that the client is experiencing respiratory alkalosis. Next, it is necessary to think about the pathophysiology that occurs in this acid-base condition and recall the manifestations that occur.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Elsevier. p. 288.

8. Answer: 1

Rationale: Atelectasis is a condition characterized by the collapse of alveoli, preventing the respiratory exchange of oxygen and carbon dioxide in a part of the lungs. The normal pH is 7.35 to 7.45. The normal $Paco_2$ is 35 to 45 mm Hg. In respiratory acidosis, the pH is decreased and the $Paco_2$ is elevated. Option 2 identifies normal values. Option 3 identifies an alkalotic condition, and option 4 identifies respiratory alkalosis.

Test-Taking Strategy: Focus on the **subject**, the arterial blood gas results in a client with atelectasis. Remember that in a respiratory imbalance you will find an opposite response between the pH and the $Paco_2$. Also, remember that the pH is decreased in an acidotic condition. First eliminate option 2 because it reflects a normal blood gas result. Options 3 and 4 identify an elevated pH, indicating an alkalotic condition. The correct option is the only one that reflects an acidotic condition.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for*

interprofessional collaborative care. (10th ed.). St. Louis: Elsevier. pp. 154, 476-477.

9. Answer: 3

Rationale: Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Some clinical manifestations of respiratory alkalosis include light-headedness, confusion, tachycardia, dysrhythmias related to hypokalemia, nausea, vomiting, diarrhea, epigastric pain, and numbness and tingling of the extremities. All three incorrect options identify normal laboratory values. The correct option identifies the presence of hypokalemia.

Test-Taking Strategy: Note the **strategic words**, *most likely*. Focus on the **data in the question** and use knowledge about the interpretation of arterial blood gas values to determine that the client is experiencing respiratory alkalosis. Next, recall the manifestations that occur in this condition and the normal laboratory values. The only abnormal laboratory value is the potassium level, the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care.* (10th ed.). St. Louis: Elsevier. pp. 272, 604.

10. Answer: 1

Rationale: Respiratory acidosis is most often caused by hypoventilation. The client with broken ribs will have difficulty with breathing adequately and is at risk for hypoventilation and resultant respiratory acidosis. The remaining options are incorrect. Respiratory alkalosis is associated with hyperventilation. There are no data in the question that indicate calcium loss or that the client is taking analgesics containing base products.

Test-Taking Strategy: Note the **strategic words**, *most likely*. Focus on the **data in the question**. Think about the location of the ribs to determine that the client will have difficulty breathing adequately. This will assist in directing you to the correct option. Remembering that hypoventilation results in respiratory acidosis will direct you to the correct option.

CHAPTER 10

Vital Signs and Laboratory Reference Intervals

Linda A. Silvestri, PhD, RN, FAAN

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS Cellular Regulation; Perfusion

I. Vital Signs

A. Description: Vital signs include temperature, pulse, respirations, blood pressure (BP), oxygen saturation (pulse oximetry), and pain assessment.

B. Guidelines for measuring vital signs

1. Initial measurement of vital signs provides baseline data on a client's health status and is used to help identify changes in the client's health status.
2. Some vital sign measurements (temperature, pulse, respirations, BP, pulse oximetry) may be delegated to assistive personnel (AP), but the nurse is responsible for interpreting the findings.
3. The nurse collaborates with the primary health care provider (PHCP) in determining the frequency of vital sign assessment and also makes independent decisions regarding their frequency on the basis of the client's status.

 **The nurse ensures that vital sign measurements are documented correctly and reports abnormal, unexpected findings to the PHCP.**

C. When vital signs are measured

1. On initial contact with a client (e.g., when a client is admitted to a health care facility; clinic visits, home care visits)
2. During physical assessment of a client
3. Before and after an invasive diagnostic procedure or surgical procedure
4. During the administration of medication that affects the cardiac, respiratory, or temperature-controlling functions (e.g., in a client who has a fever; a client taking an antihypertensive medication or other cardiac medication); may be required before, during, and after administration of the medication
5. Before, during, and after a blood transfusion

6. Whenever a client's condition changes or the client verbalizes unusual feelings such as nonspecific symptoms of physical distress (i.e., feeling funny or different, feeling sick)

7. Whenever an intervention (e.g., ambulation) may affect a client's condition

8. When a fever or known infection is present (check vital signs every 2 to 4 hours)

9. See [Clinical Judgment: Analyze Cues Box](#)

II. Temperature

A. Description

1. In the literature, variations regarding the normal range of body temperature are noted. According to 2020 WebMD, the normal body temperature can fall within a wide range, from 97.0° F (36.1° C) to 99.0° F (37.2° C). <https://www.webmd.com/lung/what-is-a-fever#1>

2. A person is considered to have a fever if they have an elevated temperature, feel warm to touch, report feeling feverish, have a flushed face, glassy eyes, or chills (<https://www.cdc.gov/quarantine/air/reporting-deaths-illness/denotations-symptoms-reportable-illnesses.html>)

3. Some health care providers consider a client has a fever if the temperature is at or above 100.4° F (38° C). It is important to follow agency guidelines and provider preferences regarding the normal range of body temperature.

4. Common measurement sites are the mouth, rectum (unless contraindicated), axilla, ear, and across the forehead (temporal artery site).

5. Rectal temperatures are usually 1° F (0.5° C) higher, and tympanic and axillary temperatures about 1° F (0.5° C) lower than the normal oral temperature.

WWW.NCLEXATNEPAL.COM

BOX 10.1 Body Temperature Conversion

To convert Fahrenheit to Celsius: Degrees Fahrenheit
 $- 32 \times 5/9 = \text{Degrees Celsius}$

Example: $98.2^\circ \text{F} - 32 \times 5/9 = 36.7^\circ \text{C}$

To convert Celsius to Fahrenheit: Degrees Celsius $\times 9/5 + 32$
 $= \text{Degrees Fahrenheit}$

Example: $38.6^\circ \text{C} \times 9/5 + 32 = 101.5^\circ \text{F}$

6. Know how to convert a temperature to a Fahrenheit or Celsius value (Box 10.1).

B. Nursing considerations

1. Time of day
 - a. Temperature is generally in the low-normal range at the time of awakening as a result of muscle inactivity.
 - b. Body temperature peaks in the late afternoon or evening, sometimes by as much as 1 or 2 degrees, usually as a result of the metabolic process, activity, and environmental temperature.
2. Environmental temperature: Body temperature is lower in cold weather and higher in warm weather.
3. Age: Temperature may fluctuate during the first year of life because the infant's heat-regulating mechanism is not fully developed.
4. Physical exercise: Use of the large muscles creates heat, causing an increase in body temperature.
5. Menstrual cycle: Temperature decreases slightly just before ovulation but may increase to 1°F above normal during ovulation.
6. Pregnancy: Body temperature may consistently stay at high-normal because of an increase in the woman's metabolic rate.
7. Stress: Emotions increase hormonal secretion, leading to increased heat production and a higher temperature.
8. Illness: Infective agents and the inflammatory response may cause an increase in temperature.
9. The inability to obtain a temperature should not be ignored, because it could represent a condition of hypothermia, a life-threatening condition in very young and older clients.

C. Methods of measurement

 Various types of electronic measuring devices are commonly used to measure temperature; it is important to follow the manufacturer's instructions on the use of the device.

1. Oral
 - a. If the client has recently consumed hot or cold foods or liquids or has smoked or chewed gum, the nurse must wait 15 to 30 minutes before taking the temperature orally.
 - b. The thermometer is placed under the tongue in one of the posterior sublingual pockets; ask the

client to keep the tongue down and the lips closed and to not bite down on the thermometer.

2. Rectal
 - a. Place the client in the left side-lying position.
 - b. The temperature is taken rectally when an accurate temperature cannot be obtained orally or via other methods, including by an electronic method, or when the client has nasal congestion, has undergone nasal or oral surgery or had the jaws wired, has a nasogastric tube in place, is unable to keep the mouth closed, or is at risk for seizures.
 - c. The thermometer is lubricated and inserted into the rectum, toward the umbilicus, about 1.5 inches (3.8 cm) (no more than 0.5 inch [1.25 cm] in an infant).

 The temperature is not taken rectally in cardiac clients; the client who has undergone rectal surgery; or the client with diarrhea, fecal impaction, or rectal bleeding or who is at risk for bleeding.

3. Axillary
 - a. This method of taking the temperature is used when the oral or other methods of temperature measurement are contraindicated.
 - b. Axillary measurement is less accurate than the oral, rectal, tympanic, or temporal artery methods but is used when other methods of measurement are not possible.
 - c. The thermometer is placed in the client's dry axilla, and the client is asked to hold the arm tightly against the chest, resting the arm on the chest. Follow the instructions accompanying the measurement device for the amount of time the thermometer should remain in the axillary area.
4. Tympanic
 - a. The auditory canal is checked for the presence of redness, swelling, discharge, or a foreign body before the probe is inserted; the probe should not be inserted if the client has an inflammatory condition of the auditory canal or if there is discharge from the ear.
 - b. The reading may be affected by an ear infection or excessive wax blocking the ear canal.
5. Temporal artery
 - a. Ensure that the client's forehead is dry.
 - b. The thermometer probe is placed flush against the skin and slid across the forehead or placed in the area of the temporal artery and held in place.
 - c. If the client is diaphoretic, the temporal artery thermometer probe may be placed on the neck, just behind the earlobe.

III. Pulse

- A. Description
 1. Pulse is a palpable bounding of blood flow in a peripheral artery; it is an indirect indicator of circulatory status.

2. The average adult pulse (heart) rate is 60 to 100 beats per minute.
3. Changes in pulse rate are used to evaluate the client's tolerance of interventions such as ambulation, bathing, dressing, and exercise.
4. Pedal pulses are checked to determine whether the circulation is blocked in the artery up to that pulse point.
5. When the pedal pulse is difficult to locate, a Doppler ultrasound stethoscope (ultrasonic stethoscope) may be needed to amplify the sounds of pulse waves.

B. Nursing considerations

1. The heart rate slows with age.
2. Exercise increases the heart rate.
3. Emotions stimulate the sympathetic nervous system, increasing the heart rate.
4. Pain increases the heart rate.
5. Increased body temperature causes the heart rate to increase.
6. Stimulant medications increase the heart rate; depressants and medications affecting the cardiac system slow it.
7. When the BP is low or when the client has decreased circulating volume, the heart rate is usually increased.
8. Hemorrhage increases the heart rate.

C. Assessing pulse qualities

1. When the pulse is being counted, note the rate, rhythm, strength (force or amplitude), and equality.
2. Once you have checked these parameters, use the grading scale for pulses to assess the information you have elicited (Box 10.2).

D. Pulse points and locations

1. The temporal artery can be palpated anterior to or in the front of the ear.
2. The carotid artery is located in the groove between the trachea and the sternocleidomastoid muscle, medial to and alongside the muscle.
3. The apical pulse may be detected at the left midclavicular, fifth intercostal space.
4. The brachial pulse is located above the elbow at the antecubital fossa, between the biceps and triceps muscles.
5. The radial pulse is located in the groove along the radial or thumb side of the client's inner wrist.
6. The ulnar pulse is located on the medial side of the wrist (little finger side of the forearm at the wrist).
7. The femoral pulse is located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine.
8. The popliteal pulse is located behind the knee.
9. The posterior tibial pulse is located on the inner side of the ankle, behind and below the medial malleolus (ankle bone).

BOX 10.2 Grading Scale for Pulses

- 4 + = Strong and bounding
- 3 + = Full pulse, increased
- 2 + = Normal, easily palpable
- 1 + = Weak, barely palpable
- 0 = Absent, not palpable

10. The dorsalis pedis pulse is located on the top of the foot, in line with the groove between the extensor tendons of the great and first toes.

 The apical pulse is counted for 1 full minute and is assessed in clients with an irregular radial pulse or a heart condition, before the administration of cardiac medications such as digoxin and beta blockers, and in children younger than 2 years.

E. Pulse deficit

1. In this condition, the peripheral pulse rate (radial pulse) is less than the ventricular contraction rate (apical pulse).
2. A pulse deficit indicates a lack of peripheral perfusion; it can be an indication of cardiac dysrhythmias.
3. One-examiner technique: Auscultate and count the apical pulse first and then immediately count the radial pulse.
4. Two-examiner technique: One person counts the apical pulse and the other counts the radial pulse simultaneously.
5. A pulse deficit indicates that cardiac contractions are ineffective, failing to send pulse waves to the periphery.
6. If a difference in pulse rate is noted, the PHCP is notified.

IV. Respirations

A. Description

1. Respiration is a mechanism the body uses to exchange gases between the atmosphere and the blood and between the blood and the cells.
2. Respiratory rates may vary with age.
3. The normal adult respiratory rate is 12 to 20 breaths per minute.

B. Nursing considerations

1. Many of the factors that affect the pulse rate also affect the respiratory rate.
2. An increased level of carbon dioxide or a lower level of oxygen in the blood results in an increase in respiratory rate.
3. Head injury or increased intracranial pressure will depress the respiratory center in the brain, resulting in shallow respirations or slowed breathing.
4. Medications such as opioid analgesics depress respirations.

5. Additional factors that can affect the respiratory rate include exercise, pain, anxiety, smoking, and body position.

C. Assessing respiratory rate

1. Count the client's respirations after measuring the radial pulse. (Continue to hold the client's wrist while counting the respirations, or position the hand on the client's chest.)
2. One respiration includes both inspiration and expiration.
3. The rate, depth, pattern, and sounds are assessed.

 The respiratory rate may be counted for 30 seconds and multiplied by 2, except in a client who is known to be very ill or is exhibiting irregular respirations, in which case respirations are counted for 1 full minute.

V. Blood Pressure

A. Description

1. Blood pressure (BP) is the force on the walls of an artery exerted by the pulsating blood under pressure from the heart.
2. The heart's contraction forces blood under high pressure into the aorta; the peak of maximum pressure when ejection occurs is the systolic pressure; the blood remaining in the arteries when the ventricles relax exerts a force known as the *diastolic pressure*.
3. The difference between the systolic and diastolic pressures is called the *pulse pressure*.
4. For an adult (age 18 years and older), a normal BP is a systolic pressure below 120 mm Hg and a diastolic pressure below 80 mm Hg.
5. A diagnosis of hypertension may be made when there are two or more readings on at least two subsequent health care visits greater than 120/80 mm Hg.
6. Categories of hypertension from the American College of Cardiology (**Box 10.3**)
7. For the International Society of Hypertension guidelines refer to: *Hypertension Clinical Practice Guidelines* (ISH, 2020), Medscape, May 29, 2020. <https://reference.medscape.com/viewarticle/931364>
8. In postural (orthostatic) hypotension, a normotensive client exhibits symptoms and low BP on rising to an upright position.
9. To obtain orthostatic vital sign measurements, check the BP and pulse with the client supine, sitting, and standing; readings are obtained 1 to 3 minutes after the client changes position.

B. Nursing considerations

1. Factors affecting BP
 - a. BP tends to increase as the aging process progresses.
 - b. Stress results in sympathetic stimulation that increases the BP.

BOX 10.3 Hypertension Categories and Guidelines

Categories

Normal: Less than 120/80 mm Hg

Elevated: Systolic between 120-129 mm Hg and diastolic less than 80 mm Hg

Stage 1: Systolic between 130-139 mm Hg or diastolic between 80-89 mm Hg

Stage 2: Systolic at least 140 mm Hg or diastolic at least 90 mm Hg

Hypertensive crisis: Systolic over 180 mm Hg and/or diastolic over 120 mm Hg, with clients needing prompt changes in medication if there are no other indications of problems, or immediate hospitalization if there are signs of organ damage.

Guidelines

- Using proper technique to measure blood pressure.
- Teaching the use of home blood pressure monitoring using validated devices.
- Appropriate training for health care providers to reveal *white-coat hypertension*.
- Prescribing medication for stage I hypertension if a client has already had a cardiovascular event such as a heart attack or stroke or is at high risk for heart attack or stroke based on age, the presence of diabetes mellitus, chronic kidney disease, or calculation of atherosclerotic risk (using the same risk calculator used in evaluating high cholesterol).
- Recognizing that many people will need two or more types of medications to control their blood pressure and that people may take their pills more consistently if multiple medications are combined into a single pill.
- Identifying socioeconomic status and psychosocial stress as risk factors for high blood pressure that should be considered in a client's plan of care.

From American College of Cardiology, 2017, New ACC/AHA High Blood Pressure Guidelines Lower Definition of Hypertension. <http://www.acc.org/latest-in-cardiology/articles/2017/11/08/11/47/mon-5pm-bp-guideline-aha-2017>

- c. The incidence of high BP is more common among Black and East Asian populations than in other populations.
 - d. Antihypertensive medications and opioid analgesics can decrease BP.
 - e. BP is typically lowest in the early morning, gradually increases during the day, and peaks in the late afternoon and evening.
 - f. Additional factors affecting the BP include smoking, activity, and body weight.
2. Guidelines for measuring BP
 - a. Determine the best site for assessment.
 - b. Avoid applying a cuff to an extremity into which intravenous (IV) fluids are infusing, where an arteriovenous shunt or stula is present, on the side on which breast or axillary surgery has been performed, or on an extremity that has been traumatized or is diseased.
 - c. The leg may be used if the brachial artery is inaccessible; the cuff is wrapped around the

thigh and the stethoscope is placed over the popliteal artery.

- d. Ensure that the client has not smoked or exercised in the 30 minutes before measurement, because both activities can yield falsely high readings.
- e. Have the client assume a sitting (with feet flat on floor) or lying position and then rest for 5 minutes before the measurement; ask the client not to speak during the measurement.
- f. Ensure that the cuff is fully deflated, and then wrap it evenly and snugly around the extremity.
- g. Ensure that the stethoscope being used fits the examiner and does not impair hearing.
- h. Document the first Korotkoff sound at phase 1 (heard as the blood pulsates through the vessel when air is released from the BP cuff and pressure on the artery is reduced) as the systolic pressure, and the beginning of the fifth Korotkoff sound at phase 5 as the diastolic pressure.
- i. BP readings obtained electronically with a vital sign monitoring machine should be checked with a manual cuff if there is any concern about the accuracy of the reading.

 When taking a BP, select the appropriate cuff size; a cuff that is too small will yield a falsely high reading, and a cuff that is too large will yield a falsely low one.

VI. Pulse Oximetry

A. Description

1. Pulse oximetry is a noninvasive test that registers the oxygen saturation of the client's hemoglobin.
2. The capillary oxygen saturation (SaO_2) is recorded as a percentage.
3. The normal value is 95% to 100%.
4. After a hypoxic client uses up the readily available oxygen (measured as the arterial oxygen pressure, PaO_2 , on arterial blood gas [ABG] testing), the reserve oxygen—that is, oxygen attached to the hemoglobin (SaO_2)—is drawn on to provide oxygen to the tissues.
5. A pulse oximeter reading can alert the nurse to hypoxemia before clinical signs occur.
6. If pulse oximetry readings are below normal, instruct the client in deep-breathing technique and recheck the pulse oximetry.

B. Nursing Considerations

1. A vascular, pulsatile area, such as the fingertip or earlobe, is needed to detect the degree of change in the transmitted light that measures the oxygenated and deoxygenated hemoglobin.
2. Factors that affect light transmission also affect the measurement of SpO_2
3. Some factors that affect light transmission can include sensor movement, fingernail polish,

hypotension, anemia, or peripheral vascular disorders.

C. Procedure

1. A sensor is placed on the client's finger, toe, nose, earlobe, or forehead to measure oxygen saturation, which then is displayed on a monitor.
2. Do not select an extremity with an impediment to blood flow or that is cold in temperature (cold fingers).

 A usual pulse oximetry reading is between 95% and 100%. A pulse oximetry reading lower than 90% necessitates PHCP notification; values below 90% are acceptable only in certain chronic conditions. Agency procedures and PHCP prescriptions are followed regarding actions to take for specific readings.

CLINICAL JUDGMENT: ANALYZE CUES

A client arrives from the postanesthesia care unit (PACU) at 1300, and the nurse is monitoring vital signs.

□□□□

□□□□

Temperature 37.2° C (98.9° F) orally

Temperature to be 36.8° C (98.2° F) orally

Heart rate 98 beats per minute

Heart rate 118 beats per minute

Respiratory rate 14 breaths per minute

Respiratory rate 18 breaths per minute

BP 142/78 mm Hg

BP 95/54 mm Hg

Oxygen saturation 95% on 3 L of oxygen via nasal cannula

Oxygen saturation 92% on 3 L of oxygen via nasal cannula

On analysis of the data, the client's vital signs are showing a significant change, particularly the blood pressure, heart rate, and oxygen saturation levels. Given the significant change and considering the client had surgery, the nurse analyzes these cues as an indication of *postoperative bleeding*.

VII. Pain

A. Types of pain

1. Acute/transient pain: Usually associated with an injury, medical condition, or surgical procedure; lasts hours to a few days
2. Chronic/persistent noncancer pain: Usually associated with long-term or chronic illnesses or disorders; may continue for months or even years
3. Chronic/episodic pain: Occurs sporadically over an extended period of time. Pain episodes last for hours, days, or weeks. Examples are migraine headaches and pain related to sickle cell crisis.
4. Cancer pain: Not all individuals with cancer have pain. Some have acute and/or chronic pain. Cancer pain is usually caused by tumor progression

and related pathological processes, invasive procedures, treatment toxicities, infection, and physical limitations.

5. Idiopathic pain: This is a chronic pain in the absence of an identifiable physical or psychological cause or pain perceived as excessive for the extent of an organic pathological condition.

B. Assessment

1. Pain is a highly individual experience.
2. Ask the client to describe pain in terms of timing, location, severity, quality, aggravating and precipitating factors, and relief measures.
3. Ask the client about the use of complementary and alternative therapies to alleviate pain.
4. Pain experienced by the older client may be manifested differently from pain experienced by members of other age-groups (e.g., sleep disturbances, changes in gait and mobility, decreased socialization, depression).
5. Clients with cognitive disorders (e.g., a client with dementia, a comatose client) may not be able to describe their pain experiences.
6. The nurse should be alert to nonverbal indicators of pain (Box 10.4).
7. Ask the client to use a number-based pain scale (a picture-based scale may be used in children or clients who cannot verbally describe their pain) to rate the degree of pain (Fig. 10.1).
8. Evaluate client response to nonpharmacological interventions.

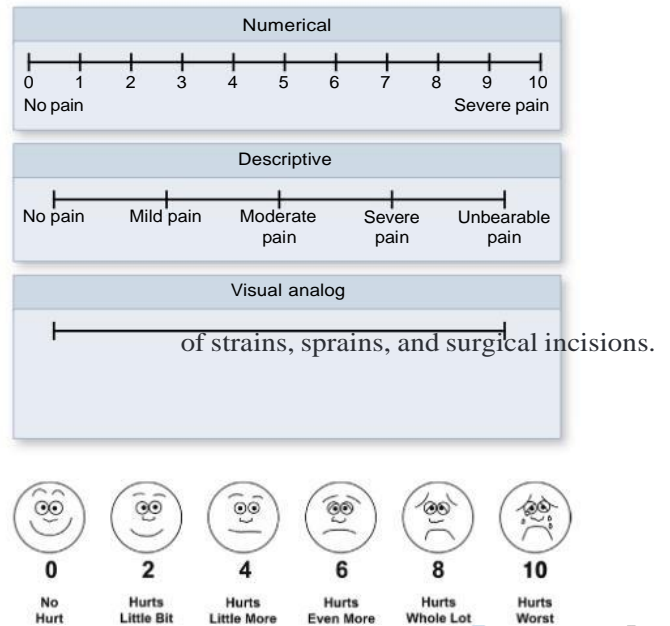

! Consider the client's culture and spiritual and religious beliefs in assessing pain; some cultures frown on the outward expression of pain.

C. Conventional nonpharmacological interventions

1. Cutaneous stimulation
 - a. Techniques include heat, cold, and pressure and vibration. Therapeutic touch and massage are also cutaneous stimulation and may be considered complementary and alternative techniques.
 - b. Such treatments may require a PHCP's prescription.
2. Transcutaneous electrical nerve stimulation (TENS)
 - a. TENS is also referred to as percutaneous electrical nerve stimulation (PENS).
 - b. This technique, which may require a PHCP's prescription, involves the application of a battery-operated device that delivers a low electrical current to the skin and underlying tissues to block pain (some similar units can be purchased without a prescription).
3. Binders, slings, and other supportive devices
 - a. Cloths or other materials or devices, wrapped around a limb or body part, can ease the pain

BOX 10.4 Nonverbal Indicators of Pain

- Moaning
- Crying
- Irritability
- Restlessness
- Grimacing or frowning
- Inability to sleep
- Rigid posture
- Increased blood pressure, heart rate, or respiratory rate
- Nausea
- Diaphoresis
- Use of the FLACC® (face, legs, activity, cry, consolability) scale or FACES® pain scale is appropriate for children or clients who cannot communicate their pain verbally. The scales are scored in a range of 0–10, with 0 representing no pain.

No pain

Unbearable
pain

Clients designate a point on the scale corresponding to their perception of the pain's severity at the time of assessment.

A

B

FIG. 10.1 Pain assessment scales. A, Numerical, descriptive, and visual analog scales. B, Wong-Baker FACES® Pain Rating Scale. (B, Copyright 1983, Wong-Baker FACES® Foundation, www.WongBakerFACES.org. Used with permission. Originally published in *Whaley & Wong's Nursing Care of Infants and Children*. ©Elsevier Inc.)

- b. Some devices may require a PHCP's prescription.
 - c. Elevation of the affected body part is another intervention that can reduce swelling; supporting an extremity on a pillow may lessen discomfort.
4. Heat and cold
- a. The application of heat and cold or alternating application of the two can soothe pain resulting from muscle strain; cold reduces swelling.

CLEX@Nepal

- b. In some conditions, such treatment may require a PHCP's prescription.
- c. Heat applications may include warm-water compresses, warm blankets, thermal pads, and tub and whirlpool baths.
- d. The temperature of the application must be monitored carefully to prevent burns; the skin of very young and older clients is extra sensitive to heat.
- e. The client should be advised to remove the source of heat or cold if changes in sensation or discomfort occur. If the change in sensation or discomfort is not relieved after removal of the application, the PHCP should be notified.

 Ice or heat should be applied with a towel or other barrier between the pack and the skin but should not be left in place for more than 15 to 30 minutes.

- D. Complementary and alternative therapies
 1. Description: Therapies are used in addition to conventional treatment to provide healing resources and focus on the mind-body connection (Box 10.5).
 2. Nursing considerations
 - a. Some complementary and alternative therapies require a PHCP's prescription.
 - b. Herbal remedies are considered pharmacological therapy by some PHCPs; because of the risk for interaction with prescription medications, it is important that the nurse ask the client about the use of such therapies.
 - c. If cultural or spiritual measures are to be employed, the nurse must elicit from the client the preferred forms of spiritual expression and learn when they are practiced so that they may be integrated into the plan of care.

VIII. Pharmacological Interventions

A. Nonopioid analgesics

1. Nonsteroidal antiinflammatory drugs (NSAIDs) and acetylsalicylic acid (aspirin) (Box 10.6)
 - a. These medication types are contraindicated if the client has gastric irritation or ulcer disease or an allergy to the medication.
 - b. Bleeding is a concern with the use of these medication types.
 - c. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
 - d. NSAIDs can amplify the effects of anticoagulants.
 - e. Hypoglycemia may result for the client taking ibuprofen if the client is concurrently taking an oral antidiabetic agent.
 - f. A high risk of toxicity exists if the client is taking ibuprofen concurrently with a calcium channel blocker.

BOX 10.5 Complementary and Alternative Therapies

Acupuncture and acupressure
 Biofeedback
 Chiropractic manipulation
 Distraction techniques
 Guided imagery and meditation techniques
 Herbal therapies
 Hypnosis
 Laughter and humor
 Art therapy, music therapy
 Massage
 Relaxation, breathing and repositioning techniques
 Spiritual measures (e.g., prayer, use of a rosary or prayer beads, reading of scripture)
 Therapeutic touch

BOX 10.6 Side and Adverse Effects of NSAIDs and Acetylsalicylic Acid

NSAIDs

- Gastric irritation
- Sodium and water retention
- Blood dyscrasias
- Tinnitus
- Pruritus

Acetylsalicylic Acid

- Gastric irritation
- Flushing
- Tinnitus

2. Acetaminophen

- a. Acetaminophen, commonly known as Tylenol, is contraindicated in clients with hepatic or renal disease, alcoholism, or hypersensitivity.
- b. Assess the client for a history of liver dysfunction.
- c. Monitor the client for signs of hepatic damage (e.g., nausea and vomiting, diarrhea, abdominal pain, jaundice).
- d. Monitor liver function parameters.
- e. Tell the client that self-medication should not continue longer than 10 days in an adult or 5 days in a child because of the risk of hepatotoxicity.
- f. The antidote to acetaminophen is acetylcysteine.

 The major concern with acetaminophen is hepatotoxicity.

B. Opioid analgesics

1. Description

- a. These medications suppress pain impulses but can also suppress respiration and coughing by acting on the respiratory and cough center, located in the medulla of the brainstem.

- b. Review the client's history, and note that clients with impaired renal or liver function may only be able to tolerate low doses of opioid analgesics; also assess for allergy.
- c. Intravenous route administration produces a faster effect than other routes, but the pain relief effect is shorter.
- d. Opioids, which produce euphoria and sedation, can cause physical dependence if used for long periods of time.
- e. Administer the medication 30 to 60 minutes before painful activities, such as coughing and deep breathing, ambulation, and dressing changes.
- f. Monitor the respiratory rate; if it is slower than 12 breaths per minute in an adult, withhold the medication and notify the PHCP.
- g. Monitor the pulse; if bradycardia develops, withhold the medication and notify the PHCP.
- h. Monitor the BP for hypotension and assess before administering pain medications to decrease the risk of adverse effects.
 - i. Auscultate the lungs for normal breath sounds.
 - j. Encourage activities such as turning, deep breathing, and incentive spirometry to help prevent atelectasis and pneumonia.
- k. Monitor the client's level of consciousness.
 - l. Initiate safety precautions.
- m. Monitor intake and output and assess the client for urine retention; also constipation is common with opioid use.
- n. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
- o. Instruct the client to avoid activities that require alertness.
- p. Assess the effectiveness of the medication 30 minutes after administration.
- q. Have an opioid antagonist (e.g., naloxone), oxygen, and resuscitation equipment available.
- r. Prescriptions for opioid analgesics can be given in only very specific circumstances. Specific forms regarding use of opioid analgesics, including risk assessment tools and informed consent forms, need to be reviewed and signed by the client. Prescription monitoring systems may need to be checked prior to a client filling a prescription for a controlled substance, to ensure that multiple prescriptions for the same medication are not being filled. Frequent collaboration between the nurse and the provider on continued need for this type of medication should be done.
- s. A pain management specialist needs to be consulted for complex pain management cases.

 An electronic infusion device is always used for continuous or dose-demand IV infusion of opioid analgesics.

C. Adjuvant analgesics

1. Description

- a. These medications are used to complement the effects of opioid analgesics.
- b. They are especially helpful for neuropathic pain.
- c. The medications that are used as adjuvant analgesics were originally developed to treat other conditions, such as depression, seizures, or dysrhythmias.
- d. Examples include amitriptyline, venlafaxine, and gabapentin.
- e. Nursing interventions depend on the medication class, side effects, and considerations for the adjuvant analgesic prescribed.
- f. Marijuana and other substances such as CBD may be considered for use for pain management, depending on physician preference and its legal status for use.

IX. Laboratory Reference Intervals

A. For reference throughout the chapter, see [Fig. 10.2](#).

B. Methods for drawing blood ([Table 10.1](#))

C. Serum sodium

- 1. A major cation of extracellular fluid
- 2. Maintains osmotic pressure and acid-base balance, and assists in the transmission of nerve impulses
- 3. Is absorbed from the small intestine and excreted in the urine in amounts dependent on dietary intake
- 4. Normal reference interval: 135 to 145 mEq/L (135 to 145 mmol/L)
- 5. Elevated values occur in the following: dehydration, impaired renal function, increased dietary or IV intake of sodium, primary aldosteronism, use of corticosteroid therapy
- 6. Below-normal values occur in the following: Addison's disease, decreased dietary intake of sodium, diabetic ketoacidosis, diuretic therapy, excessive loss from the gastrointestinal (GI) tract, excessive perspiration, water intoxication

 Drawing blood specimens from an extremity in which an IV solution is infusing can produce an inaccurate result, depending on the test being performed and the type of solution infusing. Prolonged use of a tourniquet before venous sampling can increase the blood level of potassium, producing an inaccurate result.

D. Serum potassium

- 1. A major intracellular cation, potassium regulates cellular water balance, electrical conduction in muscle cells, and acid-base balance.
- 2. The body obtains potassium through dietary ingestion and the kidneys preserve or excrete potassium, depending on cellular need.

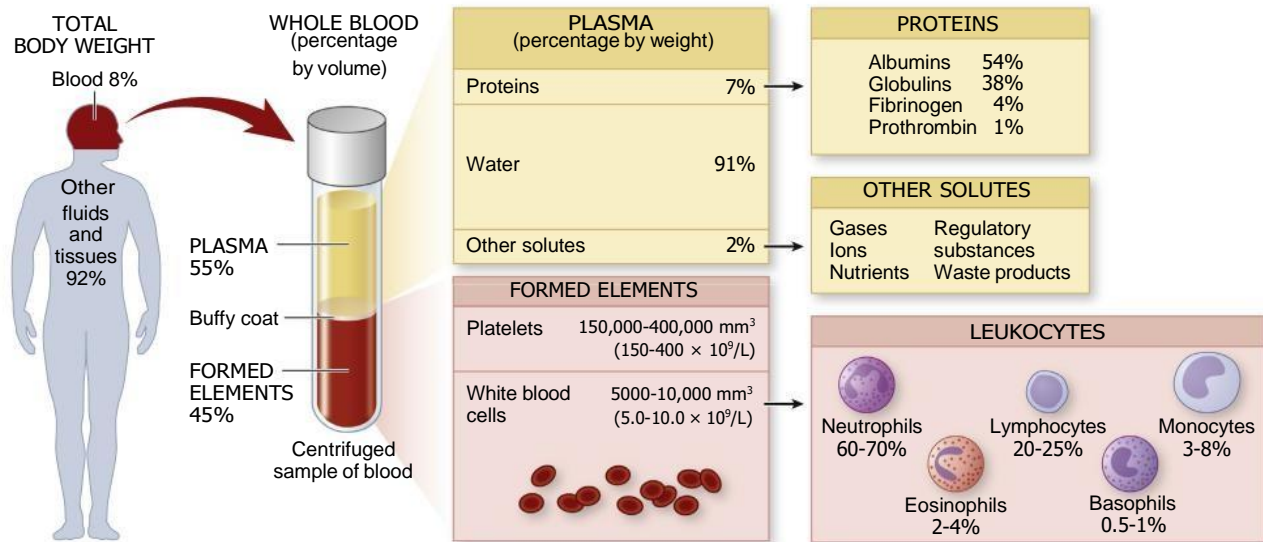

FIG. 10.2 Approximate values for the components of blood in a normal adult.

TABLE 10.1 Obtaining a Blood Sample

Peripheral Intravenous Line	Central Intravenous Line
Check PHCP's prescription. A blood sample may be drawn from a peripheral line on insertion, but typically not thereafter. Check the agency's policy on this practice.	Check PHCP's prescription.
Identify foods, medications, or other factors such as the type of solution infusing that may affect the procedure or results.	Identify foods, medications, or other factors such as the type of solution infusing that may affect the procedure or results.
Gather needed supplies, including gloves, tourniquet, transparent dressing or other type of dressing, tape, 2 x 2-inch gauze, antiseptic agent, extension set (optional), two 5- or 10-mL normal saline flushes, one empty 5- or 10-mL syringe (depending on the amount of blood needed), transfer/collection device per agency policy, specimen containers per agency policy, alcohol-impregnated intravenous (IV) line end caps, tube labels, biohazard bag, requisition form or bar code per agency policy.	Gather needed supplies, including gloves, transfer/collection device per agency policy, specimen containers per agency policy, two 5- or 10-mL normal saline flushes, one empty 5- or 10-mL syringe (depending on the amount of blood needed), antiseptic swabs, alcohol-impregnated IV line end caps, two masks, biohazard bag, requisition form or bar code per agency policy.
Perform hand hygiene. Identify the client with at least two accepted identifiers.	Perform hand hygiene. Identify the client with at least two accepted identifiers.
Explain the purpose of the test and procedure to the client.	Explain the purpose of the test and procedure to the client.
Prepare extension set if being used by priming with normal saline. Attach syringe to extension set. Place extension set within reach while maintaining aseptic technique and keeping it in the package.	Place mask on self (if one is not already being worn) and client, or ask client to turn the head away. Stop any running infusions for at least 1 minute.
Apply tourniquet 10 to 15 cm above intravenous site.	Clamp all ports. Scrub port to be used with antiseptic swab.
Apply gloves. Scrub tubing insertion port with antiseptic solution or per agency policy.	Attach 5- or 10-mL normal saline flush and unclamp line. Flush line with appropriate amount per agency policy and withdraw 5-10 mL of blood to discard (per agency policy). Clamp line and detach flush syringe.
Attach 5- or 10-mL normal saline flush and unclamp line. Flush line with appropriate amount per agency policy and withdraw 5-10 mL of blood to discard (per agency policy). Clamp line and detach flush syringe.	Scrub port with antiseptic swab. Attach 5- or 10-mL syringe or transfer/collection device to port (depending on available equipment), unclamp line, and withdraw needed sample, or attach specimen container to withdraw using vacuum system. Clamp line and detach syringe or transfer/collection device.
Scrub tubing insertion port. Attach 5- or 10-mL syringe, extension set, or transfer/collection device to port (depending on available equipment), unclamp line, and withdraw needed sample, or attach specimen container to withdraw using vacuum system. Clamp line and detach syringe or transfer/collection device.	Scrub port with antiseptic swab. Attach a 5- or 10-mL normal saline flush. Unclamp line and flush with amount per agency policy. Clamp line, remove flush syringe, and place endcap on IV line. Remove masks if appropriate and acceptable to do so.
Remove tourniquet and flush with normal saline to ensure patency.	Transfer specimen to collection device per agency policy and procedure.
Send specimen to the laboratory in biohazard bag with associated requisition forms or bar codes per agency policy.	Send specimen to the laboratory in biohazard bag with associated requisition forms or bar codes per agency policy.

3. Potassium levels are used to evaluate cardiac function, renal function, gastrointestinal function, and the need for IV replacement therapy.
 4. If the client is receiving a potassium supplementation, this needs to be noted on the laboratory form.
 5. Normal reference interval: 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L)
 6. Elevated values occur in the following: acute kidney injury or chronic kidney disease, Addison's disease, dehydration, diabetic ketoacidosis, excessive dietary or IV intake of potassium, massive tissue destruction, metabolic acidosis
 7. Below-normal values occur in the following: burns, Cushing's syndrome, deficient dietary intake of potassium, diarrhea (severe), diuretic therapy, GI fistula, insulin administration, pyloric obstruction, starvation, vomiting
 8. Clients with elevated white blood cell (WBC) counts and platelet counts may have falsely elevated potassium levels.
- E. Activated partial thromboplastin time (aPTT)
1. The aPTT evaluates how well the coagulation sequence (intrinsic clotting system) is functioning by measuring the amount of time it takes in seconds for recalcified citrated plasma to clot after partial thromboplastin is added to it.
 2. The test screens for deficiencies and inhibitors of all factors, except factors VII and XIII.
 3. Usually, the aPTT is used to monitor the effectiveness of heparin therapy and screen for coagulation disorders.
 4. Normal reference interval: 30 to 40 seconds (conventional and SI units [International System of Units]), depending on the type of activator used.
 5. If the client is receiving intermittent heparin therapy, draw the blood sample 1 hour before the next scheduled dose.
 6. Do not draw samples from an arm into which heparin is infusing.
 7. Transport specimen to the laboratory immediately.
 8. Provide direct pressure to the venipuncture site for 3 to 5 minutes.
 9. The aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy.
 10. Elevated values occur in the following: deficiency of one or more of the following: factor I, II, V, or VIII; factors IX and X; factor XI; and factor XII; hemophilia; heparin therapy; liver disease
- F. Prothrombin time (PT) and international normalized ratio (INR)
1. Prothrombin is a vitamin K-dependent glycoprotein produced by the liver that is necessary for fibrin clot formation.
 2. Each laboratory establishes a normal or control value based on the method used to perform the PT test.
 3. The PT measures the amount of time it takes in seconds for clot formation and is used to monitor response to warfarin sodium therapy or to screen for dysfunction of the extrinsic clotting system resulting from liver disease, vitamin K deficiency, or disseminated intravascular coagulation.
 4. A PT value within 2 seconds (plus or minus) of the control is considered normal.
 5. The INR is a frequently used test to measure the effects of some anticoagulants.
 6. The INR standardizes the PT ratio and is calculated in the laboratory setting by raising the observed PT ratio to the power of the international sensitivity index specific to the thromboplastin reagent used.
 7. If a PT is prescribed, a baseline specimen should be drawn before anticoagulation therapy is started; note the time of collection on the laboratory form.
 8. Provide direct pressure to the venipuncture site for 3 to 5 minutes.
 9. Concurrent warfarin therapy with heparin therapy can lengthen the PT for up to 5 hours after dosing.
 10. Diets high in green leafy vegetables can increase the absorption of vitamin K, which shortens the PT.
 11. Orally administered anticoagulation therapy usually maintains the PT at 1.5 to 2 times the laboratory control value.
 12. Normal reference intervals
 - a. PT: 11 to 12.5 seconds (conventional and SI units)
 - b. INR: 0.81 to 1.20 (conventional and SI units)
 13. For both the PT and INR, elevated values occur in the following: deficiency of one or more of the following: factor I, II, V, VII, or X; liver disease; vitamin K deficiency; warfarin therapy

 If the aPTT value is prolonged (longer than 100 seconds or per agency policy) in a client receiving IV heparin therapy or in any client at risk for thrombocytopenia, initiate bleeding precautions.

 If the PT value is longer than 25 seconds and the INR is greater than 3.0 in a client receiving standard warfarin therapy (or per agency policy), initiate bleeding precautions.

- G. Platelet count
1. Platelets function in hemostatic plug formation, clot retraction, and coagulation factor activation.
 2. Platelets are produced by the bone marrow to function in hemostasis.

3. Normal reference interval: 150,000 to 400,000 mm³ (150 to 400 × 10⁹/L)
4. Elevated values occur in the following: acute infections, chronic granulocytic leukemia, chronic pancreatitis, cirrhosis, collagen disorders, polycythemia, and postsplenectomy; high altitudes and chronic cold weather can increase values.
5. Below-normal values occur in the following: acute leukemia, chemotherapy, disseminated intravascular coagulation, hemorrhage, infection, systemic lupus erythematosus, thrombocytopenic purpura.
6. Monitor the venipuncture site for bleeding in clients with known thrombocytopenia.
7. Bleeding precautions should be instituted in clients when the platelet count falls sufficiently below the normal level; the specific value for implementing bleeding precautions usually is determined by agency policy.

 **Monitor the platelet count closely in clients receiving chemotherapy because of the risk for thrombocytopenia. In addition, any client who will be having an invasive procedure (such as a liver biopsy or thoracentesis) should have coagulation studies and platelet counts done before the procedure.**

H. Hemoglobin and hematocrit

1. Hemoglobin is the main component of erythrocytes and serves as the vehicle for transporting oxygen and carbon dioxide.
2. Hematocrit represents red blood cell (RBC) mass and is an important measurement in the presence of anemia or polycythemia (Table 10.2).
3. Fasting is not required for this test.
4. Elevated values occur in the following:
 - a. Hemoglobin: chronic obstructive pulmonary disease, high altitudes, polycythemia
 - b. Hematocrit: dehydration, high altitudes, polycythemia
5. Below-normal values occur in the following:
 - a. Hemoglobin: anemia, hemorrhage
 - b. Hematocrit: anemia, bone marrow failure, hemorrhage, leukemia, overhydration

I. Lipids

1. Blood lipids consist primarily of cholesterol, triglycerides, and phospholipids.
2. Lipid assessment includes total cholesterol, high-density lipoprotein (HDL), low-density lipoprotein (LDL), and triglycerides.
3. Cholesterol is present in all body tissues and is a major component of LDLs, brain and nerve cells, cell membranes, and some gallbladder stones.
4. Low-density lipoprotein (LDL) transports cholesterol from the liver to the tissues of the body.

TABLE 10.2 Hemoglobin and Hematocrit: Reference Intervals

Blood Component	Reference Interval
Hemoglobin (altitude dependent)	
Male adult	14-18 g/dL (140-180 g/L)
Female adult	12-16 g/dL (120-160 g/L)
Hematocrit (altitude dependent)	
Male adult	42%-52% (0.42-0.52)
Female adult	37%-47% (0.37-0.47)

5. Triglycerides are synthesized in the liver from fatty acids, protein, and glucose and are obtained from the diet.
 6. Increased cholesterol levels, LDL levels, and triglyceride levels place the client at risk for coronary artery disease.
 7. HDL helps protect against the risk of coronary artery disease.
 8. Instruct the client to abstain from food and liquid, except for water, for 12 to 14 hours and from alcohol for 24 hours before the test.
 9. Instruct the client to avoid consuming high-cholesterol foods with the evening meal before the test.
 10. Normal reference intervals (Table 10.3)
 11. Elevated values occur in the following:
 - a. Cholesterol, LDL: biliary obstruction, cirrhosis hyperlipidemia, hypothyroidism, idiopathic hypercholesterolemia, renal disease, uncontrolled diabetes, oral contraceptive use
 - b. Triglycerides: diabetes mellitus, hyperlipidemia, hypothyroidism, liver disease
 12. Below-normal values occur in the following:
 - a. Cholesterol, LDL: extensive liver disease, hyperthyroidism, malnutrition, use of corticosteroid therapy
 - b. Triglycerides: hyperthyroidism, malabsorption syndrome, malnutrition
- #### J. Fasting blood glucose
1. Glucose is a monosaccharide found in fruits and is formed from the digestion of carbohydrates and the conversion of glycogen by the liver.
 2. Glucose is the main source of cellular energy for the body and is essential for brain and erythrocyte function.
 3. Fasting blood glucose levels are used to assist in diagnosing diabetes mellitus and hypoglycemia.
 4. Instruct the client to fast for 8 to 12 hours before the test.
 5. Instruct a client with diabetes mellitus to withhold morning insulin or oral hypoglycemic medication until after the blood is drawn.
 6. Normal reference interval: glucose (fasting) 70-99 mg/dL (3.9-5.5 mmol/L)

TABLE 10.3 Lipids: Reference Intervals

Blood Component	Reference Interval
Cholesterol	< 200 mg/dL (<5.0 mmol/L)
High-density lipoproteins (HDLs)	> 60 mg/dL (>1.55 mmol/L)
Low-density lipoproteins (LDLs)	< 100 mg/dL (<2.59 mmol/L)
Triglycerides	Male: 40-160 mg/dL (0.45-1.81 mmol/L) Female: 35-135 mg/dL (0.40-1.52 mmol/L)

TABLE 10.4 Glycosylated Hemoglobin (HbA_{1c}) and Estimated Average Glucose (eAG)

HbA _{1c} %	eAG mg/dL	eAG mmol/L
5	100	5.57
6	126	7.0
7	154	8.6
8	183	10.1
9	212	11.8
10	240	13.4

Modified from: American Diabetes Association, 2020, <https://www.diabetes.org/a1c>; and Pagana, K., Pagana, T., & Pagana, T.N. (2021). *Mosby's diagnostic and laboratory tests reference*. (15th ed.). St. Louis: Mosby. p. 474.

7. Elevated values occur in the following: acute stress, cerebral lesions, Cushing's syndrome, diabetes mellitus, hyperthyroidism, pancreatic insufficiency
8. Below-normal values occur in the following: Addison's disease, hepatic disease, hypothyroidism, insulin overdose, pancreatic tumor, pituitary hypofunction, postdumping syndrome

K. Glycosylated hemoglobin (HbA_{1c})

1. HbA_{1c} is blood glucose bound to hemoglobin.
2. Hemoglobin A_{1c} (glycosylated hemoglobin A; HbA_{1c}) is a reflection of how well blood glucose levels have been controlled for the past 3 to 4 months.
3. Fasting is not required before the test.
4. Normal reference interval: <5.7%. A level of 5.7% to 6.4% indicates prediabetes, and a level of 6.5% or more indicates diabetes. Within the 5.7% to 6.4% prediabetes range, the higher your HbA_{1c}, the greater your risk is for developing type 2 diabetes (American Diabetes Association, 2020, <https://www.diabetes.org/a1c>).
5. Elevated values occur in the following: nondiabetic hyperglycemia, poorly controlled diabetes mellitus
6. Below-normal values occur in the following: chronic blood loss, chronic kidney disease, pregnancy, sickle cell anemia
7. HbA_{1c} and estimated average glucose (eAG) reference intervals (Table 10.4)

L. Renal function studies

1. Serum creatinine
 - a. Creatinine is a specific indicator of renal function.
 - b. Increased levels of creatinine indicate a slowing of the glomerular filtration rate.
 - c. Instruct the client to avoid excessive exercise for 8 hours and excessive red meat intake for 24 hours before the test.
 - d. Normal reference interval: Male: 0.6 to 1.2 mg/dL (53 to 106 μmol/L); female: 0.5 to 1.1 mg/dL (44 to 97 μmol/L)
 - e. Elevated values occur in severe renal disease.
 - f. Below-normal values occur in diseases with decreased muscle mass such as muscular dystrophy and myasthenia gravis.

2. Blood urea nitrogen (BUN)

- a. Urea nitrogen is the nitrogen portion of urea, a substance formed in the liver through an enzymatic protein breakdown process.
- b. Urea is normally freely filtered through the renal glomeruli, with a small amount reabsorbed in the tubules and the remainder excreted in the urine.
- c. BUN and creatinine ratios should be analyzed when renal function is evaluated.
- d. Normal reference interval: 10 to 20 mg/dL (3.6 to 7.1 mmol/L)
- e. Elevated levels indicate a slowing of the glomerular filtration rate.
- f. Elevated values occur in the following: burns, dehydration, GI bleeding, increase in protein catabolism (fever, stress), renal disease, shock, urinary tract infection
- g. Below-normal values occur in the following: fluid overload, malnutrition, severe liver damage, syndrome of inappropriate antidiuretic hormone

M. White blood cell (WBC) count

1. WBCs function in the immune defense system of the body.
2. The WBC differential provides specific information on WBC types.
3. A "shift to the left" (in the differential) means that an increased number of immature neutrophils are present in the blood.
4. A low total WBC count with a left shift indicates a recovery from bone marrow depression or an infection of such intensity that the demand for neutrophils in the tissue is higher than the capacity of the bone marrow to release them into the circulation.
5. A high total WBC count with a left shift indicates an increased release of neutrophils by the bone marrow in response to an overwhelming infection or inflammation.
6. An increased neutrophil count with a left shift is usually associated with bacterial infection.

7. A “shift to the right” means that cells have more than the usual number of nuclear segments; found in liver disease, Down’s syndrome, and megaloblastic and pernicious anemia.
8. Normal reference interval: 5000 to 10,000 mm³ (5.0 to 10.0 × 10⁹/L)
9. Elevated values occur in the following: inflammatory and infectious processes, leukemia
10. Below-normal values occur in the following: aplastic anemia, autoimmune diseases, overwhelming infection, side effects of chemotherapy and irradiation

▲ Monitor the WBC count and differential closely in clients receiving chemotherapy because of the risk for neutropenia; neutropenia places the client at risk for infection.

PRACTICE QUESTIONS

1. A client with atrial fibrillation who is receiving maintenance therapy of warfarin sodium has a prothrombin time (PT) of 35 seconds. On the basis of these laboratory values, the nurse anticipates which prescription?
 1. Adding a dose of heparin sodium
 2. Holding the next dose of warfarin
 3. Increasing the next dose of warfarin
 4. Administering the next dose of warfarin
2. A nurse is precepting a new graduate nurse, and the new graduate is assigned to care for a client with chronic pain. Which statement, if made by the new graduate nurse, indicates the need for further teaching regarding pain management?
 1. “I will be sure to ask my client what their pain level is on a scale of 0 to 10.”
 2. “I know that I should follow up after giving medication to make sure it is effective.”
 3. “I will be sure to cue in to any indicators that the client may be exaggerating pain.”
 4. “I know that pain in the older client might manifest as sleep disturbances or depression.”
3. A client has been admitted to the hospital for gastroenteritis and dehydration. The nurse determines that the client has received adequate volume replacement if the blood urea nitrogen (BUN) level drops to which value?
 1. 3 mg/dL (1.08 mmol/L)
 2. 15 mg/dL (5.4 mmol/L)
 3. 29 mg/dL (10.44 mmol/L)
 4. 35 mg/dL (12.6 mmol/L)
4. The nurse is explaining the appropriate methods for measuring an accurate temperature to an assistive personnel (AP). Which method, if noted by the AP as being an appropriate method, indicates the need for further teaching?
 1. Taking a rectal temperature for a client who has undergone nasal surgery
 2. Taking an oral temperature for a client with a cough and nasal congestion
 3. Taking an axillary temperature for a client who has just consumed hot coffee
 4. Taking a temperature on the neck behind the ear using an electronic device for a client who is diaphoretic
5. A client is receiving a continuous intravenous infusion of heparin sodium to treat deep vein thrombosis. The client’s activated partial thromboplastin time (aPTT) is 65 seconds. The nurse anticipates that which action is needed?
 1. Discontinuing the heparin infusion
 2. Increasing the rate of the heparin infusion
 3. Decreasing the rate of the heparin infusion
 4. Leaving the rate of the heparin infusion as is
6. A client with a history of heart failure is due for a morning dose of furosemide. Which serum potassium level, if noted in the client’s laboratory report, would the nurse report before administering the dose of furosemide?
 1. 3.2 mEq/L (3.2 mmol/L)
 2. 3.8 mEq/L (3.8 mmol/L)
 3. 4.2 mEq/L (4.2 mmol/L)
 4. 4.8 mEq/L (4.8 mmol/L)
7. Several laboratory tests are prescribed for a client, and the nurse reviews the results of the tests. Which laboratory test results would the nurse report? Select all that apply.
 - Platelets 35,000 mm³ (35 × 10⁹/L)
 - Sodium 150 mEq/L (150 mmol/L)
 - Potassium 5.0 mEq/L (5.0 mmol/L)
 - Segmented neutrophils 40% (0.40)
 - Serum creatinine, 1 mg/dL (88.3 μmol/L)
 - White blood cells, 3000 mm³ (3.0 × 10⁹/L)
8. The nurse is assessing a client who takes ibuprofen for pain. The nurse is gathering information on the client’s medication history and determines it is necessary to notify the primary health care provider (PHCP) if the client is also taking which medications? Select all that apply.
 - Warfarin
 - Glimepiride
 - Amlodipine
 - Simvastatin
 - Atorvastatin
9. A client with diabetes mellitus has a glycosylated hemoglobin A1c level of 8%. On the basis of this test result, the nurse plans to teach the client about the need for which measure?
 1. Avoiding infection
 2. Taking in adequate fluids

3. Preventing and recognizing hypoglycemia
 4. Preventing and recognizing hyperglycemia
10. The nurse is caring for a client with a diagnosis of breast cancer who is immunosuppressed. The nurse would implement neutropenic precautions if the client's white blood cell count was which value?
 1. 2000 mm³ (2.0 × 10⁹/L)
 2. 5800 mm³ (5.8 × 10⁹/L)
 3. 8400 mm³ (8.4 × 10⁹/L)
 4. 11,500 mm³ (11.5 × 10⁹/L)
 11. A client with a history of atrial fibrillation brought to the emergency department has accidentally been taking two times the prescribed dose of warfarin for the past week. After noting that the client has no evidence of obvious bleeding, the nurse plans to take which action?
 1. Prepare to administer an antidote.
 2. Draw a sample for type and crossmatch and transfuse the client.
 3. Draw a sample for an activated partial thromboplastin time (aPTT) level.
 4. Draw a sample for prothrombin time (PT) and international normalized ratio (INR).
 12. The nurse is caring for a postoperative client who is receiving demand-dose hydromorphone via a patient-controlled analgesia (PCA) pump for pain control. The nurse enters the client's room and finds the client drowsy and records the following vital signs: temperature 97.2° F (36.2° C) orally, pulse 52 beats per minute, blood pressure 101/58 mm Hg, respiratory rate 11 breaths per minute, and SpO₂ of 93% on 3 liters of oxygen via nasal cannula. Which action would the nurse take first?
 1. Document the findings.
 2. Attempt to arouse the client.
 3. Contact the primary health care provider (PHCP).
 4. Check the medication administration history on the PCA pump.
 13. A client has a hemoglobin level of 10.8 g/dL (108 mmol/L). The nurse interprets that this result is most likely caused by which condition noted in the client's history?
 1. Dehydration
 2. Heart failure
 3. Iron-deficiency anemia
 4. Chronic obstructive pulmonary disease
 14. A client with peptic ulcer disease and a history of upper gastrointestinal bleeding has a platelet count of 300,000 mm³ (300 × 10⁹/L). The nurse would plan to take which action after seeing the laboratory results?
 1. Report the abnormally low count.
 2. Report the abnormally high count.
 3. Place the client on bleeding precautions.
 4. Place the normal report in the client's medical record.

ANSWERS

1. Answer: 2

Rationale: The normal PT is 11 to 12.5 seconds (conventional therapy and SI units). A therapeutic PT level is 1.5 to 2 times higher than the normal level. Because the value of 35 seconds is high, the nurse would anticipate that the client would not receive further doses at this time. Therefore, the prescriptions noted in the remaining options are incorrect.

Test-Taking Strategy: Focus on the **subject**, a PT of 35 seconds. Recall the normal range for this value and remember that a PT greater than 25 seconds places the client at risk for bleeding; this will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 599.

2. Answer: 3

Rationale: Pain is a highly individual experience, and the new graduate nurse would not assume that the client is exaggerating pain. Rather, the nurse would frequently assess the pain and intervene accordingly through the use of both nonpharmacological and pharmacological interventions. The nurse would assess pain using a number-based scale or a picture-based scale for clients who cannot verbally describe their pain. The nurse would follow up with the client after giving medication to ensure that the medication is effective in managing the

pain. Pain experienced by the older client may be manifested differently from pain experienced by clients in other age-groups. Older clients with pain may experience sleep disturbances, changes in gait and mobility, decreased socialization, and depression; the nurse needs to be aware of this attribute in this population.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. These words indicate a **negative event query** and the need to select the incorrect statement as the answer. Recall that pain is a highly individual experience, and the nurse would not assume that the client is exaggerating pain.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 107-108.

3. Answer: 2

Rationale: The normal BUN level is 10 to 20 mg/dL (3.6 to 7.1 mmol/L). Values of 29 mg/dL (10.44 mmol/L) and 35 mg/dL (12.6 mmol/L) reflect continued dehydration. A value of 3 mg/dL (1.08 mmol/L) reflects a lower-than-normal value, which may occur with fluid volume overload, among other conditions.

Test-Taking Strategy: Focus on the **subject**, adequate fluid replacement and the normal BUN level. The correct option is the only option that identifies a normal value.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing:*

Assessment and management of clinical problems. (11th ed.). St. Louis: Mosby. p. 1632.

4. Answer: 2

Rationale: An oral temperature should be avoided if the client has nasal congestion. One of the other methods of measuring the temperature should be used, according to the equipment available. Taking a rectal temperature for a client who has undergone nasal surgery is appropriate. Other, less invasive measures should be used if available; if not available, a rectal temperature is acceptable. Taking an axillary temperature on a client who just consumed coffee is also acceptable; however, the axillary method of measurement is the least reliable, and other methods should be used if available. If electronic equipment is available and the client is diaphoretic, it is acceptable to measure the temperature on the neck behind the ear, avoiding the forehead.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. These words indicate a **negative event query** and the need to select the incorrect action as the answer. Recall that nasal congestion is a reason to avoid taking an oral temperature, as the nasal congestion will cause problems with breathing while the temperature is being taken.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing.* (10th ed.). St. Louis: Elsevier. p. 468.

5. Answer: 4

Rationale: The normal aPTT varies between 30 and 40 seconds (30 and 40 seconds), depending on the type of activator used in testing. The therapeutic dose of heparin for treatment of deep vein thrombosis is to keep the aPTT between 1.5 times (45 to 60) and 2.5 times (75 to 100) normal. This means that the client's value should not be less than 45 seconds or greater than 100 seconds. Thus, the client's aPTT is within the therapeutic range and the dose should remain unchanged.

Test-Taking Strategy: Focus on the **subject**, the expected aPTT for a client receiving a heparin sodium infusion. Remember that the normal range is 30 to 40 seconds and that the aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy. Simple multiplication of 1.5 and 2.5 by 30 and 40 will yield a range of 45 to 100 seconds. This client's value is 65 seconds.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Mosby. p. 599.

6. Answer: 1

Rationale: The normal serum potassium level in the adult is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). The correct option is the only value that falls below the therapeutic range. Administering furosemide to a client with a low potassium level and a history of cardiac problems could precipitate ventricular dysrhythmias. The remaining options are within the normal range.

Test-Taking Strategy: Note the **subject** of the question, the level that needs to be reported. This indicates that you are looking for an abnormal level. Remember, the normal serum potassium level in the adult is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). This will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Mosby. pp. 279-280.

7. Answer: 1, 2, 4, 6

Rationale: The normal values include the following: platelets 150,000 to 400,000 mm³ (150 to 400 × 10⁹/L); sodium 135 to 145 mEq/L (135 to 145 mmol/L); potassium 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L); segmented neutrophils 62% to 68% (0.62 to 0.68); serum creatinine male: 0.6 to 1.2 mg/dL (53 to 106 mcmmol/L); female: 0.5 to 1.1 mg/dL (44 to 97 mcmmol/L); and white blood cells 5000 to 10,000 mm³ (5.0 to 10.0 × 10⁹/L). The platelet level noted is low; the sodium level noted is high; the potassium level noted is normal; the segmented neutrophil level noted is low; the serum creatinine level noted is normal; and the white blood cell level is low.

Test-Taking Strategy: Focus on the **subject**, the abnormal laboratory values that need to be reported. Knowledge of the normal laboratory values for the blood studies identified in the options will assist in answering this question.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Mosby. pp. 599, 1631, 1633.

8. Answer: 1, 2, 3

Rationale: Nonsteroidal antiinflammatory drugs (NSAIDs) can amplify the effects of anticoagulants; therefore, these medications should not be taken together. Hypoglycemia may result for the client taking ibuprofen if the client is concurrently taking an oral antidiabetic agent such as glimepiride; these medications should not be combined. A high risk of toxicity exists if the client is taking ibuprofen concurrently with a calcium channel blocker such as amlodipine; therefore, this combination should be avoided. There is no known interaction between ibuprofen and simvastatin or atorvastatin.

Test-Taking Strategy: Note the **subject** of the question, data provided by the client necessitating contacting the PHCP. Determining that ibuprofen is classified as an NSAID will help you determine that it should not be combined with anticoagulants. Also recalling that hypoglycemia can occur as an adverse effect if taken with antidiabetic agents will help you recall that these medications should not be combined. From the remaining options, it is necessary to remember that toxicity can result if NSAIDs are combined with calcium channel blockers. Also note that options 4 and 5 are **comparable or alike** and are antilipemic medications. This will assist in eliminating these options.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems.* (11th ed.). St. Louis: Mosby. p. 111.

9. Answer: 4

Rationale: The normal reference range for the glycosylated hemoglobin A1c is less than 5.7%. This test measures the amount of glucose that has become permanently bound to the red blood cells from circulating glucose. Erythrocytes live for about 120 days, giving feedback about blood glucose for the past 120 days. Elevations in the blood glucose level

will cause elevations in the amount of glycosylation. Thus, the test is useful in identifying clients who have periods of hyperglycemia that are undetected in other ways. The estimated average glucose for a glycosylated hemoglobin A1c of 8% is 183 mg/dL (10.1 mmol/L). Elevations indicate continued need for teaching related to the prevention of hyperglycemic episodes.

Test-Taking Strategy: Focus on the **subject**, a glycosylated hemoglobin A1c level of 8%. Recalling the normal value and that an elevated value indicates hyperglycemia will assist in directing you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 1112-1113.

10. Answer: 1

Rationale: The normal WBC count ranges from 5000 to 10,000 mm³ (5 to 10 × 10⁹/L). The client who has a decrease in the number of circulating WBCs is immunosuppressed. The nurse implements neutropenic precautions when the client's values fall sufficiently below the normal level. The specific value for implementing neutropenic precautions usually is determined by agency policy. The remaining options are normal values.

Test-Taking Strategy: Focus on the **subject**, the need to implement neutropenic precautions. Recalling what neutropenic precautions involve and that the normal WBC count is 5000 to 10,000 mm³ (5 to 10 × 10⁹/L) will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 1633.

11. Answer: 4

Rationale: The nurse would plan to draw a sample for PT and INR level to determine the client's anticoagulation status and risk for bleeding. These results will provide information as to how to best treat this client (e.g., if an antidote such as vitamin K or a blood transfusion is needed). The aPTT monitors the effects of heparin therapy.

Test-Taking Strategy: Focus on the **subject**, a client who has taken an excessive dose of warfarin. Eliminate the option with aPTT first because it is unrelated to warfarin therapy and relates to heparin therapy. Next, eliminate the options indicating to administer an antidote and to transfuse the client because these therapies would not be implemented unless the PT and INR levels were known.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 787-788.

12. Answer: 2

Rationale: The primary concern with opioid analgesics is respiratory depression and hypotension. Based on the assessment findings, the nurse would suspect opioid overdose. The nurse would first attempt to arouse the client and then reassess the vital signs. The vital signs may begin to normalize once the client is aroused, because sleep can also cause

decreased heart rate, blood pressure, respiratory rate, and oxygen saturation. The nurse would also check to see how much medication has been taken via the PCA pump and would continue to monitor the client closely to determine whether further action is needed. The nurse would contact the PHCP and document the findings after all data are collected, after the client is stabilized, and if an abnormality still exists after arousing the client.

Test-Taking Strategy: First, note the **strategic word**, *first*. Focus on the **data in the question** and determine if an **abnormality exists**. It is clear that an abnormality exists because the client is drowsy and the vital signs are outside of the normal range. Recall that attempting to arouse the client would come before further assessment of the pump. The client would always be assessed before the equipment, before contacting the PHCP, and before documentation.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 114 - 115.

13. Answer: 3

Rationale: The normal hemoglobin level for an adult ranges from 12 to 18 g/dL (120 to 180 g/L). Iron-deficiency anemia can result in lower hemoglobin levels. Dehydration may increase the hemoglobin level by hemoconcentration. Heart failure and chronic obstructive pulmonary disease may increase the hemoglobin level as a result of the body's need for more oxygen-carrying capacity.

Test-Taking Strategy: Note the **strategic words**, *most likely*. Evaluate each of the conditions in the options in terms of their pathophysiology and whether each is likely to raise or lower the hemoglobin level. Also, note the relationship between hemoglobin level in the question and the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 599.

14. Answer: 4

Rationale: A normal platelet count ranges from 150,000 to 400,000 mm³ (150 to 400 × 10⁹/L). The nurse should place the report containing the normal laboratory value in the client's medical record. A platelet count of 300,000 mm³ (300 × 10⁹/L) is not an elevated count. The count also is not low; therefore, bleeding precautions are not needed.

Test-Taking Strategy: Focus on the **subject**, a platelet count of 300,000 mm³ (300 × 10⁹/L). Remember that options that are **comparable or alike** are unlikely to be correct. With this in mind, eliminate options 1 and 3 first, to report the abnormally low count and to place the client on bleeding precautions. From the remaining options, recalling the normal range for this laboratory test will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p.599.

Nutrition

Contributor: Janelle Willis, MSN, APRN, CNE

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS Health Promotion; Nutrition

I. Nutrients

A. Carbohydrates

1. Carbohydrates are the preferred source of energy.
2. Each gram of a carbohydrate produces 4 kcal/g. Carbohydrates promote normal fat **metabolism**; inadequate carbohydrate intake affects metabolism.
3. Carbohydrates serve as the main source of fuel, providing glucose for the brain and for the skeletal muscles during exercise; carbohydrates also promote erythrocyte and leukocyte production, and cell function.
4. Major food sources of carbohydrates include milk, grains, fruits, and vegetables.

B. Fats

1. Fats provide a concentrated source and a stored form of energy.
2. Fats protect internal organs and maintain body temperature.
3. Fats enhance absorption of the fat-soluble vitamins.
4. Fats provide 9 kcal/g.
5. Inadequate intake of essential fatty acids leads to clinical manifestations of sensitivity to cold, skin lesions, increased risk of infection, and amenorrhea in women.
6. Diets high in fat can lead to obesity and increase the risk of cardiovascular disease and some cancers.

C. Proteins

1. Amino acids, which make up proteins, are critical to all aspects of growth and development of body tissues and provide 4 kcal/g.
2. Proteins build and repair body tissues, regulate fluid balance, maintain acid-base balance, pro-

duce antibodies, provide energy, and produce enzymes and hormones.

3. Essential amino acids are required in the diet because the body cannot manufacture them.
4. Complete proteins contain all essential amino acids; incomplete proteins lack some of the essential fatty acids.
5. Inadequate protein can cause protein energy **malnutrition** and severe wasting of fat and muscle tissue.

! Major stages of the life span with specific nutritional needs are pregnancy, lactation, infancy, childhood, and adolescence. Adults and older adults may experience physiological changes related to aging that will influence individual nutritional needs.

D. Vitamins (Box 11.1)

1. Vitamins facilitate the metabolism of proteins, fats, and carbohydrates and act as catalysts for metabolic functions.
2. Vitamins promote life and growth processes and maintain and regulate body functions.
3. Fat-soluble vitamins A, D, E, and K can be stored in the body, so an excess can cause toxicity.
4. The **B vitamins** and **vitamin C** are water-soluble vitamins, are not stored in the body, and can be excreted in the urine.

E. Minerals and electrolytes (Box 11.2)

1. Minerals are components of hormones, cells, tissues, and bones.
2. Minerals act as catalysts for chemical reactions and enhancers of cell function.

BOX 11.1 Food Sources of Vitamins**Water-Soluble Vitamins**

Folic acid: Green leafy vegetables, liver, beef, fish, legumes, grapefruit, oranges

Niacin: Meats, poultry, fish, beans, peanuts, grains

Vitamin B₁ (thiamine): Pork, nuts, whole-grain cereals, legumes

Vitamin B₂ (riboflavin): Milk, lean meats, fish, grains

Vitamin B₆ (pyridoxine): Yeast, corn, meat, poultry, fish

Vitamin B₁₂ (cobalamin): Meat, liver

Vitamin C (ascorbic acid): Citrus fruits, tomatoes, broccoli, cabbage

Fat-Soluble Vitamins

Vitamin A: Dairy products, fish, liver, green or orange vegetables, fruits

Vitamin D: Fortified milk, fish oils, most cereals

Vitamin E: Vegetable oils and products made with vegetable oil (margarine and salad dressing), fruits, vegetables, grains, nuts (almonds and hazelnuts), seeds (e.g., sunflower seeds), and fortified cereals

Vitamin K: Green leafy and cruciferous vegetables, such as turnip greens, spinach, cauliflower, cabbage, and broccoli; and certain vegetable oils, including soybean oil, cottonseed oil, canola oil, and olive oil

3. Almost all foods contain some form of minerals.
4. A deficiency of minerals can develop in chronically ill or hospitalized clients.
5. Electrolytes play a major role in osmolality and body water regulation, acid-base balance, enzyme reactions, and neuromuscular activity (see Chapter 8 for additional information regarding electrolytes).

F. Water

1. Critical for cell function.
2. Makes up 60% to 70% of total body weight.
3. A person cannot survive without water for more than a few days.

II. Malnutrition Laboratory Markers**A. Hematological studies**

1. Complete blood cell count with red blood cell indices and peripheral smear
2. These studies differentiate between anemias and nutritional deficiencies.

B. Studies evaluating protein balance

1. Short-term protein status is best determined by evaluating retinol-binding protein, prealbumin, transferrin, creatinine, and blood urea nitrogen (BUN) levels.
2. Long-term protein status can be determined by evaluating serum albumin levels.
3. Nitrogen balance is evaluated by measuring urea in the urine, which provides information regarding protein loss

C. Serum electrolytes (see Chapter 8)

 Always assess the client's ability to eat and swallow, and promote independence in eating as much as is possible.

III. Dietary Guidelines for Americans

- A. The Dietary Guidelines for Americans are designed for nutritional and health professionals to assist all individuals and their families in consuming a healthy, nutritionally adequate diet.
- B. Guidelines: see Dietary Guidelines for Americans at <https://www.dietaryguidelines.gov/> and also see https://dietaryguidelines.gov/sites/default/files/2020-12/Dietary_Guidelines_for_Americans_2020-2025.pdf (Fig. 11.1).
- A. Provides a description of a balanced diet that includes grains, vegetables, fruits, dairy products, and protein foods (see U.S. Department of Agriculture at <http://www.choosemyplate.gov/>).
- B. A nutritionist should be consulted for individualized dietary recommendations (see Box 11.3 for nutrition throughout growth and development).
- C. The goal is to adapt a healthful eating pattern at an appropriate calorie level with a variety of nutrient-dense foods and beverages among all the food groups.
- D. MyPlate is based on 2020-2025 Dietary Guidelines for Americans.
- E. Client Teaching
 1. Find a healthy eating style and regularly eat a variety of foods to ensure consumption of necessary nutrients and calories.
 2. Fill half of the plate with fruits and vegetables.
 3. Vary the types of vegetables and fruits eaten.
 4. Select at least half of the grains as whole grains.
 5. Drink milk that is fat-free or low fat (1%).
 6. Vary protein consumption to include nonmeat sources.
 7. Drink and eat beverages and food with less sodium, saturated fat, and added sugars.
 8. Drink water instead of sugary drinks.

 Always consider the client's cultural, spiritual, and personal choices when planning nutritional intake.

IV. Therapeutic Diets**A. Clear liquid diet**

1. Indications
 - a. Provides fluids and some electrolytes to prevent dehydration
 - b. Used as an initial feeding after complete bowel rest
 - c. Used initially to feed a malnourished person or a person who has not had any oral intake for some time
 - d. Used for bowel preparation for surgery or diagnostic tests, as well as postoperatively
 - e. Used in gastroenteritis

BOX 11.2 Food Sources of Minerals

Calcium

Dairy products (milk, cheese, yogurt)
Tofu
Green leafy vegetables (broccoli, collards, kale, mustard greens, turnip greens, bok choy)
Salmon and sardines
Almonds, Brazil nuts, sunflower seeds, tahini, and dried beans
Blackstrap molasses

Chloride

Salt

Iron

Dried beans
Dried fruits
Egg yolks
Iron-fortified cereals
Liver
Meat (especially lean red meat, poultry)
Oysters
Salmon
Tuna
Whole grains

Magnesium

Dark green leafy vegetables
Fruits (such as bananas, dried apricots, and avocados)
Nuts (such as almonds and cashews)
Peas and beans (legumes), seeds
Soy products (such as soy flour and tofu)
Whole grains (such as brown rice and millet)
Milk

Phosphorus

Seeds (sunflower, pumpkin, and squash seeds) Whey

Cheese

Cornmeal
Beans
Nuts, salt-free (almonds, peanuts)

Potassium

All meats (red meat and chicken) and fish (salmon, cod, haddock, and sardines)
Soy products and veggie burgers
Vegetables (broccoli, peas, lima beans, tomatoes, potatoes [particularly their skins], sweet potatoes, and winter squash)
Fruits (citrus, cantaloupe, bananas, kiwi, prunes, and dried apricot)
Milk and yogurt
Nuts

Sodium

Sodium chloride (table salt)
Milk
Beets
Celery
Some drinking waters
Food products (Worcestershire sauce, soy sauce, onion salt, garlic salt, and bouillon cubes)
Processed meats (bacon, sausage, and ham)
Canned soups and vegetables
Processed baked goods
Fast foods

Zinc

Animal proteins (beef, pork, and lamb)
Nuts
Whole grains
Legumes
Yeast

Reference: MedlinePlus, *Vitamins*, updated July 2021 at <https://medlineplus.gov/ency/article/002399.htm>

FIG. 11.1 MyPlate. (From U.S. Department of Agriculture. Available at <http://www.choosemyplate.gov>)

2. Nursing considerations

- Clear liquid diet is deficient in energy (calories) and many nutrients.
- Clear liquid diet is easily digested and absorbed.
- Minimal residue is left in the gastrointestinal tract.
- Clients may find a clear liquid diet unappetizing and boring.
- As a transition diet, clear liquids are intended for short-term use.
- Clear liquids are relatively transparent to light; items considered “clear liquids” include water, bouillon, fat-free clear broth, clear fruit juices, carbonated beverages, gelatin, lemonade, ice pops, and regular or decaffeinated coffee or tea. Hard candy without coloring is also acceptable.
- By limiting caffeine intake, an upset stomach and sleeplessness may be prevented.

BOX 11.3 Nutrition Throughout Growth and Development**Infant**

The American Academy of Pediatrics recommends breast/chest-feeding for the first 6 months of life and breast/chest-feeding with additional foods from age 6 to 12 months. The average 1-month-old infant consumes approximately 18 to 21 ounces of milk or formula per day.

Introduce new foods one at a time, 4 to 7 days apart, to identify allergies.

Infants should not have cow's milk before the age of 1 year.

Children under 1 year of age should not ingest honey or corn syrup products due to the risk of botulism toxin.

Toddlers and Preschoolers

Milk is a poor source of iron, and children who consume more than 24 ounces of milk per day are at risk for developing milk anemia. Whole milk should be consumed until 2 years of age to ensure adequate fatty acid intake.

Avoid foods that pose choking hazards, such as hot dogs, candy, nuts, grapes, popcorn, and raw vegetables.

Serving finger foods to toddlers allows them to eat by themselves and to satisfy their need for independence and control.

Nutritional requirements for the preschooler are similar to those of the toddler. The average daily intake is 1800 calories. Finicky eating habits are characteristic of the 4-year-old; engaging preschoolers in meal preparation will promote the likelihood of their trying new foods.

School-Age

Children in this age-group have better appetites with a more varied intake. Assess for adequate intake of protein and vitamins A and C.

This age-group is at risk for high intake of fats, sugar, and salt related to snack foods.

Childhood obesity is a concern, which can lead to serious health problems such as diabetes and cardiovascular disease; a potential for psychological problems is also a concern. Promote healthy lifestyle habits, including nutrition programs.

Encourage physical activity.

Adolescent

Energy needs increase to meet the increased metabolic needs of growth.

This age-group has increased requirements of daily protein, calcium for bone growth, and iron to replace menstrual losses and to promote muscle development.

Increased intake of iodine and B-complex vitamins is necessary to support thyroid development and metabolism.

Fast-food consumption is common and puts the adolescent at risk for malnutrition and obesity.

The onset of eating disorders commonly occurs during adolescence.

Young and Middle Adults

Energy needs decrease as the growth period ends. Lack of physical activity and access to certain foods increases the risk of obesity and insulin resistance and other health problems such as cardiovascular disease.

Women who use oral contraceptives often need extra vitamins. Iron and calcium intake are important components of the diet.

Pregnancy

During pregnancy, protein requirements increase to 60 g per day.

Calcium needs increase to promote fetal bone mineralization. Iron supplements support increased blood volume.

Folic acid intake is required for DNA synthesis and red blood cell production.

Breast/chest-feeding

Encourage intake of protein, calcium, and vitamins A, B, and C. Promote adequate fluid intake.

Consume an additional 500 kilocalories per day to support adequate production of breast milk. Avoid alcohol, caffeine, and certain drugs, as these are absorbed into milk.

Older Adults

Energy needs are decreased due to slowed metabolic rate.

Age-related changes that affect nutrition include changes in teeth and saliva production, reduced taste and smell, decreased thirst sensation, and decreased gag reflex.

Maintaining good oral health is important.

If the individual is taking prescription medications, discourage the consumption of grapefruit and grapefruit juice because they alter absorption of many medications.

Ensure adequate calcium and vitamin D intake to prevent osteoporosis, especially in postmenopausal women.

- h. The client may consume salt and sugar.
 - i. Dairy products and nontransparent fruit juices are not clear liquids.
 - j. Instruct the client doing bowel preparation to avoid liquids that contain red or purple dye, which can mask the normal color of the lining of the colon.

 **Monitor the client's hydration status by assessing intake and output, assessing weight, monitoring for edema, and monitoring for signs of dehydration. Each kilogram (2.2 lb) of weight gained or lost is equal to 1 liter of fluid retained or lost.**

- B. Full liquid diet
 1. Indication: May be used as a transition diet after clear liquids following surgery or for clients who have difficulty chewing, swallowing, or tolerating solid foods.
 2. Nursing considerations
 - a. A full liquid diet is nutritionally deficient in energy (calories) and many nutrients.
 - b. The diet includes clear and opaque liquid foods.
 - c. Foods include all clear liquids and items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, plain yogurt, 

soups that are strained, re \square ned cooked cereals, fruit juices, and strained vegetable juices.

- d. Use of a complete nutritional liquid supplement is often necessary to meet nutrient needs for clients on a full liquid diet for more than 3 days.

 Provide nutritional supplements such as those high in protein, as prescribed, for the client on a liquid diet.

C. Mechanical soft diet

1. Indications

- a. Provides foods that have been mechanically altered in texture to require minimal chewing
- b. Used for clients who have dif \square culty chewing but can tolerate more variety in texture than a liquid diet offers
- c. Used for clients who have dental problems, surgery of the head or neck, or dysphagia (requires swallowing evaluation and may require thickened liquids if the client has swallowing dif \square culties)

2. Nursing considerations

- a. Degree of texture modi \square cation depends on individual need, including pureed, mashed, ground, or \square nely chopped.
- b. Foods include those that are part of a clear and full liquid diet, with the addition of all cream soups, ground or diced meats, \square aked \square sh, cottage cheese, rice, potatoes, pancakes, light breads, cooked vegetables, canned or cooked fruits, bananas, peanut butter, and nonfried eggs.
- c. Foods to be avoided in mechanically altered diets include nuts; dried fruits; raw fruits and vegetables; fried foods; tough, smoked, or salted meats; and foods with coarse textures.

D. Soft diet

1. Indications

- a. Used for clients who have dif \square culty chewing or swallowing
- b. Used for clients who have ulcerations of the mouth or gums, oral surgery, broken jaw, plastic surgery of the head or neck, or dysphagia, or for the client who has had a stroke

2. Nursing considerations

- a. Foods include easily digestible foods such as pastas, casseroles, tender meats, canned fruit, cooked vegetables, cakes, and cookies without nuts or coconut.
- b. Clients with mouth sores should be served foods at cooler temperatures.
- c. Clients who have dif \square culty chewing and swallowing because of dry mouth can increase salivary \square ow by sucking on sour candy.
- d. Encourage the client to eat a variety of foods.

- e. Provide plenty of \square uids with meals to ease chewing and swallowing of foods.

- f. Drinking \square uids through a straw may be easier than drinking from a cup or glass; a straw may not be allowed for clients with dysphagia (because of the risk of aspiration).

- g. All foods and seasonings are permitted; however, liquid, chopped, or pureed foods or regular foods with a soft consistency are tolerated best.

- h. Foods that contain nuts or seeds, which easily can become trapped in the mouth and cause discomfort, should be avoided. 

- i. Raw fruits and vegetables, fried foods, and whole grains should be avoided.

 Consider the client's disease or illness and how it may affect nutritional status.

E. Low- \square ber (low-residue) diet

1. Indications

- a. Supplies foods that are least likely to form an obstruction when the intestinal tract is narrowed by in \square ammation or scarring or when gastrointestinal motility is slowed
- b. Used for in \square ammatory bowel disease, partial obstructions of the intestinal tract, gastroenteritis, diarrhea, or other gastrointestinal disorders

2. Nursing considerations

- a. Foods that are low in \square ber include white bread, re \square ned cooked cereals, cooked potatoes without skins, white rice, and re \square ned pasta. 
- b. Foods to limit or avoid are raw fruits (except bananas), vegetables, nuts and seeds, plant \square ber, and whole grains.
- c. Dairy products should be limited to two servings a day.

F. High- \square ber (high-residue) diet

1. Indication: Used for constipation, irritable bowel syndrome when the primary symptom is alternating constipation and diarrhea, and asymptomatic diverticular disease

2. Nursing considerations

- a. High- \square ber diet provides 20 to 35 g of dietary \square ber daily.
- b. Volume and weight are added to the stool, speeding the movement of undigested materials through the intestine.
- c. High- \square ber foods are fruits and vegetables and whole-grain products. 
- d. Increase \square ber gradually and provide adequate \square uids to reduce possible undesirable side effects such as abdominal cramps, bloating, diarrhea, and dehydration.
- e. Gas-forming foods should be limited (Box 11.4).

BOX 11.4 Gas-Forming Foods

Apples	Melons
Artichokes	Milk
Barley	Molasses
Beans	Nuts
Bran	Onions
Broccoli	Radishes
Brussels sprouts	Soybeans
Cabbage	Wheat
Celery	Yeast
Figs	

BOX 11.5 Sodium-Free Spices and Flavorings

Allspice	Ginger
Almond extract	Lemon extract
Bay leaves	Maple extract
Caraway seeds	Marjoram
Cinnamon	Mustard powder
Curry powder	Nutmeg
Garlic powder or garlic	

G. Cardiac diet (Box 11.5)

1. Indications

- Indicated for atherosclerosis, diabetes mellitus, hyperlipidemia, hypertension, myocardial infarction, nephrotic syndrome, and renal failure
- Reduces the risk of heart disease
- Dietary Approaches to Stop Hypertension (DASH) diet: recommended to prevent and control hypertension, hypercholesterolemia, and obesity
- The DASH diet includes fruits, vegetables, whole grains, low-fat dairy foods, meat, fish, poultry, nuts, and beans; it is limited in sugar-sweetened foods and beverages, red meat, sodium, and fats.
- Plant-based diets are associated with lower risk of coronary vascular disease (CVD).
- For information on plant-based diets see <https://www.ahajournals.org/doi/10.1161/JAHA.119.012865> and <https://www.heart.org/en/healthy-living/healthy-eating/eat-smart/nutrition-basics/how-does-plant-forward-eating-benefit-your-health>

2. Nursing considerations

- Restrict total amounts of **sodium, cholesterol, and fat**, including saturated, trans, polyunsaturated, and monounsaturated.
- Teach the client about the DASH diet or other prescribed diet, such as plant-based.

H. Fat-restricted diet

1. Indications

- Used to reduce symptoms of abdominal pain, steatorrhea, flatulence, and diarrhea associated with high intakes of dietary fat and to decrease nutrient losses caused by ingestion of dietary fat in individuals with malabsorption disorders
- Used for clients with malabsorption disorders, pancreatitis, gallbladder disease, and gastroesophageal reflux

2. Nursing considerations

- Restrict total amount of fat, including saturated, trans, polyunsaturated, and monounsaturated.
- Clients with malabsorption may also have difficulty tolerating fiber and lactose.
- Vitamin and mineral deficiencies may occur in clients with diarrhea or steatorrhea.
- A fecal fat test may be prescribed and indicates fat malabsorption with excretion of more than 6 to 8 g of fat (or more than 10% of fat consumed) per day during the 3 days of specimen collection.

I. High-calorie, high-protein diet

- Indication: Used for severe stress, burns, wound healing, cancer, human immunodeficiency virus, acquired immunodeficiency syndrome, chronic obstructive pulmonary disease, respiratory failure, or any other type of debilitating disease
- Nursing considerations
 - Encourage nutrient-dense, high-calorie, high-protein foods such as whole milk and milk products, peanut butter, nuts and seeds, beef, chicken, fish, pork, and eggs.
 - Encourage snacks between meals, such as milkshakes, instant breakfasts, and nutritional supplements.

 **Calorie counts assist in determining the client's total nutritional intake and can identify a deficit or excess intake.**

J. Carbohydrate-consistent diet

- Indication: Used for clients with diabetes mellitus, hypoglycemia, hyperglycemia, and obesity
- Nursing considerations
 - A carbohydrate-consistent diet focuses on maintaining a consistent amount of carbohydrate, fat, and protein intake each day and with each meal; it is also known as “carb counting.”
 - For additional information, refer to: <https://www.diabetes.org/healthy-living/recipes-nutrition>
- The Diabetes Plate Method may also be recommended.
 - No single eating pattern has emerged as being clearly superior to all others for all

diabetes-related outcomes; evidence suggests certain eating patterns are better for specific outcomes.

- b. Until evidence strengthens, primary health care providers should focus on the key factors that are common among the patterns: emphasize nonstarchy vegetables, minimize added sugars and refined grains, and choose whole foods over highly processed foods to the extent possible.
4. Diabetes Plate Method
 - a. Fill half the plate with nonstarchy vegetables.
 - b. Fill a quarter of the plate with lean protein foods.
 - c. Fill a quarter of the plate with complex carbohydrate foods.
 - d. Drink water or a low-calorie drink.
 - e. See the American Diabetes Association Web site article titled *What is the diabetes plate method?* at <https://www.diabetesfoodhub.org/articles/what-is-the-diabetes-plate-method.html>
- K. Sodium-restricted diet (see Box 11.5)
 1. Indication: Used for hypertension, heart failure, renal disease, cardiac disease, and liver disease
 2. Nursing considerations
 - a. The American Heart Association recommends to eat no more than 2,300 mg/day, moving toward an ideal limit of 1,500 mg/day: <https://www.heart.org/en/healthy-living/healthy-eating/eat-smart/sodium/how-much-sodium-should-i-eat-per-day>
 - b. Encourage intake of fresh foods rather than processed foods, which contain higher amounts of sodium.
 - c. Canned, frozen, instant, smoked, pickled, and boxed foods usually contain higher amounts of sodium. Lunch meats, soy sauce, salad dressings, fast foods, soups, and snacks such as potato chips and pretzels also contain large amounts of sodium; teach clients to read nutritional facts on product packaging regarding sodium content per serving.
 - d. Effervescent medications contain significant amounts of sodium; these include medications that contain the active ingredient sodium bicarbonate or sodium citrate.
 - e. Salt substitutes may be used to improve palatability; most salt substitutes contain large amounts of potassium and should not be used by clients with renal disease.
 - L. Protein-restricted diet
 1. Indication: Used for renal disease and end-stage liver disease
 2. Critically ill clients with protein-losing renal diseases, malabsorption syndromes, and continuous renal replacement therapy or dialysis should have their protein needs assessed by estimating the protein equivalent of nitrogen appearance (PENA); a nutritionist should be consulted.
 3. Nursing considerations
 - a. Provide enough protein to maintain nutritional status but not an amount that will allow the buildup of waste products from protein metabolism (40 to 60 g of protein daily).
 - b. The higher the restriction of protein, the more important it becomes that all protein in the diet be of high biological value (contain all essential amino acids in recommended proportions).
 - c. An adequate total energy intake from foods is critical for clients on protein-restricted diets (protein will be used for energy rather than for protein synthesis).
 - d. Special low-protein products, such as pastas, bread, cookies, wafers, and gelatin made with wheat starch, can improve energy intake and add variety to the diet.
 - e. Carbohydrates in powdered or liquid forms can provide additional energy.
 - f. Vegetables and fruits contain some protein and, for very-low-protein diets, these foods must be calculated into the diet.
 - g. Foods are limited from the milk, meat, bread, and starch groups.
 - M. Gluten-free diet: A treatment for celiac disease and gluten sensitivity for clients needing the protein fraction “gluten” eliminated from their diets. See Chapter 34 for information on this diet.
-  Fluid restrictions may be prescribed for clients with hyponatremia, severe extracellular volume excess, and renal disorders. Ask the client about preferences regarding types of oral fluids and temperature preference of fluids.
- N. Renal diet (see Box 11.2)
 1. Indication: Used for clients with acute kidney injury or chronic kidney disease and for those requiring hemodialysis or peritoneal dialysis
 2. Nursing considerations
 - a. Controlled amounts of protein, sodium, phosphorus, calcium, potassium, and fluids may be prescribed; may also need modification in fiber, cholesterol, and fat based on individual requirements; clients on peritoneal dialysis usually have diets prescribed that are less restrictive with fluid and protein intake than those on hemodialysis.
 - b. Most clients receiving dialysis need to restrict fluids (see Clinical Judgment: Generate Solutions Box).

⚡ CLINICAL JUDGMENT: GENERATE SOLUTIONS

A client with acute kidney injury exhibiting signs of fluid volume excess has laboratory tests done that reveal decreased renal function and glomerular filtration rate. The nephrologist prescribes a fluid restriction. The nurse determines that a client need will be to alleviate thirst and generates solutions to meet this client need. The nurse includes the following measures in the plan of care to help relieve the client's thirst while adhering to the fluid restriction.

Chewing on gum
Sucking hard candy
Freezing fluids so that they take longer to consume
Adding lemon juice to water to make it more refreshing
Gargling with refrigerated mouthwash

 An initial assessment includes identifying allergies and food and medication interactions.

- c. Monitor weight daily as a priority, because weight is an important indicator of fluid status.

O. Potassium-modified diet (see Box 11.2)

1. Indications
 - a. Low-potassium diet is indicated for hyperkalemia, which may be caused by impaired renal function, hypoaldosteronism, Addison's disease, angiotensin-converting enzyme inhibitor medications, immunosuppressive medications, potassium-sparing diuretics, and chronic hyperkalemia.
 - b. High-potassium diet is indicated for hypokalemia, which may be caused by renal tubular acidosis, gastrointestinal losses (diarrhea, vomiting), intracellular shifts, potassium-depleting diuretics, antibiotics, mineralocorticoid or glucocorticoid excess resulting from primary or secondary aldosteronism, Cushing's syndrome, or exogenous corticosteroid use.

2. Nursing considerations

- a. Foods that are low in potassium include applesauce, green beans, cabbage, lettuce, peppers, grapes, blueberries, cooked summer squash, cooked turnip greens, pineapple, and raspberries.
- b. Box 11.2 lists foods that are high in potassium.

P. High-calcium diet

1. Indication: Calcium is needed during bone growth and in adulthood to prevent osteoporosis and to facilitate vascular contraction, vasodilation, muscle contraction, and nerve transmission.
2. Nursing considerations
 - a. Primary dietary sources of calcium are dairy products (see Box 11.2 for food items high in calcium).

- b. Lactose-intolerant clients should incorporate nondairy sources of calcium into their diets regularly.

Q. Low-purine diet

1. Indication: Used for gout, kidney stones, and elevated uric acid levels
2. Nursing considerations
 - a. Purine is a precursor for uric acid, which forms stones and crystals.
 - b. Foods to restrict include anchovies, herring, mackerel, sardines, scallops, organ meats, gravies, meat extracts, wild game, goose, and sweetbreads.

R. High-iron diet

1. Indication: Used for clients with anemia
2. Nursing considerations
 - a. The high-iron diet replaces iron deficit from inadequate intake or loss.
 - b. The diet includes organ meats, meat, egg yolks, whole-wheat products, dark green leafy vegetables, dried fruit, and legumes.
 - c. Inform the client that concurrent intake of vitamin C with iron foods enhances absorption of iron.

V. Vegan and Vegetarian Diets

A. Vegan

1. Vegans follow a strict vegetarian diet and consume no animal meats or foods that contain animal byproducts, such as chicken broth or beef broth.
2. Eat only foods of plant origin (e.g., whole or enriched grains, legumes, nuts, seeds, fruits, vegetables). However, there are many processed vegan foods that do not have nutritional value; it is best to eat whole foods.
3. The use of soybeans, soy milk, soybean curd (tofu), and processed soy protein products enhance the nutritional value of the diet.

B. Lacto-vegetarian

1. Lacto-vegetarians drink milk and eat cheese and dairy foods but avoid meat, fish, poultry, and eggs.
2. A diet of whole or enriched grains, legumes, nuts, seeds, fruits, and vegetables in sufficient quantities to meet energy needs provides a balanced diet.

C. Lacto-ovo-vegetarian

1. Lacto-ovo-vegetarians follow a food pattern that allows for the consumption of dairy products and eggs.
2. Consumption of adequate plant and animal food sources that excludes meat, poultry, pork, and fish poses no nutritional risks.

- D. Ovo-vegetarians: The only animal foods that the ovo-vegetarian consumes are eggs, which are an excellent source of complete proteins.

-  E. Nursing considerations
1. Vegan and vegetarian diets are not usually prescribed but are a diet choice made by a client.
 2. Ensure that the client eats a sufficient amount of varied foods to meet nutrient and energy needs.
 3. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
 4. Potential deficiencies in vegetarian diets include energy, protein, vitamin B₁₂, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
 5. To enhance absorption of iron, vegetarians should consume a good source of iron and vitamin C with each meal.
 6. Foods eaten may include tofu, tempeh, soy milk and soy products, meat analogs, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.
 7. Soy protein is considered equivalent in quality to animal protein.

 **Body mass index (BMI) can be calculated by dividing the client's weight in kilograms by height in meters squared. For example, a client who weighs 75 kg (165 pounds) and is 1.8 m (5 feet, 9 inches) tall has a BMI of 23.15 (75 divided by 1.82 = 23.15). From: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1112.**

VI. Enteral Nutrition

- A. Description: Provides liquefied foods into the gastrointestinal tract via a tube
- B. Indications
1. Used when the gastrointestinal tract is functional but oral intake is not meeting estimated nutrient needs
 2. Used for clients with swallowing problems, burns, major trauma, liver or other organ failure, or severe **malnutrition**
-  C. Nursing considerations
1. Clients with lactose intolerance need to be placed on lactose-free formulas.
 2. See Chapter 70 for information regarding the administration of gastrointestinal tube feedings and associated complications.

PRACTICE QUESTIONS

1. The nurse is teaching a client who has iron-deficiency anemia about foods the client needs to include in the diet. The nurse determines that the client understands the dietary modifications if which items are selected from the menu?
 1. Nuts and milk
 2. Coffee and tea
 3. Cooked rolled oats and fish
 4. Oranges and dark green leafy vegetables
2. The nurse is planning to teach a client with malabsorption syndrome about the necessity of following a low-fat diet. The nurse develops a list of high-fat foods to avoid and would include which food items on the list? Select all that apply.
 - 1. Oranges
 - 2. Broccoli
 - 3. Margarine
 - 4. Cream cheese
 - 5. Luncheon meats
 - 6. Broiled haddock
3. The nurse instructs a client with chronic kidney disease who is receiving hemodialysis about dietary modifications. The nurse determines that the client understands these dietary modifications if the client selects which items from the dietary menu?
 1. Cream of wheat, blueberries, coffee
 2. Sausage and eggs, banana, orange juice
 3. Bacon, cantaloupe melon, tomato juice
 4. Cured pork, grits, strawberries, orange juice
4. The nurse is conducting a dietary assessment on a client who is on a vegan diet. The nurse plans to provide dietary teaching and would focus on foods high in which vitamin that may be lacking in a vegan diet?
 1. Vitamin A
 2. Vitamin B₁₂
 3. Vitamin C
 4. Vitamin E
5. A postoperative client has been placed on a clear liquid diet. The nurse would provide the client with which items that are allowed to be consumed on this diet? Select all that apply.
 - 1. Broth
 - 2. Coffee
 - 3. Gelatin
 - 4. Pudding
 - 5. Vegetable juice
 - 6. Pureed vegetables
6. The nurse is preparing to instruct a client with hypertension on the importance of choosing foods low in sodium. The nurse would plan to teach the client to limit intake of which food?
 1. Apples
 2. Bananas
 3. Smoked salami
 4. Steamed vegetables

7. A client who is recovering from surgery has been advanced from a clear liquid diet to a full liquid diet. The client is looking forward to the diet change because they have been “bored” with the clear liquid diet. The nurse would prepare to offer which full liquid item to the client?
1. Tea
 2. Gelatin
 3. Custard
 4. Ice pop
8. A client is recovering from abdominal surgery and has a large abdominal wound. The nurse would encourage the client to eat which food item that is naturally high in vitamin C to promote wound healing?
1. Milk
 2. Oranges
 3. Bananas
 4. Chicken
9. The nurse is caring for a client with cirrhosis of the liver. To minimize the effects of the disorder, the nurse teaches the client about foods that are high in thiamine. The nurse determines that the client has the best understanding of the dietary measures to follow if the client states an intention to increase the intake of which food?
1. Milk
 2. Chicken
 3. Broccoli
 4. Legumes
10. The nurse prepares to provide instructions to a client with a low potassium level about the foods that are high in potassium and plans to tell the client to consume which foods? Select all that apply.
- 1. Peas
 - 2. Raisins
 - 3. Potatoes
 - 4. Cantaloupe
 - 5. Cauliflower
 - 6. Strawberries
11. The nurse is reviewing laboratory results and notes that a client’s serum sodium level is 150 mEq/L (150 mmol/L). The nurse reports the serum sodium level to the primary health care provider (PHCP), and the PHCP prescribes dietary instructions based on the sodium level. Which acceptable food items does the nurse instruct the client to consume? Select all that apply.
- 1. Peas
 - 2. Nuts
 - 3. Cheese
 - 4. Cauliflower
 - 5. Processed oat cereals

ANSWERS

1. Answer: 4

Rationale: Dark green leafy vegetables are a good source of iron, and oranges are a good source of vitamin C, which enhances iron absorption. All other options are not food sources that are high in iron and vitamin C.

Test-Taking Strategy: Focus on the **subject**, diet choices for a client with anemia. Think about the pathophysiology of anemia. Determine that the client needs foods high in iron, and recall that vitamin C enhances iron absorption. Use knowledge of foods high in iron and vitamin C. Remember that green leafy vegetables are high in iron and that oranges are high in vitamin C.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 610, 851.

2. Answer: 3, 4, 5

Rationale: Fruits and vegetables tend to be lower in fat because they do not come from animal sources. Broiled haddock is also naturally lower in fat. Margarine, cream cheese, and luncheon meats are high-fat foods.

Test-Taking Strategy: Focus on the **subject** of the question, the high-fat foods. Oranges and broccoli (fruit and vegetable) can be eliminated first. Next eliminate haddock because it is a broiled food. Remember that margarine, cheese, and luncheon meats are high in fat content.

Reference: Grodner, M., Escott-Stump, S., & Dorner, S. (2020). *Nutritional foundations and clinical applications*. (7th ed.). St. Louis: Elsevier. pp. 23-24, 77.

3. Answer: 1

Rationale: The diet for a client with chronic kidney disease who is receiving hemodialysis should include controlled amounts of sodium, phosphorus, calcium, potassium, and fluids, which is indicated in the correct option. The food items in the remaining options are high in sodium, phosphorus, or potassium.

Test-Taking Strategy: Focus on the **subject**, dietary modification for a client with chronic kidney disease. Think about the pathophysiology of this disorder to recall that sodium needs to be limited. Noting the items sausage, bacon, and cured pork will assist in eliminating these options.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 1071.

4. Answer: 2

Rationale: Vegans do not consume any animal products. Vitamin B₁₂ is found in animal products and therefore would most likely be lacking in a vegan diet. Vitamins A, C, and E are found in fresh fruits and vegetables, which are consumed in a vegan diet.

Test-Taking Strategy: Focus on the **subject**, a vegan diet and the vitamin lacking in this diet. Recalling the food items eaten

and restricted in this diet will direct you to the correct option. Remember that vegans do not consume any animal products and as a result may be deficient in vitamin B₁₂.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 851.

5. **Answer: 1, 2, 3**

Rationale: A clear liquid diet consists of foods that are relatively transparent to light and are clear and liquid at room and body temperature. These foods include items such as water, bouillon, clear broth, carbonated beverages, gelatin, hard candy, lemonade, ice pops, and regular or decaffeinated coffee or tea. The incorrect food items are items that are allowed on a full liquid diet.

Test-Taking Strategy: Focus on the **subject**, a clear liquid diet. Recalling that a clear liquid diet consists of foods that are relatively transparent to light and are clear will assist in answering the question.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1122.

6. **Answer: 3**

Rationale: Smoked foods are high in sodium, which is noted in the correct option. The remaining options are fruits and vegetables, which are low in sodium.

Test-Taking Strategy: Note the **subject**, the food item that is high in sodium. Remember that smoked foods are high in sodium. Also eliminate options 1, 2, and 4 because they are *comparable or alike* and are nonprocessed foods.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 245, 702, 754.

7. **Answer: 3**

Rationale: Full liquid food items include items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, soups that are strained, refined cooked cereals, and strained vegetable juices. A clear liquid diet consists of foods that are relatively transparent. The food items in the incorrect options are clear liquids.

Test-Taking Strategy: Focus on the **subject**, a full liquid item. Remember that a clear liquid diet consists of foods that are relatively transparent. This will assist you in eliminating tea, gelatin, and ice pops; in addition, these are *comparable or alike* options.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1122.

8. **Answer: 2**

Rationale: Citrus fruits and juices are especially high in vitamin C. Bananas are high in potassium. Meats and dairy products are two food groups that are high in the B vitamins.

Test-Taking Strategy: Note the **subject**, food items naturally high in vitamin C. It is necessary to recall that citrus fruits and juices are high in vitamin C; this will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing:*

Assessment and management of clinical problems. (11th ed.). St. Louis: Mosby. pp. 164, 610.

9. **Answer: 4**

Rationale: The client with cirrhosis needs to consume foods high in thiamine. Thiamine is present in a variety of foods of plant and animal origin. Legumes are especially rich in this vitamin. Other good food sources include nuts, whole-grain cereals, and pork. Milk contains vitamins A, D, and B₂. Poultry contains niacin. Broccoli contains vitamins C, E, and K and folic acid.

Test-Taking Strategy: Note the **strategic word**, *best*. This may indicate that more than one option may be a food that contains thiamine. Remembering that legumes are especially rich in thiamine will direct you to the correct option.

References: Grodner, M., Escott-Stump, S., & Dorner, S. (2020). *Nutritional foundations and clinical applications*. (7th ed.). St. Louis: Elsevier. p. 115; Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 853, 986-987.

10. **Answer: 2, 3, 4, 6**

Rationale: The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). Common food sources of potassium include avocado, bananas, cantaloupe, carrots, fish, mushrooms, oranges, potatoes, pork, beef, veal, raisins, spinach, strawberries, and tomatoes. Peas and cauliflower are high in magnesium.

Test-Taking Strategy: Focus on the **subject**, foods high in potassium. Read each food item and use knowledge about nutrition and components of food. Recall that peas and cauliflower are high in magnesium.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 245-246.

11. **Answer: 1, 2, 4**

Rationale: The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). A serum sodium level of 150 mEq/L (150 mmol/L) indicates hypernatremia. On the basis of this finding, the nurse would instruct the client to avoid foods high in sodium. Peas, nuts, and cauliflower are good food sources of phosphorus and are not high in sodium (unless they are canned or labeled as salted). Peas and cauliflower are also a good source of magnesium. Processed foods such as cheese and processed oat cereals are high in sodium content.

Test-Taking Strategy: Focus on the **subject**, foods acceptable to be consumed by a client with a sodium level of 150 mEq/L (150 mmol/L). First, you must determine that the client has hypernatremia. Select peas and cauliflower first because these are vegetables. From the remaining options, note the word *processed* in option 5 and recall that cheese is high in sodium. Remember that processed foods tend to be higher in sodium content.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 245.

Health and Physical Assessment of the Adult Client

Katherine M. Silvestri, MSN, APRN, FNP-BC

PRIORITY CONCEPTS Clinical Judgment; Health Promotion

I. Environment/Setting

- A. Establish a relationship and explain the procedure to the client.
- B. Ensure privacy and make the client feel comfortable (keep room temperature comfortable, provide sufficient lighting, avoid interruptions, and remove distractions such as noise or objects).
- C. Sit down for the interview (avoid barriers such as a desk), maintain an appropriate social distance, and maintain eye level.
- D. Use therapeutic communication techniques and open-ended questions to obtain information about the client's symptoms and concerns; allow time for the client to ask questions.
- E. Consider religious and cultural characteristics, such as language (the need for an interpreter), values and beliefs, health practices, eye contact, and touch.
- F. Keep note-taking to a minimum so that the client is the focus of attention. The use of electronic or paper standardized forms can decrease note-taking.
- G. Types of health and physical assessments (Box 12.1)
- H. SOAP (subjective, objective, assessment, plan) notes are a frequently used format for documenting client data, including health history, physical examination, assessment or diagnosis, and plan of care. The nurse should be familiar with SOAP notes, how to interpret the initial history and physical (H&P) SOAP notes, and how to follow subsequent progress SOAP notes so as to stay abreast of changes in the client's plan of care. See Table 12.1 for a detailed list of information contained in SOAP notes.

II. Health History (refer to section titled "Subjective" in Table 12.1)

- A. General state of health: Body features and physical characteristics, body movements, body posture, level

of consciousness, nutritional status, speech

- B. Chief complaint and history of present illness (document direct client quotes) that leads the client to seek care
- C. Family history: The health status of direct blood relatives as well as the client's spouse
- D. Social history
 1. Data about the client's lifestyle, with a focus on factors that may affect health
 2. Information about alcohol, drug, and tobacco use; sexual practices; tattoos; body piercing; travel history; and work setting to identify occupational hazards
- E. Domestic violence screening
 1. Done to determine whether the client is experiencing any form of domestic violence
 2. Conducted during a one-to-one interview with the client while obtaining the health history

III. Mental Status Exam

- A. The mental status can be assessed while obtaining subjective data from the client during the health history interview.
- B. Appearance
 1. Note appearance, including posture, body movements, dress, and hygiene and grooming.
 2. An inappropriate appearance and poor hygiene may be indicative of depression, manic disorder, dementia, organic brain disease, or another disorder.
- C. Behavior
 1. Level of consciousness: Assess alertness and awareness and the client's ability to interact appropriately with the environment.
 2. Facial expression and body language: Check for appropriate eye contact and determine whether

BOX 12.1 Types of Health and Physical Assessments

Complete Assessment: Includes a complete health history and physical examination and forms a baseline database.

Focused Assessment: Focuses on a limited or short-term problem, such as the client's complaint.

Episodic/Follow-up Assessment: Focuses on evaluating a client's progress.

Emergency Assessment: Involves the rapid collection of data, often during the provision of lifesaving measures.

facial expression and body language are appropriate to the situation; this assessment also provides information regarding the client's mood and affect.

3. Speech: Assess speech pattern for articulation and appropriateness of conversation.

D. Cognitive level of functioning (Box 12.2)

IV. Physical Exam (refer to section titled "Objective" in Table 12.1)

A. Overview

1. Gather equipment needed for the examination.
2. Use the senses of sight, smell, touch, and hearing to collect data.
3. Assessment includes **inspection, palpation, percussion, and auscultation**; these skills are performed one at a time, in this order (except the abdominal assessment).

B. Assessment techniques

1. Inspection
 - a. The first assessment technique, which uses vision and smell senses while observing the client
 - b. Requires good lighting, adequate body exposure with draping, and possibly the use of certain instruments such as an otoscope or ophthalmoscope
2. Palpation
 - a. Uses the sense of touch; warm the hands after performing hand hygiene and before touching the client.
 - b. Identify tender areas and palpate them last.
 - c. Start with light palpation to detect surface characteristics; then perform deeper palpation.
 - d. Light palpation is done with one hand by pressing the skin gently with the tips of two or three fingers held close together; deep palpation is done by placing one hand on top of the other and pressing down with the fingertips of both hands.
 - e. Assess texture, temperature, and moisture of the skin, as well as organ location and size and symmetry if appropriate.
 - f. Assess for swelling, vibration or pulsation, rigidity or spasticity, and crepitation.
 - g. Assess for the presence of lumps or masses, as well as the presence of tenderness or pain.

3. Percussion

- a. Involves tapping the client's skin to assess underlying structures and to determine the presence of vibrations and sounds and, if present, their intensity, duration, pitch, quality, and location
- b. Provides information related to the presence of air, fluid, or solid masses as well as organ size, shape, and position
- c. Descriptions of findings include resonance, hyperresonance, tympany, dullness, or flatness.

4. Auscultation: Involves listening with a stethoscope to sounds produced by the body for presence and quality, such as heart, lung, or bowel sounds

C. Vital signs

1. Includes temperature, radial pulse (apical pulse may be measured during the cardiovascular assessment), respirations, blood pressure, pulse oximetry, and presence of pain (refer to Chapter 10 for information on vital signs, pulse oximetry, and pain)
2. Height, weight, and nutritional status are also assessed.

V. Body Systems Assessment

A. Integumentary system: Involves inspection and palpation of skin, hair, and nails

1. **Subjective data:** Self-care behaviors, history of skin disease, medications being taken, environmental or occupational hazards and exposure to toxic substances, changes in skin color or pigmentation, change in a mole or a sore that does not heal
2. **Objective data:** Color, temperature (hypothermia or hyperthermia); excessive dryness or moisture; skin turgor; texture (smoothness, firmness); excessive bruising, itching, rash; hair loss (alopecia) or nail abnormalities such as pitting; lesions (may be inspected with a magnifier and light or with the use of a Wood's light [ultraviolet light used in a darkened room]); scars or birthmarks; edema; capillary filling time (Boxes 12.3 and 12.4; Table 12.2)
3. Dark-skinned client
 - a. Cyanosis: Check lips and tongue for a gray color; nail beds, palms, and soles for a blue color; and conjunctivae for pallor.
 - b. Jaundice: Check oral mucous membranes for a yellow color; check the sclera nearest to the iris for a yellow color.
 - c. Bleeding: Look for skin swelling and darkening, and compare the affected side with the unaffected side.
 - d. Inflammation: Check for warmth or a shiny or taut and pitting skin area, and compare with the unaffected side.

TABLE 12.1 SOAP Notes

Subjective	
Identifying client information	Name, date of birth, medical record number
Problems, allergies, medications, immunizations (PAMI) list	Ongoing list of medical problems, allergies with reactions, medications with dosages and directions, and past immunizations
General client information	Address, phone numbers, employer, work address and phone number, email address, gender, marital status, health insurance status and information
Chief complaint or reason for seeking care	Brief description of main problem; stated verbatim in quotation marks; duration is always included
History of present illness	Detailed description of all symptoms that may be related to the chief complaint Guided by “OLDCARTS” symptom analysis (onset, location, duration, character, aggravating/associated factors, relieving factors, timing, severity)
Past medical history	Hospitalizations, surgeries, childhood illnesses, adult illnesses, injuries/accidents, immunizations, past and current medications, allergies, mental health, recent laboratory tests
Family history	Pedigree may be included Includes but not limited to major health or genetic disorders, such as hypertension; cancer; cardiac, respiratory, and thyroid disorders; allergies; hepatitis Age and health of spouse and children included
Personal and social history	Varies based on health influences Cultural background and practices, home environment, general life satisfaction, safety/abuse, stressors, religious preferences, occupation, sexual activity, exposure to heat/cold or toxins, exposure to contagious diseases, concerns about cost of care, and health habits such as diet, exercise, smoking, salt intake, obesity, alcohol intake, recreational drug use, and caffeine use
Review of systems (may include some objective data)	General or constitutional symptoms: fever, chills, malaise, night sweats, fatigue, unintentional weight loss or gain, overall behavior Skin, hair, nails: rash, itching, pigmentation change, sweating, abnormal hair or nail growth Head and neck: headache, dizziness, syncope, concussions, loss of consciousness Eyes: visual acuity, double vision, blurring, light sensitivity, glaucoma, use of glasses or contacts, use of eye drops Ears: hearing loss, ear pain, tinnitus, vertigo Nose: smell, colds, nosebleeds, postnasal discharge, sinus pain Throat and mouth: hoarseness, change in voice, sore throat, gum bleeding or swelling, taste changes Lymphatics: enlargement, tenderness Chest and lungs: respiratory pain, dyspnea, wheezing, cyanosis, cough, sputum, hemoptysis, last chest x-ray Breasts/chest: development, pain, tenderness, lumps, discharge, last mammogram Heart and circulation: chest pain, edema, history of hypertension, myocardial infarction, exercise tolerance, previous cardiac tests, claudication, bruising, thrombophlebitis Hematologic: anemia, blood cell disorder, bleeding Gastrointestinal: appetite, food intolerance, dysphagia, heartburn, nausea, vomiting, diarrhea, constipation, change in stool, dark urine, previous studies such as colonoscopy, diet recall Endocrine: thyroid enlargement, heat or cold intolerance, polyphagia, polydipsia, polyuria, changes in facial or body hair, striae Genitourinary: for people with penises, puberty onset, testicular pain, libido, infertility; for people with vaginas, menses onset, regularity, duration, dysmenorrhea, last period, itching, date of last Papanicolaou (Pap) smear/human papilloma virus (HPV) test, age at menopause, libido, sexual difficulties, pregnancy (GTPAL; refer to Chapter 22); for both, dysuria, flank pain, urgency, frequency, nocturia, dribbling, hematuria, incontinence Musculoskeletal: joint pain, stiffness, redness, swelling, restricted motion, deformities Neurological: syncope, seizures, weakness, paralysis, incoordination, tremors, cognition Mental health: mood changes, depression, anxiety, difficulty concentrating, suicidal thoughts, irritability, sleep disturbances
Objective	
General statement	Age, race, gender, general appearance, weight, height, body mass index, vital signs (including orthostatic if applicable)
Mental status	Physical appearance, behavior, facial expression and body language, appropriate eye contact, level of consciousness (alertness and awareness and ability to interact appropriately with the environment), response to questions, reasoning, emotion, speech and language

Continued

TABLE 12.1 SOAP Notes—cont'd

Skin	Color, texture, temperature, turgor, uniformity, hygiene, scars, tattoos, moisture, edema, odor, lesions, trauma, hair texture and distribution, nail configuration
Head	Size, contour, scalp, facial features, facies, edema, temporal arteries
Eyes	Acuity, visual fields, edema, conjunctiva and sclera, eyebrows, extraocular movements, corneal light reflex, cover-uncover test, nystagmus, fundoscopic findings, pupils equal, round, react to light, accommodation (PERRLA) both direct and consensual
Ears	Configuration, position, alignment, tenderness, nodules, hearing, otoscopic findings
Nose	Appearance, patency, discharge, polyps, turbinates, septum, sinus tenderness, odors
Throat and mouth	Teeth, lips, tongue, buccal and oral mucosa, floor of mouth, appearance of palate, tonsils, tonsil grade, gag reflex, phonation of "Ah," voice, taste
Neck	Fullness, mobility, strength, trachea, thyroid size, shape, nodules, tenderness, bruits, masses, lymphadenopathy
Chest	Size, shape, anterior and posterior (AP) and transverse diameter, respiration, tenderness on bones, retractions/accessory muscle use
Lungs	Respiration rate, depth, work of breathing, regularity, tactile fremitus, percussion notes, breath sounds, friction rub
Breasts/Chests	Size, symmetry, contour, lesions, masses, tenderness, retractions, dimpling, nipple discharge, nipple retraction
Heart	Apical impulse, pulsation, heart rate, rhythm, thrills, heaves, lifts, heart tones, murmurs, rubs, gallops
Vasculature	Pulses, jugular venous distention or pulsations, carotid, abdominal aortic, temporal, renal, iliac, femoral artery bruit, temperature, color, skin texture, hair distribution, edema, nail beds, tenderness
Abdomen	Shape, contour, pulsations, bowel sounds, masses, organomegaly, tenderness, distention, costovertebral angle tenderness
Genitalia	Persons with penises: Symmetry, circumcision, color, urethral opening, discharge, lesions, hair distribution, palpation of penis, testes, epididymides, vasa deferentia, tenderness, masses, hernia, scrotal swelling, transillumination Persons with vaginas: Tenderness, discharge, inflammation, lesions, polyps, vaginal mucosa, cervix, discharge, odor, size and contour of uterus, mobility of cervix, adnexa, ovaries
Anus and rectum	Hemorrhoids, fissures, skin tags, inflammation, excoriation, sphincter tone and control, prostate size, contour, consistency, mobility, color and consistency of stool
Lymphatics	Presence of palpable lymph nodes, size, shape, warmth, tenderness, mobility, consistency
Musculoskeletal	Posture, alignment, symmetry, spasms, active and passive range of motion, deformities, tenderness, swelling, crepitus, muscle strength
Neurological	Cranial nerves, gait, balance, coordination with rapid alternating movements, sensory function with pain, touch, vibration, superficial and deep tendon reflexes
Assessment	
<ul style="list-style-type: none"> - Diagnosis with rationale - Rationale derived from subjective and objective data - Symptoms can be listed as diagnoses - There may be a list of differential diagnoses, which are suspected diagnoses that are yet to be confirmed - May include anticipated problems such as progression of disease or complications 	
Plan	
<ul style="list-style-type: none"> - Typically denoted in the following order: <ul style="list-style-type: none"> - Diagnostic tests, treatment plan with rationale - Client education and counseling - Referrals - Follow-up or dates for re-evaluating results of plan 	

4. Refer to [Chapter 43](#) for diagnostic tests related to the integumentary system.

! To test skin turgor, pinch a large fold of skin and assess the ability of the skin to return to its place when released. Poor turgor occurs in severe dehydration or extreme weight loss.

BOX 12.2 The Mental Status Examination: Cognitive Level of Functioning

Orientation: Assess client's orientation to person, place, and time.
Attention Span: Assess client's ability to concentrate.
Recent Memory: Assessed by asking the client to recall a recent occurrence (e.g., the means of transportation used to get to the health care agency for the physical assessment).
Remote Memory: Assessed by asking the client about a verifiable past event (e.g., a vacation).
New Learning: Used to assess the client's ability to recall unrelated words identified by the nurse; the nurse selects four words and asks the client to recall the words 5, 10, and 30 minutes later.
Judgment: Determine whether the client's actions or decisions regarding discussions during the interview are realistic.
Thought Processes and Perceptions: The way the client thinks and what the client says should be logical, coherent, and relevant; the client should be consistently aware of reality.

BOX 12.3 Characteristics of Skin Color

Cyanosis: Mottled bluish coloration
Erythema: Redness
Pallor: Pale, whitish coloration
Jaundice: Yellow coloration

BOX 12.4 Assessing Capillary Filling Time

1. Depress the nail bed to produce blanching.
2. Release and observe for the return of color.
3. Color will return within 3 seconds if arterial capillary perfusion is normal.

5. Client teaching
 - a. Provide information about factors that can be harmful to the skin, such as sun exposure.
 - b. Encourage monthly self-examination of the skin for lesions using the ABCDE (asymmetry, border irregularity, color variance, diameter greater than 6 mm, evolving size, shape, and color) mnemonic.
- B. Head, neck, and lymph nodes: Involves inspection, palpation, and auscultation of the head, neck, and lymph nodes
 1. Ask the client about headaches; episodes of dizziness (light-headedness) or vertigo (spinning sensation); history of head injury; loss of consciousness; seizures; episodes of neck pain; limitations of range of motion; numbness or tingling in the shoulders, arms, or hands; lumps or swelling in the neck; difficulty swallowing; medications being taken; and history of surgery in the head and neck region.
 2. Head
 - a. Inspect and palpate: Size, shape, masses or tenderness, and symmetry of the skull
 - b. Palpate temporal arteries, located above the cheekbone between the eye and the top of the ear.
 - c. Palpate frontal and maxillary sinuses for tenderness.
 - d. Temporomandibular joint: Ask the client to open the mouth and move it from side to side; note any crepitation, tenderness, or limited range of motion. This tests cranial nerve V, the trigeminal nerve.
 - e. Face: Inspect facial structures for shape, symmetry, involuntary movements, or swelling, such as periorbital edema (swelling around the eyes).
 3. Neck
 - a. Inspect for symmetry of accessory neck muscles.
 - b. Assess range of motion.

TABLE 12.2 Assessing for Pitting Edema

Scale	Description
1+	Slight pitting, no visible distortion, disappears rapidly
2+	A somewhat deeper pit than in 1+, but again no readily detectable distortion; disappears in 10 to 15 seconds
3+	Noticeably deep pit that may last more than a minute; dependent extremity looks fuller and swollen
4+	Very deep pit that lasts as long as 2 to 5 minutes; dependent extremity is grossly distorted

From Ball, J. W., Dains, J. E., Flynn, J. A., Solomon, B. S., & Stewart, R. W. (2019). *Seidel's guide to physical examination: An interprofessional approach*. (9th ed.). St. Louis: Elsevier. p. 367.

- c. Test cranial nerve XI (spinal accessory nerve) to assess muscle strength: Ask the client to push against resistance applied to the side of the chin (tests sternocleidomastoid muscle); also ask the client to shrug the shoulders against resistance (tests trapezius muscle).
- d. Palpate the trachea: It should be midline, without any deviations.
- e. Thyroid gland: Inspect the neck as the client takes a sip of water and swallows (thyroid tissue moves up with a swallow); palpate using an anterior-posterior approach (usually the normal adult thyroid cannot be palpated); if it is enlarged, auscultate for a bruit.
4. Lymph nodes
- Palpate using a gentle pressure and a circular motion of the finger pads.
 - Begin with the preauricular lymph nodes (in front of the ear); move to the posterior auricular lymph nodes and then downward toward the supraclavicular lymph nodes. Lymph nodes in the head and neck area to be palpated include preauricular, postauricular, tonsillar, submandibular, submental, anterior cervical chain (superficial and deep), posterior cervical chain, supraclavicular, and infraclavicular.
 - Palpate with both hands, comparing the two sides for symmetry.
 - If nodes are palpated, note their size, shape, location, mobility, consistency, and tenderness.
5. Client teaching: Instruct the client to notify the primary health care provider (PHCP) if persistent headache, dizziness, or neck pain occurs; if swelling or lumps are noted in the head and neck region; or if a neck or head injury occurs.
-  Neck movements are never performed if the client has sustained a neck injury or if a neck injury is suspected.
- C. Eyes: Includes inspection, palpation, vision-testing procedures, and the use of an ophthalmoscope
- Subjective data: Difficulty with vision (e.g., decreased acuity, double vision, blurring, blind spots); pain, redness, swelling, watery or other discharge from the eye; use of glasses or contact lenses; medications being taken; history of eye problems
 - Objective data
 - Inspect the external eye structures, including eyebrows, for symmetry; eyelashes for even distribution; eyelids for ptosis (drooping); eyeballs for exophthalmos (protrusion) or enophthalmos (recession into the orbit; sunken eye).
 - Inspect the conjunctiva (should be clear), sclera (should be white), and lacrimal apparatus (check for excessive tearing, redness, tenderness, or swelling); cornea and lens (should be smooth and clear); iris (should be flat, with a round regular shape and even coloration); eyelids; and pupils.
3. Snellen eye chart 
- The Snellen eye chart is a simple tool used to measure distance vision.
 - Position the client in a well-lighted spot 20 feet (6 meters) from the chart, with the chart at eye level, and ask the client to read the smallest line that can be discerned.
 - Instruct the client to leave on glasses or leave in contact lenses; if the glasses are for reading only, they are removed because they blur distance vision.
 - Test one eye at a time; cover the eye not being tested.
 - Record the result using the fraction at the end of the last line successfully read on the chart.
 - Normal visual acuity is 20/20 (distance in feet at which the client is standing from the chart/distance in feet at which a normal eye could have read that particular line).
 - This assessment tests cranial nerve II, the optic nerve.
4. Near vision
- Use a handheld vision screener (held about 14 inches [35.5 cm] from the eye) that contains various sizes of print or ask the client to read from a magazine.
 - Test each eye separately with the client's prescription glasses on or contact lenses in. Cover the eye not being tested.
 - Normal result is 14/14 (distance in inches at which the subject holds the card from the eye/distance in inches at which a normal eye could have read that particular line).
 - This assessment tests cranial nerve II, the optic nerve.
5. Confrontation test
- A crude but rapid test used to measure peripheral vision and compare the client's peripheral vision with the nurse's (assuming that the nurse's peripheral vision is normal)
 - The client covers one eye and looks straight ahead; the nurse, positioned 2 feet away (60 cm), covers the eye opposite the client's covered eye.
 - The nurse advances a finger or other small object from the periphery from several directions; the client should see the object at the same time the nurse does.
 - Documented as the client's peripheral vision is equal to that of the examiner's

- e. This assessment tests cranial nerve II, the optic nerve.
6. Corneal light reflex
- Used to assess for parallel alignment of the axes of the eyes
 - The client is asked to gaze straight ahead as the nurse holds a light about 12 inches (30 cm) from the client.
 - The nurse looks for reflection of the light on the corneas in exactly the same spot in each eye.
7. Cover/uncover test
- Used to check for slight degrees of deviated alignment
 - Each eye is tested separately.
 - The nurse asks the client to gaze straight ahead and cover one eye.
 - The nurse examines the uncovered eye, expecting to note a steady, fixed gaze.
8. Diagnostic positions test (six cardinal positions of gaze) (Fig. 12.1)
- The six muscles that attach the eyeball to its orbit and serve to direct the eye to points of interest are tested.
 - The client holds the head still and is asked to move the eyes to follow a small object.
 - The examiner notes any parallel movements of the eye or nystagmus, an involuntary, rhythmic, rapid twitching of the eyeballs.
 - This assessment tests cranial nerves III, IV, and VI, oculomotor, trochlear, and abducens, respectively.
9. Color vision
- Tests for color vision involve the client picking numbers or letters out of a complex and colorful picture, using what is known as the *Ishihara chart*.
 - The test is sensitive for the diagnosis of red-green blindness but cannot detect discrimination of blue.

! The first slide on the Ishihara chart is one that everyone can discriminate; failure to identify numbers on this slide suggests a problem with performing the test, not a problem with color vision.

10. Pupils (Box 12.5)

- The pupils are round and of equal size.
- Increasing light causes pupillary constriction.
- Decreasing light causes pupillary dilation.
- Constriction of both pupils is a normal response to direct light. Constriction of the pupil in which the light is being shone is considered reaction to direct light, and constriction of the pupil in which the light is not being shone is considered reaction to consensual light.

FIG. 12.1 Checking extraocular muscles in the six cardinal positions. This indicates the functioning of cranial nerves III, IV, and VI.

BOX 12.5 Assessing and Documenting Pupillary Responses

Pupillary Light Reflex

- Darken the room (to dilate the client's pupils) and ask the client to look forward.
- Test each eye.
- Advance a light in from the side to note constriction of the same-side pupil (direct light reflex) and simultaneous constriction of the other pupil (consensual light reflex).

Accommodation

- Ask the client to focus on a distant object (dilates the pupil).
- Ask the client to shift gaze to a near object held about 3 inches (7.5 cm) from the nose.
- Normal response includes pupillary constriction and convergence of the axes of the eyes.

Documenting Normal Findings: PERRLA

P = pupils
E = equal
R = round
RL = reactive to light (direct and consensual)
A = reactive to accommodation

- Sclera and cornea
 - Normal sclera color is white.
 - A yellow color to the sclera may indicate jaundice or systemic problems.
 - In a dark-skinned person, the sclera may normally appear yellow; pigmented dots may be present.
 - The cornea is transparent, smooth, shiny, and bright.
 - Cloudy areas or specks on the cornea may be the result of an accident or eye injury.
- Ophthalmoscopy or funduscopy
 - The ophthalmoscope, or funduscope, is an instrument used to examine the external structures and the interior of the eye.
 - The room is darkened so that the pupil will dilate.
 - The instrument is held with the right hand when examining the right eye and with the left hand when examining the left eye.
 - The client is asked to look straight ahead at an object on the wall.

- e. The examiner should approach the client's eye from about 12 to 15 inches (30.5 to 38 cm) away and 15 degrees lateral to the client's line of vision.
- f. As the instrument is directed at the pupil, a red glare (red reflex) is seen in the pupil.
- g. The red reflex is the reflection of light on the vascular retina.
- h. Absence of the red reflex may indicate opacity of the lens.
- i. The optic disc, retinal vessels, general background, and macula can be examined.
- j. The optic disc should be creamy yellow-orange to pink and a round or oval shape with distinct margins. Retinal vessels should be visible without nicking and engorgement. General background varies from light red to dark brown red, corresponding with the person's color.

13. Refer to [Chapter 57](#) for diagnostic tests related to the eye.

14. Client teaching

- a. Instruct the client to notify the PHCP or ophthalmologist if alterations in vision occur or any redness, swelling, or drainage from the eye is noted.
- b. Inform the client of the importance of regular eye examinations.

D. Ears: Includes inspection, palpation, hearing tests, vestibular assessment, and the use of an otoscope

1. Subjective data: Difficulty hearing, earaches, drainage from the ears, dizziness, ringing in the ears, exposure to environmental noise, use of a hearing aid, medications being taken, history of ear problems or infections

2. Objective data

- a. Inspect and palpate the external ear, noting size, shape, symmetry, skin color, and the presence of pain.
- b. Inspect the external auditory meatus for size, swelling, redness, discharge, and foreign bodies; some cerumen (earwax) may be present.

3. Auditory assessment

- a. Sound is transmitted by air conduction and bone conduction.
- b. Air conduction takes two or three times longer than bone conduction.
- c. Hearing loss is categorized as conductive, sensorineural, or mixed conductive and sensorineural.
- d. Conductive hearing loss is caused by any physical obstruction to the transmission of sound waves.
- e. Sensorineural hearing loss is caused by a defect in the cochlea, eighth cranial nerve, or the brain itself.
- f. A mixed hearing loss is a combination of a conductive and sensorineural hearing loss; it

results from problems in both the inner ear and the outer ear or middle ear.

4. Voice (whisper) test

- a. Used to determine whether hearing loss has occurred
- b. One ear is tested at a time (the ear not being tested is occluded by the client).
- c. The nurse stands 1 to 2 feet (30 to 60 cm) from the client, covers the mouth so that the client cannot read the lips, exhales fully, and softly whispers two-syllable words in the direction of the unoccluded ear; the client points a finger up during the test when the nurse's voice is heard (a ticking watch may also be used to test hearing acuity).
- d. Failure to hear the sounds could indicate possible fluid collection and/or consolidation, requiring further assessment.

5. Watch test

- a. A ticking watch is used to test for high-frequency sounds.
- b. The examiner holds a ticking watch about 5 inches (12.5 cm) from each ear and asks the client if the ticking is heard.

6. Tuning fork tests

- a. Used to measure hearing on the basis of air conduction or bone conduction; includes the Weber's and Rinne's tests. These tests are not commonly used because of their limited sensitivity to detect hearing loss.

7. Vestibular assessment ([Box 12.6](#))

8. Ooscopic exam

! Before performing an otoscopic exam and inserting the speculum, check the auditory canal for foreign bodies. Instruct the client not to move the head during the examination to avoid damage to the canal and tympanic membrane.

- a. The client's head is tilted slightly away, and the otoscope is held upside down as if it were a large pen; this permits the examiner's hand to lie against the client's head for support.
- b. In an adult, pull the pinna up and back to straighten the external canal.
- c. Visualize the external canal while slowly inserting the speculum.
- d. The normal external canal is pink and intact, without lesions and with varying amounts of cerumen and fine little hairs.
- e. Assess the tympanic membrane for intactness; the normal tympanic membrane is intact, without perforations, and should be free from lesions.
- f. The tympanic membrane is transparent, opaque, pearly gray, and slightly concave. The cone of light reflex is noted at 5 o'clock on

BOX 12.6 Vestibular Assessment

Test for Falling

1. The examiner asks the client to stand with the feet together, arms hanging loosely at the sides, and eyes closed.
2. The client normally remains erect, with only slight swaying.
3. A significant sway is a positive Romberg's sign.

Test for Past Pointing

1. The client sits in front of the examiner.
2. The client closes the eyes and extends the arms in front, pointing both index fingers at the examiner.
3. The examiner holds and touches their own extended index fingers under the client's extended index fingers to give the client a point of reference.
4. The client is instructed to raise both arms and then lower them, attempting to return to the examiner's extended index fingers.
5. The normal test response is that the client can easily return to the point of reference.
6. The client with a vestibular function problem lacks a normal sense of position and cannot return the extended fingers to the point of reference; instead, the fingers deviate to the right or left of the reference point.

Gaze Nystagmus Evaluation

1. The client's eyes are examined as the client looks straight ahead, 30 degrees to each side, upward and downward.
2. Any spontaneous nystagmus—an involuntary, rhythmic, rapid twitching of the eyeballs—represents a problem with the vestibular system.

Dix-Hallpike Maneuver

1. The client starts in a sitting position; the examiner lowers the client to the exam table and rather quickly turns the client's head to the 45-degree position.
2. If after about 30 seconds there is no nystagmus, the client is returned to a sitting position and the test is repeated on the other side.

the right and 7 o'clock on the left, and there is positive mobility when the client swallows.

- g. A fluid line or the presence of air bubbles is not normally visible.
- h. If the tympanic membrane is bulging or retracting, the edges of the light reflex will be fuzzy (diffuse) and may spread over the tympanic membrane.

 **The otoscope is never introduced blindly into the external canal because of the risk of perforating the tympanic membrane.**

9. Refer to [Chapter 57](#) for diagnostic tests related to the ear.

10 Client teaching

- a. Instruct the client to notify the PHCP or otolaryngologist if an alteration in hearing or ear pain or ringing in the ears occurs, or if

redness, swelling, or drainage from the ear is noted.

- b. Instruct the client in the proper method of cleaning the ear canal.
 - c. The client should cleanse the ear canal with the corner of a moistened washcloth and should never insert sharp objects or cotton-tipped applicators into the ear canal.
- E. Nose, mouth, and throat: Includes inspection and palpation
1. Subjective data
 - a. Nose: Ask about discharge or nosebleed (epistaxis), facial or sinus pain, history of frequent colds, altered sense of smell, allergies, medications being taken, history of nose trauma, or surgery.
 - b. Mouth and throat: Ask about the presence of sores or lesions; bleeding from the gums or elsewhere; altered sense of taste; toothaches; use of dentures or other appliances; tooth and mouth care hygiene habits; at-risk behaviors (e.g., smoking, alcohol consumption); and history of infection, trauma, or surgery.
 2. Objective data
 - a. External nose should be midline and in proportion to other facial features.
 - b. Patency of the nostrils can be tested by pushing each nasal cavity closed and asking the client to sniff inward through the other nostril.
 - c. A nasal speculum and penlight or a short, wide-tipped speculum attached to an otoscope head is used to inspect for redness, swelling, discharge, bleeding, or foreign bodies; the nasal septum is assessed for deviation.
 - d. The nurse presses the frontal sinuses (located below the eyebrows) and over the maxillary sinuses (located below the cheekbones); the client should feel firm pressure but no pain.
 - e. The external and inner surfaces of the lips are assessed for color, moisture, cracking, or lesions.
 - f. The teeth are inspected for condition and number (should be white, spaced evenly, straight, and clean, free of debris and decay).
 - g. The alignment of the upper and lower jaws is assessed by having the client bite down.
 - h. The gums are inspected for swelling, bleeding, discoloration, and retraction of gingival margins (gums normally appear pink).
 - i. The dorsal, ventral, and lateral sides of the tongue are inspected for color, surface characteristics, moisture, white patches, nodules, and ulcerations (dorsal surface and lateral surfaces are normally rough; ventral surface is smooth and glistening, with visible veins).

- j. The nurse retracts the cheek with a tongue depressor to check the buccal mucosa for color and the presence of nodules or lesions; normal mucosa is glistening, pink, soft, moist, and smooth.
 - k. Using a penlight and tongue depressor, the nurse inspects the hard and soft palates for color, shape, texture, and defects; the hard palate (roof of the mouth), which is located anteriorly, should be white and dome-shaped, and the soft palate, which extends posteriorly, should be light pink and smooth.
 - l. The uvula is inspected for midline location; the nurse asks the client to say “ahhh” and watches for the soft palate and uvula to rise in the midline (this tests one function of cranial nerve X, the vagus nerve).
 - m. Using a penlight and tongue depressor, the nurse inspects the throat for color, presence of tonsils, and the presence of exudate or lesions; tonsils should be graded (0 is surgically removed; 1 + is tonsils hidden within pillars; 2 + is tonsils extending to the pillars, 3 + is tonsils extending beyond the pillars, 4 + is tonsils extending to the midline). One technique to test cranial nerve XII (the hypoglossal nerve) is to ask the client to stick out the tongue (should protrude in the midline).
 - n. To test the gag reflex, touch the posterior pharynx with the end of a tongue blade; the client should gag momentarily (this tests the function of cranial nerve IX, the glossopharyngeal nerve).
3. Client teaching
- a. Emphasize the importance of hygiene and tooth care, as well as regular dental examinations and the use of fluoridated water or fluoride supplements.
 - b. Encourage the client to avoid at-risk behaviors (e.g., smoking, drug use, and alcohol consumption).
 - c. Stress the importance of reporting pain or abnormal occurrence (e.g., nodules, lesions, signs of infection).

F. Lungs

1. Subjective data: Cough; expectoration of sputum; shortness of breath or dyspnea; chest pain on breathing; smoking history; environmental exposure to pollution or chemicals; medications being taken; history of respiratory disease or infection; last tuberculosis test, chest radiograph, pneumonia, and any influenza immunizations. Record the smoking history in pack-years (the number of packs per day times the number of years smoked). For example, a client who has smoked one-half pack a day for 20 years has a smoking history of 10 pack-years.

2. Many health care facilities are screening for signs and symptoms of infectious respiratory diseases such as COVID-19. Questions focus on suspected exposure, recent travel, and presence of the following symptoms: fever or chills, cough, shortness of breath or difficulty breathing, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, and diarrhea. Refer to <https://www.cdc.gov/screening/paper-version.pdf> for a copy of the Centers for Disease Control and Prevention screening tool.
3. Objective data: Includes inspection, palpation, percussion, and auscultation
4. Inspection of the anterior and posterior chest: Note skin color and condition and the rate and quality of respirations, look for lumps or lesions, note the shape and configuration of the chest wall, and note the position the client takes to breathe.
5. Palpation: Palpate the entire chest wall, noting skin temperature and moisture and looking for areas of tenderness or for lumps, lesions, or masses; assess chest excursion and tactile or vocal fremitus (Box 12.7).
6. Percussion
 - a. Starting at the apices, percuss across the top of the shoulders, moving to the interspaces, making a side-to-side comparison all the way down the lung area (Fig. 12.2).
 - b. Determine the predominant note; resonance is noted in healthy lung tissue.

BOX 12.7 Palpation of the Chest

Chest Excursion

Posterior: The nurse places the thumbs along the spinal processes at the 10th rib, with the palms in light contact with the posterolateral surfaces.

The nurse's thumbs should be about 2 inches (5 cm) apart, pointing toward the spine, with the fingers pointing laterally.

Anterior: The nurse places the hands on the anterolateral wall with the thumbs along the costal margins, pointing toward the xiphoid process.

The nurse instructs the client to take a deep breath after exhaling.

The nurse should note movement of the thumbs, and chest excursion should be symmetrical, separating the thumbs approximately 2 inches (5 cm).

Tactile or Vocal Fremitus

The nurse places the ball or lower palm of the hand over the chest, starting at the lung apices and palpating from side to side.

The nurse asks the client to repeat the words “ninety-nine.” Symmetrical palpable vibration should be felt by the nurse.

FIG. 12.2 Landmarks for chest auscultation and percussion. A, Posterior view. B, Anterior view. C, Lateral views.

- c. Hyperresonance is noted when excessive air is present, and a dull note indicates lung density.
7. Auscultation
- Using the □ at diaphragm endpiece of the stethoscope, hold it □rmly against the chest wall and listen to at least one full respiration in each location (anterior, posterior, and lateral).
 - Posterior: Start at the apices and move side to side for comparison (see Fig. 12.2).
 - Anterior: Auscultate the lung □elds from the apices in the supraclavicular area down to the sixth rib; avoid percussion and auscultation over breast/chest tissue (displace this tissue), because a dull sound will be produced (see Fig. 12.2).
 - Compare □ndings on each side.
8. Normal breath sounds: Three types of breath sounds are considered normal in certain parts of the thorax, including vesicular, bronchove-
- sicular, and bronchial; breath sounds should be clear to auscultation (Fig. 12.3).
9. Abnormal breath sounds: Also known as *adventitious sounds* (Table 12.3)
10. Voice sounds (Box 12.8)
- Performed when a pathological lung condition is suspected
 - Auscultate over the chest wall; the client is asked to vocalize words or a phrase while the nurse listens to the chest.
 - Normal voice transmission is soft and muffled; the nurse can hear the sound but is unable to distinguish exactly what is being said.
- ⚠ When auscultating breath sounds, instruct the client to breathe through the mouth, and monitor the client for dizziness.
11. Refer to Chapter 51 for diagnostic tests related to the respiratory system.

FIG. 12.3 Auscultatory sounds. A, Anterior thorax. B, Posterior thorax.

TABLE 12.3 Characteristics of Adventitious Sounds

Adventitious Sound	Characteristics	Clinical Examples
Fine crackles	High-pitched crackling and popping noises (discontinuous sounds) heard during the end of inspiration. Not cleared by cough.	May be heard in pneumonia, heart failure, asthma, and restrictive pulmonary diseases
Coarse crackles	Low-pitched, bubbling or gurgling sounds that start early in inspiration and extend into the first part of expiration. Not cleared by cough.	Same as above, but condition is worse or may be heard in terminally ill clients with diminished gag reflex. Also heard in pulmonary edema and pulmonary fibrosis.
Wheeze (also called <i>sibilant</i> wheeze)	High-pitched, musical sound similar to a squeak. Heard more commonly during expiration, but may also be heard during inspiration. Occurs in small airways.	Heard in narrowed airway diseases such as asthma
Rhonchi (also called <i>sonorous</i> wheeze)	Low-pitched, coarse, loud, low snoring or moaning tone. Actually sounds like snoring. Heard primarily during expiration, but may also be heard during inspiration. Coughing may clear.	Heard in disorders causing obstruction of the trachea or bronchus, such as chronic bronchitis
Pleural friction rub	A superficial, low-pitched, coarse rubbing or grating sound. Sounds like two surfaces rubbing together. Heard throughout inspiration and expiration. Loudest over the lower antero-lateral surface. Not cleared by cough.	Heard in individuals with pleurisy (inflammation of the pleural surfaces) Heard also in pleuritis, accompanied by pain with breathing (rub disappears after a few days if pleural fluid accumulates and separates pleurae)

Data from Ignatavicius, D., Workman, M. Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 488; Jarvis, C. (2020). *Physical examination and health assessment*. (8th ed.). St. Louis: Elsevier. pp. 437-438; Ball, J. W., Dains, J. E., Flynn, J. A., Solomon, B. S., & Stewart, R. W. (2019). *Seidel's guide to physical examination: An interprofessional approach*. (9th ed.). St. Louis: Elsevier. p. 301.

12. Client teaching

- Encourage the client to avoid exposure to environmental hazards, including smoking (discuss smoking-cessation programs as appropriate).
- Client should undergo periodic examinations as prescribed (e.g., chest x-ray study, tuberculosis skin testing; refer to [Chapter 51](#)).
- Encourage the client to obtain pneumonia and influenza immunizations.
- PHCP or pulmonologist should be notified if client experiences persistent cough, shortness of breath, or other respiratory symptoms.

G. Heart

- Subjective data: Chest pain, dyspnea, cough, fatigue, edema, nocturia, leg pain or cramps (claudication), changes in skin color, obesity, medications being taken, cardiovascular risk factors, family history of cardiac or vascular problems, personal history of cardiac or vascular problems
- Objective data: May include inspection, palpation, percussion, and auscultation
- Inspection: Inspect the anterior chest for pulsations (apical impulse) created as the left ventricle

BOX 12.8 Voice Sounds**Bronchophony**

1. Ask the client to repeat the words “ninety-nine.”
2. Normal voice transmission is soft, muffled, and indistinct.

Egophony

1. Ask the client to repeat a long “ee-ee-ee” sound.
2. Normally the nurse would hear the “ee-ee-ee” sound.

Whispered Pectoriloquy

1. Ask the client to whisper the words “one, two, three.”
2. Normal voice transmission is faint, muffled, and almost inaudible.

rotates against the chest wall during systole; not always visible.

4. Palpation
 - a. Palpate the apical impulse at the fourth or fifth interspace, or medial to the midclavicular line (not palpable in obese clients or clients with thick chest walls).
 - b. Palpate the apex, left sternal border, and base for pulsations; normally none are present.
5. Percussion: May be performed to outline the heart’s borders and to check for cardiac enlargement (denoted by resonance over the lung and dull notes over the heart).
6. Auscultation
 - a. Areas of the heart (Fig. 12.4)
 - b. Auscultate heart rate and rhythm; check for a pulse deficit (auscultate the apical heartbeat while palpating an artery) if an irregularity is noted.
 - c. Assess S₁ (“lub”) and S₂ (“dub”) sounds, and listen for extra heart sounds, as well as the presence of murmurs (blowing or swooshing noise that can be faint or loud with a high, medium, or low pitch).
 - d. Grading a murmur: See Box 12.9.
7. Peripheral vascular system
 - a. Assess adequacy of blood flow to the extremities by palpating arterial pulses for equality and symmetry and checking the condition of the skin and nails.
 - b. Check for pretibial edema and measure calf circumference (see Table 12.2).
 - c. Measure blood pressure.
 - d. Palpate superficial inguinal nodes (using firm but gentle pressure), beginning in the inguinal area and moving down toward the inner thigh.
 - e. An ultrasonic stethoscope may be needed to amplify the sounds of a pulse wave if the pulse cannot be palpated.
 - f. Carotid artery: Located in the groove between the trachea and sternocleidomastoid muscle, medial to and alongside the muscle

FIG. 12.4 Auscultation areas of the heart. LICS, Left intercostal space; LMCL, left midclavicular line; RICS, right intercostal space.

BOX 12.9 Grading a Murmur

- Grade I: Very faint
- Grade II: Faint but recognizable
- Grade III: Loud but moderate in intensity
- Grade IV: Loud; accompanied by a palpable thrill
- Grade V: Very loud; accompanied by a palpable thrill; audible with the stethoscope partly off the client’s chest
- Grade VI: Extremely loud; may be heard with the stethoscope slightly above the client’s chest; accompanied by a palpable thrill

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders, p. 626.

- g. Palpate one carotid artery at a time to avoid compromising blood flow to the brain.
 - h. Auscultate each carotid artery for the presence of a bruit (a blowing, swishing, or buzzing, humming sound), which indicates blood flow turbulence; normally a bruit is not present (see **Clinical Judgment: Take Action box**).
 - i. Palpate the arteries in the extremities (Box 12.10).
8. Refer to Chapter 53 for diagnostic tests related to the cardiovascular system.
 9. Client teaching
 - a. Advise client to modify lifestyle for risk factors associated with heart and vascular disease.
 - b. Encourage the client to seek regular physical examinations.
 - c. Client should seek medical assistance for signs of heart or vascular disease.
- H. Breasts/Chest
1. Subjective data: Pain or tenderness, lumps or thickening, swollen axillary lymph nodes, nipple

⚡ CLINICAL JUDGMENT: TAKE ACTION

The nurse is performing a cardiovascular assessment and notes the presence of a blowing, swishing sound over the carotid artery. The nurse would take the following actions based on this finding:

When auscultating the client's carotid arteries, the nurse has noted a bruit, which indicates blood flow turbulence and potentially a blockage. A blockage in the carotid artery could decrease blood flow to the brain. Normally, a bruit is not present, so this finding necessitates the need for follow-up. The primary health care provider (PHCP) would be notified so that further assessment and testing could be done to determine the cause of this finding. The nurse would monitor the client's vital signs and neurological status for signs of altered blood flow to the brain. The nurse would also document the finding and that the PHCP was notified.

BOX 12.10 Arterial Pulse Points and Grading the Force of Pulses

Arteries in the Arms and Hands

Radial Pulse: Located at the radial side of the forearm at the wrist

Ulnar Pulse: Located on the opposite side of the location of the radial pulse at the wrist

Brachial Pulse: Located above the elbow at the antecubital fossa, between the biceps and triceps muscles

Arteries in the Legs

Femoral Pulse: Located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine

Popliteal Pulse: Located behind the knee

Dorsalis Pedis Pulse: Located at the top of the foot, in line with the groove between the extensor tendons of the great and first toes

Posterior Tibial Pulse: Located on the inside of the ankle, behind and below the medial malleolus (ankle bone)

Grading the Force

4+ = Strong and bounding

3+ = Full pulse, increased

2+ = Normal, easily palpable

1+ = Weak, barely palpable

0+ = Absent, not palpable

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby, pp. 478, 501.

discharge, rash or swelling, medications being taken, personal or family history of breast disease, trauma or injury to the breasts, previous surgery on the breasts, breast self-examination (BSE) compliance, mammograms as prescribed

2. Objective data: Inspection and palpation
3. Inspection
 - a. Performed with the client's arms raised above the head, the hands pressed against the hips,

and the arms extended straight ahead while the client sits and leans forward

- b. Assess size and symmetry (one breast is often larger than the other); masses, flattening, retraction, or dimpling; color and venous pattern; size, color, shape, and discharge in the nipple and areola; and the direction in which nipples point.

4. Palpation

- a. Client lies supine, with the arm on the side being examined behind the head and a small pillow under the shoulder.
- b. The nurse uses the pads of the first three fingers to compress the breast tissue gently against the chest wall, noting tissue consistency.
- c. Palpation is performed systematically, ensuring that the entire breast and tail are palpated.
- d. The nurse notes the consistency of the breast tissue, which normally feels dense, firm, and elastic.
- e. The nurse gently palpates the nipple and areola and compresses the nipple, noting any discharge.
- f. It is important to document lump or mass characteristics, which includes size, shape, consistency, movability, distinctness, nipple characteristics, skin findings over the lump, tenderness, and lymphadenopathy.

5. Axillary lymph nodes

- a. The nurse faces the client and stands on the side being examined, supporting the client's arm in a slightly flexed position, and abducts the arm away from the chest wall.
- b. The nurse places the free hand against the client's chest wall and high in the axillary hollow, then, with the fingertips, gently presses down, rolling soft tissue over the surface of the ribs and muscles.
- c. Lymph nodes are normally not palpable.

6. Client teaching

- a. Encourage and teach the client to perform BSE (refer to [Chapter 45](#) for information on performing BSE).
- b. Client should report lumps or masses to the PHCP immediately.
- c. Regular physical examinations and mammograms should be obtained as prescribed.

l. Abdomen

1. Subjective data: Changes in appetite or weight, difficulty swallowing, dietary intake, intolerance to certain foods, nausea or vomiting, pain, bowel habits, medications currently being taken, history of abdominal problems or abdominal surgery
2. Objective data
 - a. Ask the client to empty the bladder.
 - b. Be sure to warm the hands and the endpiece of the stethoscope.
 - c. Examine painful areas last.

! When performing an abdominal assessment, the specific order for assessment techniques is inspection, auscultation, percussion, and palpation.

3. Inspection

- Contour: Look down at the abdomen and then across the abdomen from the rib margin to the pubic bone; describe as flat, rounded, concave, or protuberant.
- Symmetry: Note any bulging or masses.
- Umbilicus: Should be midline and inverted
- Skin surface: Should be smooth and even
- Pulsations from the aorta may be noted in the epigastric area, and peristaltic waves may be noted across the abdomen.

4. Auscultation

- Performed before percussion and palpation, which can increase peristalsis
- Hold the stethoscope lightly against the skin and listen for bowel sounds in all four quadrants; begin in the right lower quadrant (bowel sounds are normally heard here).
- Note the character and frequency of normal bowel sounds: high-pitched gurgling sounds occurring irregularly from 5 to 30 times a minute.
- Identify as normal, hypoactive, or hyperactive (borborygmus).
- Absent sounds: Auscultate for 5 minutes before determining that sounds are absent.
- Auscultate over the aorta, renal arteries, iliac arteries, and femoral arteries for vascular sounds or bruits with the bell of the stethoscope.

5. Percussion

- All four quadrants are percussed lightly.
- Borders of the liver and spleen are percussed and measured.
- Tympany should predominate over the abdomen, with dullness over the liver and spleen.
- Percussion over the kidney at the 12th rib (costovertebral angle) should produce no pain. This is also known as *costovertebral tenderness*.

6. Palpation

- Begin with light palpation of all four quadrants, using the fingers to depress the skin about 1 cm; next perform deep palpation, depressing 5 to 8 cm.
- Palpate the liver and spleen (spleen may not be palpable).
- Palpate the aortic pulsation in the upper abdomen slightly to the left of midline; normally it pulsates in a forward direction (pulsation expands laterally if an aneurysm is present).

BOX 12.11 Common Postural Abnormalities

Lordosis (Swayback): Increased lumbar curvature

Kyphosis (Hunchback): Exaggeration of the posterior curvature of the thoracic spine

Scoliosis: Lateral spinal curvature

Reference: Jarvis, C. (2020). *Physical examination and health assessment*. (8th ed.). St. Louis: Elsevier. p. 648.

- Refer to [Chapter 49](#) for diagnostic tests related to the gastrointestinal system.

8 Client teaching

- Encourage the client to consume a balanced diet; obesity needs to be prevented.
- Substances that can cause gastric irritation should be avoided.
- The regular use of laxatives is discouraged.
- Lifestyle behaviors that can cause gastric irritation (e.g., spicy foods) should be modified.
- Regular physical examinations are important.
- The client should report gastrointestinal problems to the PHCP or gastroenterologist.

J. Musculoskeletal system

- Subjective data: Joint pain or stiffness; redness, swelling, or warm joints; limited motion of joints; muscle pain, cramps, or weakness; bone pain; limitations in activities of daily living; exercise patterns; exposure to occupational hazards (e.g., heavy lifting, prolonged standing or sitting); medications being taken; history of joint, muscle, or bone injuries; history of surgery of the joints, muscles, or bones
- Objective data: Inspection and palpation
- Inspection: Inspect gait and posture, and for cervical, thoracic, and lumbar curves ([Box 12.11](#)).
- Palpation: Palpate all bones, joints, and surrounding muscles.
- Range of motion
 - Perform active and passive range-of-motion exercises of each major joint.
 - Check for pain, limited mobility, spastic movement, joint instability, stiffness, and contractures.
 - Normally joints are nontender, without swelling, and move freely.
- Muscle tone and strength
 - Assess during measurement of range of motion.
 - Ask client to flex the muscle to be examined and then to resist while applying opposing force against the flexion.
 - Assess for increased tone (hypertonicity) or little tone (hypotonicity).
- Grading muscle strength ([Table 12.4](#))
- Refer to [Chapter 61](#) for diagnostic tests related to the musculoskeletal system.

TABLE 12.4 Assessing Muscle Strength

Muscle Function Level	Grade
No evidence of movement	0
Trace of movement	1
Full range of motion, but not against gravity ^a	2
Full range of motion against gravity but not against resistance	3
Full range of motion against gravity and some resistance, but weak	4
Full range of motion against gravity, full resistance	5

^aPassive movement.

Data from Ball, J. W., Dains, J. E., Flynn, J. A., Solomon, B. S., & Stewart, R. W. (2019). *Seidel's guide to physical examination: An interprofessional approach*. (9th ed.). St. Louis: Elsevier. p. 534.

9. Client teaching

- The client should consume a balanced diet, including foods containing calcium and vitamin D, such as dark leafy vegetables, deep yellow vegetables, and dairy products or soy or almond milk if the client is on a vegan diet.
- Activities that cause muscle strain or stress to the joints should be avoided.
- Encourage the client to maintain a normal weight.
- Participation in a regular exercise program is beneficial.
- The client should contact the PHCP if joint or muscle pain or problems occur or if limitations in range of motion or muscle strength develop.

K. Neurological system

- Subjective data: Headaches, dizziness or vertigo, tremors, weakness, incoordination, numbness or tingling in any area of the body, difficulty speaking or swallowing, medications being taken, history of seizures, history of head injury or surgery, exposure to environmental or occupational hazards (e.g., chemicals, alcohol, drugs)
- Objective data: Assessment of cranial nerves, level of consciousness, pupils, motor function, cerebellar function, coordination, sensory function, and reflexes
- Note mental and emotional status, behavior and appearance, language ability, and intellectual functioning, including memory, knowledge, abstract thinking, association, and judgment.
- Vital signs: Check temperature, pulse, respirations, and blood pressure; monitor for blood pressure or pulse changes, which may indicate

increased intracranial pressure (see Chapter 51 for abnormal respiratory patterns).

5. Cranial nerves (Table 12.5)

6. Level of consciousness

- Assess the client's behavior to determine level of consciousness (e.g., alertness, confusion, delirium, unconsciousness, stupor, coma); assessment becomes increasingly invasive as the client is less responsive. Use the Glasgow Coma Scale as appropriate (eye opening, motor response, verbal response, graded on a scale). See Chapter 59 for a description of this scale.
- Speak to client.
- Assess appropriateness of behavior and conversation.
- Lightly touch the client (as culturally appropriate).

7. Pupils

- Assess size, equality, and reaction to light (brisk, slow, or fixed), and note any unusual eye movements (check direct light and consensual light reflex); refer to Chapter 59 for abnormal pupillary findings.
- This component of the neurological examination may be performed during assessment of the eye.

8. Motor function

- Assess muscle tone, including strength and equality.
- Assess for voluntary and involuntary movements and purposeful and nonpurposeful movements.
- This component of the neurological examination may be performed during assessment of the musculoskeletal system.

9. Cerebellar function

- Monitor gait as the client walks in a straight line, heel to toe (tandem walking).
- Romberg's test: Client is asked to stand with the feet together and the arms at the sides and to close the eyes and hold the position; normally the client can maintain posture and balance.
- If appropriate, ask the client to perform a shallow knee bend or to hop in place on one leg and then the other.

10. Coordination

- Assess by asking the client to perform rapid alternating movements of the hands (e.g., turning the hands over and patting the knees continuously).
- The nurse asks the client to touch the nurse's finger, then their own nose; the client keeps the eyes open and the nurse moves the finger to different spots to ensure that the client's movements are smooth and accurate.

TABLE 12.5 Assessment of the Cranial Nerves

Cranial Nerve	Test
Cranial Nerve I: Olfactory <ul style="list-style-type: none"> Sensory Controls the sense of smell 	<ul style="list-style-type: none"> Have the client close the eyes and occlude one nostril with a finger. Ask the client to identify nonirritating and familiar odors (e.g., coffee, tea, cloves, soap, chewing gum, peppermint). Repeat the test on the other nostril.
Cranial Nerve II: Optic <ul style="list-style-type: none"> Sensory Controls vision 	<ul style="list-style-type: none"> Assess visual acuity with a Snellen chart and perform an ophthalmoscopic exam. Check peripheral vision by confrontation. Check color vision.
Cranial Nerves III, IV, and VI <i>Cranial Nerve III: Oculomotor</i> <ul style="list-style-type: none"> Motor Controls pupillary constriction, upper-eyelid elevation, and most eye movement 	<ul style="list-style-type: none"> The motor functions of cranial nerves III, IV, and VI overlap; therefore, they should be tested together. Inspect the eyelids for ptosis (drooping); then assess ocular movements and note any eye deviation. Test accommodation and direct and consensual light reflexes.
<i>Cranial Nerve IV: Trochlear</i> <ul style="list-style-type: none"> Motor Controls downward and inward eye movement 	
<i>Cranial Nerve VI: Abducens</i> <ul style="list-style-type: none"> Motor Controls lateral eye movement 	
Cranial Nerve V: Trigeminal <ul style="list-style-type: none"> Sensory and motor Controls sensation in the cornea, nasal and oral mucosa, and facial skin, as well as mastication 	<ul style="list-style-type: none"> To test motor function, ask the client to clench the teeth and assess the muscles of mastication; then try to open the client's jaws after asking the client to keep them tightly closed. The corneal reflex may be tested by the primary health care provider; this is done by lightly touching the client's cornea with a cotton wisp (this test may be omitted if the client is alert and blinking normally). Check sensory function by asking the client to close the eyes; lightly touch the forehead, cheeks, and chin, noting whether the touch is felt equally on the two sides.
Cranial Nerve VII: Facial <ul style="list-style-type: none"> Sensory and motor Controls movement of the face and taste sensation 	<ul style="list-style-type: none"> Test taste perception on the anterior two-thirds of the tongue; the client should be able to taste salty and sweet tastes. Have the client smile, frown, and show the teeth. Ask the client to puff out the cheeks. Attempt to close the client's eyes against resistance.
Cranial Nerve VIII: Acoustic or Vestibulocochlear <ul style="list-style-type: none"> Sensory Controls hearing and vestibular function 	<ul style="list-style-type: none"> Assessing the client's ability to hear tests the cochlear portion. Assessing the client's sense of equilibrium tests the vestibular portion. Check the client's hearing, using acuity tests. Observe the client's balance, and watch for swaying when walking or standing. Assessment of sensorineural hearing loss may be done with the Weber's or Rinne's tests.
Cranial Nerves IX and X <i>Cranial Nerve IX: Glossopharyngeal</i> <ul style="list-style-type: none"> Sensory and motor Controls swallowing ability, sensation in the pharyngeal soft palate and tonsillar mucosa, taste perception on the posterior third of the tongue, and salivation 	<ul style="list-style-type: none"> Usually cranial nerves IX and X are tested together. Test taste perception on the posterior third of the tongue or pharynx; the client should be able to taste bitter and sour tastes. Inspect the soft palate and watch for symmetrical elevation when the client says "aaah." Touch the posterior pharyngeal wall with a tongue depressor to elicit the gag reflex.

Continued

TABLE 12.5 Assessment of the Cranial Nerves—cont'd

Cranial Nerve	Test
Cranial Nerve X: Vagus <ul style="list-style-type: none"> - Sensory and motor - Controls swallowing and phonation, sensation in the exterior ear's posterior wall, and sensation behind the ear - Controls sensation in the thoracic and abdominal viscera 	
Cranial Nerve XI: Spinal Accessory <ul style="list-style-type: none"> - Motor - Controls strength of neck and shoulder muscles 	<ul style="list-style-type: none"> - The nurse palpates and inspects the sternocleidomastoid muscle as the client pushes the chin against the nurse's hand. - The nurse palpates and inspects the trapezius muscle as the client shrugs the shoulders against the nurse's resistance.
Cranial Nerve XII: Hypoglossal <ul style="list-style-type: none"> - Motor - Controls tongue movements involved in swallowing and speech 	<ul style="list-style-type: none"> - Observe the tongue for asymmetry, atrophy, deviation to one side, and fasciculations (uncontrollable twitching); ask the client to stick out the tongue (tongue should be midline) - Ask the client to push the tongue against a tongue depressor, and then have the client move the tongue rapidly in and out and from side to side.

Reference: Jarvis, C. (2020). *Physical examination and health assessment*. (8th ed.). St. Louis: Elsevier. p. 631.

- c. Heel-to-shin test: Assist the client into a supine position; then ask the client to place the heel on the opposite knee and run it down the shin; normally the client moves the heel down the shin in a straight line.
11. Sensory function
- Pain: Assess by applying an object with a sharp point and one with a dull point to the client's body in random order; ask the client to identify the sharp and dull feelings.
 - Light touch: Brush a piece of cotton over the client's skin at various locations in a random order, and ask the client to say when the touch is felt.
 - Position sense (kinesthesia): Move the client's finger or toe up or down and ask the client which way it has been moved; this tests the client's ability to perceive passive movement.
 - Stereognosis: Tests the client's ability to recognize objects placed in the hand
 - Graphesthesia: Tests the client's ability to identify a number traced on the client's hand
 - Two-point discrimination: Tests the client's ability to discriminate two simultaneous pinpricks on the skin
12. Deep tendon reflexes
- Includes testing the following reflexes: biceps, triceps, brachioradialis, patella, Achilles
 - Limb should be relaxed.
 - The tendon is tapped quickly with a reflex hammer, which should cause contraction of muscle.
 - Scoring deep tendon reflex activity (Box 12.12)

BOX 12.12 Scoring Deep Tendon Reflex Activity

- 0 = No response
- 1 + = Diminished, low-normal, or occurs only with reinforcement
- 2 + = Average, normal
- 3 + = Brisker than average; may indicate disease, probably normal
- 4 + = Very brisk, hyperactive with clonus; indicative of disease

Reference: Jarvis, C. (2020). *Physical examination and health assessment*. (8th ed.). St. Louis: Saunders. p. 648.

13. Plantar reflex
- A cutaneous (superficial) reflex is tested with a pointed but not sharp object.
 - The sole of the client's foot is stroked from the heel, up the lateral side, and then across the ball of the foot to the medial side.
 - The normal response is plantar flexion of all toes.

! Dorsiflexion of the great toe and fanning of the other toes (Babinski's sign) after firmly stroking the sole of the foot is abnormal in anyone older than 2 years and indicates the presence of central nervous system disease.

14. Testing for meningeal irritation
- A positive Brudzinski's sign or Kernig's sign indicates meningeal irritation.
 - Brudzinski's sign is tested with the client in the supine position. The nurse flexes the client's head (gently moves the head to the chest) and there should be no reports of pain or resistance to the neck flexion; a positive

Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.

- c. Kernig's sign is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended.
15. Refer to **Chapter 59** for additional neurological assessments and diagnostic tests.
16. Client teaching
 - a. Client should avoid exposure to environmental hazards (e.g., insecticides, lead).
 - b. High-risk behaviors that can result in head and spinal cord injuries should be avoided.
 - c. Protective devices (e.g., a helmet, body pads) should be worn when participating in high-risk behaviors.
 - d. Seat belts should always be worn.
- L. Persons with vaginas
 1. Subjective data: Urinary difficulties or symptoms such as frequency, urgency, or burning; vaginal discharge; pain; menstrual and obstetrical histories; onset of menopause; medications being taken; sexual activity and the use of barrier and other contraceptives; history of sexually transmitted infections
 2. Objective data
 - a. Use a calm and relaxing approach; the examination is embarrassing for many clients and may be a difficult experience for an adolescent; try to keep street clothes on and work around them as much as possible.
 - b. Consider the client's cultural background and beliefs regarding examination of the genitalia.
 - c. Consider sexual orientation in these types of exams, such as a transgendered individual and the sensitivity required in caring for this special population.
 - d. A complete examination will include the external genitalia and a pelvic (speculum and bi-manual) examination.
 - e. The nurse's role is to prepare the client for the examination and to assist the PHCP or other practitioner.
 - f. The client is asked to empty the bladder before the examination.
 - g. The client is placed in the lithotomy position, and a drape is placed across the client.
 3. External genitalia
 - a. Quantity and distribution of hair
 - b. Characteristics of labia majora and minora (make note of any inflammation, edema, lesions, or lacerations)
 - c. Urethral orifice is observed for color and position.
 - d. Vaginal orifice (introitus) is inspected for inflammation, edema, discoloration, discharge, and lesions.
 - e. The examiner may check Skene's and Bartholin's glands for tenderness or discharge (if discharge is present, color, odor, and consistency are noted and a culture of the discharge is obtained).
 - f. The client is assessed for the presence of a cystocele (in which a portion of the vaginal wall and bladder prolapse, or fall, into the orifice anteriorly) or a rectocele (bulging of the posterior wall of the vagina caused by prolapse of the rectum).
 4. Speculum examination of the internal genitalia
 - a. Performed by the PHCP or other practitioner
 - b. Permits visualization of the cervix and vagina
 - c. Papanicolaou (Pap) smear (test): A painless screening test for cervical cancer is done; the specimen is obtained during the speculum examination, and the nurse helps prepare the specimen for laboratory analysis. This test may or may not include screening for human papillomavirus (HPV).
 5. Bimanual examination
 - a. Performed by PHCP or other practitioner
 - b. Internal examination of the structures of the reproductive tract
 - c. May reveal masses, nodules, growths, or tenderness
 - d. The uterus is palpated for position, size, shape, contour, and mobility.
 - e. The adnexa and ovaries are palpated for masses or tenderness.
 - f. A rectovaginal examination may be done for further examination of the pelvic structures.
 6. Client teaching
 - a. Stress the importance of personal hygiene.
 - b. Explain the purpose and recommended frequency of Pap tests.
 - c. Explain the signs of sexually transmitted infections.
 - d. Educate the client on measures to prevent a sexually transmitted infection.
 - e. Inform the client with a sexually transmitted infection to inform sexual partner(s) of the need for an examination.
- M. Persons with penises
 1. Subjective data: Urinary difficulty (e.g., frequency, urgency, hesitancy or straining, dysuria, nocturia); pain, lesions, or discharge on or from the penis; pain or lesions in the scrotum; medications being taken; sexual activity and the use of contraceptives; history of sexually transmitted infections

2. Objective data
- Includes assessment (inspection and palpation) of the external genitalia and inguinal ring and canal
 - Client may stand or lie down for this examination.
 - Genitalia are manipulated gently to avoid causing erection or discomfort.
 - Sexual maturity is assessed by noting the size and shape of the penis and testes, the color and texture of the scrotal skin, and the character and distribution of pubic hair.
 - The penis is checked for the presence of lesions or discharge; a culture is obtained if a discharge is present.
 - The scrotum is inspected for size, shape, and symmetry (normally the left testicle hangs lower than the right) and is palpated for the presence of lumps.
 - Inguinal ring and canal: Inspection (asking the client to cough or bear down) and palpation are performed to assess for the presence of a hernia.
3. Client teaching
- Stress the importance of personal hygiene.
 - Teach the client how to perform testicular self-examination (TSE); a day of the month is selected, and the exam is performed on the same day each month after a shower or bath when the hands are warm and soapy and the scrotum is warm. (Refer to [Chapter 45](#) for information on performing TSE.)
 - Explain the signs of sexually transmitted infections.
 - Educate the client on measures to prevent sexually transmitted infections.
 - Inform the client with a sexually transmitted infection to inform sexual partner(s) of the need for an examination.
- N. Rectum and anus
- Subjective data: Usual bowel pattern; any change in bowel habits; rectal pain, bleeding from the rectum, or black or tarry stools; dietary habits; problems with urination; previous screening for colorectal cancer; previous screening for prostate cancer; medications being taken; history of rectal or colon problems; family history of rectal or colon problems
 - Objective data
 - Examination can detect colorectal cancer in its early stages; in men, the rectal examination can also detect prostate tumors.
 - Examined in the lithotomy position after examination of the genitalia.
 - Examine by having the client bend forward with the hips flexed and upper body resting over the examination table.
 - A nonambulatory client may be examined in the left lateral position.
 - The external anus is inspected for lumps or lesions, rashes, inflammation or excoriation, scars, or hemorrhoids.
 - Digital examination will most likely be performed by the PHCP or other practitioner.
 - Digital examination is performed to assess sphincter tone; to check for tenderness, irregularities, polyps, masses, or nodules in the rectal wall; and to assess the prostate gland.
 - The prostate gland is normally firm, without boggy, tenderness, or nodules (hardness or nodules may indicate the presence of a cancerous lesion; boggy or tenderness may indicate infection).
3. Client teaching
- Diet should include high-fiber and low-fat foods and plenty of liquids.
 - The client should obtain regular digital examinations.
 - The client should be able to identify the symptoms of colorectal cancer or prostatic cancer.
 - The client should follow the American Cancer Society's guidelines for screening for colorectal cancer and prostate cancer.

VI. Documenting Health and Physical Assessment Findings

- Documentation of findings may be either written or recorded electronically (depending on agency protocol).
- Whether written or electronic, the documentation is a legal document and a permanent record of the client's health status.
- Principles of documentation need to be followed, and data need to be recorded accurately, concisely, completely, legibly, and objectively without bias or opinions; always follow agency protocol for documentation.
- Documentation findings serve as a source of client information for other health care providers; procedures for maintaining confidentiality are always followed.
- Record findings about the client's health history and physical examination as soon as possible after completion of the health assessment.
- Refer to [Chapter 6](#) for additional information about documentation guidelines.

PRACTICE QUESTIONS

- A client who does not speak English arrives at the triage desk in the emergency department and states to the nurse that an interpreter is needed. Which is the **best** action for the nurse to take?
 - Have one of the client's family members interpret.
 - Page an interpreter from the hospital's interpreter services.

3. Have the triage receptionist who speaks the client's language interpret.
 4. Obtain a translation dictionary in the client's language and attempt to triage the client.
2. The nurse is performing a neurological assessment on a client and notes a positive Romberg's test. The nurse makes this determination based on which observation?
 1. An involuntary rhythmic, rapid twitching of the eyeballs
 2. A dorsiflexion of the great toe with fanning of the other toes
 3. A significant sway when the client stands erect with feet together, arms at the sides, and the eyes closed
 4. A lack of normal sense of position when the client is unable to return extended fingers to a point of reference
 3. The nurse notes documentation that a client is exhibiting Cheyne-Stokes respirations. On assessment of the client, the nurse would expect to note which finding?
 1. Rhythmic respirations with periods of apnea
 2. Regular rapid and deep, sustained respirations
 3. Totally irregular respiration in rhythm and depth
 4. Irregular respirations with pauses at the end of inspiration and expiration
 4. A client diagnosed with conductive hearing loss asks the nurse to explain the cause of the hearing problem. The nurse plans to explain to the client that this condition is caused by which problem?
 1. A defect in the cochlea
 2. A defect in cranial nerve VIII
 3. A physical obstruction to the transmission of sound waves
 4. A defect in the sensory fibers that lead to the cerebral cortex
 5. While performing a cardiac assessment on a client with an incompetent heart valve, the nurse auscultates a murmur. The nurse documents the finding and describes the sound as which?
 1. Lub-dub sounds
 2. Scratchy, leathery heart noise
 3. A blowing or swooshing noise
 4. Abrupt, high-pitched snapping noise
 6. The nurse is testing the extraocular movements in a client to assess for muscle weakness in the eyes. The nurse would implement which assessment technique to assess for muscle weakness in the eye?
 1. Test the corneal reflexes.
 2. Test the six cardinal positions of gaze.
 3. Test visual acuity, using a Snellen eye chart.
 4. Test sensory function by asking the client to close the eyes and then lightly touching the forehead, cheeks, and chin.
 7. The nurse is instructing a client on how to perform a testicular self-examination (TSE). The nurse would explain that which is the best time to perform this exam?
 1. After a shower or bath
 2. While standing to void
 3. After having a bowel movement
 4. While lying in bed before arising
 8. The nurse is assessing a client suspected of having meningitis for meningeal irritation and elicits a positive Brudzinski's sign. Which finding did the nurse observe?
 1. The client rigidly extends the arms with pronated forearms and plantar flexion of the feet.
 2. The client flexes a leg at the hip and knee and reports pain in the vertebral column when the leg is extended.
 3. The client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.
 4. The client's upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated.
 9. A client with a diagnosis of asthma is admitted to the hospital with respiratory distress. Which type of adventitious lung sounds would the nurse expect to hear when performing a respiratory assessment on this client?
 1. Stridor
 2. Crackles
 3. Wheezes
 4. Diminished
 10. The clinic nurse prepares to perform a focused assessment on a client who is complaining of symptoms of a cold, a cough, and lung congestion. Which would the nurse include for this type of assessment? Select all that apply.
 1. Auscultating lung sounds
 2. Obtaining the client's temperature
 3. Assessing the strength of peripheral pulses
 4. Obtaining information about the client's respirations
 5. Performing a musculoskeletal and neurological examination
 6. Asking the client about a family history of any illness or disease

ANSWERS

1. Answer: 2

Rationale: The best action is to have a professional hospital-based interpreter translate for the client. English-speaking family members may not appropriately understand what is asked of them and may paraphrase what the client is actually saying. Also, client confidentiality as well as accurate information may be compromised when a family member or a non-health care provider acts as interpreter.

Test-Taking Strategy: Note the **strategic word**, *best*. Initially focus on what the client needs. In this case the client needs and asks for an interpreter. Next keep in mind the issue of confidentiality and making sure that information is obtained in the most efficient and accurate way. This will assist in eliminating options 1, 3, and 4.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 29-30.

2. Answer: 3

Rationale: In Romberg's test, the client is asked to stand with the feet together and the arms at the sides, and to close the eyes and hold the position; normally the client can maintain posture and balance. A positive Romberg's sign is a vestibular neurological sign that is found when a client exhibits a loss of balance when closing the eyes. This may occur with cerebellar ataxia, loss of proprioception, and loss of vestibular function. A lack of normal sense of position coupled with an inability to return extended fingers to a point of reference is a finding that indicates a problem with coordination. A positive gaze nystagmus evaluation results in an involuntary rhythmic, rapid twitching of the eyeballs. A positive Babinski's test results in dorsiflexion of the great toe with fanning of the other toes; if this occurs in anyone older than 2 years, it indicates the presence of central nervous system disease.

Test-Taking Strategy: Note the **subject**, Romberg's sign. You can easily answer this question if you can recall that the client's balance is tested in this test.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 835.

3. Answer: 1

Rationale: Cheyne-Stokes respirations are rhythmic respirations with periods of apnea and can indicate a metabolic dysfunction in the cerebral hemisphere or basal ganglia. Neurogenic hyperventilation is a regular rapid and deep, sustained respiration that can indicate a dysfunction in the low midbrain and middle pons. Ataxic respirations are totally irregular in rhythm and depth and indicate a dysfunction in the medulla. Apneustic respirations are irregular respirations with pauses at the end of inspiration and expiration and can indicate a dysfunction in the middle or caudal pons.

Test-Taking Strategy: Focus on the **subject**, the characteristics of Cheyne-Stokes respirations. Recalling that periods of apnea occur with this type of respiration will help direct you to the correct answer.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. pp. 130, 1310.

4. Answer: 3

Rationale: A conductive hearing loss occurs as a result of a physical obstruction to the transmission of sound waves. A sensorineural hearing loss occurs as a result of a pathological process in the inner ear such as a defect in the cochlea, a defect in cranial nerve VIII, or a defect of the sensory fibers that lead to the cerebral cortex.

Test-Taking Strategy: Focus on the **subject**, a conductive hearing loss. Note the relationship between the word *conductive* in the question and *transmission* in the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 955-956.

5. Answer: 3

Rationale: A heart murmur is an abnormal heart sound and is described as a faint or loud blowing, swooshing sound with a high, medium, or low pitch. Lub-dub sounds are normal and represent the S₁ (first) heart sound and S₂ (second) heart sound, respectively. A pericardial friction rub is described as a scratchy, leathery heart sound. A click is described as an abrupt, high-pitched snapping sound.

Test-Taking Strategy: Focus on the **subject**, characteristics of a murmur. Eliminate option 1 because it describes normal heart sounds. Next recall that a murmur occurs as a result of the manner in which the blood is flowing through the cardiac chambers and valves. This will direct you to the correct option.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p.625; Jarvis, C. (2020). *Physical examination and health assessment*. (8th ed.). St. Louis: Elsevier. p. 456.

6. Answer: 2

Rationale: Testing the six cardinal positions of gaze (diagnostic positions test) is done to assess for muscle weakness in the eyes. The client is asked to hold the head steady and then to follow movement of an object through the positions of gaze. The client should follow the object in a parallel manner with the two eyes. A Snellen eye chart assesses visual acuity and cranial nerve II (optic). Testing sensory function by having the client close the eyes and then lightly touching areas of the face and testing the corneal reflexes assess cranial nerve V (trigeminal).

Test-Taking Strategy: Focus on the **subject**, assessing for muscle weakness in the eyes. Note the relationship between the words *extraocular movements* in the question and *positions of gaze* in the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 936.

7. Answer: 1

Rationale: The nurse needs to teach the client how to perform a TSE. The nurse would instruct the client to perform the exam on the same day each month. The nurse needs to also instruct the client that the best time to perform a TSE is after a shower or bath when the hands are warm and soapy and the scrotum is warm. Palpation is easier and the client will be better able to identify any abnormalities. The client would stand to perform the exam, but it would be difficult to perform the exam while voiding. Having a bowel movement is unrelated to performing a TSE.

Test-Taking Strategy: Note the **strategic word**, *best*. Think about the purpose of this test and visualize this assessment technique to answer correctly.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 1485-1486.

8. Answer: 3

Rationale: Brudzinski's sign is tested with the client in the supine position. The nurse flexes the client's head (gently moves the head to the chest), and there should be no reports of pain or resistance to the neck flexion. A positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column. Kernig's sign also tests for meningeal irritation and is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended. Decorticate posturing is abnormal flexion and is noted when the client's upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated. Decerebrate posturing is abnormal extension and occurs when the arms are fully extended, forearms pronated, wrists and fingers flexed, jaws clenched, neck extended, and feet plantar-flexed.

Test-Taking Strategy: Focus on the **subject**, a positive Brudzinski's sign. Recalling that a positive sign is elicited if the client reports pain will assist in eliminating options 1 and 4. Next it is necessary to know that a positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.

Reference: Jarvis, C. (2020). *Physical examination and health assessment*. (8th ed.). St. Louis: Elsevier. p. 680.

9. Answer: 3

Rationale: Asthma is a respiratory disorder characterized by recurring episodes of dyspnea, constriction of the bronchi, and wheezing. Wheezes are described as high-pitched musical sounds heard when air passes through an obstructed or narrowed lumen of a respiratory passageway. Stridor is a harsh sound noted with an upper airway obstruction and often signals a life-threatening emergency. Crackles are produced by air passing over retained airway secretions or fluid, or the sudden opening of collapsed airways. Diminished lung sounds are heard over lung tissue where poor oxygen exchange is occurring.

Test-Taking Strategy: Note the **subject**, assessment of abnormal lung sounds. Note the client's diagnosis and think about the pathophysiology that occurs in this disorder. Recalling that bronchial constriction occurs will assist in directing you to the correct option. Also, thinking about the definition of each adventitious lung sound identified in the options will direct you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 535-536.

10. Answer: 1, 2, 4

Rationale: A focused assessment focuses on a limited or short-term problem, such as the client's complaint. Because the client is complaining of symptoms of a cold, a cough, and lung congestion, the nurse would focus on the respiratory system and the presence of an infection. A complete assessment includes a complete health history and physical examination and forms a baseline database. Assessing the strength of peripheral pulses relates to a vascular assessment, which is unrelated to this client's complaints. A musculoskeletal and neurological examination also is unrelated to this client's complaints. However, strength of peripheral pulses and a musculoskeletal and neurological examination would be included in a complete assessment. Likewise, asking the client about a family history of any illness or disease would be included in a complete assessment.

Test-Taking Strategy: Focus on the **subject**, and note the words *focused assessment*. Noting that the client's symptoms relate to the respiratory system and the presence of an infection will direct you to the correct options.

CHAPTER 13

Safety and Infection Control

Contributor: Eileen H. Gray, RN, DNP, CPNP

PRIORITY CONCEPTS Infection, Safety

I. Environmental Safety

- A. Fire safety (see **Clinical Judgment: Take Action**)
1. Keep open spaces free of clutter.
 2. Clearly mark fire exits.
 3. Know the locations of all fire alarms, exits, and extinguishers (**Table 13.1**; also see **Clinical Judgment: Take Action**).

⚡ CLINICAL JUDGMENT: TAKE ACTION

The nurse leader is conducting an educational session for staff about the response plan in the event of a fire and includes the following *priority* actions to take.

RACE

1. Rescue and remove clients and staff who are in immediate danger.
2. Activate the fire alarm.
3. Confine the fire.
4. Extinguish the fire.

PASS

5. Pull the pin on the fire extinguisher.
6. Aim at the base of the fire.
7. Squeeze the extinguisher handle.
8. Sweep the extinguisher from side to side to coat the area of the fire evenly.

4. Know the telephone number for reporting fires.
5. Know the fire drill and evacuation plan of the agency.
6. Never use the elevator in the event of a fire.
7. Turn off oxygen and appliances in the vicinity of the fire.

TABLE 13.1 Types of Fire Extinguishers

Type	Class of Fire
A	Ordinary materials such as cloth, wood and paper
B	Combustible and flammable liquids such as grease, gasoline, oil and oil-based paint
C	Electrical equipment such as appliances, tools, or other equipment that is plugged in
D	Flammable metals
K	Vegetable oils, animal oils, and fats in cooking appliances

<https://www.usfa.fema.gov/prevention/outreach/extinguishers.html>

8. In the event of a fire, if a client is on life support, maintain respiratory status manually with an Ambu bag (resuscitation bag) until the client is moved away from the threat of the fire and can be placed back on life support.
9. In the event of a fire, ambulatory clients can be directed to walk by themselves to a safe area and, in some cases, may be able to assist in moving clients in wheelchairs.
10. Bedridden clients generally are moved from the scene of a fire by stretcher, their bed, or wheelchair.
11. If a client must be carried from the area of a fire, appropriate transfer techniques need to be used.
12. If fire department personnel are at the scene of the fire, they will help evacuate clients.

⚠ Remember the mnemonic RACE (*Rescue* clients, *Activate* the fire alarm, *Confine* the fire, *Extinguish* the fire) to set priorities in the event of a fire and the mnemonic PASS (*Pull* the pin, *Aim* at the base of the fire, *Squeeze* the handle, *Sweep* from side to side) to use a fire extinguisher.

B. Electrical Safety

1. Electrical equipment must be maintained in good working order and should be grounded; otherwise, it presents a **physical hazard**. Remove equipment that is not in proper working order, and notify appropriate staff.
2. Use a three-pronged electrical cord.
3. In a three-pronged electrical cord, the third, longer prong of the cord is the ground; the other two prongs carry the power to the piece of electrical equipment.
4. Check electrical cords and outlets for exposed, frayed, or damaged wires.
5. Avoid overloading any circuit.
6. Read warning labels on all equipment; never operate unfamiliar equipment.
7. Use safety extension cords only when absolutely necessary, and tape them to the floor with electrical tape.
8. Never run electrical wiring under carpets.
9. Never pull a plug by using the cord; always grasp the plug itself.
10. Never use electrical appliances near sinks, bathtubs, or other water sources.
11. Always disconnect a plug from the outlet before cleaning equipment or appliances.
12. Keep electrical items away from water.
13. If a client receives an electrical shock, turn off the electricity before touching the client.

 Any electrical equipment that the client brings into the health care facility must be inspected for safety before use.

C. Radiation safety (Refer to Chapter 43 for additional radiation safety measures)

1. Know the protocols and guidelines of the health care agency.
2. Label potentially radioactive material.
3. To reduce exposure to radiation, do the following.
 - a. Limit the time spent near the source.
 - b. Make the distance from the source as great as possible.
 - c. Use a shielding device such as a lead apron.
4. Monitor radiation exposure with a film (dosimeter) badge.
5. Place the client who has a radiation implant in a private room.
6. Never touch dislodged radiation implants.
7. Keep all linens in the client's room until the implant is removed.

D. Disposal of infectious wastes

1. Handle all infectious materials as a hazard.
2. Dispose of waste in designated areas only, using proper containers for disposal.

3. Ensure that infectious material is labeled properly.
4. Dispose of all sharps immediately after use in closed, puncture-resistant disposal containers that are leak-proof and labeled or color-coded.

 Needles (sharps) should not be recapped, bent, or broken because of the risk of accidental injury (needlestick).

E. Physiological changes in the older client that increase the risk of accidents (Box 13.1)

F. Risk for falls assessment

1. Needs to be client-centered and include the use of a fall risk scale per agency protocols
2. Include the client's own perceptions of personal risk factors for falls and the client's method to adapt to these factors. Areas of concern may include gait stability, muscle strength and coordination, balance, and vision.
3. Assess for any previous accidents.
4. Assess with the client any concerns about their immediate environment, including stairs, use of throw rugs, grab bars, a raised toilet seat, or environmental lighting.
5. Review/analyze the medications, both prescription and nonprescription, that the client is taking that could have side/adverse effects that could place the client at risk for a fall.
6. Determine any scheduled procedures that pose risks to the client.

BOX 13.1 Physiological Changes in Older Clients That Increase the Risk of Accidents

Musculoskeletal Changes

Strength and function of muscles decrease. Joints become less mobile and bones become brittle. Postural changes and limits to range of motion occur.

Nervous System Changes

Voluntary and autonomic reflexes become slower. Decreased ability to respond to multiple stimuli occurs. Decreased sensitivity to touch occurs.

Sensory Changes

Decreased vision and lens accommodation and cataracts develop. Delayed transmission of hot and cold impulses occurs. Impaired hearing develops, with high-frequency tones less perceptible.

Genitourinary Changes

Increased nocturia and occurrences of incontinence may occur.

Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 450, 636-637.
Touhy, T., & Jett, K. (2022). *Ebersole and Hess' gerontological nursing & healthy aging*. (6th ed.). St. Louis: Elsevier. pp. 51, 209.

BOX 13.2 Measures to Prevent Falls

- Assess the client's risk for falling; use agency fall risk assessment scale.
- Assign the client at risk for falling to a room near the nurses' station.
- Teach preventive measures to high-risk clients.
- Alert all personnel to the client's risk for falling; use agency fall risk alert procedures and methods as necessary.
- Assess the client frequently.
- Orient the client to physical surroundings.
- Instruct the client to seek assistance when getting up.
- Explain the use of the nurse call system.
- Use safety devices such as □oor pads and bed or chair alarms; these devices alert health care personnel of the person getting out of bed or a chair.
- Keep the bed in the low position with side rails adjusted to a safe position (follow agency policy).
- Lock all beds, wheelchairs, and stretchers.
- Keep clients' personal items within their reach.
- Eliminate clutter and obstacles in the client's room.
- Provide adequate lighting and avoid slippery surfaces.
- Reduce bathroom hazards.
- Maintain the client's toileting schedule throughout the day.
- Instruct the client on the importance of functional shoes with stable soles and heels.

G. Measures to prevent falls (Box 13.2)

H. Measures to promote safety in ambulation for the client

1. Gait belt may be used to keep the center of gravity midline.
 - a. Place the belt on the client prior to ambulation.
 - b. Encircle the client's waist with the belt.
 - c. Hold on to both sides or back of the belt so that the client does not lean to one side. Be sure the belt is snug with just enough room to get your □ngers under it.
 - d. Return the client to bed or a nearby chair if the client develops dizziness or becomes unsteady.
 - e. When □nished safely ambulating the client, remove belt and replace it in its appropriate storage area.

I. The Joint Commission: National Patient Safety Goals 2021

1. The Joint Commission establishes safety guidelines that ensure the highest standards of care. Refer to the following website for detailed information on these goals: <https://www.jointcommission.org/standards/national-patient-safety-goals/hospital-national-patient-safety-goals/>

 J. Steps to prevent injury to the health care worker (Box 13.3)

 K. Restraints (safety devices)

1. Restraints are protective devices used to limit the physical activity of a client or to immobilize a client or an extremity.

BOX 13.3 Steps to Prevent Injury to the Health Care Worker When Moving a Client

- Use available safety equipment.
- Keep the weight to be lifted as close to the body as possible.
- Bend at the knees.
- Tighten abdominal muscles and tuck the pelvis.
- Maintain the trunk erect and knees bent so that multiple muscle groups work together in a coordinated manner.

Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 778, 820.

2. Side rails

- a. The agency policy should be checked and followed when using side rails.
- b. The use of side rails is not considered a restraint when they are used to prevent a sedated client from falling out of bed, depending on state and agency policy.
- c. The client must be able to exit the bed easily in case of an emergency when using side rails. Only the top two side rails should be used.
- d. The bed must be kept in the lowest position.

3. *Physical restraints* restrict client movement through the application of a device.

4. *Chemical restraints* are medications given to inhibit a speci□c behavior or movement.

5. Interventions (see [Clinical Judgment: Prioritize Hypotheses](#))

- a. Use alternative devices, such as pressure-sensitive beds or chair pads with alarms or other types of bed or chair alarms, whenever possible.
- b. If restraints are necessary, the primary health care provider's (PHCP's) prescriptions should state the type of restraint, identify speci□c client behaviors for which restraints are to be used, and identify a limited time frame for use.
- c. If the PHCP is not present at the time the restraints are placed, the PHCP would do an assessment within an hour of application of restraints.
- d. The PHCP's prescriptions for restraints would be renewed within a speci□c time frame according to agency policy.
- e. Restraints are not to be prescribed PRN (as needed).
- f. The reason for the safety device would be given to the client and the family, and their permission would be sought and documented.

BOX 13.4 Documentation Points With Use of a Safety Device (Restraint)

- Reason for safety device
- Method of use for safety device
- Date and time of application of safety device
- Duration of use of safety device and client's response
- Release from safety device with periodic exercise and circulatory, neurovascular, and skin assessment
- Assessment of continued need for safety device
- Evaluation of client's response

BOX 13.5 Alternatives to Restraints

- Client and family orientation to environment
- Companionship, supervision, trained sitters
- Diversion with activities such as folding towels
- Assign to room near nurses' station.
- De-escalation and verbal intervention for aggression
- Visual and auditory stimuli
- Block views of stairs; dress in gown; cover intravenous lines.
- Relaxation techniques to promote sleep
- Exercise and ambulation schedules
- Plan for toileting, nutrition, and pain management needs.
- Discontinue bothersome treatments as soon as possible.

Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 406.

- g. Restraints must not interfere with any treatments or affect the client's health problem.
- h. Use a half-bow, a safety knot (quick-release tie), or a restraint with a quick-release buckle to secure the device to the bed frame or chair, not to a movable part of the bed (including the side rails).
- i. Ensure that there is enough slack on the straps to allow some movement of the body part.
- j. Assess tightness, skin integrity and neurovascular and circulatory status frequently (per agency policies) and remove the safety device at least every 2 hours to permit muscle exercise and activities of daily living, and to promote circulation. Always follow agency policies.
- k. Continually assess and document the need for safety devices (Box 13.4).
 1. Offer □uids if clinically indicated at least every 2 hours.
- m. Offer bedpan or toileting every 2 hours.
- n. Use alternatives to restraints whenever possible (Box 13.5).

⚡ CLINICAL JUDGMENT: PRIORITIZE HYPOTHESES

A client is disoriented and unsteady and continually attempts to climb out of bed. *Priority* client needs include the following:

- Safety and fall prevention
- Room located near the nurses' station
- Orientation to the surroundings
- Bed or chair alarm activated
- Comfortable and safe position
- Personal belongings in reach
- Pain controlled
- Visual and auditory stimuli appropriate (i.e., clock, calendar, television, radio)
- Toileting routine established
- Exercise and ambulation schedule in place
- Nonskid socks or footwear, environment free of clutter and tripping hazards, nurse call system in reach
- Support persons present when possible

⚠ A PHCP's prescription for use of a safety device (restraint) is needed. Alternative measures for safety devices should always be used □rst.

6. Alternatives to safety devices for a client with confusion (see also Box 13.5)
 - a. Orient the client and family to the surroundings with every interaction, and identify the client by name.
 - b. Explain all procedures and treatments to the client and family.
 - c. Encourage family and friends to stay with the client, and use sitters for clients who need supervision.
 - d. Assign confused and disoriented clients to rooms near the nurses' station.
 - e. Provide appropriate visual and auditory stimuli, such as a night-light, clocks, calendars, television, and a radio, to the client; leave the client's room door open.
 - f. Place familiar items, such as family pictures, near the client's bedside.
 - g. Maintain toileting routines.
 - h. Eliminate bothersome treatments, such as nasogastric tube feedings, as soon as possible.
 - i. Evaluate all medications that the client is receiving.
 - j. Use relaxation techniques with the client.
 - k. Institute exercise and ambulation schedules as the client's condition allows.
 - l. Collaborate with the PHCP to evaluate oxygenation status, vital signs, electrolyte/laboratory values, and other pertinent assessment □ndings that may provide information about the cause of the client's confusion.

L. Poisons

1. A poison is any substance that impairs health or destroys life when ingested, inhaled, or otherwise absorbed by the body.
2. Specific antidotes or treatments are available only for some types of poisons.
3. The capacity of body tissue to recover from a poison determines the reversibility of the effect.
4. Poison can impair the respiratory, circulatory, central nervous, hepatic, gastrointestinal, and renal systems of the body.
5. The infant, toddler, preschooler, and young school-age child must be protected from accidental poisoning.
6. In older adults, diminished eyesight and impaired memory may result in accidental ingestion of poisonous substances or an overdose of prescribed medications.
7. A Poison Control Center phone number should be visible on the telephone in homes with small children; in all cases of suspected poisoning, the number should be called immediately.
8. Interventions
 - a. Remove any obvious materials from the mouth, eyes, or body area immediately.
 - b. Identify the type and amount of substance ingested to help determine the correct type and amount of antidote needed.
 - c. Call the Poison Control Center before attempting an intervention.
 - d. If instructed by the Poison Control Center to take the person to the emergency department, call an ambulance.
 - e. If the victim vomits or vomiting is induced, save the vomitus if requested to do so, and deliver it to the emergency department.
 - f. Never induce vomiting after ingestion of lye, household cleaners, grease, or petroleum products.
 - g. Never induce vomiting in an unconscious victim.

 The Poison Control Center should be called first before attempting an intervention.

II. Health Care–Associated (Nosocomial) Infections

- A. Health care–associated (nosocomial) infections also are referred to as *hospital-acquired infections*.
- B. These infections are acquired in a hospital or other health care facility and were not present or incubating at the time of a client’s admission.
- C. *Clostridium difficile* is spread mainly by hand-to-hand contact in a health care setting. Clients taking multiple antibiotics for a prolonged period are most at risk.
- D. Common drug-resistant infections: vancomycin-resistant enterococci (VRE), methicillin-resistant *Staphylococcus aureus* (MRSA), multidrug-resistant tuberculosis, carbapenem-resistant *Enterobacteriaceae* (CRE)

- E. Illness and some medications such as immunosuppressants impair the normal defense mechanisms.
- F. The hospital environment provides exposure to a variety of virulent organisms that the client has not been exposed to in the past; therefore, the client has not developed resistance to these organisms.
- G. Infections can be transmitted by health care personnel who fail to practice proper standard precautions (i.e., handwashing procedures or a failure to change gloves between client contacts).
- H. At many health care agencies, dispensers containing an alcohol-based solution for hand sanitization are mounted at the entrance to each client’s room; it is important to note that alcohol-based sanitizers are ineffective against some infectious agents such as *Clostridium difficile* spores; therefore, handwashing is necessary.

III. Standard Precautions

A. Description

1. Nurses must practice standard precautions with all clients in any setting, regardless of the diagnosis or presumed infectiveness.
2. Standard precautions include handwashing before and after glove application. Additionally, standard precautions include the use of masks, eye protection, and gowns, when appropriate, for client contact.
3. These precautions apply to blood, all body fluids (whether or not they contain blood), secretions and excretions, nonintact skin, and mucous membranes.

B. Interventions

1. Wash hands between client contacts; after contact with blood, body fluids, secretions or excretions, nonintact skin, or mucous membranes; after contact with equipment or contaminated articles; and immediately after removing gloves.
2. Wear gloves when touching blood, body fluids, secretions, excretions, nonintact skin, mucous membranes, or contaminated items; remove gloves and wash hands between client care contacts.
3. For routine decontamination of hands, use alcohol-based hand rubs when hands are not visibly soiled. For more information on hand hygiene from the Centers for Disease Control and Prevention (CDC), see www.cdc.gov/hand-hygiene/
4. Wear masks and eye protection, or face shields, if client care activities may generate splashes or sprays of blood or body fluid.
5. Wear gowns if soiling of clothing is likely from blood or body fluid; wash hands after removing a gown.
6. Steps for donning and removing personal protective equipment (PPE) (Table 13.2)

TABLE 13.2 Steps for Donning and Removing Personal Protective Equipment (PPE)

Donning of PPE	Removal of PPE ^a
Gown	Gown
Fully cover front of body from neck to knees and upper arms to end of wrist. Fasten in the back at neck and waist; wrap around the back.	Unfasten at neck, then at waist. Remove using a peeling motion, pulling gown from each shoulder toward the hands. Allow gown to fall forward, and roll into a bundle to discard.
Mask or Respirator	Mask or Respirator
Secure ties or elastic band behind the ears and/or back of the head. Fit snug to face and below chin. Fit to nose bridge. Respirator <input type="checkbox"/> would be checked per agency policy.	Grasp bottom ties then top ties to remove
Goggles/Face Shield	Goggles/Face Shield
Adjust to <input type="checkbox"/> according to agency policy.	Remove from the back by lifting the band or earpieces.
Gloves	Gloves
Select appropriate size and extend to cover wrists of gown.	Grasp outside of glove with opposite hand with glove still on and peel <input type="checkbox"/> Hold on to removed glove in gloved hand. Slide <input type="checkbox"/> ngers of ungloved hand under clean side of remaining glove at wrist and peel <input type="checkbox"/> .

^aNote: All equipment is considered contaminated on the outside.
Adapted from: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 441-443.

7. Clean and reprocess client care equipment properly and discard single-use items.
8. Place contaminated linens in leak-proof bags and limit handling to prevent skin and mucous membrane exposure. Dispose according to agency policy.
9. Use needleless devices or special needle safety devices whenever possible to reduce the risk of needlesticks and sharps injuries to health care workers.
10. Discard all sharp instruments and needles in a puncture-resistant container; dispose of needles uncapped or engage the safety mechanism on the needle if available.
11. Clean spills of blood or body fluids with a solution of bleach and water (diluted 1:10) or agency-approved disinfectant.

 **Handle all blood and body fluids from all clients as if they were contaminated.**

IV. Transmission-Based Precautions

- A. Transmission-based precautions include airborne, droplet, and contact precautions.
- B. Airborne precautions
 1. Diseases
 - a. Measles
 - b. Chicken pox (varicella)
 - c. Disseminated varicella zoster
 - d. Pulmonary or laryngeal tuberculosis
 - e. SARS-CoV-2; coronavirus (COVID-19)
 2. Barrier protection
 - a. Single room is maintained under negative pressure; door remains closed except upon entering and exiting.
 - b. Negative air flow pressure is used in the room, with a minimum of six to 12 air exchanges per hour via high-efficiency particulate air (HEPA) filtration mask or according to agency protocol.
 - c. Ultraviolet germicide irradiation or HEPA filter is used in the room.
 - d. Health care workers wear a respiratory mask (N95 or higher level).
 - e. In cases of COVID clients, both airborne and droplet precautions may be instituted. Contact precautions may also be needed. Follow agency protocols; health care workers also need to wear eye protection (i.e., face shield or goggles).
 - f. A surgical mask is placed on the client when the client needs to leave the room; the client leaves the room only if necessary.
- C. Droplet precautions
 1. Diseases
 - a. Adenovirus
 - b. Diphtheria (pharyngeal)
 - c. Epiglottitis
 - d. Influenza (flu)
 - e. Meningitis
 - f. Mumps
 - g. Mycoplasmal pneumonia or meningococcal pneumonia
 - h. Parvovirus B19
 - i. Pertussis
 - j. Pneumonia
 - k. Rubella
 1. Scarlet fever
 - m. Sepsis
 - n. Streptococcal pharyngitis
 - o. SARS-CoV-2; coronavirus (COVID-19)
 2. Barrier protection
 - a. Private room or cohort client (a client whose body cultures contain the same organism)
 - b. Wear a surgical mask when within 3 feet of a client.
 - c. Health care workers wear a respiratory mask (N95 or higher level).

- d. In cases of COVID clients, both airborne and droplet precautions may be instituted. Contact precautions may also need to be instituted. Follow agency protocols; health care workers also need to wear eye protection (i.e., face shield or goggles).
- e. Place a mask on the client when the client needs to leave the room.

D. Contact precautions

1. Diseases

- a. Colonization or infection with a multidrug-resistant organism
- b. Enteric infections, such as *Clostridium difficile*
- c. Respiratory infections, such as respiratory syncytial virus
- d. Influenza: Infection can occur by touching something with flu viruses on it and then touching the mouth or nose.
- e. Wound infections
- f. Skin infections, such as cutaneous diphtheria, herpes simplex, impetigo, pediculosis, scabies, staphylococci, and varicella zoster
- g. Eye infections, such as conjunctivitis
- h. Adenovirus
- i. Indirect contact transmission may occur when contaminated object or instrument, or hands, are encountered.
- j. SARS-CoV-2; coronavirus (COVID-19)

2. Barrier protection

- a. Private room or cohort client
- b. Use gloves and a gown whenever entering the client's room.
- c. With *C. difficile*: gloves and gown are worn when in the client's room, use of soap and water for handwashing when exiting, no sharing of equipment between clients, and room cleaned with chlorine (bleach) to kill spores and prevent the spread of infection.

V. Emergency Response Plan and Disasters (see Clinical Judgment: Generate Solutions and see Chapter 7 for additional information on disaster planning)

VI. Biological Warfare Agents

- A. A warfare agent is a biological or chemical substance that can cause mass destruction or fatality.
- B. Anthrax (Fig. 13.1)
 1. The disease is caused by *Bacillus anthracis* and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.
 2. Anthrax is transmitted by direct contact with bacteria and spores; spores are dormant encapsulated bacteria that become active when they enter a living host (no person-to-person spread) (Box 13.6).

⚡ CLINICAL JUDGMENT: GENERATE SOLUTIONS

The nurse leader is conducting an emergency meeting for staff about the COVID-19 surge response plan and would plan to include the following points:

- Know the emergency response plan of the agency.
- In the event of a disaster, the emergency response plan is activated immediately.
- *Internal disasters* are those that occur within the health care facility.
- *External disasters*, such as COVID-19, occur in the community, and victims are brought to the health care facility for care.
- When the health care facility is notified of a disaster, the nurse would follow the guidelines specified in the emergency response plan of the facility.
- Resources are allocated to respective units, such as protective equipment, client care equipment, and staff to care for clients with COVID-19.
- As part of the disaster plan, infection prevention and control protocols are instituted to mitigate the spread of the disease.

3. The infection is carried to the lymph nodes and then spreads to the rest of the body by way of the blood and lymph systems; high levels of toxins lead to shock and death.
4. In the lungs, anthrax can cause buildup of fluid, tissue decay, and death (fatal if untreated).
5. A blood test is available to detect anthrax (detects and amplifies *Bacillus anthracis* DNA if present in the blood sample).
6. Anthrax is usually treated with antibiotics such as ciprofloxacin, doxycycline, or penicillin.
7. The vaccine for anthrax has limited availability.

⚠ Anthrax is transmitted by direct contact with bacteria and spores and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.

FIG. 13.1 Anthrax. (From Swartz, 2010.)

BOX 13.6 Anthrax: Transmission and Symptoms**Skin**

Spores enter the skin through cuts and abrasions and are contracted by handling contaminated animal skin products.

Infection starts with an itchy bump like a mosquito bite and progresses to a small liquid-filled sac.

The sac becomes a painless ulcer with an area of black, dead tissue in the middle.

Toxins destroy surrounding tissue.

Gastrointestinal

Infection occurs after the ingestion of contaminated undercooked meat.

Symptoms begin with nausea, loss of appetite, and vomiting.

The disease progresses to severe abdominal pain, vomiting of blood, and severe diarrhea.

Inhalation

Infection is caused by the inhalation of bacterial spores, which multiply in the alveoli.

The disease begins with the same symptoms as the flu, including fever, muscle aches, and fatigue.

Symptoms suddenly become more severe with the development of breathing problems and shock.

Toxins cause hemorrhage and destruction of lung tissue.

FIG. 13.2 Smallpox. (Courtesy Centers for Disease Control and Prevention [CDC]: *Evaluating patients for smallpox*. Atlanta, 2002, CDC.)

C. Smallpox (Fig. 13.2)

1. Smallpox is transmitted in air droplets and by handling contaminated materials and is highly contagious.
2. Symptoms begin 7 to 17 days after exposure and include fever, back pain, vomiting, malaise, and headache.
3. Papules develop 2 days after symptoms develop and progress to pustular vesicles that are abundant on the face and extremities initially.
4. A vaccine is available to those at risk for exposure to smallpox.

D. Botulism

1. Botulism is a serious paralytic illness caused by a nerve toxin produced by the bacterium *Clostridium botulinum* (death can occur within 24 hours).

2. Its spores are found in the soil and can spread through the air or food (improperly canned food) or via a contaminated wound.
3. Botulism cannot be spread from person to person.
4. Symptoms include abdominal cramps, diarrhea, nausea and vomiting, double vision, blurred vision, drooping eyelids, difficulty swallowing or speaking, dry mouth, and muscle weakness.
5. Neurological symptoms begin 12 to 36 hours after ingestion of food-borne botulism and 24 to 72 hours after inhalation and can progress to paralysis of the arms, legs, trunk, or respiratory muscles (mechanical ventilation is necessary).
6. If diagnosed early, food-borne and wound botulism can be treated with an antitoxin that blocks the action of toxins circulating in the blood.
7. For wound botulism, surgical removal of the source of the toxin-producing bacteria may be done; antibiotics may be prescribed.
8. No vaccine is available.

E. Plague

1. Plague is caused by *Yersinia pestis*, a bacteria found in rodents and fleas.
2. Plague is contracted by being bitten by a rodent or flea that is carrying the plague bacterium, by the ingestion of contaminated meat, or by handling an animal infected with the bacteria.
3. Transmission is by direct person-to-person contact.
4. Forms include bubonic (most common), pneumonic, and septicemic (most deadly).
5. Symptoms usually begin within 1 to 3 days and include fever, chest pain, lymph node swelling, and a productive cough (hemoptysis).
6. The disease rapidly progresses to dyspnea, stridor, and cyanosis; death occurs from respiratory failure, shock, and bleeding.
7. Antibiotics are effective only if administered immediately; the usual medications of choice include streptomycin or gentamicin.
8. A vaccine is available.

F. Tularemia

1. Tularemia (also called *deer fly fever* or *rabbit fever*) is an infectious disease of animals caused by the bacillus *Francisella tularensis*.
2. The disease is transmitted by ticks, deer flies, or contact with an infected animal.
3. Symptoms include fever, headache, and an ulcerated skin lesion with localized lymph node enlargement, eye infections, gastrointestinal ulcerations, or pneumonia.
4. Treatment is with antibiotics such as streptomycin, gentamicin, doxycycline, and ciprofloxacin.
5. Recovery produces lifelong immunity (a vaccine is available).

G. Hemorrhagic fever

1. Hemorrhagic fever is caused by several viruses, including Marburg, Lassa, Junin, and Ebola.
2. The virus is carried by rodents and mosquitoes.
3. The disease can be transmitted directly via body fluids from person to person.
4. Manifestations include fever, headache, malaise, conjunctivitis, nausea, vomiting, hypotension, hemorrhage of tissues and organs, and organ failure.
5. No known specific treatment is available; treatment is symptomatic.

H. Ebola Virus Disease (EVD)

1. Previously known as Ebola hemorrhagic fever
2. Caused by infection with a virus of the family *Filoviridae*, genus *Ebolavirus*
3. First discovered in 1976 in the Democratic Republic of the Congo. Outbreaks have appeared in Africa and in several other countries in the world.
4. The natural reservoir host of *Ebolavirus* remains unknown. It is believed that the virus is animal-borne and that bats are the most likely reservoir.
5. Spread of the virus is through contact with objects (such as clothes, bedding, needles, syringes/sharps, or medical equipment) that have been contaminated with the virus.
6. Symptoms similar to hemorrhagic fever may appear from 2 to 21 days after exposure.
7. Assessment: Ask the client if they traveled to an area with EVD such as Guinea, Nigeria, or Sierra Leone within the last 21 days or if they had contact with someone with EVD and had any of the following symptoms:
 - a. Fever at home or a current temperature of 38°C (100.4°F) or greater
 - b. Severe headache
 - c. Muscle pain
 - d. Weakness
 - e. Fatigue
 - f. Diarrhea
 - g. Vomiting
 - h. Abdominal pain
 - i. Unexplained bleeding or bruising
8. Interventions
 - a. If the assessment indicates possible infection with EVD, the client needs to be isolated in a private room with a private bathroom or a covered bedside commode with the door closed.
 - b. Health care workers need to wear the proper personal protective equipment (PPE) and follow updated procedures designated by the Centers for Disease Control and Prevention for donning (putting on) and removing PPE. Refer to the following website for updated in-

formation: <http://www.cdc.gov/vhf/ebola/healthcare-us/ppe/guidance.html>

- c. The number of health care workers entering the room should be limited, and a log of everyone who enters and leaves the room needs to be kept.
- d. Only necessary tests and procedures should be performed, and aerosol-generating procedures should be avoided.
- e. Refer to the CDC guidelines for cleaning, disinfecting, and managing waste: <https://www.cdc.gov/vhf/ebola/clinicians/cleaning/hospitals.html>
- f. The agency's infection control program needs to be notified, as well as state and local public health authorities.

VII. Chemical Warfare Agents

A. Sarin

1. Sarin is a highly toxic nerve gas that can cause death within minutes of exposure.
2. It enters the body through the eyes and skin and acts by paralyzing the respiratory muscles.

B. Phosgene is a colorless gas normally used in chemical manufacturing that if inhaled at high concentrations for a long enough period will lead to severe respiratory distress, pulmonary edema, and death.

C. Mustard gas is yellow to brown and has a garlic-like odor that irritates the eyes and causes skin burns and blisters.

D. Ionizing radiation

1. Acute radiation exposure develops after a substantial exposure to radiation and is referred to as *nuclear warfare*.
2. Exposure can occur from external radiation or internal absorption.
3. Symptoms depend on the amount of exposure to the radiation and range from nausea and vomiting, diarrhea, fever, electrolyte imbalances, and neurological and cardiovascular impairment to leukopenia, purpura, hemorrhage, and death.

VIII. Nurse's Role in Exposure to Warfare Agents

- A. Be aware that, initially, a bioterrorism attack may resemble a naturally occurring outbreak of an infectious disease.
- B. Nurses and other health care workers must be prepared to assess and determine what type of event occurred, the number of clients who may be affected, and how and when clients will be expected to arrive at the health care agency.
- C. It is essential to be aware that changes in the microorganism can occur that may increase its virulence or make it resistant to conventional antibiotics or vaccines.
- D. See Chapter 7 for additional information on disasters and emergency response planning.

PRACTICE QUESTIONS

- The nurse is preparing to initiate an intravenous (IV) line containing potassium chloride using an IV infusion pump. While preparing to plug the pump cord into the wall, the nurse finds that no outlet is available in the wall socket. The nurse would take which action?
 - Initiate the IV line without the use of a pump.
 - Contact the electrical maintenance department for assistance.
 - Plug in the pump cord in the available plug above the room sink.
 - Use an extension cord from the nurses' lounge for the pump plug.
- The nurse obtains a prescription from a primary health care provider to restrain a client and instructs an assistive personnel (AP) to apply the safety device to the client. Which observation of unsafe application of the safety device would indicate that further instruction is required for the AP?
 - Placing a safety knot in the safety device straps
 - Safely securing the safety device straps to the side rails
 - Applying safety device straps that do not tighten when force is applied against them
 - Securing so that two fingers can slide easily between the safety device and the client's skin
- The community health nurse is providing a teaching session about anthrax to members of the community and asks the participants about the methods of transmission. Which answers by the participants would indicate that teaching was effective? Select all that apply.
 - a. Bites from ticks or deer flies
 - b. Inhalation of bacterial spores
 - c. Through a cut or abrasion in the skin
 - d. Direct contact with an infected individual
 - e. Sexual contact with an infected individual
 - f. Ingestion of contaminated undercooked meat
- The nurse is giving report to an assistive personnel (AP) who will be caring for a client who has hand restraints (safety devices) applied. How frequently would the nurse instruct the AP to remove the restraints to allow for muscle activity?
 - Every 2 hours
 - Every 3 hours
 - Every 4 hours
 - Every 6 hours
- The nurse is reviewing a plan of care for a client with an internal radiation implant. Which intervention, if noted in the plan, indicates the need for revision of the plan?
 - Wearing gloves when emptying the client's bedpan
 - Keeping all linens in the room until the implant is removed
 - Wearing a lead apron when providing direct care to the client
 - Placing the client in a semiprivate room at the end of the hallway
- Contact precautions are initiated for a client with a health care-associated (nosocomial) infection caused by methicillin-resistant *Staphylococcus aureus* (MRSA). The nurse prepares to provide colostomy care and would obtain which protective items to perform this procedure?
 - Gloves and gown
 - Gloves and goggles
 - Gloves, gown, and shoe protectors
 - Gloves, gown, goggles, and a mask or face shield
- The nurse enters a client's room and finds that the wastebasket is on fire. The nurse immediately assists the client out of the room. What is the next nursing action?
 - Call for help.
 - Extinguish the fire.
 - Activate the fire alarm.
 - Confine the fire by closing the room door.
- A parent calls a neighbor who is a nurse and tells the nurse that their 3-year-old child has just ingested liquid furniture polish. The nurse would direct the parent to take which immediate action?
 - Induce vomiting.
 - Call an ambulance.
 - Call the Poison Control Center.
 - Bring the child to the emergency department.
- The emergency department (ED) nurse receives a telephone call and is informed that a tornado has hit a local residential area and that numerous casualties have occurred. The victims will be brought to the ED. The nurse would take which initial action?
 - Prepare the triage rooms.
 - Activate the emergency response plan specific to the facility.
 - Obtain additional supplies from the central supply department.
 - Obtain additional nursing staff to assist in treating the casualties.

10. The nurse is caring for a client with meningitis and implements which transmission-based precaution for this client?
1. Private room or cohort client
 2. Personal respiratory protection device
 3. Private room with negative air flow pressure
 4. Mask worn by staff when the client needs to leave the room
11. The nurse working in the emergency department (ED) is assessing a client who recently returned from Nigeria and presented complaining of a fever at home, fatigue, muscle pain, and abdominal pain. Which action would the nurse take next?
1. Check the client's temperature.
 2. Isolate the client in a private room.
 3. Check a complete set of vital signs.
 4. Contact the primary health care provider.

ANSWERS

1. Answer: 2

Rationale: Electrical equipment must be maintained in good working order and needs to be grounded; otherwise, it presents an electrical hazard. An IV line that contains potassium chloride would be administered by an infusion pump. The nurse needs to use hospital resources for assistance. A regular extension cord would not be used because it poses a risk for fire. Use of electrical appliances near a sink also presents a hazard.

Test-Taking Strategy: Note the **subject**, electrical safety. Recalling safety issues will direct you to the correct option. Contacting the maintenance department is the only correct option, since the other options are not considered safe practice when implementing electrical actions. In addition, since potassium chloride is in the IV solution, a pump must be used. **Reference:** Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 407.

2. Answer: 2

Rationale: The safety device straps are secured to the bed frame and never to the side rails to avoid accidental injury in the event that the side rails are released. A half-bow or safety knot or device with a quick release buckle would be used to apply a safety device because it does not tighten when force is applied against it and it allows quick and easy removal of the safety device in case of an emergency. The safety device would be secure, and one or two fingers need to slide easily between the safety device and the client's skin.

Test-Taking Strategy: Focus on the **subject**, the unsafe intervention. Also note the **strategic words**, *further instruction is required*. These words indicate a **negative event query** and the need to select the incorrect option. Read each option carefully. The words *securing the safety device straps to the side rails* in option 2 would direct your attention to this as an incorrect and unsafe action.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 416.

3. Answer: 2, 3, 6

Rationale: Anthrax is caused by *Bacillus anthracis* and can be contracted through the digestive system or abrasions in the

skin, or inhaled through the lungs. It cannot be spread from person to person, and it is not contracted via bites from ticks or deer flies.

Test-Taking Strategy: Focus on the **subject**, routes of transmission of anthrax, and note the **strategic word**, *effective*. Knowledge regarding the methods of contracting anthrax is needed to answer this question. Remember that it is not spread by person-to-person contact or contracted via tick or deer fly bites.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 582.

4. Answer: 1

Rationale: The nurse would instruct the AP to remove the safety device at least every 2 hours to permit muscle exercise and to promote circulation. Options 2, 3, and 4 are incorrect because they are too infrequent time checks. Agency guidelines regarding the use of safety devices would always be followed.

Test-Taking Strategy: Focus on the **subject**, removing safety device to permit muscle exercise and to promote circulation. In this situation, selecting the option that identifies the most frequent time frame is best.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 416.

5. Answer: 4

Rationale: A private room with a private bath is essential if a client has an internal radiation implant. This is necessary to prevent accidental exposure of other clients to radiation. The remaining options identify accurate interventions for a client with an internal radiation implant and protect the nurse from exposure.

Test-Taking Strategy: Note the **strategic words**, *indicates the need for revision*. These words indicate a **negative event query** and the need to select the incorrect nursing intervention. Remember that the client with an internal radiation implant needs to be placed in a private room.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 381.

6. Answer: 4

Rationale: Splashes of body secretions can occur when providing colostomy care. Goggles and a mask or face shield are worn to protect the face and mucous membranes of the eyes during interventions that may produce splashes of blood, body fluids, secretions, or excretions. In addition, contact precautions require the use of gloves, and a gown needs to be worn if direct client contact is anticipated. Shoe protectors are not necessary.

Test-Taking Strategy: Focus on the **subject**, protective items needed to perform colostomy care. Also, note the words **contact precautions**. Visualize care for this client to determine the necessary items required for self-protection. This will direct you to the correct option.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 409; Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 438, 441-443.

7. Answer: 3

Rationale: The order of priority in the event of a fire is to rescue the clients who are in immediate danger. The next step is to activate the fire alarm. The fire then is confined by closing all doors and, finally, the fire is extinguished.

Test-Taking Strategy: Note the **strategic word**, *next*. Remember the mnemonic **RACE** to prioritize in the event of a fire. **R** is *rescue* clients in immediate danger, **A** is *alarm* (sound the alarm), **C** is *confine* the fire by closing all doors, and **E** is *extinguish* the fire.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 225; Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 406-407.

8. Answer: 3

Rationale: If a poisoning occurs, the Poison Control Center needs to be contacted immediately. Vomiting would not be induced if the victim is unconscious or if the substance ingested is a strong corrosive or petroleum product. Bringing the child to the emergency department or calling an ambulance would not be the initial action because this would delay treatment. The Poison Control Center may advise the parent to bring the child to the emergency department; if this is the case, the parent needs to call an ambulance.

Test-Taking Strategy: Note the **strategic word**, *immediate*. Calling the Poison Control Center is the first action, since it will direct the parent on the next step to take based on the type of poisoning. The other options are unsafe or could cause a delay in treatment.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 444; Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 386-387.

9. Answer: 2

Rationale: In an external disaster (a disaster that occurs outside of the institution or agency), many victims may be

brought to the ED for treatment. The initial nursing action must be to activate the emergency response plan specific to the facility. Once the emergency response plan is activated, the actions in the other options will occur.

Test-Taking Strategy: Note the **strategic word**, *initial*, and determine the priority action. Note that the correct option is the **umbrella option**. The emergency response plan includes all of the other options.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 226, 228-229.

10. Answer: 1

Rationale: Meningitis is transmitted by droplet infection. Precautions for this disease include a private room or cohort client and use of a standard precaution mask. Private negative airflow pressure rooms and personal respiratory protection devices are required for clients with airborne disease such as tuberculosis. When appropriate, a mask must be worn by the client and not the staff when the client leaves the room.

Test-Taking Strategy: Focus on the **subject**, the correct precaution needs for a client with meningitis. Recalling that meningitis is transmitted by droplets will direct you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 410.

11. Answer: 2

Rationale: The nurse would suspect the potential for Ebola virus disease (EVD) because of the client's recent travel to Nigeria. The nurse needs to consider the symptoms that the client is reporting, and clients who meet the exposure criteria need to be isolated in a private room before other treatment measures are taken. Exposure criteria include a fever reported at home or in the ED of 38.0°C (100.4°F) or headache, fatigue, weakness, muscle pain, vomiting, diarrhea, abdominal pain, or signs of bleeding. This client is reporting a fever and is showing other signs of EVD, and therefore needs to be isolated. After isolating the client, it would be acceptable to then collect further data and notify the primary health care provider and other state and local authorities of the client's signs and symptoms.

Test-Taking Strategy: Note the **strategic word**, *next*. This indicates that some or all of the other options may be partially or totally correct, but the nurse needs to prioritize. Eliminate options 1 and 3 first because they are **comparable or alike**. Next note that the client recently traveled to Nigeria. Recall that isolation to prevent transmission of an infection is the immediate priority in the care of a client with suspected EVD.

CHAPTER 14

Medication Administration and Intravenous Therapies

Contributor: Eileen H. Gray, RN, DNP, CPNP

PRIORITY CONCEPTS Clinical Judgment, Safety

I. Medication Administration (Box 14.1)

In most clinical settings, an electronic infusion device is used to administer intravenous (IV) solutions and IV medications. However, the NCLEX-RN® examination is going to require that you correctly calculate an intravenous infusion rate via drops per minute in addition to calculating medication doses, so be sure that you master this skill.

II. Medication Measurement Systems

A. Metric system (Box 14.2)

1. The basic units of metric measures are the meter, liter, and gram.
2. Meter measures length; liter measures volume; gram measures mass.

B. Apothecary and household systems

1. The apothecary and household systems are the oldest of the medication measurement systems.
2. Apothecary measures such as grain, dram, and minim are not commonly used in the clinical setting.
3. Commonly used household measures include drop, teaspoon, tablespoon, ounce, pint, and cup.

⚠ The NCLEX will not present questions that require you to convert from the apothecary system of measurement to the metric system; however, this system is still important to know because, although it is not commonly used, you may encounter it in the clinical setting.

C. Additional common medication measures

1. Milliequivalent
 - a. Milliequivalent is abbreviated mEq.
 - b. The milliequivalent is an expression of the number of grams of a medication contained in 1 mL of a solution.

- c. For example, the measure of serum potassium is given in milliequivalents.

2. Unit

- a. Unit measures a medication in terms of its action, not its physical weight.
- b. For example, penicillin, heparin sodium, and insulin are measured in units.

III. Conversions

A. Conversion between metric units (Box 14.3 and Clinical Judgment: Generate Solutions box)

1. The metric system is a decimal system; therefore, conversions between the units in this system can be done by dividing or multiplying by 1000 or by moving the decimal point 3 places to the right or 3 places to the left.
2. In the metric system, to convert a larger unit to a smaller unit, multiply by 1000 or move the decimal point 3 places to the right.
3. In the metric system, to convert a smaller unit to a larger unit, divide by 1000 or move the decimal point 3 places to the left.

CLINICAL JUDGMENT: GENERATE SOLUTIONS

The nurse reviews the physician's medication orders for a client diagnosed with a seizure disorder.

Physician's Orders

Phenytoin 0.2 g orally twice daily

The nurse prepares to administer the medication and reads the medication bottle, which states that each capsule is 100 mg. The nurse converts 0.2 g to mg and determines that 0.2 g is equal to 200 mg and prepares for the administration of 2 capsules.

BOX 14.1 Medication Administration

- Assess the medication prescription.
- Compare the client's medication prescription with all medications that the client was previously taking (medication reconciliation).
- Ask the client about a history of allergies and any use of herbal substances.
- Assess the client's current condition and the purpose for the medication or intravenous (IV) solution.
- Determine the client's understanding of the purpose of the prescribed medication or need for IV solution.
- Teach the client about the medication and about self-administration at home.
- Identify and address concerns (social, cultural, religious, spiritual) that the client may have about taking the medication.
- Assess the need for conversion when preparing a dose of medication for administration to the client.
- Assess the rights of medication administration, such as: right prescription, right medication, right dose, right client, right route, right frequency/time, right reason, right education (medication name, purpose, action, and possible undesirable side or adverse effects), right assessment (performed by a qualified health care provider), right to refuse medication regardless of the consequences, right approach/technique, right evaluation/response, and right documentation.
- Inform the client of additional medication rights, which include not receiving unnecessary medication; being advised of the experimental nature of medication therapy and the need to give written consent for its use; being informed if prescribed medications are a part of a research study; and receiving appropriate supportive therapy in relation to medication therapy.
- Assess the vital signs, check significant laboratory results, and identify any potential interactions (food or medication interactions) before administering medication, when appropriate.
- Document the administration of the prescribed therapy and the client's response to the therapy.

B. Conversion between systems

1. Conversion between systems is necessary when a medication prescription is written in one system, but the medication label is stated in another.
2. Medications are not always prescribed and prepared in the same system of measurement; therefore, conversion of units from one system to another is necessary. However, the metric system is the most commonly used system in the clinical setting.
3. Calculating equivalents between two systems may be done by using the method of ratio and proportion (Boxes 14.4 and 14.5).

 Conversion is the first step in the calculation of dosages.

BOX 14.2 Metric System

Abbreviations	Equivalents
meter: m	1 mcg = 0.000001 g
liter: L	1 mg = 1000 mcg or 0.001 g
milliliter: mL	1 g = 1000 mg
kilogram: kg	1 kg = 1000 g
gram: g	1 kg = 2.2 lb
milligram: mg	1 mL = 0.001 L
microgram: mcg	
milliequivalents: mEq	

BOX 14.3 Conversion Between Metric Units**Problem 1**

Convert 2 g to milligrams.

Solution

Change a larger unit to a smaller unit:

2 g = 2000 mg (multiply by 1000 or move decimal point 3 places to the right)

Problem 2

Convert 250 mL to liters.

Solution

Change a smaller unit to a larger unit:

250 mL = 0.25 L (divide by 1000 or move decimal point 3 places to the left)

IV. Medication Labels

- A. A medication label always contains the **generic name** and may contain the **trade name** of the medication.
- B. Always check expiration dates on medication labels. 

 The NCLEX tests you on generic names of medications. Trade names will not be presented on the exam for most medications, so be sure to learn medications by their generic names. However, you will probably still encounter the trade names in the clinical setting.

V. Medication Prescriptions (Box (v.)) 

- A. In a medication prescription, the name of the medication is written first, followed by the dosage, route, and frequency (depending on the frequency of the prescription, times of administration are usually established by the health care agency and written in an agency policy).
- B. Medication prescriptions need to be written using accepted abbreviations, acronyms, and symbols approved by The Joint Commission; also follow agency guidelines.

 If the nurse has any questions about or sees inconsistencies in the written prescription, the nurse must contact the person who wrote the prescription immediately and must verify the prescription.

BOX 14.4 Ratio and Proportion

Ratio: The relationship between two numbers, separated by a colon; for example, 1:2 (1 to 2).

Proportion: The relationship between two ratios, separated by a double colon (::) or an equal sign (=).

Formula:

$$H(\text{on hand}) : V(\text{vehicle}) :: (=) \text{desired dose} : X(\text{unknown})$$

To solve a ratio and proportion problem: The middle numbers (the means) are multiplied, and the end numbers (the extremes) are multiplied.

Sample Problem:

The prescription reads morphine sulfate, 4 mg by intravenous push (IVP). The medication ampule reads 10 mg/mL. The nurse would prepare how many mL to administer the correct dose?

$$H(\text{on hand}) : V(\text{vehicle}) :: (=) \text{desired dose} : X(\text{unknown})$$

$$H = 10 \text{ mg}$$

$$V = 1 \text{ mL}$$

$$\text{Desired dose} = 4 \text{ mg}$$

$$X = \text{unknown}$$

$$\text{Set up the formula: } 10 : 1 :: 4 : X$$

Solve:

$$\text{Multiply means: } 4 \times 1 = 4$$

$$\text{Multiply extremes: } 10X$$

$$10X = 4$$

$$X = 0.4 \text{ mL}$$

VI. Oral Medications

- A. Scored tablets contain an indented mark to be used for possible breakage into partial doses; when necessary, scored tablets (those marked for division) can be divided into halves or quarters according to agency policy.
- B. Enteric-coated tablets and sustained-released capsules delay absorption until the medication reaches the small intestine; these medications would not be crushed.
- C. Capsules contain a powdered or oily medication in a gelatin cover. Medication can be given in powdered or gelatin form or as a whole capsule.
- D. Orally administered liquids are supplied in solution form and contain a specific amount of medication in a given amount of solution, as stated on the label.
- E. The medicine cup
 1. The medicine cup has a capacity of 30 mL or 1 ounce (oz) and is used for orally administered liquids.
 2. The medicine cup is calibrated to measure teaspoons, tablespoons, and ounces.
 3. To pour accurately, place the medication cup on a level surface at eye level and then pour the liquid while reading the measuring markings.

BOX 14.5 Calculating Equivalents Between Two Systems

Calculating equivalents between two systems may be done by using the method of ratio and proportion.

Problem

The primary health care provider (PHCP) prescribes nitroglycerin $\frac{1}{150}$ grain (gr).

The medication label reads 0.4 milligrams (mg) per tablet. The nurse prepares to administer how many tablets to the client?

If you knew that $\frac{1}{150}$ gr was equal to 0.4 mg, you would know that you need to administer 1 tablet. Otherwise, use the ratio and proportion formula. Also, recall that 1 gr = 60 mg.

Note that grain is a measure in the apothecary system, but nitroglycerin is one medication that you may find prescribed in this unit of measure.

Ratio and Proportion Formula

$$H(\text{on hand}) : V(\text{vehicle}) :: (=) \text{desired dose} : X(\text{unknown})$$

$$1 \text{ gr} : 60 \text{ mg} :: \frac{1}{150} \text{ gr} : X \text{ mg}$$

$$60 \times \frac{1}{150} = X$$

$$X = 0.4 \text{ mg (1 tablet)}$$

BOX 14.6 Medication Prescriptions

- Name of client
- Date and time when prescription is written
- Name of medication to be given
- Dosage of medication
- Medication route
- Time and frequency of administration
- Signature of person writing the prescription

Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 613.

- F. Volumes of less than 5 mL are measured using a syringe with the needle removed.

 A calibrated syringe is used for giving medicine to children.

VII. Parenteral Medications

- A. Parenteral means an injection route, and parenteral medications are administered by intravenous (IV), intramuscular, subcutaneous, or intradermal injection (see Fig. 14.1 for angles of injection).
- B. Parenteral medications are packaged in single-use ampules, in single- and multiple-use rubber-stoppered vials, and in premeasured syringes and cartridges.
- C. The standard 3-mL syringe is used to measure most injectable medications and is calibrated in tenths (0.1) of a milliliter.

FIG. 14.1 Angles of injection.

- D. The syringe is filled by drawing in solution until the top ring on the plunger (i.e., the ring closest to the needle), not the middle section or the bottom ring of the plunger, is aligned with the desired calibration (Fig. 14.2).
- E. The nurse would not administer more than 3 mL per intramuscular injection site (2 mL for the deltoid) or 0.5 to 1.5 mL for an adult per subcutaneous injection site; larger volumes are difficult for an injection site to absorb and, if prescribed, need to be verified. Variations for pediatric clients are discussed in the pediatric sections of this text.
- F. For an average-sized adult a 25-gauge $\frac{5}{8}$ -inch needle at a 45-degree angle or a $\frac{1}{2}$ -inch needle at a 90-degree angle is used for subcutaneous injections.
- G. For an intramuscular injection in an adult client, the client's weight, site for injection, and the amount of adipose tissue influences needle size. An obese person may require a needle 2 to 3 inches long, whereas a thin person requires only a $\frac{1}{2}$ - to 1-inch needle; the gauge of the needle will depend on the viscosity of the solution being injected, with a larger gauge needed for more viscous solutions. If a Z-track method is used, a larger, deeper muscle such as the ventrogluteal muscle would be chosen as the site.
- H. For an intradermal injection, a tuberculin or small syringe is used. The angle of insertion for an intradermal injection is 5 to 15 degrees.

Always question and verify excessively large or small volumes of medication.

FIG. 14.2 Parts of a syringe.

FIG. 14.3 Five-milliliter syringe.

FIG. 14.4 Tuberculin syringe.

- I. Pre-filled medication cartridge
 1. The medication cartridge slips into the cartridge holder, which provides a plunger for injection of the medication.
 2. The cartridge is designed to provide sufficient space to allow for the addition of a second medication when combined dosages are prescribed.
1. The pre-filled medication cartridge is to be used once and discarded; if the nurse is to give less than the full single dose provided, the nurse needs to discard the extra amount before giving the client the injection, in accordance with agency policies and procedures.
- J. In general, standard medication doses for adults are to be rounded to the nearest tenth (0.1 mL) of a milliliter and measured on the milliliter scale; for example, 1.28 mL is rounded to 1.3 mL (follow agency policy for rounding medication doses).
- K. When volumes larger than 3 mL are required, the nurse may use a 5-mL syringe; these syringes are calibrated in fifths (0.2 mL) (Fig. 14.3).
- L. Other syringe sizes may be available (10, 20, and 50 mL) and may be used for medication administration requiring dilution.

⚠ When performing a calculation, if rounding is necessary, perform the rounding at the end of the calculation. When taking the NCLEX, follow the instructions provided in the question regarding the need to round. For example, the NCLEX question may read: Record your answer using one decimal place.
- M. Tuberculin syringe (Fig. 14.4)
 1. The tuberculin syringe holds 1 mL and is used to measure small or critical amounts of medication, such as allergen extract, vaccine, or a child's medication.

FIG. 14.5 A 100-unit insulin syringe.

2. The syringe is calibrated in hundredths (0.01) of a milliliter, with each one-tenth (0.1) marked on the metric scale.

N. Insulin syringe (Fig. 14.5)

1. The standard 100-unit insulin syringe is calibrated for 100 units of insulin (100 units = 1 mL); low-dose insulin syringes, such as a 30-unit insulin syringe or a 50-unit insulin syringe, are available for a more precise insulin draw for clients with low-dose insulin prescriptions.
2. Insulin would not be measured in any other type of syringe.

⚠ If the insulin prescription states to administer regular and NPH insulin, combine both types of insulin in the same syringe. Use the mnemonic RN: Draw Regular insulin into the insulin syringe first, and then draw the MPH insulin. Of note, with newer insulin types on the market, such as long-acting and rapid-acting insulin, regular and NPH insulin are used less frequently because of safety and convenience factors.

3. Other insulin delivery methods

- a. Insulin pumps are small, computerized devices that mimic the way the human pancreas works by delivering small doses of short-acting insulin continuously (basal rate).
- b. For many people with diabetes, insulin pens are a more convenient and portable option than vials and syringes. They can also make insulin delivery easier for anyone with arthritis or other dexterity issues.
- c. See Chapter 48 for addition information on insulin administration devices.

- O. Safety needles contain shielding devices that are attached to the needle and slipped over the needle to reduce the incidence of needlestick injuries. Engaging the safety feature of the needle would occur immediately after the administration of the medication.

VIII. Injectable Medications in Powder Form

- A. Some medications become unstable when stored in solution form and are therefore packaged in powder form.
- B. Powders must be dissolved with a sterile diluent before use; usually, sterile water or normal saline is used. The dissolving procedure is called reconstitution (Box 14.7).

IX. Calculating the Correct Dosage (Box 14.8)

- A. When calculating dosages of oral medications, check the calculation and question the prescription if the calculation calls for more than 3 tablets.
- B. When calculating dosages of parenteral medications, check the calculation and question the prescription if the amount to be given is too large a dose.
- C. Be sure that all measures are in the same system and that all units are in the same size, converting when necessary; carefully consider what the reasonable amount of the medication that would be administered is.
- D. Round standard injection doses to tenths and measure in a 3-mL syringe (follow agency policy).
- E. Per agency policy, it may be acceptable to round down (avoid rounding up) small, critical amounts or children's doses to hundredths and measure in a 1-mL tuberculin syringe (example: 1.752 mL can be rounded to 1.75 mL).
- F. In addition to using the standard formula, calculations can be done using dimensional analysis (see Box 14.8 for an example of the standard formula and dimensional analysis).

⚠ Regardless of the source or cause of a medication error, if the nurse gives an incorrect dose, the nurse is legally responsible for the action.

X. Percentage and Ratio Solutions

- A. Percentage solutions
 1. Express the number of grams (g) of the medication per 100 mL of solution.
 2. For example, calcium gluconate 10% is 10 g of pure medication per 100 mL of solution.
- B. Ratio solutions
 1. Express the number of grams of the medication per total milliliters of solution.
 2. For example, epinephrine 1:1000 is 1 g of pure medication per 1000 mL of solution.

XI. Intravenous Flow Rates (Box 14.9)

- A. Monitor IV flow rate frequently even if the IV solution is being administered through an electronic infusion device (follow agency policy regarding frequency).
- B. If an IV is running behind schedule, collaborate with the primary health care provider (PHCP) to determine the client's ability to tolerate an increased flow rate, particularly for older clients and those with cardiac, pulmonary, renal, or neurological conditions.

! The nurse would never increase the rate of (i.e., speed up) an IV infusion to catch up if the infusion is running behind schedule without PHCP approval. The nurse needs to include any IV fluid administered in the intake portion of the client's assessment.

BOX 14.7 Reconstitution

- In reconstituting a medication, locate the instructions on the label or in the vial package insert, and read and follow the directions carefully.
- Instructions will state the volume of diluent to be used and the resulting volume of the reconstituted medication.
- Often, the powdered medication adds volume to the solution in addition to the amount of diluent added.
- The total volume of the prepared solution will exceed the volume of the diluent added.
- When reconstituting a multiple-dose vial, label the medication vial with the date and time of preparation, your initials, and the date of expiration.
- Indicating the strength per volume on the medication label also is important.

BOX 14.8 Calculating a Medication Dosage

Prescription:

The prescription reads: Administer 5000 units of heparin subcutaneously. The medication bottle reads 7500 units/mL. How many mL will the nurse prepare for administration? Round the answer to the nearest tenth position.

Standard Formula:

$$\frac{D}{A} \times Q = X$$

D (desired) is the dosage that the primary health care provider prescribed.

A (available) is the dosage strength as stated on the medication label.

Q (quantity) is the volume or form in which the dosage strength is available, such as tablets, capsules, or milliliters.

$$\frac{5000 \text{ units}}{7500 \text{ units}} \times 1 \text{ mL} = 0.66 \text{ mL} = 0.7 \text{ mL}$$

Dimensional Analysis Formula:

- Prepare to set up an equation.
- Identify the unit of measure desired in the calculation. Write the label for the answer, such as mL, on the right side of the equation.
- Place the available information from the problem in fraction form on the left side of the equation. The abbreviation or unit matching the desired unit on the right side needs to be placed in the numerator.
- Enter conversion factors as fractions to work toward the desired label. (Equals over equals)
- Cross out all labels that are in both the numerator and the denominator.
- Perform the math: Multiply the numerators; multiply the denominators. Then divide the numerator by the denominator.

- C. Whenever a prescribed IV rate is increased, the nurse needs to assess the client for increased respirations and increased lung congestion, which could indicate fluid overload.
- D. Intravenously administered fluids are prescribed most frequently based on milliliters per hour.
- E. The volume per hour prescribed is administered by setting the flow rate, which is counted in drops per minute.

BOX 14.9 Formulas for Intravenous Calculations

Flow Rates

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

Infusion Time

$$\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} = \text{Infusion time}$$

Number of Milliliters per Hour

$$\frac{\text{Total volume in milliliters}}{\text{Number of hours}} = \text{Number of milliliters per hour}$$

Prescription:

The prescription reads: Administer 5000 units of heparin subcutaneously. The medication bottle reads 7500 units/mL. How many mL will the nurse prepare for administration? Round the answer to the nearest tenth position.

- Begin by identifying the unit of measure desired in the calculation. Write the label for the answer, which is mL, on the right side of the equation.
- Place what is prescribed in the numerator of the first fraction (5000 units). Next, set up the conversion factor, which is also a fraction. In this case, it is the concentration of the medication. The heparin concentration is 7500 units per 1 mL. Since units is in the numerator in our first fraction, units should go in the denominator of our second fraction, so the two values (units) cancel out, and the desired unit—mL—should go in the numerator. Setting it up in this way will result in an answer in milliliters, which is what the question is asking for.

$$\frac{5000 \text{ units}}{1} \times \frac{1 \text{ mL}}{7500 \text{ units}} = \text{mL}$$

The unit of measure "units" in the numerator and denominator cancel each other out, leaving mL, which is the desired unit of measure in this question.

$$\frac{5000 \cancel{\text{units}}}{1} \times \frac{1 \text{ mL}}{7500 \cancel{\text{units}}}$$

Perform the math by multiplying across the numerators and multiplying across the denominators. Then divide the final fraction to get your desired result, and remember to round to the nearest tenth accordingly.

$$\frac{5000 \text{ mL}}{7500} = 0.66 \text{ mL} = 0.7 \text{ mL}$$

BOX 14.10 Infusions Prescribed by Unit Dosage per Hour

Calculation of these problems can be done using a two-step process.

1. Determine the amount of medication per milliliter (mL).
2. Determine the infusion rate or milliliters per hour.

Problem 1

Prescription: Continuous heparin sodium by IV at 1000 units per hour

Available: IV bag of 500 mL D₅W with 20,000 units of heparin sodium

How many milliliters per hour are required to administer the correct dose?

Solution

Step 1: Calculate the amount of medication (units) per 1 mL.

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{20,000 \text{ units}}{500 \text{ mL}} = 40 \text{ units/1 mL}$$

Step 2: Calculate milliliters per hour.

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hour}$$

$$\frac{1000 \text{ units}}{40 \text{ units}} = 25 \text{ mL/hour}$$

Problem 2

Prescription: Continuous regular insulin by IV at 10 units per hour

Available: IV bag of 100 mL NS with 50 units regular insulin
How many milliliters per hour are required to administer the correct dose?

Solution

Step 1: Calculate the amount of medication (units) per 1 mL.

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{50 \text{ units}}{100 \text{ mL}} = 0.5 \text{ units/1 mL}$$

Step 2: Calculate milliliters per hour.

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hour}$$

$$\frac{10 \text{ units}}{0.5 \text{ units/mL}} = 20 \text{ mL/hour}$$

F. Most low rate calculations involve changing milliliters per hour to drops per minute.

G. Intravenous tubing

1. IV tubing sets are calibrated in drops per milliliter; this calibration is needed for calculating low rates.
2. A standard or macrodrip set is used for routine adult IV administrations; depending on the manufacturer and type of tubing, the set will require 10 to 20 drops (gtt) to equal 1 mL.
3. A minidrip or microdrip set is used when more exact measurements are needed, such as in intensive care units and pediatric units.
4. In a minidrip or microdrip set, 60 gtt is usually equal to 1 mL.
5. The calibration, in drops per milliliter, is written on the IV tubing package.

XII. Calculation of Infusions Prescribed by Unit Dosage per Hour

- A. The most common medications that will be prescribed by unit dosage per hour and run by continuous infusion are heparin sodium and regular insulin.
- B. Calculation of these infusions can be done using a two-step process (Box 14.10).

PRACTICE QUESTIONS

1. A prescription reads 1000 mL of normal saline (NS) to infuse over 12 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse prepares to set the low rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
2. A prescription reads to administer an intravenous (IV) dose of 400,000 units of penicillin G benzathine to a client with an infection. The label on the 10-milliliter (mL) ampule sent from the pharmacy reads penicillin G benzathine, 300,000 units/mL. The nurse prepares how many milliliters (mL) to administer the correct dose? Fill in the blank. Record your answer using 1 decimal place.
Answer: _____ mL
3. A prescription reads potassium chloride 30 mEq to be added to 1000 mL normal saline (NS) and to be administered over a 10-hour period. The label on the medication bottle reads 40 mEq/20 mL. The nurse prepares how many milliliters (mL) of potassium chloride to administer the correct dose of medication? Fill in the blank.
Answer: _____ mL

4. A prescription reads clindamycin phosphate 0.3 g in 50 mL normal saline (NS) to be administered intravenously over 30 minutes for a client with an infection. The medication label reads clindamycin phosphate 900 mg in 6 mL. The nurse prepares how many milliliters (mL) of the medication to administer the correct dose? Fill in the blank.
Answer: _____ mL
5. A prescription reads 1000 mL of normal saline 0.9% to infuse over 8 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
6. A prescription reads heparin sodium, 1300 units/hr by continuous intravenous (IV) infusion. The pharmacy prepares the medication and delivers an IV bag labeled heparin sodium 20,000 units/250 mL D₅W. An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters (mL) per hour to deliver 1300 units per hour? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ mL/hr
7. A prescription reads 3000 mL of D₅W to be administered over a 24-hour period. The nurse determines that how many milliliters (mL) per hour will be administered to the client? Fill in the blank.
Answer: _____ mL/hr
8. Gentamicin sulfate, 80 mg in 100 mL normal saline (NS), is to be administered over 30 minutes to a client with an infection. The drop factor is 10 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
9. A prescription reads levothyroxine, 150 mcg orally daily. The medication label reads levothyroxine, 0.1 mg/tablet. The nurse administers how many tablet(s) to the client? Fill in the blank.
Answer: _____ tablet(s)
10. Cefuroxime sodium, 1 g in 50 mL normal saline (NS), is to be administered over 30 minutes to a client with an infection. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank.
Answer: _____ drops per minute
11. A prescription reads 1000 mL D₅W to infuse at a rate of 125 mL/hr. The nurse determines that it will take how many hours for 1 L to infuse? Fill in the blank.
Answer: _____ hour(s)
12. A prescription reads to infuse 1 unit of packed red blood cells over 4 hours. The unit of blood contains 250 mL. The drop factor is 10 drops (gtt)/1 mL. The nurse prepares to set the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
13. A prescription reads morphine sulfate, 8 mg stat. The medication ampule reads morphine sulfate, 10 mg/mL. The nurse prepares how many milliliters (mL) to administer the correct dose? Fill in the blank.
Answer: _____ mL
14. A prescription reads regular insulin, 8 units/hr by continuous intravenous (IV) infusion. The pharmacy prepares the medication and then delivers an IV bag labeled 100 units of regular insulin in 100 mL normal saline (NS). An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters (mL) per hour to deliver 8 units/hr? Fill in the blank.
Answer: _____ mL/hr

ANSWERS

1. Answer: 21

Rationale: Use the standard intravenous (IV) flow rate formula or dimensional analysis. Both methods of calculation are provided.

Standard Formula:

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{1000 \text{ mL} \times 15 \text{ gtt}}{720 \text{ minutes}} = \frac{15,000}{720} = 20.8, \text{ or } 21 \text{ gtt/min}$$

Dimensional Analysis:

$$\frac{1000 \text{ mL}}{12 \text{ hours}} \times \frac{15 \text{ gtt}}{1 \text{ mL}} \times \frac{1 \text{ hour}}{60 \text{ minutes}} = ? \text{ gtt/min}$$

$$\frac{1000 \text{ mL}}{12 \text{ hours}} \times \frac{15 \text{ gtt}}{1 \text{ mL}} \times \frac{1 \text{ hour}}{60 \text{ minutes}} = ? \text{ gtt/min}$$

$$\frac{15,000 \text{ gtt}}{720 \text{ minutes}} = 20.8 \text{ gtt/min} = 21 \text{ gtt/min}$$

Test-Taking Strategy: Focus on the **subject**, calculating an IV flow rate. Use the standard or dimensional analysis formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator, and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

2. Answer: 1.3

Rationale: Use the medication dose formula.

Formula:

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{400,000 \text{ units} \times 1 \text{ mL}}{300,000 \text{ units}} = \text{Milliliters per dose}$$

$$\frac{400,000}{300,000} = 1.33 = 1.3 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator, and make sure that the answer makes sense. Remember to record your answer using 1 decimal place.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

3. Answer: 15

Rationale: In most facilities, potassium chloride is premixed in the intravenous solution, and the nurse will need to verify the correct dose before administration. In some cases the nurse will need to add the potassium chloride and will use the medication calculation formula to determine the number of millimeters to be added. The standard formula and the dimensional analysis method are provided for this question.

Standard Formula:

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{30 \text{ mEq} \times 20 \text{ mL}}{40 \text{ mEq}} = 15 \text{ mL}$$

Dimensional Analysis:

$$\frac{30 \text{ mEq}}{1} \times \frac{20 \text{ mL}}{40 \text{ mEq}} = ? \text{ mL}$$

$$\frac{30 \text{ mEq}}{1} \times \frac{20 \text{ mL}}{40 \text{ mEq}} = ? \text{ mL}$$

$$\frac{600 \text{ mL}}{40} = 15 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. Follow either the standard formula or the formula for dimensional analysis for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

4. Answer: 2

Rationale: You must convert 0.3 g to milligrams. In the metric system, to convert a larger unit to a smaller unit, multiply by 1000 or move the decimal 3 places to the right. Therefore, 0.3

g = 300 mg. After conversion from grams to milligrams, use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{300 \text{ mg} \times 6 \text{ mL}}{900 \text{ mg}} = \frac{1800}{900} = 2 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. In this medication calculation problem, first you must convert grams to milligrams. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

5. Answer: 31

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drop per minute}$$

$$\frac{1000 \text{ mL} \times 15 \text{ gtt}}{480 \text{ minutes}} = \frac{15,000}{480} = 31.2, \text{ or } 31 \text{ gtt/min}$$

Test-Taking Strategy: Focus on the **subject**, an IV flow rate. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

6. Answer: 16

Rationale: Calculation of this problem can be done using a two-step process. First, you need to determine the amount of heparin sodium in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

Formula:

Step 1:

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \text{Amount of medication per milliliter}$$

$$\frac{20,000 \text{ units}}{250 \text{ mL}} = 80 \text{ units/mL}$$

Step 2:

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \text{Infusion rate, or mL/hr}$$

$$\frac{1300 \text{ units}}{80 \text{ units/mL}} = 16.25, \text{ or } 16 \text{ mL/hr}$$

Test-Taking Strategy: Focus on the **subject**, an IV flow rate. Read the question carefully, noting that two steps can be used to solve this medication problem. Follow the formula, verify your answer using a calculator, and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

7. Answer: 125

Rationale: Use the intravenous (IV) formula to determine milliliters per hour.

Formula:

$$\frac{\text{Total volume in milliliters}}{\text{Number of hours}} = \text{Milliliters per hour}$$

$$\frac{3000 \text{ mL}}{24 \text{ hours}} = 125 \text{ mL/hr}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation of mL per hour. Read the question carefully, noting that the question is asking about milliliters per hour to be administered to the client. Use the formula for calculating milliliters per hour. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

8. Answer: 33

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{100 \text{ mL} \times 10 \text{ gtt}}{30 \text{ minutes}} = \frac{1000}{30} = 33.3, \text{ or } 33 \text{ gtt/min}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

9. Answer: 1.5

Rationale: You must convert 150 mcg to milligrams. In the metric system, to convert a smaller unit to a larger unit, divide by 1000 or move the decimal 3 places to the left. Therefore, 150 mcg equals 0.15 mg. Next, use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired}}{\text{Available}} \times \text{Tablet} = \text{Tablets per dose}$$

$$\frac{0.15 \text{ mg}}{0.1 \text{ mg}} \times 1 \text{ tablet} = 1.5 \text{ tablets}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. In this medication calculation problem, first you must convert micrograms to milligrams. Next, follow the formula for the calculation of the correct dose, verify your answer using a calculator, and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 598.

10. Answer: 25

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minutes}} = \text{Drops per minute}$$

$$\frac{50 \text{ mL} \times 15 \text{ gtt}}{30 \text{ minutes}} = \frac{750}{30} = 25 \text{ gtt/min}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator, and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

11. Answer: 8

Rationale: You must determine that 1 L equals 1000 mL. Next, use the formula for determining infusion time in hours.

Formula:

$$\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} = \text{Infusion time}$$

$$\frac{1000 \text{ mL}}{125 \text{ mL}} = 8 \text{ hours}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion time calculation. Read the question carefully, noting that the question is asking about infusion time in hours. First, convert 1 L to milliliters. Next, use the formula for determining infusion time in hours. Verify your answer using a calculator, and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

12. Answer: 10

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \times \text{Drop factor}}{\text{Time in minute}} = \text{Drops per minute}$$

$$\frac{250 \text{ mL} \times 10 \text{ gtt}}{240 \text{ minutes}} = \frac{2500}{240} = 10.4, \text{ or } 10 \text{ gtt/min}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion rate. Although an infusion pump would be used, use the formula to calculate drops per minute to answer the question. Once you have performed the calculation, verify your answer

using a calculator, and make sure that the answer makes sense. Remember to record the answer to the nearest whole number.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

13. **Answer: 0.8**

Rationale: Use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired} \times \text{mL}}{\text{Available}} = \text{Milliliters per dose}$$

$$\frac{8 \text{ mg} \times 1 \text{ mL}}{10 \text{ mg}} = 0.8 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 598.

14. **Answer: 8**

Rationale: Calculation of this problem can be done using a two-step process. First, you need to determine the amount of

regular insulin in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

Formula:

Step 1:

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}}$$

$$= \text{Amount of medication per milliliter}$$

$$\frac{100 \text{ units}}{100 \text{ mL}} = 1 \text{ unit/mL}$$

Step 2:

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}}$$

$$= \text{Infusion rate, or milliliters per hour}$$

$$\frac{8 \text{ units}}{1 \text{ unit/mL}} = 8 \text{ mL/hour}$$

Test-Taking Strategy: Focus on the **subject**, an IV flow rate. Read the question carefully, noting that two steps can be used to solve this medication problem. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. These steps can be used for similar medication problems related to the administration of heparin sodium or regular insulin by IV infusion.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1022-1023.

Perioperative Nursing Care

Contributor: Eileen H. Gray, RN, DNP, CPNP

PRIORITY CONCEPTS Infection; Safety

I. Preoperative Care

 A client may return home shortly after having a surgical procedure because many surgical procedures are done through ambulatory care or 1-day-stay surgical units. Perioperative care procedures apply even when the client returns home on the same day of the surgical procedure.

- Obtaining telephone consent from a legal guardian or power of attorney for health care is an acceptable practice if clients are unable to give consent themselves. The nurse must engage another nurse as a witness to the consent given over the telephone. If a client is unable to consent for self, the surgeon still needs to educate the client to the greatest extent possible.

A. Obtaining informed consent (see **Clinical Judgment: Take Action Box**)

- The surgeon who will be performing the surgery is responsible for explaining the surgical procedure to the client and answering the client's questions. Often, the nurse is responsible for obtaining the client's signature on the consent form for surgery, which indicates the client's agreement to the procedure based on the surgeon's explanation.
- The nurse may witness the client's signing of the consent form, but the nurse must be sure that the client has understood the surgeon's explanation of the surgery.
- The nurse needs to document the witnessing of the signing of the consent form after the client acknowledges understanding the procedure.
- Minors (clients younger than 18 years) may need a parent or legal guardian to sign the consent form.
- Clients who are not alert or oriented may need their power of attorney for health care or a legal guardian to sign the consent form.
- Psychiatric clients have a right to refuse treatment until a court has legally determined that they are unable to make decisions for themselves.
- No sedation would be administered to the client before the client signs the consent form.

CLINICAL JUDGMENT: TAKE ACTION

The nurse is assisting the surgeon in obtaining informed consent from a client for a scheduled surgical procedure. The client signs the consent, but after the surgeon leaves the nursing unit, the client informs the nurse about being unclear about certain aspects of the surgical procedure. As it is a responsibility of the nurse to ensure that the client has understood the surgeon's explanation of the procedure, the nurse takes action and notifies the surgeon about the need for clarification before moving forward with surgical preparation.

B. Nutrition

- Review the surgeon's prescriptions regarding NPO (nothing by mouth) status before surgery.
- Withhold solid foods and liquids as prescribed to avoid aspiration, usually for 6 to 8 hours before general anesthesia and for approximately 3 hours before surgery with local anesthesia (as prescribed).
- Insert an intravenous (IV) line and administer IV fluids, if prescribed. Per agency policy, the IV catheter size would be large enough to administer blood products and intravenous fluids if they are required (fluids are also administered to protect the kidneys during anesthesia).

C. Elimination

1. If the client is to have intestinal or abdominal surgery, per surgeon's preference, an enema, laxative, or both may be prescribed for the day or night before surgery.
2. The client needs to void immediately before surgery.
3. Insert an indwelling urinary catheter, if prescribed; urinary catheter collection bags need to be emptied immediately before surgery, and the nurse would document the amount and characteristics of the urine.

D. Surgical site

1. Clean the surgical site with a mild antiseptic or antibacterial soap on the night before surgery, as prescribed.
2. Shave the operative site, as prescribed; shaving may be done in the operative area.

 **Hair on the head or face (including the eyebrows) would be shaved only if prescribed.**

E. Preoperative client teaching

1. Explain fears and anxieties prior to surgery, and inform the client about what to expect postoperatively.
2. Inform the client to notify the nurse of any allergies to medications or any environmental allergies. The client also needs to notify the nurse of the use of any vitamins, herbal supplements, or over-the-counter medications.
3. Inform the client to notify the nurse if the client experiences any pain postoperatively and that pain medication will be prescribed and given as the client requests. The client needs to be informed that some degree of pain would be expected and is normal. Advise the client about charts (pain scales) that may be used to ascertain level of pain.
4. Demonstrate the use of a patient-controlled analgesia (PCA) pump if prescribed, and explain that the client is the sole person who would push the button to administer medication.
5. Instruct the client on how to use noninvasive pain-relief techniques, such as relaxation, distraction techniques, and guided imagery, before the pain occurs and as soon as the pain is noticed.
6. The nurse would instruct the client not to smoke (for at least 24 hours before surgery); discuss smoking-cessation treatments and programs.
7. Instruct the client in deep-breathing and coughing techniques, the use of incentive spirometry, early ambulation as long as there are no activity restrictions, and the importance of performing the techniques postoperatively to prevent the development of pneumonia, atelectasis, and thrombus formation (Box 15.1).

BOX 15.1 Client Teaching

Deep-Breathing and Coughing Exercises

Instruct the client that a sitting position gives the best lung expansion for coughing and deep-breathing exercises. Instruct the client to breathe deeply 3 times, inhaling through the nostrils and exhaling slowly through pursed lips. Instruct the client that the third breath would be held for 3 seconds; then the client would cough deeply 3 times. The client needs to perform this exercise every 1 to 2 hours.

Incentive Spirometry

Instruct the client to assume a sitting or upright position. Instruct the client to place the mouth tightly around the mouthpiece. Instruct the client to inhale slowly to raise and maintain the □ow rate indicator on the device, as prescribed. Instruct the client to hold the breath for 5 seconds and then to exhale through pursed lips. Instruct the client to repeat this process 10 times every hour.

Leg and Foot Exercises

Gastrocnemius (calf) pumping: Instruct the client to move both ankles by pointing the toes up and then down. Quadriceps (thigh) setting: Instruct the client to press the back of the knees against the bed and then to relax the knees; this contracts and relaxes the thigh and calf muscles to prevent thrombus formation. Foot circles: Instruct the client to rotate each foot in a circle. Hip and knee movements: Instruct the client to □ex the knee and thigh and to straighten the leg, holding the position for 5 seconds before lowering (not performed if the client is having abdominal surgery or if the client has a back problem).

Splinting the Incision

If the surgical incision is abdominal or thoracic, instruct the client to place a pillow, or one hand with the other hand on top, over the incisional area. During deep breathing and coughing, the client presses gently against the incisional area to splint or support it.

Adapted from: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 166-167; Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp.1360, 1362-1364.

8. Instruct the client in leg and foot exercises and the purpose of sequential compression devices to prevent venous stasis of blood and to facilitate venous blood return (Fig. 15.1; see Box 15.1; see Fig. 15.3).
9. Instruct the client in how to splint an incision, turn, and reposition (Fig. 15.2; see Box 15.1).
10. Inform the client of any invasive devices that may be needed after surgery, such as a nasogastric tube, drain, urinary catheter, epidural catheter, or IV or subclavian lines.
11. Instruct the client not to pull on any of the invasive devices; they will be removed as soon as possible.

FIG. 15.1 Postoperative leg exercises.

FIG. 15.2 Techniques for splinting a wound when coughing.

FIG. 15.3 Sequential compression device.

BOX 15.2 Cultural and Spiritual Aspects of Perioperative Nursing Care

- Provide culturally sensitive care.
- Ask clients about their cultural practices and spiritual beliefs and what their preferences are with regard to all aspects of care.
- Institute strategies to address preferences.
- Determine the primary language spoken.
- Secure the help of a professional interpreter to communicate with non-English-speaking clients.
- Ask about feelings related to surgery and pain.
- Use pictures or phrase cards to communicate and assess the non-English-speaking client's perception of pain or other feelings.
- Provide preoperative and postoperative educational materials in the appropriate language.
- Identify support systems.
- Allow a family member to be present if appropriate.

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1332.

- F. Psychosocial preparation
1. Be alert to the client's level of anxiety.
 2. Answer any questions or concerns that the client may have regarding surgery.
 3. Allow time for privacy for the client to prepare psychologically for surgery.
 4. Provide support and assistance as needed.
 5. Take cultural and spiritual aspects into consideration when providing care (Box 15.2).
- G. Preoperative checklist
1. Ensure that the client is wearing an identification bracelet.
 2. Assess for allergies, including an allergy to latex (see Chapter 63 for information on latex allergy).
 3. Review the preoperative checklist to be sure that each item is addressed before the client is transported to surgery.
 4. Follow agency policies regarding preoperative procedures, including informed consents, preoperative checklists, prescribed laboratory or radiological tests, and any other preoperative procedure.
 5. Ensure that informed consent forms have been signed for the operative procedure, any blood transfusions, disposal of a limb, or surgical sterilization procedures.

6. Ensure that a history and physical examination have been completed and documented in the client's record (Box 15.3).
7. Ensure that consultation requests have been completed and documented in the client's record.
8. Ensure that prescribed laboratory results are documented in the client's record.

BOX 15.3 Medical Problems That Increase Risk During Surgery

- Older age
- Obesity
- Bleeding disorders such as thrombocytopenia or hemophilia
- Diabetes mellitus
- Chronic pain
- Heart disease, such as a recent myocardial infarction, dysrhythmia, heart failure, or peripheral vascular disease
- Obstructive sleep apnea
- Upper respiratory infection
- Liver disease
- Fever
- Chronic respiratory disease, such as emphysema, bronchitis, or asthma
- Immunological disorders, such as leukemia, infection with human immunodeficiency virus, acquired immunodeficiency syndrome, bone marrow depression, or use of chemotherapy or immunosuppressive agents
- Abuse of recreational drugs
- Smoking

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1329.

9. Ensure that electrocardiogram and chest radiography reports are documented in the client's record.
 10. Ensure that a blood type, screen, and cross-match are performed and documented in the client's record within the established time frame per agency policy.
 11. Remove jewelry, makeup, dentures, hairpins, nail polish (depending on agency procedures), glasses, and prostheses.
 12. Document that valuables have been given to the client's family members or locked in the hospital safe.
 13. Document the last time that the client ate or drank.
 14. Document that the client voided before surgery.
 15. Document that the prescribed preoperative medications were given (**Box 15.4**).
 16. Monitor and document the client's vital signs.
- H. Preoperative medications
1. Prepare to administer preoperative medications as prescribed before surgery.
 2. Instruct the client about the desired effects of the preoperative medication.

BOX 15.4 Substances That Can Affect the Client in Surgery**Antibiotics**

Antibiotics potentiate the action of anesthetic agents.

Anticholinergics

Medications with anticholinergic effects increase the potential for confusion, tachycardia, and intestinal hypomotility and hypomotility.

Anticoagulants, Antiplatelets, and Thrombolytics

These medications alter normal clotting factors and increase the risk of hemorrhaging.

Acetylsalicylic acid (aspirin), clopidogrel, and nonsteroidal antiinflammatory drugs are commonly used medications that can alter platelet aggregation.

These medications would be discontinued at least 48 hours before surgery or as specified by the surgeon; clopidogrel usually has to be discontinued 5 days before surgery.

Anticonvulsants

Long-term use of certain anticonvulsants can alter the metabolism of anesthetic agents.

Antidepressants

Antidepressants may lower the blood pressure during anesthesia.

Antidysrhythmics

Antidysrhythmic medications reduce cardiac contractility and impair cardiac conduction during anesthesia.

Antihypertensives

Antihypertensive medications can interact with anesthetic agents and cause bradycardia, hypotension, and impaired circulation.

Corticosteroids

Corticosteroids cause adrenal atrophy and reduce the ability of the body to withstand stress.

Before and during surgery, dosages may be increased temporarily.

Diuretics

Diuretics potentiate electrolyte imbalances after surgery.

Herbal Substances

Herbal substances can interact with anesthesia and cause a variety of adverse effects. These substances may need to be stopped at a specific time before surgery. During the preoperative period, the client needs to be asked whether they are taking an herbal substance.

Insulin

The need for insulin after surgery in a diabetic may be reduced because the client's nutritional intake is decreased, or the need for insulin may be increased because of the stress response and intravenous administration of glucose solutions.

Note: Some medications may be on hold until after surgery.

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1330.

 After administering the preoperative medications, keep the client in bed with the side rails up and in low position (per agency policy). Place the call bell next to the client; instruct the client not to get out of bed and to call for assistance if needed.

I. Arrival in the Operating Room

1. Guidelines to prevent wrong site and wrong procedure surgery
 - a. The surgeon meets with the client in the preoperative area and uses a surgical marking pen to mark the operative site.
 - b. In the operating room, the nurse and surgeon ensure and reconfirm that the operative site has been appropriately marked.
 - c. Just before starting the surgical procedure, a time-out is conducted with all members of the operative team present to identify the correct client and appropriate surgical site again.
2. When the client arrives in the operating room, the operating room nurse will verify the identification bracelet with the client's verbal response and will review the client's chart.
3. The client's record will be checked for completeness and reviewed for informed consent forms, history and physical examination, and allergic reaction information.
4. The surgeon's prescriptions will be verified and implemented.
5. The IV line may be initiated at this time (or in the preoperative area), if prescribed.
6. The anesthesia team will administer the prescribed anesthesia.

 Verification of the client and the surgical operative site is critical.

II. Postoperative Care

A. Description

1. Postoperative care is the management of a client after surgery and includes care given during the immediate postoperative period as well as during the days after surgery.
2. The goal of postoperative care is to prevent complications, to promote healing of the surgical incision, and to return the client to a healthy state.

B. Respiratory system

 Assess breath sounds; stridor, wheezing, or a crowing sound can indicate partial obstruction, bronchospasm, or laryngospasm, while crackles or rhonchi may indicate atelectasis, pneumonia, or pulmonary edema.

1. Monitor airway patency and ensure adequate ventilation (prolonged mechanical ventilation during anesthesia may affect postoperative lung function).
 2. Monitor vital signs per agency policy. Older clients, those who smoke, and those with a history of lung disease or obesity are at greater risk for respiratory complications after surgery and should be assessed more frequently.
 3. Remember that extubated clients who are lethargic may not be able to maintain an airway.
 4. Monitor for secretions; if the client is unable to clear the airway by coughing, suction the secretions from the client's airway.
 5. Observe chest movement for symmetry and the use of accessory muscles.
 6. Monitor oxygen administration if prescribed.
 7. Monitor pulse oximetry and end-tidal carbon dioxide (CO₂) as prescribed.
 8. Encourage deep-breathing and coughing exercises as soon as possible after surgery.
 9. Note the rate, depth, and quality of respirations; the respiratory rate would be greater than 10 and less than 30 breaths per minute.
 10. Monitor for signs of respiratory distress, atelectasis, or other respiratory complications.
 11. If the client's oxygen saturation drops below 95% (or below the presurgical baseline), immediately take action by notifying the surgeon or anesthesia provider. If the client's condition continues to deteriorate or other symptoms arise, an emergency response is imperative.
- #### C. Cardiovascular system
1. Monitor circulatory status, such as skin color, peripheral pulses, and capillary refill, and for the absence of edema, numbness, and tingling.
 2. Monitor for bleeding.
 3. Assess the pulse for rate and rhythm (a bounding pulse may indicate hypertension, fluid overload, or client anxiety).
 4. Monitor for signs of hypertension and hypotension.
 5. Monitor for cardiac dysrhythmias.
 6. Monitor for signs of thrombophlebitis, particularly in clients who were in the lithotomy position during surgery.
 7. Encourage the use of antiembolism stockings or sequential compression devices (Fig. 15.3), if prescribed, to promote venous return, strengthen muscle tone, and prevent pooling of blood in the extremities.
 8. Monitor all clients for VTE risk, and ensure that prophylactic measures are in place; these measures may include antiembolism stockings, pneumatic compression devices, leg exercises, early mobility, and drug therapy.

D. Musculoskeletal system

1. Assess the client for movement of the extremities.
2. Review the surgeon's prescriptions regarding client positioning or restrictions.
3. Encourage ambulation if prescribed; before ambulation, instruct the client to sit at the edge of the bed with the feet supported to assume balance.
4. Unless contraindicated, place the client in a low-Fowler's position after surgery to increase the size of the thorax for lung expansion.
5. Avoid positioning the postoperative client in a **supine** position until pharyngeal reflexes have returned; if the client is comatose or semicomatose, position on the side (in addition, an oral airway may be needed).
6. If the client is unable to get out of bed, turn the client every 1 to 2 hours unless contraindicated.

E. Neurological system

1. Assess level of consciousness.
2. Assess neurological status, and compare it to the client's presurgical status.
3. Make frequent attempts to awaken the client until the client fully awakens.
4. Orient the client to the environment.
5. An older adult may take longer than a younger adult to return to presurgical orientation.
6. Speak in a soft tone; filter out extraneous noises in the environment.
7. Maintain the client's body temperature and prevent heat loss by providing the client with warm blankets and raising the room temperature as necessary.
8. Evaluate motor function by asking the client to move each extremity.
9. Assess the client's sensation to touch.

F. Temperature control

1. Monitor temperature.
2. Older adults are at risk for hypothermia because of age-related changes.
3. Monitor for signs of hypothermia that may result from anesthesia, a cool operating room, or exposure of the skin and internal organs during surgery.
4. Apply warm blankets, continue oxygen, and administer medication as prescribed if the client experiences postoperative shivering.

G. Integumentary system

1. Assess the surgical site, drains, and wound dressings (serous drainage may occur from an incision, but notify the surgeon if excessive bleeding occurs from the site). Mark time and date for any drainage on surgical dressings, and monitor for excessive drainage per agency policy.
2. Assess the skin for redness, abrasions, or breakdown that may have resulted from surgical positioning.

3. Monitor body temperature and wound for signs of infection.
4. Check for drainage, and record amount, color, consistency, and odor.
5. Assess tissue integrity frequently per agency protocol for redness, increased swelling, tenderness, or pain.
6. Maintain a dry, intact dressing (sterile or clean).
 - a. Sterile technique means that everything used in the care of the client is free from microorganisms.
 - b. Clean technique involves meticulous hand-washing, maintaining a clean environment by preparing a clean field, using clean gloves and sterile instruments, and preventing contamination of materials and supplies.
7. Change dressings as prescribed, noting the amount of bleeding or drainage, odor, and intactness of sutures or staples; commonly used dressings include 4 × 4-inch gauze, nonadherent pads, abdominal pads, gauze rolls, and split gauze (commonly referred to as *drain sponges*).
8. Wound drains need to be patent; prepare to assist with the removal of drains (as prescribed by the surgeon) when the drainage amount becomes insignificant. Empty drains as needed, and document the output and drainage characteristics.
9. An abdominal binder may be prescribed for obese and debilitated individuals to prevent dehiscence of the incision.

H. Fluid and electrolyte balance

1. Monitor hydration status by inspecting the color and moisture of mucous membranes, skin turgor, skin texture, and tenting of the skin (in an older client, tenting is tested over the sternum or forehead).
2. Monitor IV fluid administration as prescribed.
3. Record intake and output.
4. Monitor for signs of fluid or electrolyte imbalances.

I. Gastrointestinal system

1. Monitor intake and output and for nausea and vomiting.
2. Maintain patency of the nasogastric tube if present, and monitor placement and drainage per agency procedure.
3. Monitor for abdominal distention.
4. Monitor for passage of flatus and return of bowel sounds.
5. Encourage ambulation as early as possible after surgery to promote peristalsis.
6. Administer frequent oral care, at least every 2 hours.
7. Maintain the NPO status until the gag reflex and peristalsis return.
8. When oral fluids are permitted, start with ice chips and water.

9. Ensure that the client advances to clear liquids and then to a regular diet, as prescribed and as the client can tolerate.
10. To prevent aspiration, turn the client to a side-lying position if vomiting occurs; have suctioning equipment available and ready to use.

 After gastric surgery do not move or irrigate the nasogastric tube unless ordered.

J. Renal system

1. Assess the bladder for distention.
2. Monitor urine output (urinary output needs to be at least 30 mL/hr).
3. If the client does not have a urinary catheter, the client is expected to void within 6 to 8 hours postoperatively, depending on the type of anesthesia administered; ensure that the amount is at least 200 mL.

K. Pain management

1. Assess the type of anesthetic used and preoperative medication that the client received, and note whether the client received any pain medications in the postanesthesia period. For the older adult, dosages may need to be adjusted.
2. Assess for pain, and inquire about the type and location of pain; ask the client to rate the degree of pain on a scale of 1 to 10, with 10 being the most severe.
3. If the client is unable to rate the pain using a numerical pain scale, use a descriptor scale that lists words that describe different levels of pain intensity, such as *no pain*, *mild pain*, *moderate pain*, and *severe pain*, or other available pain rating scales.
4. Monitor for objective data related to pain, such as facial expressions, body gestures, increased pulse rate, increased blood pressure, and increased respirations, restlessness, profuse sweating, confusion, and moaning and crying.
5. Inquire about the effectiveness of the last pain medication.
6. Assess respiratory rate, blood pressure, heart rate, oxygen saturation, and level of consciousness (LOC), and note if or when last medication was given prior to administering pain medication. Administer pain medication as prescribed.
7. Ensure that the client with a patient-controlled analgesia (PCA) pump understands how to use it.
8. If an opioid has been prescribed, after administration, assess the client every 30 minutes for respiratory rate and pain relief.
9. Use noninvasive measures to relieve postoperative pain, including provision of distraction, relaxation techniques, guided imagery, comfort

measures, positioning, backrubs, heat or cold therapy, and a quiet and restful environment.

10. Document the effectiveness of the pain medication and noninvasive pain-relief measures.

 Consider cultural and spiritual practices and beliefs when planning pain management.

III. Pneumonia and Atelectasis

A. Description (Box 15.5 and Fig. 15.4)

1. Pneumonia: An inflammation of the alveoli caused by an infectious process that may develop 3 to 5 days postoperatively as a result of infection, aspiration, or immobility
2. Atelectasis: A collapsed or airless state of the lung that may be the result of airway obstruction caused by accumulated secretions or failure of the client to deep-breathe or ambulate after surgery; a postoperative complication that usually occurs 1 to 2 days after surgery. Incentive spirometry and other postoperative exercises help to prevent this complication.

B. Assessment

1. Dyspnea and increased respiratory rate
2. Crackles over involved lung area
3. Elevated temperature
4. Productive cough and chest pain

C. Interventions

1. Assess lung sounds.
2. Reposition the client every 1 to 2 hours.
3. Encourage the client to deep-breathe, cough, and use the incentive spirometer as prescribed.
4. Provide chest physiotherapy and postural drainage as prescribed.
5. Encourage fluid intake and early ambulation.

BOX 15.5 Postoperative Complications

- Pneumonia and atelectasis
- Hypoxemia
- Pulmonary embolism
- Hemorrhage
- Deconditioning
- Shock
- Malignant hyperthermia
- Intractable pain
- Thrombophlebitis
- Urinary retention
- Urinary tract infection
- Constipation
- Paralytic ileus
- Skin breakdown
- Acute kidney injury
- Wound infection
- Wound dehiscence
- Wound evisceration
- Sepsis

FIG. 15.4 Postoperative atelectasis. A, Normal bronchiole and alveoli. B, Mucous plug in bronchiole. C, Collapse of alveoli caused by atelectasis following absorption of air.

6. Use suction to clear secretions if the client is unable to cough.
7. Encourage use of incentive spirometry.

M. Hypoxemia

A. Description: An inadequate concentration of oxygen in arterial blood; in the postoperative client, hypoxemia can be due to shallow breathing from the effects of anesthesia or medications.

B. Assessment

1. Restlessness
2. Dyspnea
3. Diaphoresis
4. Tachycardia
5. Hypertension
6. Cyanosis
7. Low pulse oximetry readings

C. Interventions

1. Monitor for signs of hypoxemia.
2. Notify the surgeon.
3. Monitor lung sounds and pulse oximetry.
4. Administer oxygen as prescribed.
5. Encourage deep breathing and coughing and use of the incentive spirometer.
6. Turn and reposition the client frequently; encourage ambulation.

V. Pulmonary Embolism

A. Description: An embolus blocking the pulmonary artery and disrupting blood flow to one or more lobes of the lung

B. Assessment

1. Sudden dyspnea
2. Sudden sharp chest or upper abdominal pain
3. Cyanosis

4. Tachycardia
5. A drop in blood pressure

C. Interventions

1. Notify the surgeon immediately, because pulmonary embolism may be life-threatening and requires emergency action.
2. Monitor vital signs.
3. Administer oxygen, medications, and treatments as prescribed.

VI. Hemorrhage

A. Description: The loss of a large amount of blood externally or internally in a short time period

B. Assessment

1. Restlessness
2. Weak and rapid pulse
3. Hypotension
4. Tachypnea
5. Cool, clammy skin
6. Reduced urine output

C. Interventions

1. Provide pressure to the site of bleeding.
2. Notify the surgeon.
3. Administer oxygen as prescribed.
4. Administer IV fluids and blood as prescribed.
5. Prepare the client for a surgical procedure if necessary.

VII. Shock

A. Description: Loss of circulatory fluid volume, which usually is caused by hemorrhage

B. Assessment: Similar to assessment findings in hemorrhage

C. Interventions

1. If shock develops, elevate the legs.
2. Notify the surgeon.
3. Determine and treat the cause of shock.
4. Administer oxygen as prescribed.
5. Monitor level of consciousness.
6. Monitor vital signs for increased pulse or decreased blood pressure.
7. Monitor intake and output.
8. Assess color, temperature, turgor, and moisture of the skin and mucous membranes.
9. Administer IV fluids, blood, and colloid solutions as prescribed.

⚠ If the client had spinal anesthesia, do not elevate the legs any higher than placing them on the pillow; otherwise, the diaphragm muscles needed for effective breathing could be impaired.

VIII. Thrombophlebitis

A. Description

1. Thrombophlebitis is an inflammation of a vein, often accompanied by clot formation.
2. Veins in the legs are affected most commonly.

 B. Assessment

1. Vein inflammation
2. Aching or cramping pain
3. Vein feels hard and cordlike and is tender to touch.
4. Elevated temperature

 C. Interventions

1. Monitor legs for swelling, inflammation, pain, tenderness, venous distention, and cyanosis; notify the surgeon if any of these signs are present.
2. Elevate the extremity 30 degrees without allowing any pressure on the popliteal area.
3. Encourage the use of antiembolism stockings as prescribed; remove stockings twice a day to wash and inspect the legs.
4. Use a sequential compression device as prescribed (see Fig. 15.3).
5. Perform passive range-of-motion exercises every 2 hours if the client is confined to bed rest.
6. Encourage early ambulation, as prescribed.
7. Do not allow the client to dangle the legs.
8. Instruct the client not to sit in one position for an extended period of time.
9. Ultrasound may be ordered.
10. Administer anticoagulants such as heparin sodium or enoxaparin as prescribed.

IX. Urinary Retention

A. Description

1. Urinary retention is an involuntary accumulation of urine in the bladder as a result of loss of muscle tone.
2. It is caused by the effects of anesthetics or opioid analgesics and appears 6 to 8 hours after surgery.

 B. Assessment

1. Inability to void
2. Restlessness and diaphoresis
3. Lower abdominal pain
4. Distended bladder
5. Hypertension
6. On percussion, the bladder sounds like a drum.

 C. Interventions

1. Monitor for voiding.
2. Assess for a distended bladder by palpation and bladder scanning if indicated.
3. Encourage ambulation when prescribed.
4. Encourage fluid intake unless contraindicated.
5. Assist the client to void by helping the client stand or ensuring proper positioning for voiding.
6. Provide privacy.
7. Pour warm water over the perineum, or allow the client to hear running water to promote voiding.
8. Contact the surgeon and catheterize the client as prescribed after all noninvasive techniques have been attempted.

X. Constipation

A. Description

1. Constipation is an abnormally infrequent passage of stool, which may result from anesthesia, opioid analgesia, decreased activity, and decreased oral intake.
2. When the client resumes a solid diet postoperatively, failure to pass stool within 48 hours may indicate constipation.

B. Assessment

1. Bowel sounds
2. Absence of bowel movements
3. Abdominal distention
4. Anorexia, headache, and nausea

C. Interventions

1. Encourage fluid intake up to 3000 mL/day unless contraindicated.
2. Encourage early ambulation.
3. Encourage consumption of fiber foods unless contraindicated.
4. Provide privacy and adequate time for bowel elimination.
5. Administer stool softeners and laxatives as prescribed.

XI. Paralytic Ileus

A. Description

1. Paralytic ileus is failure of appropriate forward movement of bowel contents.
2. The condition may occur as a result of anesthetic medications or of manipulation of the bowel during the surgical procedure.

B. Assessment

1. Vomiting postoperatively
2. Abdominal distention
3. Absence of bowel sounds, bowel movement, or flatus

C. Interventions

1. Monitor intake and output.
2. Maintain NPO status until bowel sounds return.
3. Maintain patency of a nasogastric tube if in place; assess patency and drainage per agency procedure.
4. Encourage ambulation.
5. Administer IV fluids or parenteral nutrition as prescribed.
6. Administer medications as prescribed to increase gastrointestinal motility and secretions.
7. If ileus occurs, it is treated first nonsurgically with bowel decompression by insertion of a nasogastric tube attached to intermittent or constant suction.

 Postoperative vomiting, abdominal distention, and absence of bowel sounds may be signs of paralytic ileus.

XII. Wound Infection

A. Description

1. Wound infection may be caused by poor aseptic technique or a contaminated wound before surgical exploration; existing client conditions such as **diabetes mellitus** or immunocompromise may place the client at risk.
2. Infection usually occurs 3 to 6 days after surgery.
3. Purulent material may exit from the drains or separated wound edges.

B. Assessment

1. Fever and chills
2. Warm, tender, painful, and inflamed incision site
3. Edematous skin at the incision and tight skin sutures
4. Elevated white blood cell count

C. Interventions

1. Monitor temperature.
2. Monitor incision site for approximation of suture line, edema, or bleeding and for signs of infection

(*REEDA*: redness, erythema, ecchymosis, drainage, approximation of the wound edges); notify the surgeon if signs of wound infection are present.

3. Maintain patency of drains, and assess drainage amount, color, consistency, and odor.
4. Maintain asepsis, change the dressing, and perform wound irrigation if prescribed (**Box 15.6**).
5. Anticipate prescriptions for wound culture and blood culture if infection is suspected.
6. Administer antibiotics as prescribed.

XIII. Wound Dehiscence and Evisceration (Fig. 15.1)

A. Description

1. Wound dehiscence is separation of the wound edges at the suture line; it usually occurs 5 to 10 days after surgery.
2. Wound evisceration is protrusion of the internal organs through an incision; it usually occurs 5 to 10 days after surgery.

BOX 15.6 Procedure for Sterile Dressing Change and Wound Irrigation^a

- Verify the prescription for the procedure in the medical record.
- Anticipate supplies that will be needed and gather supplies, including personal protective equipment (PPE) and additional equipment needed for protection (i.e., gown, face shield, clean and sterile gloves), a sterile dressing change kit if available, and any anticipated additional supplies such as gauze, drain sponges, cotton-tipped applicators, tape, an abdominal pad, a measuring tool, syringe for irrigation, irrigation basin, extra pair of sterile gloves, and underpad.
- Introduce self to client, identify the client with two accepted identifiers and compare against the medical record, provide privacy, and explain the procedure.
- Assess the client's pain level using an appropriate pain scale, and medicate as necessary.
- Assess the client for allergies, particularly to tape or latex.
- Perform hand hygiene and don PPE.
- Position the client appropriately, apply clean gloves, and place the underpad underneath the client.
- Remove the soiled dressing, assess and characterize drainage noted on the dressing, and discard the removed dressing in the biohazard waste. Note: If a moist-to-dry dressing adheres to the wound, gently free the dressing and warn the client of the discomfort; if a dry dressing adheres to the wound that is not to be debrided, moisten the dressing with normal saline and remove.
- Assess the wound and periwound for size (length, width, depth; measure using measuring tool), appearance, color, drainage, edema, approximation, granulation tissue, presence and condition of drains, and odor; and palpate edges for tenderness or pain.
- Cover the wound with sterile gauze by opening a sterile gauze pack and lightly placing the gauze on the wound without touching the dressing material; remove gloves and perform hand hygiene.
- Set up the sterile field: Prepare sterile equipment using sterile technique on an overbed table. If irrigation is prescribed, pour any prescribed irrigation solution into a sterile basin and draw solution into the irrigating syringe. Gently irrigate the wound with the prescribed solution from the least contaminated area to the most contaminated area. Use an approved irrigation basin to collect solution from the irrigating procedure.
- Cleanse the wound with sterile gauze from the least contaminated area to the most contaminated area, using single-stroke motions. Discard the gauze from each stroke and use a new one for the next stroke. If drains are present, use cotton-tipped applicators to hold drains up, and clean around drain sites using circular strokes, starting near the drain and moving outward from the insertion site using cotton-tipped applicators or sterile gauze. Dry sites in the same manner using sterile gauze.
- Apply any prescribed wound antiseptic with a cotton-tipped applicator or sterile gauze, using the same technique as when cleansing the wound.
- Dress the wound with the prescribed dressings using sterile technique, and secure in place.
- Date/time/initial the dressing, and discard supplies as indicated per agency procedures. Remove gloves.
- Assist the client to a comfortable position and ensure safety; assess pain level.
- Document the procedure, any related assessments, client response, and any additional procedural responses.

^a Note: Adapt procedure if irrigation is not prescribed or if the client does not have drains or tubes in place. Always follow agency procedures for dressing changes and wound irrigations.

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 1290-1292.

FIG. 15.5 Complications of wound healing.

3. Dehiscence and evisceration are most common among obese clients, clients who have had abdominal surgery, or those who have poor wound-healing ability.

4. Wound evisceration is an emergency.

B. Assessment: Dehiscence

1. Increased drainage
2. Opened wound edges
3. Appearance of underlying tissues through the wound

C. Assessment: Evisceration

1. Discharge of serosanguineous fluid from a previously dry wound
2. The appearance of loops of bowel or other abdominal contents through the wound
3. Client reports feeling a popping sensation after coughing or turning.

D. Interventions (see Clinical Judgment: Take Action)

⚡ CLINICAL JUDGMENT: TAKE ACTION

A client who had a right colectomy calls the nurse and reports a popping feeling in the incisional area. The nurse removes the abdominal dressing to assess the wound and notes that the incision line has opened and a loop of bowel is protruding from the wound. The nurse takes action and implements the following interventions:

- Calls for help; asks that the surgeon be notified and that needed supplies be brought to the client's room.
- Stays with the client.
- Places the client in a low-Fowler's position with the knees bent.
- Covers the wound with a sterile normal saline dressing and keeps the dressing moist.
- Takes vital signs and monitors the client closely for signs of shock.
- Prepares the client for surgery as necessary.
- Documents the occurrence, actions taken, and the client's response.

BOX 15.7 Postoperative Discharge Teaching

- Assess the client's readiness to learn, educational level, and desire to change or modify lifestyle. Use the teach-back method to ensure client understanding.
- Assess the need for resources needed for home care.
- Demonstrate care of the incision and how to change the dressing.
- Instruct the client to cover the incision with plastic if showering is allowed.
- Ensure that the client is provided with a 48-hour supply of dressings, per agency procedure, for home use.
- Instruct the client on the importance of returning to the surgeon's office for follow-up.
- Instruct the client that sutures usually are removed in the surgeon's office 7 to 14 days after surgery.
- Inform the client that staples are removed 7 to 14 days after surgery and that the skin may become slightly reddened when staples are ready to be removed.
- Sterile adhesive strips (e.g., Steri-Strips®) may be applied to provide extra support after the sutures are removed.
- Instruct the client on the use of medications, their purpose, dosages, administration, and side effects or adverse effects.
- Instruct the client on diet and to drink 6 to 8 glasses of liquid a day unless contraindicated.
- Instruct the client about activity levels and to resume normal activities gradually.
- Instruct the client to avoid lifting for 6 weeks if a major surgical procedure was performed.
- Instruct the client with an abdominal incision not to lift anything weighing 10 pounds or more and not to engage in any activities that involve pushing or pulling.
- The client usually can return to work in 6 to 8 weeks, depending on the procedure and as prescribed by the surgeon.
- Instruct the client about the signs and symptoms of complications and when to call the surgeon.

XIV. Ambulatory Care or <-Day-Stay Surgical Units

A. General criteria for client discharge

1. Is alert and oriented
2. Vital signs are at baseline.
3. Laboratory values (if prescribed) are within normal limits.
4. Has voided
5. Has no respiratory distress
6. Is able to ambulate, swallow, and cough
7. Has minimal pain.
8. Is not vomiting
9. Has minimal, if any, bleeding from the incision site with absence of purulent drainage
10. Has a responsible adult available to drive the client home
11. Discharge is appropriate and safe for client (i.e., to home or facility).
12. The surgeon has signed a release form.

B. Discharge teaching (Box 15.7)

1. Discharge teaching needs to be performed before the date of the scheduled procedure.

2. Provide written instructions to the client and family regarding the specifics of care.
 3. Instruct the client and family about postoperative complications that can occur.
 4. Provide appropriate resources for home care support.
 5. Instruct the client not to drive, make important decisions, or sign any legal documents for 24 hours after receiving general anesthesia.
 6. Instruct client on safety in the home, and determine which assistive devices may be needed.
 7. Instruct client on a nutritional plan or dietary modifications that work with the need to promote the healing process. A diet high in protein, calories, and vitamins promotes wound healing.
 8. Instruct the client to call the surgeon, ambulatory center, or emergency department if postoperative problems occur.
 9. Instruct the client to keep follow-up appointments with the surgeon.
4. Report immediately any slight increase in blood pressure or pulse.
 4. A client with a gastric ulcer is scheduled for surgery. The client cannot sign the operative consent form because of sedation from opioid analgesics that have been administered. The nurse would take which most appropriate action in the care of this client?
 1. Obtain a court order for the surgery.
 2. Have the charge nurse sign the informed consent immediately.
 3. Send the client to surgery without the consent form being signed.
 4. Obtain a telephone consent from a family member, following agency policy.
 5. A preoperative client expresses anxiety to the nurse about upcoming surgery. Which response by the nurse is most likely to stimulate further discussion between the client and the nurse?
 1. "If it's any help, everyone is nervous before surgery."
 2. "I will be happy to explain the entire surgical procedure to you."
 3. "Can you share with me what you've been told about your surgery?"
 4. "Let me tell you about the care you'll receive after surgery and the amount of pain you can anticipate."

PRACTICE QUESTIONS

1. The nurse has just reassessed the condition of a postoperative client who was admitted 1 hour ago to the surgical unit. The nurse plans to monitor which parameter most carefully during the next hour?
 1. Urinary output of 20 mL/hr
 2. Temperature of 37.6° C (99.6° F)
 3. Blood pressure of 100/70 mm Hg
 4. Serous drainage on the surgical dressing
2. The nurse is teaching a client about coughing and deep-breathing techniques to prevent postoperative complications. Which statement is most appropriate for the nurse to make to the client at this time as it relates to these techniques?
 1. "Use of an incentive spirometer will help prevent pneumonia."
 2. "Close monitoring of your oxygen saturation will detect hypoxemia."
 3. "Administration of intravenous fluids will prevent or treat fluid imbalance."
 4. "Early ambulation and administration of blood thinners will prevent pulmonary embolism."
3. The nurse is creating a plan of care for a client scheduled for surgery. The nurse would include which activity in the nursing care plan for the client on the day of surgery?
 1. Avoid oral hygiene and rinsing with mouthwash.
 2. Verify that the client has not eaten for the last 24 hours.
 3. Have the client void immediately before going into surgery.
 4. The nurse is conducting preoperative teaching with a client about the use of an incentive spirometer. The nurse needs to include which piece of information in discussions with the client?
 1. Inhale as rapidly as possible.
 2. Keep a loose seal between the lips and the mouthpiece.
 3. After maximum inspiration, hold the breath for 15 seconds and exhale.
 4. The best results are achieved when sitting up or with the head of the bed elevated 45 to 90 degrees.
7. The nurse has conducted preoperative teaching for a client scheduled for surgery in 1 week. The client has a history of arthritis and has been taking acetylsalicylic acid. The nurse determines that the client needs additional teaching if the client makes which statement?
 1. "Aspirin can cause bleeding after surgery."
 2. "Aspirin can cause my ability to clot blood to be abnormal."
 3. "I need to continue to take the aspirin until the day of surgery."
 4. "I need to check with my doctor about the need to stop the aspirin before the scheduled surgery."

8. The nurse assesses a client's surgical incision for signs of infection. Which finding by the nurse would be interpreted as a normal finding at the surgical site?
 1. Hard reddened skin
 2. Serous drainage
 3. Purulent drainage
 4. Warm, tender skin
9. The nurse is monitoring the status of a postoperative client in the immediate postoperative period. The nurse would become most concerned with which sign that could indicate an evolving complication?
 1. Increasing restlessness
 2. A pulse of 86 beats per minute
 3. Blood pressure of 110/70 mm Hg
 4. Hypoactive bowel sounds in all four quadrants
10. A client who has had abdominal surgery complains of feeling as though "something gave way" in the incisional site. The nurse removes the dressing and notes the presence of a loop of bowel protruding through the incision. Which interventions would the nurse take? Select all that apply.
 1. Contact the surgeon.
 2. Instruct the client to remain quiet.
 3. Prepare the client for wound closure.
 4. Document the findings and actions taken.
 5. Place a sterile saline dressing and ice packs over the wound.
 6. Place the client in a supine position without a pillow under the head.
11. A client who has undergone preadmission testing has had blood drawn for serum laboratory studies, including a complete blood count, coagulation studies, and electrolytes and creatinine levels. Which laboratory result would be reported to the surgeon's office by the nurse, knowing that it could cause surgery to be postponed?
 1. Hemoglobin, 8.0 g/dL (80 mmol/L)
 2. Sodium, 145 mEq/L (145 mmol/L)
 3. Serum creatinine, 0.8 mg/dL (70.6 mcmol/L)
 4. Platelets, 210,000 cells/mm³ (210 × 10⁹/L)
12. The nurse receives a telephone call from the postanesthesia care unit, stating that a client is being transferred to the surgical unit. The nurse plans to take which action first on arrival of the client?
 1. Assess the patency of the airway.
 2. Check tubes or drains for patency.
 3. Check the dressing to assess for bleeding.
 4. Assess the vital signs to compare with preoperative measurements.
13. The nurse is reviewing a surgeon's prescription sheet for a preoperative client that states that the client must be nothing by mouth (NPO) after midnight. The nurse needs to call the surgeon to clarify that which medication would be given to the client and not withheld?
 1. Prednisone
 2. Ferrous sulfate
 3. Cyclobenzaprine
 4. Conjugated estrogen

ANSWERS

1. Answer: 1

Rationale: Urine output would be maintained at a minimum of 30 mL/hr for an adult. An output of less than 30 mL for 2 consecutive hours needs to be reported to the surgeon. A temperature higher than 37.7° C (100° F) or lower than 36.1° C (97° F) and a falling systolic blood pressure, lower than 90 mm Hg, are usually considered reportable immediately. The client's preoperative or baseline blood pressure is used to make informed postoperative comparisons. Moderate or light serous drainage from the surgical site is considered normal.

Test-Taking Strategy: Note the **strategic word**, *most*. Focus on the **subject**, expected postoperative assessment findings. To answer this question correctly, you must know the normal ranges for temperature, blood pressure, urinary output, and wound drainage. Note that the urinary output is the only observation that is not within the normal range.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 175-176.

2. Answer: 1

Rationale: Postoperative respiratory problems are atelectasis, pneumonia, and pulmonary emboli. Pneumonia is the inflammation of lung tissue that causes productive cough, dyspnea, and lung crackles and can be caused by retained pulmonary secretions. Use of an incentive spirometer helps prevent pneumonia and atelectasis. Hypoxemia is an inadequate concentration of oxygen in arterial blood. While close monitoring of the oxygen saturation will help detect hypoxemia, monitoring is not directly related to coughing and deep-breathing techniques. Fluid imbalance can be a deficit or excess related to fluid loss or overload, and surgical clients are often given intravenous fluids to prevent a deficit; however, this is not related to coughing and deep breathing. Pulmonary embolus occurs as a result of a blockage of the pulmonary artery that disrupts blood flow to one or more lobes of the lung; this is usually due to clot formation. Early ambulation and administration of blood thinners help prevent this complication; however, it is not related to coughing and deep-breathing techniques.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the **subject**, client instructions related to coughing

and deep-breathing techniques. Also, focus on the **data in the question** and note the relationship between the words *coughing* and *deep-breathing* in the question and *pneumonia* in the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 166-167.

3. Answer: 3

Rationale: The nurse would assist the client to void immediately before surgery so that the bladder will be empty. Oral hygiene is allowed, but the client would not swallow any water. The client usually has a restriction of food and fluids for 6 to 8 hours (or longer as prescribed) before surgery instead of 24 hours. A slight increase in blood pressure and pulse is common during the preoperative period and is usually the result of anxiety.

Test-Taking Strategy: Focus on the **subject**, preoperative care measures. Think about the measures that may be helpful and promote comfort. Oral hygiene needs to be administered, since it may make the client feel more comfortable. A client would have nothing by mouth (NPO) for 6 to 8 hours before surgery rather than 24 hours. A slight increase in blood pressure or pulse is insignificant in this situation.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 169.

4. Answer: 4

Rationale: Every effort would be made to obtain permission from a responsible family member to perform surgery if the client is unable to sign the consent form. A telephone consent must be witnessed by two persons who hear the family member's oral consent. The two witnesses then sign the consent with the name of the family member, noting that an oral consent was obtained. Consent is not informed if it is obtained from a client who is confused, unconscious, mentally incompetent, or under the influence of sedatives. In an emergency, a client may be unable to sign and family members may be unavailable. In this situation, a surgeon is permitted legally to perform surgery without consent, but the data in the question do not indicate an emergency. Options 1, 2, and 3 are inappropriate in this situation. Also, agency policies regarding informed consent would always be followed.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the **data in the question**. Eliminate options 1 and 3 first. Option 1 will delay necessary surgery, and option 3 is inappropriate. Option 2 is not an acceptable and legal role of a charge nurse. Select option 4, since it is the only legally acceptable option: to obtain a telephone permission from a family member if it is witnessed by two persons.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 312-313.

5. Answer: 3

Rationale: Explanations would begin with the information that the client knows. By providing the client with individualized explanations of care and procedures, the nurse can assist the client in handling anxiety and fear for a smooth preoperative experience. Clients who are calm and emotionally pre-

pared for surgery withstand anesthesia better and experience fewer postoperative complications. Option 1 does not focus on the client's anxiety. Explaining the entire surgical procedure may increase the client's anxiety. Option 4 avoids the client's anxiety and is focused on postoperative care.

Test-Taking Strategy: Note that the client expresses anxiety. Use **therapeutic communication techniques**. Note the **strategic words**, *most likely*, and also note the words *stimulate further discussion*. Also use the **steps of the nursing process**. The correct option addresses assessment and is the only therapeutic response.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 168-169.

6. Answer: 4

Rationale: For optimal lung expansion with the incentive spirometer, the client would assume the semi-Fowler's or high-Fowler's position. The mouthpiece needs to be covered completely and tightly while the client inhales slowly, with a constant flow through the unit. The breath would be held for 5 seconds before exhaling slowly.

Test-Taking Strategy: Focus on the **subject**, correct use of an incentive spirometer, and visualize the procedure. Note the words *rapidly*, *loose*, and *15 seconds* in the incorrect options. Options 1, 2, and 3 are incorrect steps regarding incentive spirometer use.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 166, 168.

7. Answer: 3

Rationale: Antiplatelets alter normal clotting factors and increase the risk of bleeding after surgery. Aspirin has properties that can alter platelet aggregation and would be discontinued at least 48 hours before surgery. However, the client needs to check with the surgeon regarding when to stop taking the aspirin when a surgical procedure is scheduled. Options 1, 2, and 4 are accurate client statements.

Test-Taking Strategy: Note the **strategic words**, *needs additional teaching*. These words indicate a **negative event query** and that you need to select the incorrect client statement. Eliminate options 1 and 2 first because they are **comparable or alike**. From the remaining options, recalling that aspirin has properties that can alter platelet aggregation will direct you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 164.

8. Answer: 2

Rationale: Serous drainage is an expected finding at a surgical site. The other options indicate signs of wound infection. Signs and symptoms of infection include warm, red, and tender skin around the incision. Wound infection usually appears 3 to 6 days after surgery. The client also may have a fever and chills. Purulent material may exit from drains or from separated wound edges. Infection may be caused by poor aseptic technique or a contaminated wound before surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk.

Test-Taking Strategy: Focus on the **subject**, normal findings in the postoperative period. Eliminate options 1, 3, and 4 because they are **comparable or alike** and are manifestations of infection.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 176-177.

9. Answer: 1

Rationale: Increasing restlessness is a sign that requires continuous and close monitoring because it could indicate a potential complication such as hemorrhage, shock, or pulmonary embolism. A blood pressure of 110/70 mm Hg with a pulse of 86 beats per minute is within normal limits. Hypoactive bowel sounds heard in all four quadrants are a normal occurrence in the immediate postoperative period.

Test-Taking Strategy: Note the **strategic word**, *most*. Focus on the **subject**, a manifestation of an evolving complication in the immediate postoperative period. Eliminate each of the incorrect options because they are **comparable or alike** and are normal, expected findings, especially given the time frame noted in the question.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 331.

10. Answer: 1, 2, 3, 4

Rationale: Wound dehiscence is the separation of the wound edges. Wound evisceration is protrusion of the internal organs through an incision. If wound dehiscence or evisceration occurs, the nurse would call for help, stay with the client, ask another nurse to contact the surgeon, and obtain needed supplies to care for the client. The nurse places the client in a low-Fowler's position, and the client is kept quiet and instructed not to cough. Protruding organs are covered with a sterile saline dressing. Ice is not applied because of its vasoconstrictive effect. The treatment for evisceration is usually immediate wound closure under local or general anesthesia. The nurse also documents the findings and actions taken.

Test-Taking Strategy: Focus on the **subject**, that the client is experiencing wound evisceration. Visualizing this occurrence will assist you in determining that the client would not be placed supine and that ice packs would not be placed on the incision.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 177, 181.

11. Answer: 1

Rationale: Routine screening tests include a complete blood count, serum electrolyte analysis, coagulation studies, and a

serum creatinine test. The complete blood count includes the hemoglobin analysis. All of these values are within normal range except for hemoglobin. If a client has a low hemoglobin level, the surgery is likely to be postponed by the surgeon.

Test-Taking Strategy: Focus on the **subject**, an abnormal laboratory result that needs to be reported. Use knowledge of the normal reference intervals to assist in answering correctly. The hemoglobin value is the only abnormal laboratory finding.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 787.

12. Answer: 1

Rationale: The first action of the nurse is to assess the patency of the airway and respiratory function. If the airway is not patent, the nurse must take immediate measures for the survival of the client. The nurse then takes vital signs followed by checking the dressing and the tubes or drains. The other nursing actions would be performed after a patent airway has been established.

Test-Taking Strategy: Note the **strategic word**, *first*. Use the principles of prioritization to answer this question. Use the **ABCs—airway, breathing, and circulation**. Ensuring airway patency is the first action to be taken, directing you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 329.

13. Answer: 1

Rationale: Prednisone is a corticosteroid. With prolonged use, corticosteroids cause adrenal atrophy, which reduces the ability of the body to withstand stress. When stress is severe, corticosteroids are essential to life. Before and during surgery, dosages may be increased temporarily and may be given parenterally rather than orally. Ferrous sulfate is an oral iron preparation used to treat iron-deficiency anemia. Cyclobenzaprine is a skeletal muscle relaxant. Conjugated estrogen is an estrogen used for hormone replacement therapy in postmenopausal individuals. These last three medications may be withheld before surgery without undue effects on the client.

Test-Taking Strategy: Focus on the **subject**, the medication that would be administered in the preoperative period. Use knowledge about medications that may have special implications for the surgical client. Prednisone is a corticosteroid. Recall that when stress is severe, such as with surgery, corticosteroids are essential to life.

CHAPTER 16

Hygiene, Mobility, and Skin Integrity

Linda A. Silvestri, PhD, RN, FAAN

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS: Mobility; Skin Integrity

 When providing nursing care, factors influencing hygiene need to be considered. This may include social practices, personal preferences, body image, socioeconomic status, health beliefs, cultural variables, developmental stage, and physical condition.

I. Hygiene

A. Self-care ability

1. Assessment of self-care ability involves checking muscle strength, flexibility, balance, visual acuity, and detection of thermal and tactile stimuli.
-  2. Observing self-care during hygiene will help to determine presence of activity intolerance.
3. Clients who have limitations in mobility and strength, vision, fine motor skills, or activity intolerance will need assistance with hygiene.

 Activity intolerance may manifest by changes with respiratory rate and effort, skin color, pulse rate, or complaints of dizziness, weakness, or fatigue.

B. Bathing

1. Types of baths include complete bed bath, partial bed bath, sponge bath at the sink, tub bath, shower, bag bath or travel bath, and a chlorhexidine gluconate (CHG) bath.
2. Complete bed baths, tub baths, and showers can be exhausting for the client because oxygen consumption and demand are increased.
3. Partial bed baths are helpful for clients who are in need of only partial hygiene or are partially dependent.
4. Bath basins with soap and water are usually no longer used because the basin serves as a reservoir for bacteria and can be a possible mode of transmission for infection.

5. The use of CHG in place of standard soap and water has been shown to decrease bacterial growth in wash basins.
6. Bath basins, if used, are not to be used as a place for supply storage and need to be dried completely after use.
7. Depending on the client's health problem, infection control measures need to be implemented as appropriate; disposable items should be used if available and washcloths, towels, and linens need to be placed in appropriate receptacles after use. 

 The nurse needs to assess for any known allergies to soaps or skin care products before performing hygiene care.

8. During bathing, the nurse needs to provide privacy, maintain safety and warmth, promote independence, and anticipate client needs.
9. Perineal care involves cleansing the client's genital and anal areas.
10. Perineal care needs to be done at least once per day and as needed.
11. During perineal care, the nurse would assess for soreness, excoriation, pain, and odor, and ask about burning during urination.
12. Males who are uncircumcised, clients with indwelling urinary catheters, clients who had rectal or genital surgery, or women who are postpartum are at risk for infection.
13. Skin breakdown in the perineal area can occur and needs to be regularly assessed.
14. Clients at risk for perineal skin breakdown are those with urinary and fecal incontinence, surgical dressings in the area, indwelling urinary catheters, and obesity. 

BOX 16.1 Skin Assessment During Hygiene

- Note color, texture, thickness, turgor, and temperature.
- Check for lesions, dryness, scaling, and cracking.
- Carefully assess skin in contact with any device, such as oxygen tubing, feeding tube, orthopedic device, antiembolism stockings, and pressure areas.
- Focus on hard-to-reach areas and skinfolds, including the perineum and under the breasts.
- Assess for signs of impaired sensation, circulation, nutrition, or hygiene.
- Assess for signs of skin problems carefully in the darker-skinned client.
- Note any odors during the assessment.

 Embarrassment should not cause the nurse to overlook a client's hygiene needs.

C. Skin care

1. During hygiene, skin characteristics and problems influenced by hygiene measures are assessed (Box 16.1).
2. Risk factors for skin problems
 - a. Immobilization
 - b. Overweight or obese client
 - c. Reduced sensation related to a neurological problem
 - d. Altered cognition from dementia or psychological problem
 - e. Inadequate nutrition and hydration
 - f. Excessive secretions from perspiration, urination, defecation, and wound drainage
 - g. Use of medical devices that can cause skin injury
 - h. Vascular insufficiency
3. Common skin problems: dry skin, acne, skin rashes, contact dermatitis, abrasions, surgical incisions, wounds

D. Foot and nail care

1. Examination of the feet is important during hygiene care so that nail and foot conditions can be detected early on (Box 16.2).
2. Clients with a past medical history of peripheral circulation problems and diabetic neuropathy have an increased risk for problems with the feet or nails.
3. Common foot and nail problems
 - a. Callus
 - b. Corns
 - c. Plantar warts
 - d. Tinea pedis (athlete's foot)
 - e. Ingrown nails
 - f. Paronychia
 - g. Foot odors

BOX 16.2 Foot and Nail Assessment

- Examination needs to include inspection of the nails and all surfaces on the feet, particularly between the toes and on the sole of the foot.
- Problems with dryness, inflammation, cracking, and lesions should be noted and may be signs of an acute or chronic foot problem.
- Pain or discomfort and altered gait may signify a problem with the feet or nails.
- Assessment focuses on palpation of the pedal pulses, light touch and pinprick sensation, temperature, and gait.

4. To perform routine foot and nail care, soak the hands and feet, dry thoroughly, and trim the nails, except for those clients with diabetes mellitus or peripheral vascular disease.

 When providing hygiene care to clients with diabetes mellitus or peripheral vascular disease, the feet would not be soaked and the nails would not be trimmed, and the primary health care provider or a podiatrist would be consulted for foot care if needed.

5. The feet need to be washed daily with lukewarm water and dried thoroughly, paying attention to between the toes.
6. Long soaks and harsh chemicals need to be avoided because maceration and infection could occur.
7. Lotion needs to be applied on the feet, avoiding in between the toes.
8. Toenails would be trimmed straight across and the edges filed, unless the client has diabetes mellitus or peripheral vascular disease in which a podiatrist would be consulted.
9. Temperature extremes are avoided, and well-fitting shoes need to be worn.
10. To prevent infection and pressure areas, clean, absorbent cotton socks that have no seams or have not been mended need to be worn by the client with diabetes mellitus or peripheral vascular disorder.

E. Oral care

1. Oral hygiene promotes comfort and improves appetite.
2. Routine oral care includes brushing, flossing, and rinsing.
3. Routine oral care and brushing with fluoride toothpaste need to be done twice a day.
4. Using mouth rinse is helpful in preventing tooth decay; alcohol-free mouth rinses need to be used.
5. Check for oral lesions or lesions on the lips or around the mouth.

BOX 16.3 Client Conditions That Require Special Oral Hygiene Needs

- Unconsciousness: Drying of salivary secretions, absent gag reflex, pooling of salivary secretions increasing the risk of microorganism growth and pneumonia risk
- Diabetes mellitus: Frequent periodontal disease
- Immunosuppression, head and neck radiation, nasogastric intubation: Stomatitis and change in food/liquid tolerance
- Chemotherapy: Frequent periodontal disease
- Artificial airway: Drying of salivary secretions
- Drug use (such as methamphetamine): Xerostomia, bruxism (teeth grinding), dental caries

 **Commercially made foam swabs are ineffective in removing plaque from the teeth.**

6. Flossing with unwaxed floss would be done when performing mouth care, before and after brushing.
7. Avoid vigorous flossing, especially with clients who are receiving chemotherapy or radiation, or who are on anticoagulation therapy.
8. Clients with special oral hygiene needs (**Box 16.3**)

 **Oral care with a chlorhexidine gluconate product reduces the risk of ventilator-associated pneumonia.**

9. Denture care needs to be done regularly to avoid infection and irritation.
10. Dentures must be handled carefully so that they are not broken; they can be difficult to replace if broken.
11. Dentures need to be removed at night to let the gums rest and to prevent the buildup of bacteria.
12. Dentures need to be placed in a labeled container and not a napkin or tissue or on the dietary tray so that they are not mistakenly thrown away.
13. Dentures and the mouth need to be rinsed after meals, cleaned regularly, and soaked overnight.
14. Remaining teeth need to be brushed and flossed regularly.

F. Hair care

1. Ask the client about preferences for hair care, including types of shampoo or conditioners.
2. Assess the hair and scalp during hair care, and observe the client's ability to perform personal hair care.
3. Check for alopecia and pediculosis capitis (head lice), and check for lesions on the scalp; clients

BOX 16.4 Shaving

- Each client needs a personal razor.
- An electric shaver rather than a razor needs to be used for clients on anticoagulants or antiplatelets and for clients with low platelets or with a bleeding disorder.
- The skin needs to be moistened with lukewarm water and shaving cream applied.
- The skin needs to be pulled taut and the area shaved with long, firm strokes in the direction that the hair grows.
- Mustaches and beards if not shaved need to be groomed daily, including shampooing and combing.
- Check for any lesions or abnormal growths.

with pediculosis capitis may need a pediculicidal shampoo.

 **Clients who are immobilized often have tangled hair that can become matted if not frequently cleaned and brushed. This can negatively impact the client's overall sense of well-being.**

4. Brushing the hair frequently helps to distribute the oil evenly and keeps the hair clean.
5. Braiding helps to prevent tangles.
6. Dry shampoos and shampoo caps can be useful; shampoo caps provide a warm, wet massage to the scalp and clean the hair.
7. Shaving may be done after bathing (**Box 16.4**).

 **An electric razor or clippers need to be used for clients prone to bleeding, such as those on anticoagulant or antiplatelet medications, or those with low platelet counts.**

G. Eyes, ears, nose care

1. Hygiene care may need to be modified for clients who have sensory impairments.
2. During hygiene care, function of the eyes, ears, and nose would be assessed.

 **For clients who use oxygen tubing, a feeding tube, or a nasotracheal tube, skin assessment and care of the nose and ears underneath the devices need to be done routinely.**

3. The eyes need to be cleaned with a water-moistened soft washcloth, cleaning from the inner canthus to outer canthus.
4. A different part of the washcloth would be used each time the eye is cleaned.
5. Ability to blink should be assessed. For clients who are unconscious the ability to blink may be impaired, potentially causing injury to the eye due to dryness; lubricating eye drops should be used.

6. The ear can become impacted with cerumen and may require irrigation.
7. The client is taught not to use Q-tips or to put anything in the ear.
8. The client should be assisted in the care of eyeglasses, contact lenses, and hearing aids and needs to be taught how to clean these assistive devices.

II. Mobility

A. Assessment of mobility

1. Mobility status needs to be assessed, considering the effects of disease on mobility.
2. Start by assessing the client in a supported position with the client lying in bed. Next assess the client moving into a sitting position, transferring to a chair, and then walking with or without assistive devices.
3. Assistive devices may be necessary to promote mobility, exercise, and independence.

B. Complications of immobility

1. Metabolic
 - a. Endocrine function, metabolism, calcium resorption, and gastrointestinal functioning are impacted by immobility.
 - b. The endocrine system reacts to maintain blood pressure and electrolyte balance.
 - c. Metabolic rate is decreased, causing fluid and electrolyte imbalances and gastrointestinal disturbances, except if a fever is present (metabolic rate is increased).
 - d. Calorie and protein deficiency occur as the body breaks down proteins, causing a negative nitrogen balance, weight loss from decreased muscle mass, and weakness from tissue breakdown.
 - e. Calcium resorption from bones occurs, and the kidneys need to excrete excess calcium, increasing the potential for renal failure and pathological fractures.
 - f. Constipation, fecal impaction, pseudodiarrrhea, and bowel obstruction can occur.
2. Respiratory
 - a. Collapse of the alveoli, also called atelectasis, and inflammation of the lung from the pooling of static secretions, or hypostatic pneumonia, occur with immobility.
 - b. Prolonged immobility can eventually lead to ineffective cough, allowing mucus to remain in the airways, which causes pneumonia.
3. Cardiovascular
 - a. Orthostatic hypotension, increased cardiac workload, and thrombus formation can occur with immobility.
 - b. When changing positions, the client may describe dizziness, light-headedness, or nausea; pallor, tachycardia, or fainting can occur.

- c. Oxygen consumption increases as cardiac demand increases.
- d. An accumulation of platelets, fibrin, clotting factors, and other blood elements attaches to the wall of a vessel and occludes blood flow, also known as a thrombus.

4. Musculoskeletal

- a. Protein loss can result in the loss of lean body mass, leading to weakness.
- b. Weakness can lead to a heightened risk for falling.
- c. Disuse osteoporosis as a result of bone resorption can occur.
- d. Joint contractures can occur, such as foot-drop, and can be a permanent and debilitating complication of immobility.

5. Urinary

- a. When lying flat, urine does not empty into the bladder as readily without the aid of gravity, causing urinary stasis.
- b. Urinary stasis increases the risk for urinary tract infection and renal calculi.
- c. Dehydration and concentrated urine, which commonly occur with immobility, further increase the risk for infection and calculi.

6. Integumentary

- a. Immobility is a major risk factor for pressure injury and impaired skin integrity.
- b. Bony prominences are areas most affected by pressure injury.
- c. Pressure over bony prominences disrupts cellular metabolism and oxygenation to affected areas.

7. Psychosocial

- a. Changes in coping, cognitive or sensory functions, and emotional responses can result from immobility.
- b. Depression may result from changes in daily routine as a result of immobility, and can lead to withdrawal.

C. Crutch walking

1. Description

- a. An accurate measurement of the client for crutches is important, because an incorrect measurement could damage the brachial plexus.
- b. The distance between the axillae and the arm pieces on the crutches needs to be 2 to 3 finger widths in the axilla space.
- c. The elbows should be slightly flexed, 20 to 30 degrees, when the client is walking.
- d. When ambulating with the client, stand on the affected side.
- e. Instruct the client never to rest the axillae on the axillary bars.
- f. Instruct the client to look up and outward when ambulating and to place the crutches 6

TABLE 16.1 Crutch Gaits

Type of Gait	Use	Procedure
Two-point gait	For clients who can bear weight on both legs and have mastered the four-point gait.	The crutch on the affected side and the unaffected foot are advanced at the same time.
Three-point gait	For clients who can bear weight on only one leg.	The client bears weight on both crutches and then on the uninvolved leg, repeating the sequence.
Four-point gait	For clients who can bear weight on both legs.	The right crutch is advanced, then the left foot, then the left crutch, and then the right foot. Three points of support are on the floor at all times.
Swing-through gait	For clients who have adequate muscle power and balance in the arms and legs; commonly used by clients with paraplegia who wear weight-supporting braces on their legs.	With weight placed on the supported legs, the client places the crutches one stride in front and then swings to or through them while they support their weight.

Adapted from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 799.

to 10 inches (25.5 cm) diagonally in front of the foot.

- g. Instruct the client to stop ambulation if numbness or tingling in the hands or arms occurs.

D. Crutch gaits (Table 16.1 and Clinical Judgment: Evaluate Outcomes Box)

1. Assisting the client with crutches to sit and stand
 - a. Place the unaffected leg against the front of the chair.
 - b. Move the crutches to the affected side, and grasp the arm of the chair with the hand on the unaffected side.
 - c. Flex the knee of the unaffected leg to lower self into the chair while placing the affected leg straight out in front.
 - d. Reverse the steps to move from a sitting to standing position.
2. Going up the stairs
 - a. The client moves the unaffected leg up first.
 - b. The client moves the affected leg and the crutches up.
3. Going down the stairs
 - a. The client moves the crutches and the affected leg down.
 - b. The client moves the unaffected leg down.

CLINICAL JUDGMENT: EVALUATE OUTCOMES

The client is being discharged from the emergency department after treatment for a severe sprain in the right ankle. The client requires crutches for walking and has been instructed on the three-point gait. The nurse observes the client walking and determines that the client safely uses the crutches because the client is bearing weight on both crutches and then on the left leg, repeating the sequence.

E. Canes and walkers

1. Description: Canes and walkers are made of a lightweight material with a rubber tip at the bottom.
2. Interventions
 - a. Stand at the affected side of the client when ambulating; use of a gait or transfer belt may be necessary.
 - b. The handle needs to be at the level of the client's greater trochanter.
 - c. The client's elbow should be flexed at a 15- to 30-degree angle.
 - d. Instruct the client to hold the cane 4 to 6 inches (10 to 15 cm) to the side of the foot.
 - e. Instruct the client to hold the cane in the hand on the unaffected side so that the cane and weaker leg can work together with each step.
 - f. Instruct the client to move the cane at the same time as the affected leg.
 - g. Instruct the client to inspect the rubber tips regularly for worn places.
3. Hemicanes or quadripod canes
 - a. Hemicanes or quadripod canes are used for clients who have the use of only one upper extremity.
 - b. Hemicanes provide more security than a quadripod cane; however, both types provide more security than a single-tipped cane.
 - c. Position the cane at the client's unaffected side, with the straight, nonangled side adjacent to the body.
 - d. Position the cane 6 inches (15 cm) from the unaffected client's side, with the hand grip level with the greater trochanter.
4. Walker
 - a. Stand adjacent to the client on the affected side.

- b. Instruct the client to put all four points of the walker flat on the floor before putting weight on the handpieces.
- c. Instruct the client to move the walker forward, followed by the affected or weaker foot and then the unaffected foot.

! Safety is the priority concern when the client uses an assistive device such as a cane, walker, or crutches. Be sure that the client understands and demonstrates correct use of the device and verbalizes the risks associated with use, especially on wet surfaces. The rubber bottom on an assistive device needs to be checked regularly for wear and cracks.

III. Skin Integrity

- A. The skin is the largest organ in the body and provides protection against disease, synthesizes vitamin D, and perceives pain, temperature, and touch.
- B. Assessing skin integrity, identifying problems, and initiating interventions are important nursing roles.

! The Braden scale is an assessment tool used to predict pressure ulcer risk, and is often completed as part of a nursing assessment on a routine basis.

- C. Factors affecting skin integrity
 1. Nutrition
 - a. Proper nutrition is required to maintain skin integrity and promote wound healing.
 - b. Protein, vitamins, and trace minerals are important for healing.
 - c. Calories are required for cellular support for healing.
 - d. Serum albumin is frequently measured as an indicator of nutrition for clients who need support with wound healing.
 2. Tissue perfusion
 - a. Oxygen is required for healing.
 - b. Clients with **diabetes mellitus** and poor tissue perfusion are at increased risk for impaired skin integrity and delayed wound healing.
 3. Infection
 - a. The inflammatory phase of the healing process is prolonged in the presence of infection, delaying the wound healing process.
 - b. Indications of infection include redness in the tissue, pain, fever, change in the volume or character of wound drainage, purulent drainage, and odor.
 4. Age: With aging, inflammatory response and wound healing may be delayed.
 5. Medical devices that can cause pressure injury (Box 16.5)
 6. Immobility
 7. Incontinence

BOX 16.5 Medical Devices Related to Pressure Injury

- Gastrointestinal and nasogastric tubes
- Endotracheal, nasotracheal, and tracheostomy tubes
- Nasal cannula
- Noninvasive positive-pressure ventilation and bilevel positive airway pressure (NIPPV and BiPap)
- Drainage tubing
- Indwelling urinary catheter or fecal reservoir
- Orthopedic devices
- Compression stockings
- Immobilization devices or restraints

- D. Wound classification
 1. A wound results from disruption of the function and integrity of body tissues.
 2. Wounds are classified based on the status of skin integrity, cause of the wound, and severity of the injury or damage.
 3. Classification is divided into onset and duration (acute and chronic) and healing process (primary [first], secondary [second], tertiary [third] intention).
- E. Wound healing
 1. Phases of wound healing
 - a. Inflammatory: Begins at the time of injury and lasts 3 to 5 days; manifestations include local edema, pain, redness, and warmth.
 - b. Fibroblastic: Begins the fourth day after injury and lasts 2 to 4 weeks; scar tissue forms, and granulation tissue forms in the tissue bed.
 - c. Maturation: Begins as early as 3 weeks after the injury and may last for 1 year; scar tissue becomes thinner and is firm and inelastic on palpation.
 2. Healing by intention
 - a. Primary (first) intention: Wound edges are approximated and held in place (i.e., with sutures) until healing occurs; wound is easily closed and dead space is eliminated.
 - b. Second (second) intention: This type of healing occurs with injuries or wounds that have tissue loss and require gradual filling in of the dead space with connective tissue.
 - c. Tertiary (third) intention: This type of healing involves delayed primary closure and occurs with wounds that are intentionally left open for several days for irrigation or removal of debris and exudates; once debris has been removed and inflammation resolves, the wound is closed by first intention.

3. Types of wound drainage (Box 16.6)

IV. Pressure Injury

A. Description

1. A pressure injury is an impairment of skin integrity.
2. A pressure injury can occur anywhere on the body; tissue damage results when the skin and underlying tissue are compressed between a bony prominence and an external surface for an extended period (Fig. 16.1).
3. The tissue compression restricts blood flow to the skin, which can result in tissue ischemia, inflammation, and necrosis; once a pressure injury develops, it is difficult to heal.

! Prevention of skin breakdown in any part of the client's body is a primary role for the nurse.

B. Risk factors

1. Skin pressure

BOX 16.6 Types of Exudate from Wounds

Serous

- Clear or straw-colored and watery

Serosanguineous

- Pale, pink, and watery

Sanguineous

- Red drainage that is abnormal and indicates active bleeding

Purulent

- Yellow, gray, tan, brown, or green drainage due to infection in the wound

2. Skin shearing and friction

3. Immobility

4. Malnutrition

5. Incontinence

6. Decreased sensory perception

C. Assessment and staging (Box 16.7)

D. Interventions

! Avoid direct massage to a reddened skin area, because massage can damage the capillary beds and cause tissue breakdown and necrosis.

1. Identify clients at risk for developing a pressure injury.
2. Institute measures to prevent pressure injury, such as appropriate positioning, using pressure-relief devices, ensuring adequate nutrition, and developing a plan for skin cleansing and care.
3. Perform frequent skin assessments, and monitor for an alteration in skin integrity (refer to Chapter 12 for more information on skin assessment).
4. Keep the client's skin dry and the sheets wrinkle-free; if the client is incontinent, check the client frequently and change pads or any items placed under the client immediately after they are soiled.
5. Use creams and lotions to lubricate the skin and a barrier protection ointment for the incontinent client.
6. Turn and reposition the immobile client every 2 hours or more frequently if necessary; provide active and passive range-of-motion exercises at least every 8 hours.

FIG. 16.1 Pressure points in lying and sitting positions.

BOX 16.7 Stages of Pressure Injuries

Stage <

Stage 1

Skin is intact.

Area is red (not purple or maroon) and does not blanch with external pressure.

May appear differently in people with darker pigmentation.

Area may be preceded by changes in sensation, temperature, or firmness.

Stage >

Stage 2

Skin is not intact.

Partial-thickness skin loss with exposed dermis.

Wound bed is viable, pink or red, and moist.

Presents as an intact or open/ruptured serum-filled blister.

Stage ^

Stage 3

Full-thickness skin loss is present with adipose tissue visible in the ulcer.

Granulation tissue and rolled wound edges are often present.

Slough and/or eschar may be present.

Undermining and tunneling may be present.

Subcutaneous tissue may be damaged or necrotic.

Stage v

Stage 4

Full-thickness skin and tissue loss with exposed or palpable fascia, muscle, tendon, ligament, cartilage, or bone.

May have slough or eschar.

Rolled wound edges, undermining, or tunneling may be present.

BOX 16.7 Stages of Pressure Injuries—Cont'd

Unstageable

Unstageable

Obscured full-thickness skin and tissue loss.

The extent of the damage cannot be confirmed because it is obscured by eschar and slough.

Suspected Deep-Tissue Injury

Suspected
deep-tissue injury

Persistent nonblanchable deep red, maroon, or purple discoloration.

May appear differently in people with darker pigmentation.

Epidermal separation shows a dark wound bed or a blood-filled blister.

Adapted from Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. pp. 442–443. Figures from National Pressure Ulcer Advisory Panel (NPUAP) and European Pressure Ulcer Advisory Panel. (2009). Pressure ulcer prevention and treatment: Clinical practice guideline. Washington, DC, NPUAP copyright and used with permission.

7. If a pressure injury is present, record the location and size of the wound (length, width, depth in centimeters), monitor and record the type and amount of exudates (a culture of the exudate may be prescribed), and assess for undermining and tunneling. Depending on agency policy, it may be required to have picture documentation on file of a pressure injury or other disruption in skin integrity that may include a client identifier, measuring device, and a label indicating wound laterality and location. If a wound or other skin problem is noted, it may be necessary to request a referral to a wound care and/or nutrition specialist.
8. Serosanguineous exudate (pale, pink, and watery) may be noted; purulent exudates indicate colonization of the wound with bacteria.
9. Use agency protocols for skin assessment and management of a wound.
10. Treatment may include wound dressings and debridement; skin grafting may be necessary (Tables 16.2 and 16.3).
11. Other treatments may include electrical stimulation to the wound area (increases blood vessel growth and stimulates granulation), vacuum-assisted wound closure (removes infectious material from the wound and promotes granulation), hyperbaric oxygen therapy (administration of oxygen under high pressure raises tissue oxygen concentration), and the use of topical growth factors (biologically active substances that stimulate cell growth).

TABLE 16.2 Types of Dressings and Mechanism of Action for Pressure Injuries

Pressure Injury Stage	Dressing Type	Mechanism of Action
1	None Transparent dressing Hydrocolloid dressing	Slow resolution without epidermal loss within 7 to 14 days
2	Composite □Im Hydrocolloid Hydrogel covered with foam or gauze dressing	Heals through reepithelialization
3	Hydrocolloid Hydrogel covered with foam dressing Calcium alginate Gauze	Heals through granulation and reepithelialization
4	Hydrogel covered with foam dressing Calcium alginate Gauze	Heals through granulation, reepithelialization, and scar tissue development
Unstageable	Adherent □Im Gauze with a prescribed solution Enzymes None	Eschar loosens and lifts at edges as healing occurs; surgical debridement may be necessary.
Suspected deep-tissue injury	Calcium alginate or others	Healing process depends on the treatment used.

Data from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M.(2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1262.

TABLE 16.3 Types of Dressing Materials

Type	Indications, Uses, and Considerations	Frequency of Dressing Changes
Alginate	Provides hemostasis, debridement, absorption, and protection. Can be used as packing for deep wounds and for infected wounds. Requires a secondary dressing for securing.	When dressing is saturated (every 3 to 5 days) or more frequently
Antimicrobial	Impregnated with an antimicrobial agent such as a medical-grade honey, chlorhexidine, or silver ions.	Frequency of change as prescribed and depends on the amount of drainage
Biological	Provides protection and debridement after eschar removal. May be used for dormant and nonhealing wounds that do not respond to other topical therapies. May be used for burns or before pigskin and cadaver skin grafts. Conforms to uneven wound surfaces; reduces pain. Requires a secondary dressing for securing.	Topical growth factors: changed daily Skin substitutes: the need for dressing change varies
Gauze	Continuous dry dressing provides absorption and protection. Continuous wet dressing provides protection, a means for the delivery of topical treatment, and debridement. Wet to damp dressing provides atraumatic mechanical debridement. May be painful on removal.	Clean base: every 12 to 24 hr Necrotic base: every 4 to 6 hr
Foam	Provides absorption, protection, insulation, and debridement. Conforms to uneven wound surfaces. Requires a secondary dressing for securing.	When dressing is saturated or more frequently; can remain for a maximum of 7 days
Hydrocolloidal	Provides absorption, protection, and debridement. Is waterproof and painless on removal.	Clean base: on leakage of exudates Necrotic base: every 24 hr
Hydrogel	Provides absorption, protection, and debridement. Conducive to use with topical agents. Designed to maintain a moist environment. Conforms to uneven wound surfaces but allows only partial wound visualization. Requires a secondary dressing for securing.	Clean base: every 24 hr Necrotic base: every 6 to 8 hr

Continued

TABLE 16.3 Types of Dressing Materials—Cont'd

Type	Indications, Uses, and Considerations	Frequency of Dressing Changes
Adhesive transparent film	Provides protection for partial-thickness lesions and debridement and serves as a secondary (cover) dressing. Provides good wound visualization. Is waterproof and reduces pain. Use is limited to superficial lesions. Is nonabsorbent, adheres to normal and healing tissue. Dressing may be difficult to apply.	Clean base: on leakage of exudates Necrotic base: every 24 hr
Superabsorbent	Minimizes adherence to the wound while collecting exudate. Used for heavily exuding pressure injuries.	As frequently as needed as it becomes wet with exudate

Adapted from Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 445.

PRACTICE QUESTIONS

- A client being measured for crutches asks the nurse why the crutches cannot rest up underneath the arm for extra support. The nurse responds, knowing that which would most likely result from this improper crutch measurement?
 - A fall and further injury
 - Injury to the brachial plexus nerves
 - Skin breakdown in the area of the axilla
 - Impaired range of motion while the client ambulates
- The nurse has given the client instructions about crutch safety. Which statements indicate that the client understands the instructions? Select all that apply.
 - <. "I should not use someone else's crutches."
 - >. "I need to remove any scatter rugs at home."
 - ^. "I can use crutch tips even when they are wet."
 - v. "I need to have spare crutches and tips available."
 - . "When I'm using the crutches, my arms need to be completely straight."
- The staff nurse reviews the nursing documentation in a client's chart and notes that the wound care nurse has documented that the client has a stage 2 pressure injury in the sacral area. Which finding would the nurse expect to note on assessment of the client's sacral area?
 - Intact skin
 - Full-thickness skin loss
 - Exposed bone, tendon, or muscle
 - Partial-thickness skin loss with exposed dermis
- The nurse is performing a skin assessment on a client and notes an area of full-thickness loss of skin on the sacrum. Adipose tissue and granulation tissue are present with no visible muscle, tendon, ligament, cartilage, or bone. How would the nurse classify this pressure injury?
 - Stage 1 pressure injury
 - Stage 2 pressure injury
 - Stage 3 pressure injury
 - Stage 4 pressure injury
- The nurse is preparing to provide wound care to a client with a stage 1 pressure injury. Which dressing would the nurse expect to be prescribed in the treatment of this wound?
 - Hydrogel dressing
 - Transparent dressing
 - Antimicrobial dressing
 - Calcium alginate dressing
- The nurse in a long-term care facility is observing a nursing student provide foot care to a client with diabetes mellitus. Which action by the nursing student would indicate a need for further teaching?
 - The nursing student tells the client to avoid soaking the feet.
 - The nursing student dries the feet thoroughly, including in between the toes.
 - The nursing student advises the client to consult the physician or a podiatrist regarding nail trimming.
 - The nursing student applies lotion to the dorsal and plantar surfaces of the feet and in between the toes.
- The nurse is reviewing dental care with a client who is edentulous and wears dentures. Which client statement indicates an understanding of proper dental care?
 - "Since I have no teeth, I do not need to brush my mouth."
 - "I need to use hot water when cleaning my dentures to kill bacteria."
 - "I will remove my dentures before bed and keep them in my labeled denture cup covered with water."

4. "When I am not wearing my dentures during the day, I can keep them in the denture cup with no water, as they should only be in water at night."
8. The nurse is preparing to give a full bed bath to a client. Which question is most important for the nurse to ask the client before beginning the bed bath?
 1. "Do you have any allergies?"
 2. "Will you be able to wash your own hair?"
 3. "Are there any areas you want us to spend more time bathing?"
 4. "Do you have any preferences regarding how we help you bathe?"
9. The nurse is teaching a client with right-sided weakness related to a stroke about how to properly ambulate with a cane. Which client action would indicate a need for further teaching?
 1. The client holds the cane on the right side of the body.
 2. The client moves the weaker leg toward the cane first.
 3. The client holds the cane 6 inches laterally from the foot.
 4. The client keeps two points of support on the floor at all times.
10. The nurse is preparing a list of client care activities to be done during the shift. For which clients would the nurse instruct the assistive personnel (AP) to use an electric razor for shaving? Select all that apply.
 - 1. A client with leukocytosis
 - 2. A client with thrombocytosis
 - 3. A client with thrombocytopenia
 - 4. A client receiving an antiplatelet medication
 - 5. A client receiving acetaminophen as needed for mild pain

WWW.NCLEXATNEPAL.COM

ANSWERS

1. Answer: 2

Rationale: Crutches are measured so that the tops are 2 to 3 finger widths from the axillae. This ensures that the client's axillae are not resting on the crutch or bearing the weight of the crutch, which could result in injury to the nerves of the brachial plexus. Although the conditions in options 1, 3, and 4 can occur, they are not the most likely result from resting the axilla directly on the crutches.

Test-Taking Strategy: Note the **strategic words**, *most likely*, and focus on the **data in the question**. Recalling the risk associated with brachial nerve plexus injury will direct you to the correct option.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby, p.798.

2. Answer: 1, 2, 4

Rationale: The client should use only crutches measured for the client. When assessing for home safety, the nurse ensures that the client knows to remove any scatter rugs and does not walk on highly waxed floors. The tips need to be inspected for wear, and spare crutches and tips need to be available if needed. Crutch tips should remain dry. If crutch tips get wet, the client needs to dry them with a cloth or paper towel. When walking with crutches, both elbows need to be flexed not more than 30 degrees when the palms are on the handle.

Test-Taking Strategy: Focus on the **subject**, client understanding of instructions for the use of crutches. Visualize the use of crutches by the client and then each option, and think about the safety associated with each instruction. This will assist in answering correctly.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby, p. 798.

3. Answer: 4

Rationale: In a stage 2 pressure injury, the skin is not intact. Partial-thickness skin loss with exposed dermis is present. It presents with a viable red-pink and moist wound bed. It may also present as an intact or ruptured serum-filled blister. The skin is intact in stage 1. Full-thickness skin loss occurs in stage 3. Exposed bone, tendon, or muscle is present in stage 4.

Test-Taking Strategy: Focus on the **subject**, assessment of a pressure injury. Focus on the words *stage 2*, and use knowledge of the stages of pressure injuries. Visualizing the appearance of a stage 2 pressure injury will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby, pp. 168-169.

4. Answer: 3

Rationale: A stage 3 pressure injury is characterized by full-thickness skin loss in which adipose tissue is apparent with slough or eschar. There may also be granulation tissue and rolled wound edges. There is no exposed fascia, muscle, tendon, ligament, cartilage, or bone; this would be noted in a stage 4 pressure injury.

Test-Taking Strategy: Focus on the **subject**, assessment of a pressure injury. Remember that with a stage 3 pressure injury, there is full-thickness skin loss with adipose and granulation tissue. Slough or eschar may also be present. There is no exposed fascia, muscle, tendon, ligament, cartilage, or bone. Use knowledge of the stages of pressure injuries. Visualizing

the appearance of a stage 3 pressure injury will direct you to the correct option.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 1238-1239.

5. Answer: 2

Rationale: A stage 1 pressure injury is characterized by intact skin with nonblanchable erythema. Dressings used to manage a stage 1 pressure injury include transparent dressings, hydrocolloid dressings, or no dressing and leaving the wound open to air. The wound should resolve without epidermal loss over a period of 7 to 14 days. Hydrogel dressings are used to maintain a moist environment for wound healing. Calcium alginate is absorbent and is used in stage 4 wounds or those with deeper tissue injury. Antimicrobial dressings are used for pressure injuries that are infected.

Test-Taking Strategy: Focus on the **subject**, the wound dressing that is appropriate in the treatment of a stage 1 pressure injury. Remember that dressing use is conservative in this type of pressure injury, and includes the use of transparent dressings or no dressing. The wound is expected to heal without epidermal loss over a period of 7 to 14 days.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1260.

6. Answer: 4

Rationale: Clients with diabetes mellitus are at an increased risk for impaired skin integrity related to peripheral neuropathy or vascular insufficiency. The feet are at an increased risk for the development of wounds and some clients may be unable to thoroughly inspect the feet regularly due to impaired mobility or other impairments. Meticulous foot care is necessary to prevent complications. The client's feet would not be soaked to prevent maceration, or skin softening, as this increases the risk of infection. Regarding nail trimming, a podiatrist or a physician's order may be necessary to trim the nails, as a client with diabetes mellitus is at increased risk for infection if the skin were to be accidentally cut. The feet need to be dried thoroughly, with special attention given to the areas between the toes, as skin breakdown or ulcers can go undetected in this area. Lotion needs to be applied to the dorsal and plantar surfaces of the foot. However, it would not be applied between the toes as this area needs to be kept dry. Therefore, option 4 is the action by the nursing student that requires a need for further teaching.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. This indicates a **negative event query** and requires you to choose the option that is an incorrect action and requires further education from the nurse. Remember that there are differences in foot care between clients without diabetes mellitus or vascular problems and clients with diabetes mellitus or vascular problems. Clients with diabetes mellitus should not soak their feet; this prevents tissue maceration. The area between the toes needs to be inspected and kept dry; lotion would not be applied between the toes. Due to the increased risk of infection, a podiatrist or order from the physician to trim the client's nails may be necessary, depending on facility policy or physician preference.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 875-876.

7. Answer: 3

Rationale: Denture care and oral hygiene are important in the care of the edentulous client who wears dentures. Clients may think that since they no longer have teeth, they no longer need to brush their gums. Educate clients that proper brushing is still essential to maintain good gum health. Therefore, option 1 is incorrect. Dentures need to be cleaned on a regular basis to avoid gingival infection and irritation. Whenever the dentures are removed, they need to be stored in the client's labeled denture cup and covered with water to prevent drying out and warping of the dentures. Therefore, option 4 is incorrect. Dentures need to be cleaned in lukewarm, or tepid, water to prevent damaging or warping the dentures. Therefore, option 2 is incorrect. Option 3, the correct answer, indicates client understanding, as dentures need to be removed at night to provide the gums rest and prevent bacteria buildup. The dentures need to be stored in the client's labeled denture cup and covered with water.

Test-Taking Strategy: Focus on the **subject**, dental care for the edentulous client who wears dentures. Use knowledge about the basic guidelines for mouth care to answer correctly. Remember that clients without any teeth or with many missing teeth still need to perform regular oral hygiene practices, such as brushing the gums or remaining teeth twice a day to maintain good gum health. Dentures need to be cleaned in tepid water and stored in the client's denture cup covered in water when not being worn and should be removed at night and properly stored to provide the gums rest and prevent bacteria buildup.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 877- 878.

8. Answer: 1

Rationale: Bed baths involve applying water and a cleansing agent, such as soap or chlorhexidine gluconate (CHG), to the skin. The nurse needs to first inquire about any allergies to ensure that the client is not allergic to the cleansing agent that will be used. Although options 2, 3, and 4 are appropriate questions to ask the client, the determination of any client allergies is the most important client data to obtain before beginning the bed bath.

Test-Taking Strategy: Note the **strategic words**, *most important*. Use **Maslow's Hierarchy of Needs theory**. Option 1 is the option that addresses a physiological need, which is the priority to maintain client safety.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 863.

9. Answer: 1

Rationale: Canes are assistive devices used to support clients with one-sided weakness or partial or complete leg paralysis. Canes are lightweight and easily movable. The cane needs to be held on the stronger side of the body and 4 to 6 inches laterally from the foot. While walking, the client needs to advance the cane forward 6 to 10 inches while keeping body

weight distributed on both lower extremities. The client would then move the weaker leg forward toward the cane to distribute body weight between the cane and the stronger leg. Then, the client advances the stronger leg past the cane. Remind the client to keep two points of support on the floor at all times to prevent falls. Therefore, since the cane needs to be held on the stronger side of the body and this client has right-sided weakness and is holding the cane on the right side, option 1 is the answer that requires a need for further teaching from the nurse.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. This indicates a **negative event query** and requires you to determine which option is incorrect and requires the nurse to intervene to reeducate the client. Focus on the **subject**, the proper technique for walking with a cane. Remember that the cane needs to be held on the stronger side of the body and that the client would advance the cane, then the weaker leg, and then the stronger leg in that sequence.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 797.

10. **Answer: 3, 4**

Rationale: Electric razors need to be used for clients who are at risk for bleeding, which include clients with thrombocytopenia (a low platelet level), clients with bleeding or clotting disorders, and clients taking certain medications, such as antiplatelet and anticoagulation medications. Therefore, options 3 and 4 are correct. Leukocytosis is not related to bleeding risk, as this indicates an elevated white blood cell count. Thrombocytosis indicates a higher-than-normal platelet level, which increases the risk for clotting. Finally, acetaminophen is not a medication that increases the client's risk for bleeding.

Test-Taking Strategy: Focus on the **subject**, clients who need to be shaved with an electric razor. Remember that electric razors are used for clients who are at an increased risk for bleeding. Then, determine which client factors increase the risk for bleeding; this includes thrombocytopenia and certain medications, such as antiplatelet medications and anticoagulants.

CHAPTER 17

Urinary and Bowel Elimination

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE
Linda A. Silvestri, PhD, RN, FAAN

PRIORITY CONCEPTS Elimination; Infection

! Physiological, psychosocial, or treatment-induced factors can affect urinary elimination, and nurses play a key role in assessing and managing urinary problems.

I. Urinary Assessment

A. Considerations

1. The client's ability to manage urinary elimination and any cultural considerations related to urinary elimination patterns need to be assessed.
2. Include the client's daily urination patterns (Box 17.1) and the presence of any renal or urinary symptoms in the physical assessment (Box 17.2).
3. Intake and output and urine characteristics are monitored on an ongoing basis.
 - a. Intake and output: Provides information about bladder emptying, renal function, and fluid and electrolyte balance
 - b. Urine output should be at least 30 mL/hr and needs to be compared to amount of fluid intake (true urine output).
 - c. If the urine output falls below 30 mL/hr, further follow-up is needed.

! Urine output of less than 30 mL/hr may indicate renal impairment or hypovolemia, which can occur in many conditions, such as dehydration or blood loss. Polyuria or urine output of less than 30 mL/hr for two consecutive voidings is a sign of an acute condition and requires prompt assessment and follow-up.

- d. Urine characteristics: Assess color, clarity, and odor.
- e. Urine normally is clear or transparent at the time of urination.

- f. Normal color can be pale straw-colored to amber in color and depends on urinary concentration.
- g. Urine normally has an ammonia odor.
- h. If urine stands for some time, it can appear cloudy because of protein concentration.
- i. Urine can also appear cloudy from bacteria and white blood cells.
- j. Increases in fluid intake and diuretics can lighten the color.
- k. Blood in the urine is abnormal and requires follow-up.
 1. Medications such as phenazopyridine (a urinary tract analgesic) and certain foods (such as beets) can change the color of the urine.
- m. Some foods, such as asparagus, can change the odor of the urine.
- n. A foul odor may indicate a urinary tract infection (UTI).
- o. Health problems can also affect the characteristics of the urine; therefore, it is important to assess the client's past and current medical history.
4. Diagnostic tests: Refer to Chapter 10 and Chapter 55 for information on diagnostic tests related to urinary elimination.

II. Urinary Alterations

- A. Problems or alterations with urinary elimination include urinary retention, urinary tract infections (UTIs), urinary incontinence, and urinary diversion.
- B. Urinary retention
 1. Characterized by disruption in the ability to partially or completely empty the bladder
 2. Causes pressure and discomfort in and over the area of the bladder

BOX 17.1 Assessment of Urination Patterns

- Daily fluid intake
- Normal daily voidings
- Waking during sleep to urinate
- Urgency, dysuria, frequency, hesitancy, polyuria, oliguria, nocturia, dribbling, hematuria, retention
- Caffeine intake
- Medications affecting urination (diuretics, bladder irritants)

BOX 17.2 Abnormal Assessment Findings of the Renal and Urinary System

- Kidneys: Flank pain, costovertebral angle tenderness
- Bladder: Distended abdomen, sensation of urgency on palpation of the bladder
- Genitalia and urethra: Drainage, inflammation, tenderness, lesions, rashes, or appearance of catheter entrance site (if a catheter is present)
- Perineum: Skin impairment, burning and itching of the skin, pain, odor

Adapted from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 1159-1560.

3. Client may experience no urination over several hours or may experience urgency and frequent small-volume urination or dribbling.
4. Straining to void is a characteristic sign.
5. Postvoid residual by ultrasound or straight catheterization is an important measure to determine urinary retention.
6. Causes can include blockage from an enlarged prostate, renal or urinary stones, or health problems that lead to urinary conditions.

C. UTI

1. UTI is a common health care–associated infection.
2. Common symptoms include dysuria, urgency, frequency, suprapubic tenderness, incontinence, or cloudy foul-smelling urine; blood may appear in the urine.

 **Elderly clients may experience nonspecific symptoms of UTI such as fatigue, confusion, delirium, mental status changes, decreased function, incontinence, or falls. Elderly clients also may not experience fever as a response to infection.**

3. The most common causative organism is *Escherichia coli*.
4. Risk factors for UTI: It is an important nursing responsibility to recognize clients who are at risk for a UTI (Box 17.3).
5. Lower UTIs affect the urethra and bladder and can cause cystitis.

BOX 17.3 Risk Factors for Urinary Tract Infection

- Indwelling urinary catheter
- Urinary stasis or retention
- Poor perineal hygiene
- Urinary and fecal incontinence
- Constipation
- Urinary procedures or surgeries
- Urinary tract stones
- Congenital defects that cause obstruction
- Obesity
- Pregnancy
- Menopause
- Multiple sex partners
- Conditions that comprise the immune response
- Habitual delay in voiding (teacher's bladder, nurse's bladder)

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 1025.

6. Upper UTIs affect the ureters and kidneys and can cause pyelonephritis.
7. Ascending UTIs can lead to bacteremia, or urosepsis, a life-threatening condition.
8. Asymptomatic bacteriuria is not considered an infection and is not treated with antibiotics.
9. Symptomatic UTI is treated with antibiotics.

 **Catheter-associated urinary tract infection (CAUTI) is a common health care–associated infection that can be prevented with effective nursing care.**

III. Urinary Incontinence

- A. Includes urge incontinence, stress incontinence, or mixed incontinence, each of which causes an involuntary loss of urine
- B. Associated with elderly persons because they have difficulty accessing the toilet in time or have problems with dexterity, making it difficult to remove clothing for toileting; the nurse needs to identify and implement measures to promote safety.
- C. Multifactorial incontinence is associated with multiple risk factors and includes chronic illness, medications, age, and environmental factors.
- D. Pelvic muscle exercises and bladder training may be helpful to alleviate some types of incontinence.
- E. Medication is available to treat some types of incontinence, such as that associated with an overactive bladder.
- F. Urge incontinence
 1. Also known as overactive bladder
 2. Usually the person feels a strong urge to urinate even when the bladder is not full.
 3. It is characterized by an overwhelming urge to urinate immediately, frequently followed by leakage and loss of urine before the person can reach a bathroom.

4. Nocturnal frequency and incontinence are common.
5. Can be caused by physical problems such as damage to the brain, the spine, or the nerves that innervate the bladder, leading to muscle contraction in the bladder; conditions include **diabetes mellitus** or neurological disease or trauma.
6. The condition is also likely to develop as the person ages as a result of changes in the bladder lining and muscle.

G. Stress incontinence

1. Occurs when the urethral sphincter and/or the pelvic floor muscles have been weakened or damaged; the bladder cannot dependably hold in urine.
2. Any physical exertion that increases abdominal pressure, such as coughing or laughing, places pressure on the bladder, causing leakage; leakage is usually in small amounts.

H. Mixed incontinence: Characterized by both urge incontinence (overactive bladder) and stress incontinence

I. Overflow incontinence

1. Occurs when something blocks the urine from flowing normally out of the bladder, such as prostate enlargement, tumors, stones, scar tissue, or a prolapsed uterus or bladder
2. Also occurs when the bladder muscle becomes underactive, so the client does not feel an urge to urinate
3. Urine leakage occurs; the bladder becomes distended, pulling the urethra open and allowing urine to leak out.
4. Additional causes include spasms from surgery, diabetes mellitus, or cardiovascular disease; nerve damage; medications; and aging.

J. Functional incontinence

1. The urinary tract is functioning properly, but incontinence occurs; it is usually caused by a disability or a health problem such as arthritis and the inability to get to a bathroom and undress on time; institute safety measures.
2. Certain medications such as diuretics can also be a cause of this type of incontinence.

K. Reflex incontinence

1. Occurs when the bladder muscle contracts and urine leaks without any warning or urge
2. Occurs as a result of nerve damage in persons with neurological disorders, such as multiple sclerosis or spinal cord injury, or in those who experienced trauma or underwent certain surgical procedures

IV. Urinary Catheters

A. Types of urinary catheters

1. Simple urethral catheter: A single-lumen catheter; usually used for straight catheterization to empty the client's bladder, obtain sterile urine

specimens, or check the residual amount of urine after the client voids

2. Indwelling urethral catheter with balloon: This is a double-lumen catheter; it is used when an indwelling catheter is needed for continuous bladder drainage; one lumen is for drainage and the other is for balloon inflation.

3. Three-way indwelling catheter: A triple-lumen catheter; used when bladder irrigation and drainage are necessary; one lumen is for instilling the bladder irrigant solution, one lumen is for continuous bladder drainage, and one lumen is for balloon inflation.

! Strict aseptic technique is necessary for insertion and care of a urinary catheter.

B. Urinary catheter care

1. Cleansing: Use gloves and wash the perineal area with warm, soapy water once or twice a day and as needed per agency procedure; with the nondominant hand, pull back the labia or foreskin to expose the meatus (in the adult person, return the foreskin to its normal position); cleanse along the catheter with soap and water; do not use lotion or powders near the catheter.
2. Anchor the catheter using a secure device per agency procedure to prevent catheter movement and urethral tension.
3. Maintain the catheter bag below the level of the bladder to ensure a downhill flow of urine.
4. Institute a plan to decrease infection.
5. Teach the client, particularly the ambulatory client, about care of the catheter.
6. Avoid disconnecting the urinary catheter from the drainage tube except for catheter irrigation, if irrigation is prescribed.
7. Sterile technique must be maintained whenever the drainage system is opened.
8. If prescribed, a urine specimen can be obtained from the catheter sampling port using sterile technique and following agency procedures.
9. A collection leg bag may be used by a client with a long-term catheter; the client needs to be taught how to change the bag or how to clean the bag if it is reusable.
10. Empty the collecting bag regularly, and accurately record the urine output.
11. Because of the risk of infection, remove the catheter as soon as possible; consider alternative forms of urinary drainage methods, such as external catheters, which are associated with fewer cases of bacteriuria and CAUTI.

C. Catheter insertion and removal (Box 17.4)

D. Ureteral and nephrostomy tubes (Fig. 17.1)

1. Never clamp the tube.
2. Maintain patency.

BOX 17.4 Urinary Catheters: Insertion and Removal Procedures**Insertion Procedure**

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Place the client in position for catheterization:
People with vaginas: Assist to dorsal recumbent position (supine with knees flexed) and legs open to allow for full visualization and maintenance of the sterile field. Support legs with pillows to reduce muscle tension and promote comfort.
People with penises: Assist to supine position with thighs slightly abducted.
4. Wearing clean gloves, wash the perineal area with soap and water as needed; dry thoroughly. Remove and discard gloves; perform hand hygiene.
5. Open outer wrapping of the catheter kit, remembering that all components of the catheterization tray are sterile (all supplies are arranged in the box in order of sequence of use).
6. Apply waterproof sterile drape (when packed as first item in tray).
7. Urinary catheter preparation procedure
 - A. Place a sterile drape with the plastic side down under the client's buttocks.
 - B. Don sterile gloves using sterile technique.
 - C. Pick up the fenestrated drape from the tray. Allow it to unfold without touching the sterile surface. Apply the drape over perineum, exposing the labia or penis.
 - D. While maintaining sterility, open the packet of lubricant and squeeze the lubricant out on the sterile field. Lubricate the catheter tip by dipping it into water-soluble gel, 2.5 to 5 cm (1 to 2 inches) or 12.5 to 17.5 cm (5 to 7 inches) depending on the reproductive anatomy. Attach the prefilled syringe to the balloon port. Prepare cotton balls or swab sticks for cleansing the perineal area.
 - E. Remember with a sterile technique, the sterile field and gloved hands must be maintained above the level of the waist, the 1-inch (2.5 cm) border on the field is considered contaminated, and nurses cannot turn their backs to the field at any time.
8. Catheter insertion:
 - A. *People with vaginas:* With the nondominant hand, fully expose urethral meatus by spreading the labia, taking care to not allow the labia to close. Using forceps in the sterile dominant hand, pick up the cotton ball or swab sticks saturated with antiseptic solution, wiping from front to back (from clitoris toward anus). Using a new cotton ball or swab for each area cleansed, wipe the right labial fold, left labial fold, and directly over center of urethral meatus. Pick up and hold the catheter 7.5 to

10 cm (3 to 4 inches) from catheter tip. Advance catheter a total of 7.5 cm (3 inches) in the adult or until urine flows out of catheter end. When urine appears, advance the catheter another 2.5 to 5 cm (1 to 2 inches). Do not use force to insert catheter.

- B. *People with penises:* Apply a fenestrated drape with the fenestrated slit resting over the penis. Grasp the penis at the shaft just below the glans. (If the client is not circumcised, retract the foreskin with the nondominant hand.) With the dominant hand, pick up an antiseptic-soaked cotton ball with forceps or a swab stick and clean the penis. Move the cotton ball or swab in a circular motion from the urethral meatus down to the base of the glans. Repeat cleaning 2 more times, using a clean cotton ball/swab stick each time. Pick up the catheter with the gloved dominant hand and insert the catheter by lifting the penis to a position perpendicular to the client's body and apply light traction. Advance the catheter 17.5 to 22.5 cm (7 to 9 inches) in the adult or until urine flows out of catheter end. Advance an additional 2.5 to 5 cm (1 to 2 inches) after urine appears. Lower the penis and hold the catheter securely in the nondominant hand.
9. Inflate the balloon fully per manufacturer's directions and gently pull back on the catheter until resistance is felt.
 10. Secure the catheter tubing to the inner thigh with an agency-approved securing device.
 11. Record the type and size of the catheter inserted, the amount of fluid used to inflate the balloon, characteristics and amount of urine drained, specimen collection if appropriate, the client's response to the procedure, and that teaching was completed.

Removal Procedure

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Position the client in the same position as during catheterization.
4. Remove the securing device and place a drape between the thighs or over a client's thighs if inserting the catheter through the penis.
5. Insert a 10-mL syringe into the balloon injection port. Slowly withdraw all of the solution to deflate the balloon totally.
6. After deflation, explain to the client that they may feel a burning sensation as the catheter is withdrawn. Pull the catheter out smoothly and slowly.
7. Assess the client's urinary function by noting the first voiding after catheter removal and documenting the time and amount of voiding for the next 24 hours.

Adapted from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 1189-1191.

3. Irrigate only if prescribed by the surgeon, using strict aseptic technique; a maximum of 5 mL of sterile normal saline (NS) is instilled slowly and gently.
4. If patency cannot be established with the prescribed irrigation, notify the surgeon immediately.

! If the client has a ureteral or nephrostomy tube, monitor output closely; urine output of less than 30 mL/hr or lack of output for more than 15 minutes should be reported to the primary health care provider immediately.

FIG. 17.1 Nephrostomy tube.

V. Urinary Diversion (Fig. 17.1)

- A. Various surgical procedures are performed to create alternative pathways for urine collection and excretion.
- B. Urinary diversion is most often performed when a cystectomy (bladder removal) is performed; however, urinary diversion may be performed with or without cystectomy (bladder removal).
- C. The surgery may be performed in two stages if the client has bladder cancer and the tumor is extensive, with the creation of the urinary diversion first and the cystectomy several weeks later.
- D. If a radical cystectomy is performed, lower extremity lymphedema may occur as a result of lymph node dissection, and impotence may occur in some persons.
- E. Ureterostomy
 1. Ureterostomy may be performed as a palliative procedure if the ureters are obstructed by the tumor.
 2. The ureters are attached to the surface of the abdomen, where the urine flows directly into a drainage appliance; the client must wear a pouch.
 3. Potential problems include infection, skin irritation, and obstruction to urinary flow as a result of strictures at the opening.
- F. Continent internal ileal reservoir
 1. The Kock pouch is a continent internal ileal reservoir created from a segment of the ileum and ascending colon. Other types include the Mainz and Florida pouch systems.
 2. The ureters are implanted into the side of the reservoir, and a special nipple valve is constructed to attach the reservoir to the skin.
 3. Postoperatively, the client will have a urinary catheter in place to drain urine continuously until the pouch has healed.
 4. The urinary catheter is irrigated gently with normal saline to prevent obstruction from mucus or clots.
- G. Sigmoidostomy
 1. With this diversion, urine is diverted to the large intestine so that no stoma is needed.
 2. Urine is excreted with bowel movements.
 3. Bowel incontinence can result.
- H. Conduits
 1. Ureters are implanted into a segment of the ileum or colon, with the formation of an abdominal stoma.
 2. The urine flows into the conduit and is propelled continuously out through the stoma by peristalsis.
 3. The client is required to wear an appliance over the stoma to collect the urine (Box 17.6).
 4. Complications include obstruction, pyelonephritis, leakage at the anastomosis site, stenosis, hydronephrosis, calculi, skin irritation and ulceration, and stomal defects.
- I. Preoperative interventions
 1. Instruct the client in preoperative, operative, and postoperative management, including diet, medications, nasogastric tube placement, IV lines, NPO status, pain control, coughing and deep breathing, leg exercises, and postoperative activity.
 2. Demonstrate appliance application and use for those clients who will have a stoma.
 3. Encourage teach-back; postoperatively, observe the client perform stoma care and appliance changes.
 4. Arrange an enterostomal nurse consult; also arrange for a visit with a person who has undergone a urinary diversion as appropriate and if the client is agreeable to a visit.
 5. Encourage discussion of feelings, including the effects on sexual activities.

⚠ Monitor urinary output closely after bladder surgery. Irrigate the ureteral catheter (if present and if prescribed) gently with the prescribed amount and type of sterile irrigation solution to prevent obstruction. Follow the surgeon's prescriptions and agency policy regarding irrigation.
- J. Postoperative interventions
 1. Monitor vital signs.
 2. Assess incision site.
 3. Assess stoma every hour for the first 24 hours (should be red and moist).
 4. Monitor for edema in the stoma, which may be present in the immediate postoperative period.
 5. Notify the surgeon if the stoma appears dark and dusky (indicates necrosis).

FIG. 17.2 Urinary diversion procedures.

- 6. Monitor for prolapse or retraction of the stoma; notify the surgeon if observed.
- 7. Assess bowel function; monitor for expected return of peristalsis in 2 to 3 days.
- 8. Maintain NPO status as prescribed until bowel sounds return.
- 9. Monitor for continuous urine flow (30 to 60 mL/hr).
- 10. Notify the surgeon if the urine output is less than 30 mL/hr or if no urine output occurs for more than 15 minutes.
- 11. Ureteral stents or catheters, if present, may be in place for 2 to 3 weeks or until healing occurs; maintain stability with catheters to prevent dislodgment.
- 12. Monitor for hematuria.
- 13. Monitor for signs of peritonitis.
- 14. Monitor for bladder distention following a partial cystectomy.
- 15. Monitor for shock, hemorrhage, thrombophlebitis, and lower extremity lymphedema after a radical cystectomy.

BOX 17.5 Self-Irrigation and Catheterization of a Stoma**Irrigation**

- Instruct the client to wash hands and use clean technique.
- Instruct the client to use a catheter and syringe, instill 60 mL of normal saline or water into the reservoir, and aspirate gently or allow to drain.
- Instruct the client to irrigate slowly until the drainage remains free of mucus but to be careful not to overirrigate.

Catheterization

- Instruct the client to wash hands and use clean technique.
- Initially, instruct the client to insert a catheter every 2 to 3 hours to drain the reservoir; during each week thereafter, increase the interval by 1 hour until catheterization is done every 4 to 6 hours.
- Lubricate the catheter well with water-soluble lubricant, and instruct the client never to force the catheter into the reservoir.
- If resistance is met, instruct the client to pause, rotate the catheter, and apply gentle pressure to insert.
- Instruct the client to notify the surgeon if the client is unable to insert the catheter.
- When urine has stopped, instruct the client to take several deep breaths and gently move the catheter in and out 2 to 3 inches (5 to 7.5 cm) to ensure that the pouch is empty.
- Instruct the client to withdraw the catheter slowly and pinch the catheter when withdrawn so that it does not leak urine.
- Instruct the client to carry catheterization supplies with them.

16. Monitor the urinary drainage pouch for leaks, and check skin integrity (see **Box 17.6**).
17. Monitor the pH of the urine because highly alkaline or acidic urine can cause skin irritation and facilitate crystal formation (do not place the dipstick in the stoma); normal pH is 4.0 to 6.0.
18. Instruct the client regarding the potential for urinary tract infection or the development of calculi.
19. Instruct the client to assess the skin for irritation, monitor the urinary drainage pouch, and report any leakage.
20. Encourage the client to express feelings about changes in body image, embarrassment, and sexual dysfunction; the nurse needs to assist the client to acknowledge the change so that adaptation can begin.

**VI. Restorative Care: Promoting Urinary Elimination****A. Fluid intake**

1. In the absence of heart disease and with normal renal function, approximately 2000 to 2300 mL of fluid per day is optimal.

BOX 17.6 Urinary Stoma Care

- Instruct the client to change the appliance in the morning, when urinary production is slowest.
- Collect equipment, remove collection bag, and use water or commercial solvent to loosen adhesive.
- Hold a rolled gauze pad against the stoma to collect and absorb urine during the procedure.
- Cleanse the skin around the stoma and under the drainage bag with mild nonresidue soap and water.
- Inspect the skin for excoriation, and instruct the client to prevent urine from coming into contact with the skin.
- After the skin is dry, apply skin adhesive around the appliance.
- Instruct the client to cut the stoma opening of the skin barrier just large enough to fit over the stoma (no more than 3 mm larger than the stoma).
- Instruct the client that the stoma will begin to shrink, requiring a smaller stoma opening on the skin barrier.
- Apply the skin barrier before attaching the appliance.
- Place the appliance over the stoma and secure in place.
- Encourage self-care; teach the client to use a mirror.
- Instruct the client that the pouch may be drained by a bedside bag or leg bag, especially at night.
- Instruct the client to empty the urinary collection bag when it is one-third full to prevent pulling of the appliance and leakage.
- Instruct the client to check the appliance seal if perspiring occurs.
- Instruct the client to leave the urinary pouch in place as long as it is not leaking and to change it every 5 to 7 days.
- During appliance changes, leave the skin open to air for as long as possible.
- Use a karaya-free product because urine erodes karaya.
- To control odor, instruct the client to drink adequate fluids, wash the appliance thoroughly with soap and lukewarm water, and soak the collection pouch in dilute white vinegar for 20 to 30 minutes; a special deodorant tablet can also be placed into the pouch while it is being worn.
- Instruct the client who takes baths to keep the level of the water below the stoma and to avoid oily soaps.
- If the client plans to shower, instruct the client to direct the flow of water away from the stoma.

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 1056.

2. Adequate intake assists with eliminating particles that collect in the urinary tract.
 3. Setting schedules to consume fluids may be helpful, and fluids should be taken in frequently in small volumes.
 4. Nocturia can be prevented by avoiding fluid intake 2 hours prior to sleep.
- B. Elimination habits**
1. Adhere to the normal voiding routine as much as possible.
 2. Ensure privacy and ask visitors to leave the room to avoid client embarrassment and promote elimination.

3. Use running water to help promote urination and to cover urination sounds.
 4. Assess toileting needs frequently and offer assistance with toileting.
- C. Complete emptying
1. Small volumes of urine may remain in the bladder after urination.
 2. High residual volume increases the risk for incontinence and infection.
 3. A normal voiding position is helpful in ensuring complete bladder emptying.
 4. People with vaginas void more easily in the sitting position, while people with penises do so more easily in a standing position.
 5. Immobilization may inhibit normal voiding because of the need to use a urinal or bedpan; ensure privacy for voiding.
 6. Attempting a second void after the urine flow stops assists with complete emptying; this is also called double voiding.
 7. Assess postvoid residual with a bladder scanner to determine bladder emptying.
- D. Infection prevention
1. Promoting fluid intake, ensuring good perineal hygiene practices, and adhering to regular urination intervals help to prevent infection of the urinary tract.
 2. Wearing cotton underwear and avoiding scented products and tight clothing are recommended; wiping from front to back is also a good hygiene practice for people with vaginas.
- E. Lifestyle changes
1. Avoid foods and drinks that cause bladder irritation, such as coffee, tea, soft drinks, and chocolate, and avoid smoking.
 2. Take measures to avoid constipation or urinary tract infections, including adequate hydration, having good voiding habits, and perineal hygiene.
 3. Elevate the feet in the afternoon for a few hours to promote daytime voiding and eliminate nighttime voiding, particularly for those who have edema in the lower extremities.
- F. Pelvic floor exercises
1. Pelvic floor exercises help clients experiencing urinary incontinence.
 2. Involves contracting the pelvic floor muscles using a structured exercise program; also referred to as Kegel exercises
 3. Pelvic physical therapy may be an option for clients requiring rehabilitation of the pelvic floor muscles.
- G. Bladder training
1. Bladder training helps clients control urinary symptoms, such as urgency and frequency.
 2. Using a journaling method, a schedule is implemented around the times when the client struggles with leaking or incontinence episodes.
3. Inhibition of the urge to void is encouraged by using slow, deep breathing and pelvic floor contractions in quick succession; once the urge subsides, then the client is instructed to go to the bathroom.
 4. Intact cognition is required to implement this strategy.
- H. Toileting schedules
1. Timed or scheduled toileting is very helpful in promoting continence.
 2. Schedules should be set every 2 to 3 hours or at specific times of the day.
 3. This method is helpful for clients with cognitive impairment; it requires consistent caregiving for clients who are functionally unable to adhere to a schedule.
- I. Catheterization
1. May be necessary for clients who experience chronic retention or inability to fully empty the bladder
 2. Principles of asepsis need to be followed for catheterization.
 3. Draining 400 mL of urine with each catheterization is an indicator of a good voiding schedule using this method.
- VII. Bowel Elimination
- A. Bowel assessment
1. Age
 - a. Infants have more rapid peristalsis and smaller stomach capacity, while older adults may have difficulty chewing and swallowing and experience decreased peristalsis.
 - b. Perineal muscle tone and the anal sphincter weaken with aging, which can lead to bowel incontinence.
 2. Dietary and personal habits
 - a. Fiber provides bulk for fecal matter.
 - b. Gas-forming foods such as cabbage, beans, and broccoli can cause bowel distention and increase motility.
 - c. Whole grains and fresh fruit and vegetables help promote peristalsis.
 - d. Adequate fluid intake is important in promoting bowel elimination.
 - e. Reduced fluid and fiber can lead to hard stool and subsequently constipation.
 - f. Determining the best time for defecation based on one's personal schedule helps to promote regular bowel elimination.
 3. Physical activity
 - a. Peristalsis is promoted by physical activity.
 - b. Early mobilization is necessary after procedures and surgeries (unless contraindicated) to prevent constipation.
 - c. Spinal cord injury, chronic illness, and certain neurological diseases can predispose to constipation.

4. Psychological factors
 - a. Prolonged emotional stress can disrupt the digestive process; it usually accelerates digestion and peristalsis.
 - b. Depression can cause decreased peristalsis and lead to constipation.
5. Medications
 - a. Medications can cause a change in bowel elimination as a therapeutic effect or side/adverse effect.
 - b. Laxatives and antidiarrheal agents are indicated for their effect on bowel elimination.
 - c. Opioid analgesics slow peristalsis and can cause constipation.
 - d. Antibiotics can disrupt intestinal flora and can cause diarrhea.
 - e. Some herbal products are known to have an effect on bowel elimination; their use should be approved by the primary health care provider.
6. Positioning
 - a. The squatting or sitting position is the normal position for defecation.
 - b. Exertion of intraabdominal pressure is needed for normal defecation; immobilized clients have difficulty when attempting to defecate lying down.
 - c. When using a bedpan, the head of the bed should be elevated to a position of comfort for the client, if not contraindicated.
7. Pregnancy
 - a. Hormonal changes and the growing fetus can cause constipation during pregnancy.
 - b. Impaction may occur later in the pregnancy due to a mechanical obstruction.
 - c. Medications such as those high in iron can also lead to constipation.
8. Pain: Injuries or tissue disruption in the perianal area due to surgery or other abnormalities can cause suppression of defecation and can lead to constipation.
9. The nurse needs to be alert to clients at risk for bowel alterations and to monitor closely so that measures can be implemented to prevent alterations.

VIII. Bowel Alterations

A. Constipation

1. Characterized by infrequent bowel movements (less than three per week) and the difficult passage of hard, dry stools
2. See [Box 17.7](#) for causes of constipation.

B. Impaction

1. The inability to expel feces related to unrelieved constipation, which can ultimately result in intestinal obstruction
2. Confused and debilitated clients are at highest risk for impaction.

BOX 17.7 Causes of Constipation

- Aging
- Avoiding defecation
- Changes in life routines, such as traveling
- Chronic bowel problems
- Lack of physical activity
- Low fluid and fiber intake
- Neurological conditions
- Pregnancy
- Stress
- Use of opiates

Adapted from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1201.

3. Impaction is characterized by repeated urges to defecate for multiple days without successful defecation.
4. Continuous oozing of liquid stool can be indicative of intestinal obstruction; the primary health care provider is notified if obstruction is suspected.

C. Diarrhea

1. An increased number of stools with the passage of unformed, liquid stool, often associated with digestion and absorption conditions; the client has difficulty controlling the urge to defecate.
2. Gastrointestinal contents pass too quickly, causing an inability for stool to form.
3. Dehydration and electrolyte imbalances can result from diarrhea if the lost fluid is not replaced.

D. Incontinence

1. The inability to control passage of gas and feces
2. Has a significant impact on body image
3. Impaired cognition and other physical conditions, such as neurological conditions, can cause bowel incontinence.
4. Antibiotic therapy, *Clostridium difficile*, and foodborne pathogens are causes of bowel incontinence manifested by loose stool or diarrhea.

E. Flatulence

1. Accumulation of gas in the lumen of the bowel, causing fullness and abdominal cramping, and possibly sharp abdominal pain
2. Gas escapes through the mouth (belching) or the anus (flatus).

F. Hemorrhoids

1. Engorgement and dilation of veins in the rectum lining, internal or external, often causing pain
2. Caused by straining, pregnancy, and certain conditions such as heart or liver failure

- G. Diagnostic tests: Refer to [Chapter 49](#) for more information on diagnostic tests related to bowel elimination.

The ascending colostomy is done for right-sided tumors.

The transverse (double-barrel) colostomy is often used in such emergencies as intestinal obstruction or perforation because it can be created quickly. There are two stomas. The proximal one, closest to the small intestine, drains feces. The distal stoma drains mucus.

The descending colostomy is done for left-sided tumors.

The sigmoid colostomy is done for rectal tumors.

FIG. 17.3 Different locations of colostomies in the colon. (From Ignatavicius, D., Workman, L., Rebar, C., Heimgartner, N. (2021). *Medical-surgical nursing*. (10th ed.). St. Louis: Elsevier.)

IX. Bowel Diversion

A. Ostomies

1. Temporary or permanent procedure that involves pulling part of the intestine through the abdominal wall to assist with the passage of bowel contents

! A stoma that is purple-black in color indicates compromised circulation, requiring immediate surgeon notification.

2. Referred to as either an ileostomy or colostomy, as determined by the location of the bowel affected
3. Ileostomies have a liquid stool because of the location being higher in the gastrointestinal tract.
4. New ostomies can be a major life adjustment, and these clients need consistent follow-up and extended care.
5. Locations of colostomies (Fig. 17.3)

B. Colostomy, ileostomy (see [Clinical Judgment: Take Action Box](#))

1. Preoperative interventions
 - a. Consult with the enterostomal therapist to assist in identifying optimal placement of the ostomy.

- b. Instruct the client in prescribed preoperative diet; bowel preparation with laxatives and/or enemas may be prescribed per surgeon preference.
- c. Intestinal antiseptics and antibiotics may be prescribed per surgeon preference to decrease the bacterial content of the colon and to reduce the risk of infection from the surgical procedure.

2. Postoperative: Colostomy

- a. If a pouch system is not in place, petroleum jelly gauze is usually placed over the stoma to keep it moist, covered with a dry sterile dressing; a pouch system is usually placed on the stoma as soon as possible.
- b. Monitor the pouch system for proper fit and signs of leakage; empty the pouch when one-third full.
- c. Monitor the stoma for size, unusual bleeding, color changes, or necrotic tissue.
- d. Note that the normal stoma color is red or pink, indicating high vascularity.
- e. Note that a pale pink stoma indicates low hemoglobin and hematocrit levels.
- f. Notify the surgeon if the stoma appears dark and dusky (indicates necrosis).

- g. Assess the functioning of the colostomy.
 - h. Expect that stool will be liquid postoperatively but will become more solid, depending on the area of the colostomy.
 - i. Expect liquid stool from an ascending colon colostomy, loose to semiformal stool from a transverse colon colostomy, and near-normal stool from a descending and sigmoid colostomy.
 - j. Fecal matter should not be allowed to remain on the skin.
 - k. Administer analgesics and antibiotics as prescribed.
 1. If a perineal wound is present, irrigate the wound if prescribed, and monitor for signs of infection; provide comfort measures for perineal itching and pain.
 - m. Instruct the client to avoid foods that cause excessive gas formation and odor.
 - n. Instruct the client in stoma care and irrigations as prescribed.
 - o. Instruct the client on when to resume normal activities as prescribed, including work, travel, and sexual intercourse; provide psychosocial support.
3. Postoperative: Ileostomy
- a. Healthy stoma is red in color.
 - b. Notify the surgeon if the stoma appears dark and dusky (indicates necrosis).
 - c. Postoperative drainage will be dark green and progress to yellow as the client begins to eat.
 - d. Stool is liquid.
 - e. Risk for dehydration and electrolyte imbalance exists.

⚡ CLINICAL JUDGMENT: TAKE ACTION

The nurse is performing an assessment on a postoperative client following creation of a colostomy. The client's vital signs are 99.6° F (37.5° C), heart rate 72 beats per minute, respirations 18 breaths per minute, blood pressure 122/78 mm Hg, oxygen saturation 93%. The client's abdomen is slightly distended, and bowel sounds are absent. A collection bag is attached to the client's skin. The nurse assesses the stoma and notes that it is dark blue in color. The nurse would take action and contact the surgeon because a stoma that is dark blue in color indicates a lack of blood supply and possible necrosis.

- C. Ostomy care
- a. Irrigation is sometimes necessary for some clients and may be recommended; irrigation allows for regulation of bowel emptying (Box 17.8).

BOX 17.8 Colostomy Irrigation

Purpose

Irrigation may be recommended for some clients. It involves instilling fluid through the stoma to stimulate bowel emptying.

Description

Irrigation is performed by instilling 500 to 1000 mL of lukewarm tap water through the stoma and allowing the water and stool to drain into a collection bag.

Procedure

- If ambulatory, position the client sitting on the toilet.
- If on bed rest, position the client on the side.
- Hang the irrigation bag so that the bottom of the bag is at the level of the client's shoulder or slightly higher.
- Insert the irrigation tube carefully and without force.
- Begin the flow of irrigation.
- Clamp the tubing if cramping occurs; release the tubing clamp as cramping subsides.
- Avoid frequent irrigations, which can lead to loss of fluids and electrolytes.
- Perform irrigation at about the same time each day.
- Perform irrigation preferably 1 hour after a meal.
- To enhance effectiveness of the irrigation, massage the abdomen gently.

Adapted from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby, pp. 1220-1221.

- b. Pouching: A pouch is used to collect fecal material, protect the skin, and minimize odor.
- c. Nutrition: Appetite may be diminished immediately following creation of a new ostomy; once adjusted to the new ileostomy or colostomy, there are generally no dietary restrictions unless a coexisting condition requires restrictions; adequate fluid intake helps to prevent blockage of the colostomy, and foods that cause gas should be limited.

! There is a risk for fluid volume disturbance with ileostomies because of the liquid nature of the stool and frequent passage of the stool.

X. Restorative Care: Promoting Bowel Elimination

- A. Bowel training
1. Useful in chronic constipation or bowel incontinence
 2. Use of measures to promote defecation (Box 17.9); a schedule is set up to attempt defecation at the same time each day.
 3. A caregiver may be necessary if cognitive limitations are present.
- B. Food and fluid intake
1. A diet high in fiber consisting of whole grains, legumes, fresh fruit and vegetables and adequate fluid intake help to promote defecation and prevent constipation.

BOX 17.9 Measures to Promote Defecation

- Maintain a consistent time for defecation.
- Consume a hot drink or prune juice if allowed.
- Ensure privacy.
- Offer toileting regularly in an unhurried manner.
- Assist the client to lean forward while on the toilet, or provide a stool to elevate the legs while sitting on the toilet (assists with pressure on the abdomen).
- Encourage regular exercise.

From: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1210.

2. Clear liquids and a low-residue diet consisting of white rice, bread, bananas, potatoes, and cereals are helpful in treating diarrhea and in preventing dehydration.

 C. Exercise

1. Exercise stimulates peristalsis and is recommended for a minimum of 150 minutes per week.
2. Ambulation is important, and active and passive range-of-motion exercises for immobilized clients should be done to prevent disruption in bowel elimination.

 D. Incontinence

1. Fecal collection devices (internal or external) may be used for bowel incontinence if the skin is intact.
2. Most useful for clients having frequent liquid stools

 **Maintaining skin integrity is important for the client experiencing diarrhea, bowel incontinence, or if the client has a bowel diversion.**

 E. Laxatives

1. Medications used to promote elimination of stool from the bowel
2. May be needed to promote elimination if other interventions are unsuccessful
3. May be given orally, or rectally in the form of a suppository
4. Should not be used on a long-term basis because of the effect of decreased motility and decreased sensory perception for bowel elimination
5. May also be used for the purpose of diagnostic testing that requires bowel emptying

 F. Antidiarrheals

1. Medications used to decrease muscle tone in the bowel to slow bowel elimination
2. Treatment for diarrhea is directed at the cause (e.g., foodborne, antibiotics, or steroids).
3. Antidiarrheals may also be prescribed when the diarrhea becomes an impairment in daily life.

BOX 17.10 Enema Administration

- Review the prescription and note the reason for administration.
- Perform bowel and abdominal assessment, including last bowel movement, hemorrhoids, abdominal pain or cramping.
- Auscultate for bowel sounds, and inspect and palpate the abdomen for distention.
- Assess for allergies to contents of the enema.
- Perform hand hygiene.
- Provide privacy and use clean technique.
- Have drapes, pads, and a bedpan ready for use.
- Gather and organize enema equipment.
- Explain procedure.
- Raise the bed to a working height, and keep the side rails on the right side of the bed up.
- Position the client in left lateral side-lying position.
- Apply clean gloves.
- Place a waterproof pad with the absorbent side up under the hips and buttocks.
- Separate buttocks and inspect perianal region.
- Remove the plastic cap from the tip of the container.
- Apply water-soluble lubricant as needed; some enemas are already lubricated.
- Expel air from the enema container if needed.
- Insert the lubricated tip of the catheter gently into the anal canal, pointed toward the umbilicus.
- Squeeze and roll the plastic bottle or raise the container to the level of the shoulder and release the clamp, allowing the prescribed amount and type of solution to flow into the rectum.
- Instill all solution from the bottle or container.
- If the client complains of cramping, stop inserting the solution from the bottle or container and ask the client to take some deep breaths; then resume the flow of solution slowly.
- Place layers of toilet tissue around the tube at the anus, and gently withdraw the rectal tube.
- Explain to the client that some distention and cramping are normal and that they should try to retain the solution as long as possible until the urge to defecate occurs.
- Discard the enema container according to agency policy.
- Remove and discard gloves and perform hand hygiene.
- Help the client to the bathroom or commode, or place on the bedpan.
- Instruct the client not to flush the toilet; observe the character of stool.
- Assist with personal care as needed.

Adapted from Potter, P.A., Perry, A.G., Stockert, P., & Hall, A. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 1220-1223.

G. Enemas (**Box 17.10**)

1. Involve the instillation of solution into the rectum and sigmoid colon, resulting in defecation by increasing peristalsis, breaking up the fecal mass, and promoting the defecation reflex
2. Enemas may be prescribed as “high” or “low,” which refers to the height the enema solution is delivered from, which is proportional to the

BOX 17.11 Digital Removal of Stool

- Provide privacy and use clean technique.
- Have drapes, pads, and a bedpan ready for use.
- Position the client in left lateral side-lying position.
- Encourage deep breathing.
- Insert a lubricated, gloved finger into the rectum, and locate the fecal mass.
- Massage around the mass, and break up the mass with the finger.
- Remove small pieces at a time.
- Routinely assess tolerance to the procedure, and monitor the pulse during and after the procedure.

Modified from Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 1216.

pressure exerted on the colon during administration.

⚠ Fluid imbalance is a potential complication of enema administration.

3. Cleansing enemas assist in complete evacuation of feces from the colon and involve the infusion of large amounts into the colon.
4. Types of cleansing enemas include normal saline, soapsuds, and low-volume hypertonic saline enemas.
5. Normal saline enemas are preferred as there is less fluid absorption because it is an isotonic solution.
6. Soapsuds enemas create irritation and thereby stimulate peristalsis.
7. Hypertonic saline enemas are helpful for those who cannot tolerate large volumes of fluid; the Fleet enema is the most common hypertonic saline enema.

⚠ Hypertonic saline enemas are contraindicated in dehydration and for young infants.

8. Tap water enemas stimulate defecation without causing large fluid shifts; however, circulatory overload can occur if the body absorbs too much water; therefore, tap water enemas should be limited to no more than three.
9. Oil retention enemas lubricate the feces and promote defecation in this way; these enemas need to be retained for hours to have the best effect.
10. Digital removal: As a last resort, this method can be used to remove stool that is too large to be passed on its own or passed with other interventions (Box 17.11).

⚠ Digital removal of stool may stimulate the vagus nerve and cause a decrease in the heart rate.

PRACTICE QUESTIONS

1. The nurse is assessing a client with bladder cancer who had a cystectomy and creation of a ureterosomy. Which statement by the client indicates the need for more education about urinary stoma care?
 1. "I change my pouch every week."
 2. "I change the appliance in the morning."
 3. "I empty the urinary collection bag when it is two-thirds full."
 4. "When I'm in the shower, I direct the flow of water away from my stoma."
2. The nurse is providing care for a client with ulcerative colitis who underwent the creation of a transverse colostomy. Which observation requires immediate notification of the surgeon?
 1. Stoma is beefy red and shiny.
 2. Stoma has a purple discoloration.
 3. Skin excoriation is noted around the stoma.
 4. Semiformed stool is noted in the ostomy pouch.
3. A client with ulcerative colitis had a new colostomy created 2 days earlier and is beginning to pass malodorous flatus from the stoma. What is the correct interpretation by the nurse?
 1. This is a normal, expected event.
 2. The client is experiencing early signs of ischemic bowel.
 3. The client should not have the nasogastric tube removed.
 4. This indicates inadequate preoperative bowel preparation.
4. A client with Crohn's disease has just had surgery to create an ileostomy. The nurse assesses the client in the postoperative period for which most frequent complication of this type of surgery?
 1. Folate deficiency
 2. Malabsorption of fat
 3. Intestinal obstruction
 4. Fluid and electrolyte imbalance
5. The staff nurse is observing a new graduate nurse provide indwelling urinary catheter care to an uncircumcised client. Which action by the new graduate nurse would indicate a need for further teaching?
 1. Cleans the catheter proximally to distally with soap and water
 2. Maintains the urinary collection bag below the level of the bladder
 3. Removes a loose catheter anchor and places a new anchor on the lower leg
 4. Uses the nondominant hand to pull back the foreskin to cleanse the urethral meatus with soap and water and returns the foreskin to its normal position

6. The nurse is inserting an indwelling urinary catheter in a client. As the nurse begins to inflate the balloon, the client starts to complain of pain. Which action would the nurse take?
 1. Continue to inflate the balloon.
 2. Deflate the balloon, slightly withdraw the catheter, and attempt to reinflate the balloon.
 3. Deflate the balloon, completely withdraw the catheter, and end the procedure to notify the primary health care provider.
 4. Stop inflating the balloon, allow the saline solution to drain into the syringe, and advance the catheter farther before reinflating the balloon.

7. The surgeon asks the nurse to obtain a urinary catheter that will be used for continuous bladder irrigation. Which urinary catheter would the nurse obtain?
 1. A straight catheter
 2. A Coudé tip catheter
 3. A triple-lumen catheter
 4. A double-lumen catheter

8. A primary health care provider has ordered digital removal of stool for a constipated client. How would the nurse position the client for this procedure?
 1. Prone position
 2. Lithotomy position
 3. Left lateral side-lying position
 4. Right lateral side-lying position

9. The nurse is preparing to irrigate a client's sigmoid colostomy. The nurse would plan for which intervention to perform this procedure?
 1. Instilling 500 to 1000 mL of lukewarm tap water through the stoma
 2. Advising the client to hold the breath if cramping occurs during instillation of the solution
 3. Hanging the irrigation solution so that the bottom of the bag is 18 inches above the client's torso
 4. Inserting the irrigation tube with a small amount of force and a twisting motion into the stoma and unclamping the tubing to allow the solution to flow into the stoma

10. The nurse is teaching a client with a urinary stoma about how to change the collection bag and appliance at home. Which of the following client statements indicates an understanding of the procedure?
 1. "The stoma needs to be cleaned with only water."
 2. "The best time to change the appliance is at night."
 3. "The pouch needs to be changed every 5 to 7 days."
 4. "I'll cut the skin barrier 10 millimeters larger than the stoma."

ANSWERS

1. Answer: 3

Rationale: The urinary collection bag needs to be changed when it is one-third full to prevent pulling of the appliance and leakage. The remaining options identify correct statements about the care of a urinary stoma.

Test-Taking Strategy: Note the **strategic words**, *need for more education*. These words indicate a **negative event query** and the need to select the incorrect client statement. Therefore, eliminate the options that indicate client understanding. Noting the words *two-thirds full* will assist in directing you to the correct option.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Hegmarter, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 398.

2. Answer: 2

Rationale: Ischemia of the stoma would be associated with a dusky or bluish or purple color. A beefy red and shiny stoma is normal and expected. Skin excoriation needs to be addressed and treated but does not require as immediate attention as purple discoloration of the stoma. Semiformed stool is a normal finding.

Test-Taking Strategy: Note the **strategic word**, *immediate*, and focus on the **subject**, the observation that requires surgeon notification. Note the words *purple discoloration* in option 2. Recall that purple indicates ischemia.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Hegmarter, N. (2021). *Medical-surgical nursing: Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Elsevier. p. 1121.

3. Answer: 1

Rationale: As peristalsis returns following creation of a colostomy, the client begins to pass malodorous flatus. This indicates returning bowel function and is an expected event. Within 72 hours of surgery, the client should begin passing stool via the colostomy. Options 2, 3, and 4 are incorrect interpretations.

Test-Taking Strategy: Focus on the **subject**, that the client is passing flatus from the stoma. Think about the normal functioning of the gastrointestinal tract and note the time frame in the question to assist in answering correctly.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 954.

4. Answer: 4

Rationale: A frequent complication that occurs following ileostomy is fluid and electrolyte imbalance. The client requires constant monitoring of intake and output so that measures can be implemented to prevent this from occurring. Losses require replacement by intravenous infusion until the client can tolerate a diet orally. Intestinal obstruction is a less frequent complication. Fat malabsorption and folate deficiency are complications that could occur later in the postoperative period.

Test-Taking Strategy: Note the **strategic word**, *most*. Also note the **subject**, an ileostomy. Remember that ileostomy drainage is liquid, placing the client at risk for fluid and electrolyte imbalance.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 956.

5. Answer: 3

Rationale: Routine catheter care is imperative in the prevention of catheter-associated urinary tract infections (CAUTIs). Meticulous technique needs to be used to prevent the introduction of microorganisms to the urinary tract. For uncircumcised persons, the nurse would retract the foreskin to inspect the urethral meatus for skin irritation and then cleanse the site with warm, soapy water and return the foreskin to its normal position. The catheter tubing needs to be cleaned in a proximal to distal direction. The urinary drainage bag needs to be maintained below the level of the bladder to prevent reflux of urine into the urinary tract. Any loose anchors need to be removed and replaced to ensure that the catheter tubing does not get pulled on, as this could cause trauma to the urethra. However, the anchor needs to be placed on the upper thigh, not the lower leg. Therefore, option 3 is the action that requires a need for further teaching.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. These words indicate a **negative event query** and the need to select the incorrect action. Visualize and think about the components of indwelling urinary catheter care in order to eliminate the correct actions and identify the action that requires further teaching.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1190.

6. Answer: 4

Rationale: The client's pain during inflation of the balloon may be related to the urinary catheter tip being located in the urethra and not the bladder. If the client begins to complain of pain with the inflation of an indwelling urinary catheter balloon, the nurse would allow the fluid injected into the balloon to drain back into the syringe attached to the balloon inflation port. Then, the nurse would advance the catheter farther into the urethra to the bladder, and then attempt to inflate the balloon. Therefore, option 4 is correct.

Test-Taking Strategy: Focus on the **subject**, the procedure for indwelling urinary catheter insertion. Focus on the **data in the question**, and note that the client complains of pain during

balloon inflation. Think about the anatomy of the urinary tract and what this client complaint could mean. Visualize the procedure in order to ascertain between expected and unexpected findings during the procedure and the appropriate actions to take.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1187.

7. Answer: 3

Rationale: Straight catheters are used for intermittent catheterization. Double-lumen catheters are used for indwelling urinary catheterization in which one lumen drains urine in the bladder and the other lumen is used to inflate and deflate the balloon. Triple-lumen catheters are used for continuous bladder irrigation or bladder medication instillation. One lumen is to inflate and deflate the balloon, another lumen is to drain urine and the irrigation solution, and the other lumen instills the irrigation solution into the bladder. A Coudé tip catheter is a catheter with a curved tip at the end that is used to advance the catheter past a hypertrophied prostate, in which using a standard catheter would be difficult. Therefore, option 3 is correct.

Test-Taking Strategy: Focus on the **subject**, the urinary catheter used for continuous bladder irrigation. Visualize the procedure for continuous bladder irrigation. Remember that a triple-lumen catheter is necessary to allow balloon inflation, irrigation solution instillation, and urinary and irrigation solution drainage.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1168.

8. Answer: 3

Rationale: For digital removal of stool, the client would be placed in the left lateral side-lying position, as this position follows the anatomical curvature of the colon. Options 1, 2, and 4 are inappropriate positions for this procedure.

Test-Taking Strategy: Focus on the **subject**, the correct position for performing digital removal of stool. Remember that for this procedure and most procedures involving manipulation of the rectum and sigmoid colon, the left lateral side-lying position is ideal as it follows the normal curvature of the bowel.

Reference: Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1215.

9. Answer: 1

Rationale: Clients with sigmoid colostomies may require irrigation of the stoma to promote regular colon emptying. Irrigation is performed by instilling 500 to 1000 mL of lukewarm tap water through the stoma and then allowing the irrigation solution and stool to drain into a collection bag. The nurse hangs the irrigation solution so that the bottom of the bag is level with the client's shoulder. The nurse inserts the irrigation tube without force into the stoma and unclamps the tubing to allow the solution to flow into the stoma. The nurse would clamp the tubing if cramping occurs and then resume the instillation as tolerated.

Test-Taking Strategy: Focus on the **subject**, irrigation of a sigmoid colostomy. Visualize this procedure to assist in answering correctly. Eliminate option 3 because of the words “18 inches above.” Next eliminate option 4 because the nurse should not “force” tube insertion. To select from the remaining options, eliminate option 2 because of the words “hold the breath.” The client should be encouraged to take slow, deep breaths if cramping occurs.

St. Louis: Elsevier. p. 956; Potter, P., Perry, A.G., Stockert, P.A., & Hall, A.M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1216.

10. **Answer: 3**

Rationale: Clients with urinary diversions need to be educated on the proper care of the urinary stoma. An appliance

with an attached collection bag is placed over the stoma to collect urine. The most ideal time to change the appliance is in the morning, not at night. The stoma needs to be cleaned with both nonresidue soap and water, not just water. The skin barrier needs to be cut no more than 3 millimeters larger than the stoma to prevent urine leakage and irritation of the exposed skin. The pouch needs to be changed every 5 to 7 days. Therefore, option 3 indicates client understanding of the procedure.

Test-Taking Strategy: Focus on the **subject**, care of a urinary diversion or stoma. Visualize a urinary stoma and think about the goals of care. Next, consider the actions in each of the options to answer correctly. This will assist in answering correctly.

UNIT IV

Growth and Development Across the Life Span

Pyramid to Success

Normal growth and development proceed in an orderly, systematic, and predictable pattern, which provides a basis for identifying and assessing an individual's abilities. Understanding the normal path of growth and development across the life span assists the nurse in identifying appropriate and expected human behavior. The Pyramid to Success focuses on Sigmund Freud's theory of psychosexual development, Jean Piaget's theory of cognitive development, Erik Erikson's psychosocial theory, and Lawrence Kohlberg's theory of moral development. Growth and development concepts also focus on the aging process and on physical characteristics, nutritional behaviors, skills, play, and specific safety measures relevant to a particular age group that will ensure a safe and hazard-free environment. When a question is presented on the NCLEX-RN® examination, if an age is identified in the question, note the age and think about the associated growth and developmental concepts to answer the question correctly.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

- Acting as a client advocate
- Communicating with the interprofessional health care team
- Ensuring home safety and security plans
- Ensuring that informed consent has been obtained for invasive treatments or procedures
- Maintaining confidentiality
- Preventing accidents and errors considering risks related to age
- Prioritizing hypotheses in the care of a client based on client needs

- Providing care in accordance with ethical and legal standards
- Providing care using a nonjudgmental approach
- Recognizing cues that present a risk for injury
- Respecting client and family needs, based on their preferences
- Upholding the client's rights

Health Promotion and Maintenance

- Discussing high-risk behaviors and lifestyle choices
- Generating solutions to assist the client to modify high-risk behaviors
- Identifying changes that occur as a result of the aging process
- Identifying developmental stages and transitions
- Maintaining health and wellness and self-care measures
- Monitoring growth and development
- Performing the necessary health and physical assessment techniques based on age
- Providing client and family education
- Respecting health care beliefs and preferences

Psychosocial Integrity

- Assessing for abuse and neglect
- Considering grief and loss issues and end-of-life care
- Identifying coping mechanisms
- Identifying cultural, religious, and spiritual practices and beliefs of the client and appropriate support systems
- Identifying loss of quantity and quality of relationships with the older client
- Monitoring for adjustment to potential deterioration in physical and mental health and well-being in the older client
- Monitoring for changes and adjustment in role function in the older client (threat to independent functioning)
- Monitoring for sensory and perceptual alterations
- Providing resources for the client and family

Physiological Integrity

Administering medication safely and teaching the client about prescribed medications
Evaluating outcomes of care
Identifying practices or restrictions related to procedures and treatments
Monitoring for alterations in body systems and the related risks associated with the client's age

Providing basic care and comfort needs

Providing interventions compatible with the client's age; cultural, spiritual, religious, and health care beliefs; education level; and language
Recognizing cues that indicate the need for interventions
Taking action to meet the client's needs based on growth and development

CHAPTER 18

Theories of Growth and Development

Linda A. Silvestri, PhD, RN, FAAN

Angela E. Silvestri, PhD, APRN, FNP-BC, CNE

PRIORITY CONCEPTS Development, Health Promotion

I. Psychosocial Development: Erik Erikson

- A. The theory
1. Erikson's theory of psychosocial development describes the human life cycle as a series of eight developmental stages from birth to death.
 2. Each stage presents a psychosocial crisis in which the goal is to integrate physical, maturation, and societal demands.
 3. The result of one stage may not be permanent, but can be changed by experience(s) later in life.
 4. The theory focuses on psychosocial tasks that should be accomplished throughout the life cycle.
- B. Psychosocial development: Occurs through a life-long series of crises affected by social and cultural factors

! According to Erikson's theory of psychosocial development, each psychosocial crisis needs to be resolved for the child or adult to progress emotionally. Unsuccessful resolution can leave the person emotionally disabled.

- C. Stages of psychosocial development (Table 18.1)
- D. Interventions to assist the client in achieving Erikson's stages of development (Box 18.1; see Clinical Judgment: Generate Solutions Box)

⚡ CLINICAL JUDGMENT: GENERATE SOLUTIONS

A parent of a 3-year-old tells the clinic nurse that the child is rebelling constantly and having temper tantrums and that as parents they do not know what to do about it. Using Erikson's psychosocial development theory, the nurse generates solutions for the parents and plans to provide the following recommendations:

- Set limits on the child's behavior.
- Address the child's behavior when the child has a temper tantrum.
- Provide a simple explanation of why the behavior is unacceptable.

II. Cognitive Development: Jean Piaget

- A. The theory
1. Piaget's theory of cognitive development defines cognitive acts as ways in which the mind organizes and adapts to its environment (i.e., "mental mapping").
 2. *Schema* refers to an individual's cognitive structure or framework of thought.
 3. Schemata
 - a. Schemata are categories that an individual forms in their mind to organize and understand the world.

TABLE 18.1 Erik Erikson's Stages of Psychosocial Development

Age	Psychosocial Crisis	Task	Resolution of Crisis	
			Successful	Unsuccessful
Infancy (birth to 18 mo)	Trust versus mistrust	Attachment to the primary caregiver	Trust in persons; faith and hope about the environment and future	General difficulties relating to persons effectively; suspicion; trust-fear conflict, fear of the future
Early childhood (18 mo to 3 yr)	Autonomy versus shame and doubt	Gaining some basic control over self and environment	Sense of self-control and adequacy; willpower	Independence-fear conflict; severe feelings of self-doubt; lack self-control
Late childhood (3-6 yr)	Initiative versus guilt	Becoming purposeful and directive	Ability to initiate one's own activities; sense of purpose	Aggression-fear conflict; sense of inadequacy or guilt
School age (6-12 yr)	Industry versus inferiority	Developing social, physical, and learning skills	Competence; ability to learn and work	Sense of inferiority; difficulty learning and working
Adolescence (12-20 yr)	Identity versus role confusion	Developing sense of identity	Sense of personal identity	Unsure about one's identity; have a weak sense of self, experience role confusion, and are confused about the future
Early adulthood (20-35 yr)	Intimacy versus isolation	Establishing intimate bonds of love and friendship	Ability to love deeply and commit oneself	Emotional isolation, egocentricity
Middle adulthood (35-65 yr)	Generativity versus stagnation	Fulfilling life goals that involve family, career, and society	Ability to give and care for others	Self-absorption; inability to grow as a person
Later adulthood (65 yr to death)	Integrity versus despair	Looking back over one's life and accepting its meaning	Sense of integrity and fulfillment	Dissatisfaction with life

Adapted from Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders.

Sutton, J. (Reviewer 12/11/2020). *Erik Erikson's Stages of psychosocial development explained*. [PositivePsychology.com](https://positivepsychology.com/erikson-stages/). Retrieved 12/15/2020 at <https://positivepsychology.com/erikson-stages/>.

BOX 18.1 Interventions to Assist the Client in Achieving Erikson's Stages of Development

Infancy

Hold and touch the infant frequently.
Offer comfort after painful procedures.
Meet the infant's needs for food, hygiene, and comfort.
Encourage parents to play an active role while the infant is hospitalized.

Early Childhood

Allow self-feeding opportunities.
Encourage the child to remove and put on own clothes.
Allow the child to make choices, ensuring safety.

Late Childhood

Offer medical equipment for play.
Respect the child's choices and expressions of feelings.

School Age

Encourage the child to continue schoolwork while hospitalized.
Encourage the child to bring favorite activities to the hospital.

Adolescence

Take the health history and perform examinations without the parents present.
Allow the adolescent a choice in the plan of care.

Early Adulthood

Include support from the client's partner or significant other, including family support.
Assist with rehabilitation and contacting support services as needed before return to work.

Middle Adulthood

Assist in choosing creative ways to foster social development.
Encourage volunteer activities.

Later Adulthood

Listen attentively to reminiscence stories about their life's accomplishments.
Assist with making changes to living arrangements.

- b. A young child has only a few schemata with which to understand the world; gradually, these are increased in number.
 - c. Adults use a wide variety of schemata to understand the world.
4. Assimilation
 - a. Assimilation is the ability to incorporate new ideas, objects, and experiences into the framework of one's thoughts.
 - b. The growing child will perceive and give meaning to new information according to what is already known and understood.
 5. Accommodation
 - a. Accommodation is the ability to change a schema to introduce new ideas, objects, or experiences.
 - b. Accommodation changes the mental structure so that new experiences can be added.
-  B. Stages of cognitive development
1. Sensorimotor stage
 - a. Birth to 2 years
 - b. Development proceeds from reflex activity to imagining and solving problems through the senses and movement.
 - c. The **infant** or toddler learns about reality and how it works.
 - d. The infant or toddler does not recognize that objects continue to be in existence if they are out of the visual field.
 2. Preoperational stage
 - a. 2 to 7 years
 - b. The child learns to think in terms of past, present, and future.
 - c. The child moves from knowing the world through sensation and movement to prelogical thinking and finding solutions to problems.
 - d. The child is egocentric.
 - e. The child is unable to conceptualize and requires concrete examples.
 3. Concrete operational
 - a. 7 to 11 years
 - b. The child is able to classify, order, and sort facts.
 - c. The child moves from prelogical thought to solving concrete problems through logic.
 - d. The child begins to develop abstract thinking.
 - e. The child is less egocentric and thinks about how others may view a situation.
 4. Formal operational
 - a. 11 years to adulthood
 - b. The person is able to think abstractly and logically.
 - c. Logical thinking is expanded to include solving abstract and concrete problems.

III. Moral Development: Lawrence Kohlberg

- A. Moral development
 1. Moral development is a complicated process involving the acceptance of the values and rules of society in a way that shapes behavior.
 2. Moral development is classified in a series of levels and behaviors.
 3. Moral development is sequential.
 4. Stages or levels of moral development cannot be skipped.
- B. Levels of moral development (Box 18.2)

IV. Psychosexual Development: Sigmund Freud

- A. Components of the theory (Box 18.3)
- B. Levels of awareness
 1. Unconscious level of awareness
 - a. The unconscious is not logical and is governed by the Pleasure Principle, which refers to seeking immediate tension reduction.
 - b. Memories, feelings, thoughts, or wishes are repressed and are not available to the conscious mind.
 - c. These repressed memories, thoughts, or feelings, if made prematurely conscious, can cause anxiety.
 2. Preconscious level of awareness
 - a. The preconscious is called the *subconscious*.
 - b. The preconscious includes experiences, thoughts, feelings, or desires that might not be in immediate awareness but can be recalled to consciousness.
 - c. The subconscious can help repress unpleasant thoughts or feelings and can examine and censor certain wishes and thinking.
 3. Conscious level of awareness
 - a. The conscious mind is logical and is regulated by the Reality Principle.
 - b. Consciousness includes all experiences that are within an individual's awareness and that the individual is able to control and includes all information that is remembered easily and is immediately available to an individual.
- C. Agencies of the mind: id, ego, and superego

 The id, ego, and superego are the three systems of personality. These psychological processes follow different operating principles. In a mature and well-adjusted personality, they work together as a team under the leadership of the ego.

1. The id
 - a. Source of all drives, present at birth; operates according to the Pleasure Principle
 - b. Does not tolerate uncomfortable states and seeks to discharge the tension and return to a more comfortable, constant level of energy

BOX 18.2 Moral Development: Lawrence Kohlberg**Level One: Preconventional Morality****Stage 0 (Birth to 2 Years): Egocentric Judgment**

The infant has no awareness of right or wrong.

Stage 1 (2 to 4 Years): Punishment-Obedience Orientation

At this stage, children cannot reason as mature members of society.

Children view the world in a selfish way, with no real understanding of right or wrong.

The child obeys rules and demonstrates acceptable behavior to avoid punishment and to avoid displeasing those who are in power, and because the child fears punishment from a superior force, such as a parent.

A toddler typically is at the first substage of the preconventional stage, involving punishment and obedience orientation, in which the toddler makes judgments based on avoiding punishment or obtaining a reward.

Physical punishment and withholding privileges tend to give the toddler a negative view of morals.

Withdrawing love and affection as punishment leads to feelings of guilt in the toddler.

Appropriate discipline includes providing simple explanations of why certain behaviors are unacceptable, praising appropriate behavior, and using distractions when the toddler is headed for an unsafe action.

Stage 2 (4 to 7 Years): Instrumental Relativist Orientation (Individualism and Exchange)

The child conforms to rules to obtain rewards or have favors returned—e.g., “What is in it for me?”

The child’s moral standards are those of others, and the child observes them either to avoid punishment or obtain rewards.

A preschooler is in the preconventional stage of moral development.

In this stage, conscience emerges and the emphasis is on external control.

Level Two: Conventional Morality

The child conforms to rules to please others.

The child has increased awareness of others’ feelings.

A concern for social order begins to emerge.

A child views good behavior as that which those in authority will approve.

If the behavior is unacceptable, the child feels guilty.

Stage 3 (7 to 10 Years): Good Boy or Nice Girl Orientation

Conformity occurs to avoid disapproval or dislike by others.

This stage involves living up to what is expected by individuals close to the child or what individuals generally expect of others in their roles such as daughter, son, brother, sister, and friend.

Being good is important and is interpreted as having good motives and showing concern about others.

Being good also means maintaining mutual relationships, such as trust, loyalty, respect, and gratitude.

Stage 4 (10 to 12 Years): Law and Order Orientation

The child considers society as a whole when making judgments. Emphasis is on obeying laws to maintain social order.

Moral reasoning develops as the child shifts the focus of living to society.

The school-age child is at the conventional level of the conformity stage and has an increased desire to please others.

The child observes and to some extent internalizes the standards of others.

The child wants to be considered “good” by those individuals whose opinions matter to the child.

Level Three: Postconventional Morality

The individual focuses on individual rights and principles of conscience.

The focus is on concerns regarding what is best for all.

Stage 5: Social Contract and Legalistic Orientation

The person is aware that others hold a variety of values and opinions and that most values and rules are relative to the group.

The adolescent in this stage gives and takes and does not expect to get something without paying for it.

At this stage, the person may disobey rules if the rules are perceived as inconsistent with the individual’s personal values.

Stage 6: Universal Ethical Principles Orientation

Conformity is based on universal principles of justice and occurs to avoid self-condemnation.

This stage involves following self-chosen ethical principles. The development of the postconventional level of morality occurs in the adolescent at about age 13 years, marked by the development of an individual conscience and a defined set of moral values.

The adolescent can now acknowledge a conflict between two socially accepted standards and try to decide between them.

Control of conduct is now internal in standards observed and in reasoning about right and wrong.

Adapted from: Kurt, S. “Stages of Moral Development – Lawrence Kohlberg,” in *Educational Technology*, August 17, 2020. Retrieved from <https://educationaltechnology.net/stages-of-moral-development-lawrence-kohlberg/>. Kohlberg, L. (Oct 1974). “Education, Moral Development and Faith.” *Journal of Moral Education*. 4 (1): 5–16. doi:10.1080/0305724740040102.

BOX 18.3 Components of Sigmund Freud’s Psychosexual Development Theory

- Levels of awareness
- Agencies of the mind (id, ego, superego)
- Concept of anxiety and defense mechanisms
- Psychosexual stages of development

- c. Acts immediately in an impulsive, irrational way and pays no attention to the consequences of its actions; therefore, often behaves in ways harmful to self and others
- d. The primary process is a psychological activity in which the id attempts to reduce tension.

- e. The primary process by itself is not capable of reducing tension; therefore, a secondary psychological process must develop if the individual is to survive. When this occurs, the structure of the second system of the personality, the ego, begins to take form.
2. The ego
 - a. Functions include reality testing and problem solving; follows the Reality Principle
 - b. Begins its development during the fourth or fifth month of life
 - c. Emerges out of the id and acts as an intermediary between the id and the external world
 - d. Emerges because the needs, wishes, and demands of the id require appropriate exchanges with reality
 - e. The ego distinguishes between things in the mind and things in the external world.
3. The superego
 - a. Necessary part of socialization that develops during the phallic stage at 3 to 6 years of age
 - b. Develops from interactions with the child's parents during the extended period of childhood dependency
- c. Includes internalization of the values, ideals, and moral standards of parents and society
- d. Superego consists of the conscience and the ego ideal.
- e. Conscience refers to capacity for self-evaluation and criticism; when moral codes are violated, the conscience punishes the individual by instilling guilt.
- D. Anxiety and defense mechanisms
 1. The ego develops defenses or defense mechanisms to fight off anxiety.
 2. Defense mechanisms operate on an unconscious level, except for suppression, so the individual is not aware of their operation.
 3. Defense mechanisms deny, falsify, or distort reality to make it less threatening.
 4. An individual cannot survive without defense mechanisms; however, if the individual becomes too extreme in distorting reality, interference with healthy adjustment and personal growth may occur.
- E. Psychosexual stages of development (Box 18.4)
 1. Human development proceeds through a series of stages from infancy to adulthood.

BOX 18.4 Freud's Psychosexual Stages of Development

Oral Stage (Birth to 1 Year)

During this stage, the infant is concerned with self-gratification.

The infant is all id, operating on the Pleasure Principle and striving for immediate gratification of needs.

When the infant experiences gratification of basic needs, a sense of trust and security begins.

The ego begins to emerge as the infant begins to see self as separate from the caregiver; this marks the beginning of the development of a sense of self.

Anal Stage (1 to 3 Years)

Toilet training occurs during this period, and the child gains pleasure from learning to control their bodily needs. It provides a sense of accomplishment and independence.

The conflict of this stage is between those demands from society and the parents and the sensations of pleasure associated with the anus.

The child begins to gain a sense of control over instinctive drives and learns to delay immediate gratification to gain a future goal.

Phallic Stage (3 to 6 Years)

The child experiences pleasurable and conflicting feelings associated with the genital organs.

The pleasures of masturbation and the fantasy life of children set the stage for the Oedipus complex.

The child's unconscious sexual attraction to and wish to possess the parent of the opposite sex, the hostility and desire to remove the parent of the same sex, and the subsequent guilt about these wishes constitute the conflict the child faces.

The conflict is resolved when the child begins to identify with the parent of the same sex.

The emergence of the superego is the solution to and the result of these intense impulses.

Latency Stage (6 to 12 Years)

The latency stage is a tapering off of conscious biological and sexual urges.

The sexual impulses are channeled and elevated into a more culturally accepted level of activity such as intellectual pursuits and social communication.

Growth of ego functions and the ability to care about and relate to others outside the home is the task of this stage of development.

Genital Stage (12 Years and Beyond)

The genital stage emerges at adolescence with the onset of puberty, when the genital organs mature.

The individual gains gratification from their own body.

During this stage, the individual develops satisfying sexual and emotional relationships.

The individual plans life goals and gains a strong sense of personal identity.

Adapted from: McLeod, S. A. (2018, April 5). What are the most interesting ideas of Sigmund Freud? *Simply Psychology*. <https://www.simplypsychology.org/Sigmund-Freud.html>.

McLeod, S. A. (2019, July 18). Psychosexual stages. *Simply Psychology*. <https://www.simplypsychology.org/psychosexual.html>.

2. Each stage is characterized by the inborn tendency of all individuals to reduce tension and seek pleasure.
3. Each stage is associated with a particular conflict that must be resolved before the child can move successfully to the next stage.
4. Experiences during the early stages determine an individual's adjustment patterns and the personality traits that the individual has as an adult.
3. This stage is characterized by repression of sexuality.
4. This stage is associated with identification with the same-sex parent.
5. The nurse is preparing to describe Piaget's cognitive developmental theory to pediatric nursing staff. The nurse would plan to tell the staff that which child behavior is characteristic of the formal operations stage?
 1. The child's basic abilities to think abstractly and problem-solve are similar to an adult's.
 2. The child learns to think in a concrete fashion and expects others to view the world in the same way.
 3. The child begins to understand the environment and conceptualize objects that are no longer visible.
 4. The child is able to classify, order, and sort facts and is able to see a variety of solutions to a problem.

PRACTICE QUESTIONS

1. The clinic nurse is preparing to explain the concepts of Kohlberg's theory of moral development with a parent. The nurse would plan to tell the parent that which factor motivates good and bad actions for the child at the preconventional level?
 1. Peer pressure
 2. Social pressure
 3. Parents' behavior
 4. Punishment and reward
2. The nurse is preparing to provide instructions to new parents regarding the psychosocial development of the newborn infant. Using Erikson's psychosocial development theory, the nurse would instruct the parents to take which measure?
 1. Allow the newborn infant to signal a need.
 2. Anticipate all needs of the newborn infant.
 3. Attend to the newborn infant immediately when crying.
 4. Avoid the newborn infant during the first 10 minutes of crying.
3. The nurse notes that a 6-year-old child does not recognize that objects exist when the objects are outside of the visual field. Based on this observation, which action would the nurse take?
 1. Report the observation to the pediatrician.
 2. Move the objects in the child's direct field of vision.
 3. Teach the child how to visually scan the environment.
 4. Provide additional lighting for the child during play activities.
4. A nursing student is preparing to present a clinical conference to peers regarding Freud's psychosexual stages of development, specifically the anal stage. The student would plan to explain to the group that which characteristic relates to the anal stage?
 1. This stage is associated with toilet training.
 2. This stage is characterized by oral gratification.
6. The parent of an 8-year-old child tells the clinic nurse of a concern that the child seems to be more attentive to friends than anything else. Using Erikson's psychosocial development theory, the nurse would plan to make which response?
 1. "You need to be concerned."
 2. "You need to monitor the child's behavior closely."
 3. "At this age, children are developing their own personalities."
 4. "You need to provide more praise to the child to stop this behavior."
7. The nurse educator is preparing to conduct a teaching session about school-age children regarding the theories of growth and development and plans to discuss Kohlberg's theory of moral development. What information would the nurse include in the session? Select all that apply.
 - 1. Individuals move through all six stages in a sequential fashion.
 - 2. Moral development progresses in relationship to cognitive development.
 - 3. A person's ability to make moral judgments develops over a period of time.
 - 4. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior.
 - 5. In stage 1 (punishment-obedience orientation), children are expected to reason as mature members of society.
 - 6. In stage 2 (instrumental-relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

ANSWERS

1. Answer: 4

Rationale: In the preconventional stage, morals are thought to be motivated by punishment and reward. If the child is obedient and is not punished, then the child is being moral. The child sees actions as good or bad. If the child's actions are good, the child is praised. If the child's actions are bad, the child is punished. Options 1, 2, and 3 are not associated factors for this stage of moral development.

Test-Taking Strategy: Eliminate options 1 and 2; they are **comparable or alike** because peer pressure is the same as social pressure. Focus on the **subject**, the factor that motivates good and bad actions, to select from the remaining options.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 465; Varcарolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders. p. 26.

2. Answer: 1

Rationale: According to Erikson, the caregiver should not try to anticipate the newborn infant's needs at all times but needs to allow the newborn infant to signal needs. If a newborn infant is not allowed to signal a need, the newborn will not learn how to control the environment. Erikson believed that a delayed or prolonged response to a newborn infant's signal would inhibit the development of trust and lead to mistrust of others.

Test-Taking Strategy: Focus on the **subject**, psychosocial development of the newborn infant. Eliminate options 2 and 4 because of the **closed-ended words** *all* and *avoid* in these options. Use knowledge about Erikson's theory to select correctly from the remaining options.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 344; Varcарolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders. pp. 20-21.

3. Answer: 1

Rationale: According to Jean Piaget's theory of cognitive development, it is normal for the infant or toddler not to recognize that objects continue to be in existence if out of the visual field; however, this is abnormal for the 6-year-old. If a 6-year-old child does not recognize that objects still exist even when outside the visual field, the child is not progressing normally through the developmental stages. The nurse would report this finding to the pediatrician so that both medical and psychosocial follow-up can be initiated. Options 2, 3, and 4 delay necessary follow-up and treatment.

Test-Taking Strategy: Focus on the **data in the question**. Also, note the age of the child and think about developmental concepts related to this age. Noting that the child is unable to recognize that objects continue to be in existence even if out of the visual field will direct you to the correct option. Also, note that options 2, 3, and 4 are **comparable or alike** and are interventions that will delay follow-up for an abnormal observation.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 463; Varcарolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders. pp. 25-26.

4. Answer: 1

Rationale: In general, toilet training occurs during the anal stage. According to Freud, the child gains pleasure from the elimination of feces and from their retention. Option 2 relates to the oral stage. Option 3 relates to the latency period. Option 4 relates to the phallic stage.

Test-Taking Strategy: Focus on the **subject**, the anal stage of Freud's psychosexual stages of development. Note the relationship between the words *anal* in the question and *toilet training* in the correct option.

References: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 136; Varcарolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders. p. 20.

5. Answer: 1

Rationale: In the formal operations stage, the child's basic abilities to think abstractly and problem-solve are similar to an adult's. Option 2 identifies the preoperational stage; the child learns to think in a concrete fashion and expects others to view the world in the same way, called egocentric thinking. Option 3 identifies the sensorimotor stage; object permanence is achieved around 9 months of age and the child can conceptualize objects that are no longer visible. Option 4 identifies the concrete operational stage; the child is able to see another's point of view and is able to classify, order, and sort facts and see a variety of solutions to a problem.

Test-Taking Strategy: Focus on the **subject**, the formal operational stage of Piaget's cognitive developmental theory. Specific knowledge about this stage is needed to answer the question. Also, note the relationship between the **subject** and the description in the correct option. Remember that in the formal operations stage, the child has the ability to think abstractly and logically.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 530; Varcарolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders. p. 25.

6. Answer: 3

Rationale: According to Erikson, during school-age years (6 to 12 years of age), the child begins to move toward peers and friends and away from the parents for support. The child also begins to develop special interests that reflect their own developing personality instead of the parents'. Therefore, options 1, 2, and 4 are incorrect responses.

Test-Taking Strategy: Use knowledge of Erikson's psychosocial development theory related to middle childhood and school-age years. Options 1 and 2 can be eliminated first because they are **comparable or alike** and indicate that the parent should be concerned about the child. Eliminate option 4 next because although praising the child for accomplishments

is important at this age, the behavior that the child is exhibiting is normal.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 462; Varcarolis, E., & Fosbre, C. (2021). *Essentials of psychiatric mental health nursing: A communication approach to evidence-based care*. (4th ed.). St. Louis: Saunders. pp. 20-21.

7. Answer: 2, 3, 4, 6

Rationale: Kohlberg's theory states that individuals move through stages of development in a sequential fashion but that not everyone reaches stages 5 and 6 in their development of personal morality. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior. It states that moral development progresses in relationship to cognitive development and that a person's ability to make moral judgments develops over

a period of time. In stage 1, ages 2 to 3 years (punishment-obedience orientation), children cannot reason as mature members of society. In stage 2, ages 4 to 7 years (instrumental-relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

Test-Taking Strategy: Read each option carefully. Recalling that the theory provides a framework for understanding how individuals determine a moral code to guide their behavior and recalling the ages associated with each stage will assist in answering the question. Also noting the **closed-ended word all** in option 1 and the word *mature* in option 5 will assist in eliminating these options.

CHAPTER 19

Growth, Development, and Stages of Life

Contributor: Lisa Nicholas, MSN, RN

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS Development, Family Dynamics

I. The Hospitalized Infant and Toddler

A. Separation anxiety

1. Protest
 - a. Crying, screaming, searching for a parent; avoidance and rejection of contact with strangers
 - b. Verbal attacks on others
 - c. Physical fighting: Kicking, biting, hitting, pinching
2. Despair
 - a. Withdrawn, depressed, uninterested in the environment
 - b. Loss of newly learned skills
3. Detachment
 - a. Detachment is uncommon and occurs only after lengthy separations from the parent.
 - b. Superficially, the toddler appears to have adjusted to the loss.
 - c. During the detachment phase, the toddler again becomes more interested in the environment, plays with others, and seems to form new relationships; this behavior is a form of resignation and is not a sign of contentment.
 - d. The toddler detaches from the parent in an effort to escape the emotional pain of desiring the parent's presence.
 - e. During the detachment phase, the toddler copes by forming shallow relationships with others, becoming increasingly self-centered, and attaching primary importance to material objects.
 - f. Detachment is the most serious phase because reversal of the potential adverse effects

is less likely to occur once detachment is established.

- g. In most situations, the temporary separation imposed by hospitalization does not cause such prolonged parental absence that the toddler enters into detachment.

B. Fear of injury and pain: Affected by previous experiences, separation from parents, and preparation for the experience

C. Loss of control

1. Hospitalization, with its own set of rituals and routines, can severely disrupt the life of a toddler.
2. The lack of control often is exhibited in behaviors related to feeding, toileting, playing, and bedtime.
3. The toddler may demonstrate regression.

D. Interventions

1. Provide therapeutic touch, and speak softly to the infant.
2. Provide opportunities for sucking and oral stimulation for the infant, using a pacifier if the infant is NPO (nothing by mouth).
3. Provide stimulation, if appropriate, for the infant, using objects of contrasting colors and textures, such as age-appropriate toys.
4. Provide choices as much as possible to the toddler to enable them to have some control.
5. Approach the toddler with a positive attitude.
6. Allow the toddler to express feelings of protest.
7. Encourage toddlers to talk about parents or others in their lives.
8. Accept regressive behavior without ridiculing the toddler.

9. Provide the toddler with favorite and comforting objects.
10. Utilize **play** therapy for the toddler.
11. Allow the toddler as much mobility as possible.
12. Anticipate temper tantrums from the toddler, and maintain a safe environment for physical acting out.
13. Employ pain reduction techniques, as appropriate.

 For the hospitalized toddler, provide routines and rituals as close as possible to what they are used to at home.

II. The Hospitalized Preschooler (see Clinical Judgment: Take Action Box)

A. Separation anxiety

1. Separation anxiety is generally less obvious and less serious than in the toddler.
2. As stress increases, the preschooler's ability to separate from the parents decreases.
3. Protest
 - a. Protest is less direct and aggressive than in the toddler.
 - b. The preschooler may displace feelings onto others.
4. Despair
 - a. The preschooler reacts in a manner similar to that of the toddler.
 - b. The preschooler is quietly withdrawn, depressed, and uninterested in the environment.
 - c. The child exhibits loss of newly learned skills.
 - d. The preschooler becomes generally uncooperative, refusing to eat or take medication.
 - e. The preschooler repeatedly asks when the parents will be visiting.
5. Detachment: Similar to the toddler

B. Fear of injury and pain

1. The preschooler has a general lack of understanding of body integrity.
2. The child fears invasive procedures and mutilation.
3. The child imagines things to be much worse than they are.
4. Preschoolers believe that they are ill because of something they did or thought.

C. Loss of control

1. The preschooler likes familiar routines and rituals and may show regression if not allowed to maintain some control.
2. Preschoolers' egocentric and magical thinking limits their ability to understand events, because they view all experiences from their own self-referenced (egocentric) perspective.
3. The child has attained a good deal of independence and self-care at home and may expect that to continue in the hospital.

CLINICAL JUDGMENT: TAKE ACTION

The nurse is caring for a hospitalized preschool child who is very apprehensive. To promote comfort for the child, the nurse would take the following actions:

- Provide a safe and secure environment.
- Take time to communicate with the child.
- Allow the child to express feelings such as anxiety, fear, or anger.
- Accept any regressive behavior.
- Assist the preschooler with moving from regressive to appropriate behaviors.
- Encourage rooming-in with parents or leaving a favorite toy with the child.
- Allow mobility and provide play and diversional activities.
- Encourage interaction for the preschooler with other children of the same age if possible.
- Encourage the preschooler to be independent.
- Explain procedures simply on the preschooler's level.
- Avoid intrusive procedures when possible.

D. Interventions

1. Provide a safe and secure environment.
2. Take time for communication.
3. Allow the preschooler to express anger.
4. Acknowledge fears and anxiety.
5. Accept regressive behavior; assist the preschooler in moving from regressive to appropriate behaviors according to age.
6. Encourage rooming-in or leaving a favorite toy.
7. Allow mobility and provide **play** and diversional activities.
8. Place the preschooler with other children of the same age if possible.
9. Encourage the preschooler to be independent.
10. Explain procedures simply, on the preschooler's level.
11. Avoid intrusive procedures when possible.
12. Allow the wearing of underpants.

III. The Hospitalized School-Age Child

A. Separation anxiety

1. The school-age child is accustomed to periods of separation from the parents, but as stressors are added, the separation becomes more difficult.
2. The child is more concerned with missing school and the fear that friends will forget them.
3. Usually, the stages of behavior of protest, despair, and detachment do not occur with school-age children.

B. Fear of injury and pain

1. The school-age child fears bodily injury and pain.
2. The child fears illness itself, disability, death, and intrusive procedures in genital areas.

3. The child is uncomfortable with any type of sexual examination.
 4. The child groans or whines, holds rigidly still, and communicates about pain.
- C. Loss of control
1. The child is usually highly social, independent, and involved with activities.
 2. The child seeks information and asks relevant questions about tests and procedures and the illness.
 3. The child associates their actions with the cause of the illness.
 4. The child may feel helpless and dependent if physical limitations occur.
- D. Interventions
1. Encourage rooming-in.
 2. Focus on the school-age child's abilities and needs.
 3. Encourage the school-age child to become involved with their own care.
 4. Accept regression but encourage independence.
 5. Provide choices to the school-age child.
 6. Allow expression of feelings verbally and non-verbally.
 7. Acknowledge fears and concerns and allow for discussion.
 8. Explain all procedures, using body diagrams or outlines.
 9. Provide privacy.
 10. Avoid intrusive procedures if possible.
 11. Allow the school-age child to wear underpants.
 12. Involve the school-age child in activities appropriate to the developmental level and illness.
 13. Encourage the school-age child to contact friends.
 14. Provide for educational needs.
 15. Use appropriate interventions to relieve pain.

IV. The Hospitalized Adolescent

- A. Separation anxiety
1. Adolescents are not sure whether they want their parents with them when they are hospitalized.
 2. Adolescents become upset if friends go on with their lives, excluding them.

 For the hospitalized adolescent, separation from friends is a source of anxiety.

- B. Fear of injury and pain
1. Adolescents fear being different from others and their peers.
 2. Adolescents may give the impression that they are not afraid, even though they are terrified.
 3. Adolescents become guarded when any areas related to sexual development are examined.
- C. Loss of control
1. Behaviors exhibited include anger, withdrawal, and uncooperativeness.

2. Adolescents seek help and then reject it.
- D. Interventions
1. Encourage questions about appearance and effects of the illness on the future.
 2. Explore feelings about the hospital and the significance that the illness might have for relationships.
 3. Encourage adolescents to wear their own clothes and carry out normal grooming activities.
 4. Allow favorite foods to be brought into the hospital if possible.
 5. Provide privacy.
 6. Use body diagrams to prepare for procedures.
 7. Introduce the adolescent client to other adolescents in the nursing unit if appropriate and possible.
 8. Encourage maintaining contact with peer groups.
 9. Provide for educational needs.
 10. Identify formation of future plans.
 11. Help develop positive coping mechanisms.

V. Communication Approaches

A. General guidelines (Box 19.1)

B. Infant

1. Infants respond to nonverbal communication behaviors of adults, such as holding, rocking, patting, cuddling, and touching.
2. Use a slow approach, and allow the infant to get to know the nurse.
3. Use a calm, soft, soothing voice.
4. Be responsive to cries.
5. Talk and read to infants.
6. Allow security objects such as blankets and pacifiers if the infant has them.

C. Toddler

1. Approach the toddler cautiously.
2. Remember that toddlers accept the verbal communications of others literally.
3. Learn the toddler's words for common items and use them in conversations.
4. Use short, concrete terms.
5. Prepare the toddler for procedures immediately before the event.
6. Repeat explanations and descriptions.
7. Use play for demonstrations.

BOX 19.1 General Guidelines for Communication

Allow the child to feel comfortable with the nurse.
 Communicate through the use of objects.
 Allow the child to express fears and concerns.
 Speak clearly and in a quiet, unhurried voice.
 Offer choices when possible.
 Be honest with the child.
 Set limits with the child as appropriate.

8. Use visual aids such as picture books, puppets, and dolls.
 9. Allow the toddler to handle the equipment or instruments; explain what the equipment or instrument does and how it feels.
 10. Encourage the use of comfort objects.
- D. Preschooler
1. Seek opportunities to offer choices.
 2. Speak in simple sentences.
 3. Be concise and limit the length of explanations.
 4. Allow asking questions.
 5. Describe procedures as they are about to be performed.
 6. Use play to explain procedures and activities.
 7. Allow the handling of equipment or instruments, which will ease fear and help to answer questions.
- E. School-age child
1. Establish limits.
 2. Provide reassurance to help in alleviating fears and anxieties.
 3. Engage in conversations that encourage thinking.
 4. Use medical play techniques.
 5. Use photographs, books, dolls, and videos to explain procedures.
 6. Explain in clear terms.
 7. Allow time for composure and privacy.
- F. Adolescent
1. Remember that the adolescent may be preoccupied with body image.
 2. Encourage and support independence.
 3. Provide privacy.
 4. Use photographs, books, and videos to explain procedures.
 5. Engage in conversations about the adolescent's interests.
 6. Avoid becoming too abstract, too detailed, and too technical.
 7. Avoid responding by prying, confronting, condescending, or expressing judgmental attitudes.

VI. Car Safety Seats and Guidelines

- A. The safest place for all children to ride, regardless of age, is in the back seat of the car.
- B. Lock the car doors; four-door cars should be equipped with child safety locks on the back doors.
- C. There are different types of car safety seats, and the manufacturer's guidelines need to be followed.
- D. For specific information regarding car safety, refer to *Car seats: information for families* (© 2021 American Academy of Pediatrics), found at <https://www.healthychildren.org/English/safety-prevention/on-the-go/Pages/Car-Safety-Seats-Information-for-Families.aspx>

BOX 19.2 Preventive Services and Screenings: Infancy Through Adolescence

- History
- Measurements
 - Length/Height/Weight
 - Head Circumference
 - Body mass index (BMI)
 - Blood pressure
- Sensory Screening
 - Vision
 - Hearing
- Developmental/Behavioral Health
 - Developmental screening
 - Autism spectrum disorder screening
 - Developmental surveillance
 - Psychosocial/behavioral assessment
 - Depression screening
 - Maternal depression screening (as appropriate)
- Physical Examination
 - Procedures
 - Newborn blood
 - Newborn bilirubin
 - Critical congenital heart defect
 - Immunizations
 - Anemia
 - Lead
 - Tuberculosis
 - Dyslipidemia
 - Sexually transmitted infections
 - Human immunodeficiency virus
 - Cervical dysplasia
- Health
 - Fluoride varnish
 - Fluoride supplementation
- Anticipatory Guidance

VII. Preventive Pediatric Health Care

- A. Well-checks are important in promoting health early in childhood and preventing diseases later in life. Childhood obesity, type 2 diabetes mellitus, and hyperlipidemia are noted to have an increased incidence in recent years. See Chapters 33 and 37 for more information on these problems.
- B. The American Academy of Pediatrics (AAP) and Bright Futures have developed guidelines regarding the recommended ages children should receive certain assessments and screenings. See Box 19.2 for more information regarding the recommended preventive services and screenings and see Box 19.3 for the suggested timeline for preventive services, also known as well-child checks. For detailed information on these screenings and the timeline, access the following links: <https://brightfutures.aap.org/Pages/default.aspx> https://www.aap.org/en-us/Documents/periodicity_schedule.pdf

BOX 19.3 Preventive Services and Screenings: Well-Check Schedule

- Prenatal visit
- Newborn visit
- First week visit (3 to 5 days)
- 1 month visit
- 2 month visit
- 3 month visit
- 4 month visit
- 6 month visit
- 9 month visit
- 12 month visit
- 15 month visit
- 18 month visit
- 2 year visit
- 2-year visit
- 3 year visit
- Annual visits from 4 years of age to 18 years of age; thereafter, the child should begin to visit a general practitioner

BOX 19.4 Guidelines for Administration of Vaccines

- Follow manufacturer's recommendations for route of administration, storage, and reconstitution of the vaccine.
- If refrigeration is necessary, store on a central shelf and not on the door; frequent temperature changes from opening the refrigerator door can alter the vaccine's potency.
- Verify the prescription before administration
- Obtain an immunization history from the parents and assess for allergies.
- Provide information to the parents about the vaccine.
- A vaccine information statement needs to be given to the parents or individual, and informed consent for administration needs to be obtained.
- Check the lot number and expiration date on the vaccine bottle and prepare the injection.
- Parenteral vaccines are given in separate syringes in different injection sites.
- Select the appropriate site for administration.
- Vaccines administered intramuscularly are given in the vastus lateralis muscle (best site) or ventrogluteal muscle (the deltoid can be used for children 36 months of age and older).
- Vaccines administered subcutaneously are given in the fatty areas in the lateral upper arms and anterior thighs.
- Adequate needle length and gauge are as follows: intramuscular, 1 inch, 23/25 gauge; subcutaneous, 5/8 inch, 25 gauge (needle length may vary depending on the child's size).
- Mild side effects include fever, soreness, swelling, or redness at injection site.
- A topical anesthetic may be applied to injection site before the injection.
- For painful or red injection sites, advise the parent to apply cool compresses for the first 24 hours, and then use warm or cold compresses as long as needed.
- An age-appropriate dose of acetaminophen or ibuprofen, per health care provider's preference, may be administered every 4 to 6 hours for vaccine-associated discomfort.
- Maintain an immunization record—document day, month, year of administration; manufacturer and lot number of vaccine; name, address, and title of person administering the vaccine; and site and route of administration. Provide a vaccination record to the parents.
- A vaccine adverse event report needs to be filed and the health department needs to be notified if an adverse reaction to an immunization occurs.

Modified from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 178-179.

VIII. Immunizations**A. Guidelines**

1. Immunizations are an important aspect of health promotion during childhood.
2. In the United States, the recommended age for beginning primary immunizations of infants is at birth.
3. Children who began primary immunizations at the recommended age but failed to receive all required doses do not need to begin the series again; they need to receive only the missed doses.
4. If there is suspicion that the parent will not bring the child to the pediatrician or health care clinic for follow-up immunizations according to the optimal immunization schedule, any of the recommended vaccines can be administered simultaneously.

B. General contraindications and precautions

1. A vaccine is contraindicated if the child has experienced an anaphylactic reaction to a previously administered vaccine or a component in the vaccine.
2. Live virus vaccines generally are not administered to individuals with severely deficient immune systems, individuals with a severe sensitivity to gelatin, or pregnant women.
3. A vaccine is administered with caution to an individual with a moderate or severe acute illness, with or without fever.
4. See **Section IX, Recommended Immunizations**, for specific information for each type of vaccine.

C. Guidelines for administration (Box 19.4)

 **Children born preterm should receive the full dose of each vaccine at the appropriate chronological age.**

IX. Recommended Immunizations (Box 19.4)

- A. For the most up-to-date information, refer to Centers for Disease Control and Prevention (CDC) website: <http://www.cdc.gov/vaccines/schedules/index.html>.
- B. Hepatitis B vaccine (HepB)
 1. Administered by the intramuscular route
 2. Contraindications: Severe allergic reaction to previous dose or vaccine component (components include aluminum hydroxide, yeast protein)

BOX 19.5 Recommended Childhood and Adolescent Immunizations: 2021

Birth: Hepatitis B vaccine (HepB)

1 month: HepB

2 months: Inactivated poliovirus vaccine (IPV); diphtheria, tetanus, acellular pertussis (DTaP) vaccine; *Haemophilus influenzae* type b conjugate vaccine (Hib); pneumococcal conjugate vaccine (PCV), rotavirus (RV)

4 months: DTaP, Hib, IPV, PCV, RV

6 months: DTaP, Hib, HepB, IPV, PCV, RV (dose may be needed depending on type of vaccine used for first and second doses)

12-15 months: Hib; PCV; measles, mumps, rubella (MMR) vaccine; hepatitis A, first dose (second dose is given 6-18 months after the first dose); varicella vaccine

15-18 months: DTaP

18-33 months: Hepatitis A (second dose given 6-18 months after the first dose)

4-6 years: DTaP, IPV, MMR, varicella vaccine

11-12 years: MMR (if not administered at 4-6 years); diphtheria, tetanus, acellular pertussis adolescent preparation (Tdap); meningococcal vaccine (MCV4) with a booster at age 16 years; human papillomavirus (HPV) (first dose at age 11 to 12 years, second dose 2 months after first dose, and third dose 6 months after first dose)

12 years and older: COVID-19 vaccine: 1 or 2 doses, depending on manufacturer and most current CDC recommendations

Note: Influenza vaccine is recommended annually for children beginning at age 6 months.

From Centers for Disease Control and Prevention (CDC): *Immunization schedules*, Atlanta, 2021, CDC. Available at <http://www.cdc.gov/vaccines/schedules/index.html>.

Updated yearly. See <https://www.cdc.gov/vaccines/covid-19/eua/index.html> for COVID-19 vaccine information.

3. Precautions: An infant weighing less than 2000 g or an infant with moderate or severe acute illness with or without fever
4. HBsAg (hepatitis B surface antigen)-positive birthing parents
 - a. Infant should receive HepB vaccine and hepatitis B immunoglobulin (HBIG) within 12 hours of birth.
 - b. Infant should be tested for HBsAg and antibody to HBsAg after completion of HepB series (9 to 18 months of age).
5. Birthing parents whose HBsAg status is unknown
 - a. Infant should receive the first dose of hepatitis vaccine series within 12 hours of birth.
 - b. Maternal blood should be drawn as soon as possible to determine the birthing parent's HBsAg status.
 - c. If the birthing parent's HBsAg test result is positive, the infant should receive HBIG as soon as possible (no later than 1 week of age).

C. Rotavirus vaccine (RV)

1. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months of age; children younger than 3 months have some protection because of maternally acquired antibodies.
2. Vaccines are available and are administered by the oral route because the vaccine must replicate in the infant's gut.
3. Vaccine may be withheld if an infant is experiencing severe vomiting and diarrhea; it is administered as soon as the infant recovers.

D. Diphtheria, tetanus, acellular pertussis (DTaP); tetanus toxoid; reduced diphtheria toxoid and acellular pertussis vaccine (Tdap adolescent preparation)

1. Administered by intramuscular route
2. The Tdap (adolescent preparation) is recommended at 11 to 12 years of age for children who have completed the recommended childhood DTaP series but have not received a tetanus and diphtheria toxoid (Td) booster dose; children 13 to 18 years old who have not received Tdap should receive a dose.
3. Td does not provide protection against pertussis; Td is used as a booster every 10 years after Tdap is administered at 11 to 18 years of age.
4. Encephalopathy is a complication.
5. Contraindications: Encephalopathy within 7 days of a previous dose or a severe allergic reaction to a previous dose or to a vaccine component

E. *Haemophilus influenzae* type b (Hib) conjugate vaccine (Hib)

1. Protects against numerous serious infections caused by *H. influenzae* type b, such as bacterial meningitis, epiglottitis, bacterial pneumonia, septic arthritis, and sepsis
2. Administered by the intramuscular route
3. Contraindications: Severe allergic reaction to a previous dose or vaccine component

F. Influenza vaccine: Vaccine is recommended annually for children beginning at age 6 months.

G. Inactivated poliovirus vaccine (IPV)

1. IPV is administered by the subcutaneous route (it may also be given by the intramuscular route).
2. Contraindications: Severe allergic reaction to a previous dose or vaccine component; components may include formalin, neomycin, streptomycin, or polymyxin B.

H. Measles, mumps, rubella (MMR) vaccine

1. Vaccine is administered by the subcutaneous route.
2. Contraindications: Severe allergic reaction to a previous dose or vaccine component (gelatin, neomycin, eggs), pregnancy, known immunodeficiency

3. If the child received immunoglobulin, the MMR vaccine should be postponed for at least 3 to 6 months (immunoglobulin can inhibit the immune response to the MMR vaccine).
- I. Varicella vaccine
 1. It is administered by the subcutaneous route.
 2. Children receiving the vaccine should avoid aspirin or aspirin-containing products because of the risk of Reye's syndrome.
 3. Contraindications: Severe allergic reaction to a previous dose or vaccine component (gelatin, bovine albumin, neomycin), significant suppression of cellular immunity, pregnancy
 - J. Pneumococcal conjugate vaccine (PCV)
 1. PCV prevents infection with *Streptococcus pneumoniae*, which may cause meningitis, pneumonia, septicemia, sinusitis, and otitis media.
 2. It is administered by the intramuscular route.
 3. Contraindications: Severe allergic reaction to a previous dose or vaccine component
 - K. Pneumococcal polysaccharide (PPSV23)
 1. Protects against community-acquired pneumonia.
 2. It is administered by the intramuscular route.
 3. Contraindications: Severe allergic reaction to a previous dose or vaccine component
 - L. Hepatitis A vaccine (HepA)
 1. It is administered by the intramuscular route.
 2. Contraindications: Severe allergic reaction to a previous dose or vaccine component
 - M. Meningococcal vaccine (MCV)
 1. Vaccine protects against *Neisseria meningitidis*.
 2. MCV4 is the preferred type of vaccine and is given intramuscularly.
 3. MCV4 should be administered to all children at age 11 to 12 years and to unvaccinated adolescents at high school entry (age 15 years); all college freshmen living in dormitories should be vaccinated.
 4. Revaccination is recommended for children who remain at increased risk after 3 years (if the first dose was administered at age 2 to 6 years) or after 5 years (if the first dose was administered at age 7 years or older).
 5. It is contraindicated in children with a history of Guillain-Barré syndrome.
 - N. Human papillomavirus vaccine (HPV)
 1. Depending on the type of vaccine used (HPV2 or HPV4), the HPV vaccine guards against diseases that are caused by HPV types 6, 11, 16, and 18, such as cervical cancer, cervical abnormalities that can lead to cervical cancer, and genital warts.
 2. The vaccine is most effective for children if administered before exposure to human papillomavirus through sexual contact.
 3. The vaccine is administered as three injections over 6 months—first dose at age 11 to 12 years, the second dose 2 months after the first dose, and the third dose 6 months after the first dose.
 4. A three-dose series may be administered to some at 9 to 18 years old to reduce their likelihood of acquiring genital warts.
 5. The vaccine can cause pain, swelling, itching, and redness at the injection site; fever; nausea; and dizziness.
 6. The vaccine is contraindicated in individuals with a reaction to a previous injection and in pregnant women.
 - N. Zoster recombinant (RZV)
 1. Protects against shingles and postherpetic neuralgia
 2. Two-dose series separated by 2-6 months administered at 50 years of age or older regardless of previous history of varicella zoster or vaccination against varicella
 3. Contraindications: Severe allergic reaction to a previous dose or vaccine component, tested negative for immunity for varicella zoster virus (if negative, should get the varicella zoster vaccine), currently have shingles, currently pregnant or breast-feeding/chest-feeding
 - O. COVID-19 vaccine
 1. Prevents and protects against coronavirus disease caused by SARS-CoV-2
 2. Recommended for children 5 years of age and older
 3. COVID-19 causes a range of symptoms, mild to severe. The most common symptoms are fever or chills, cough, shortness of breath, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, and diarrhea.
 4. A one- or two-dose series is administered followed by a booster, with the time frame for each depending on the manufacturer and CDC recommendations.
 5. The vaccine is contraindicated in individuals with a severe allergic reaction, including difficulty breathing, swelling of the face and throat, fast heartbeat, total body rash, or dizziness and weakness.
 6. Myocarditis or pericarditis is a rare side effect of the vaccine and is usually transient. Chest pain, shortness of breath, and palpitations need to be reported.
 7. Other side effects include injection site pain, tiredness, headache, muscle pain, chills, joint pain, fever, injection site swelling, injection site redness, nausea, feeling unwell, swollen lymph nodes, diarrhea, vomiting, and arm pain.

BOX 19.6 Recommended Adulthood Immunizations: 2021

19+ years:

- Influenza inactivated/recombinant (19+ years) or influenza live attenuated (up to age 49): 1 dose annually.
 - For 65+ years, the high-dose influenza vaccine or the adjuvanted influenza vaccine is used
- Tetanus, diphtheria, pertussis (Tdap or Td): 1 dose Tdap, then Td or Tdap booster every 10 years, 1 dose Tdap each pregnancy, 1 dose Td/Tdap for wound management
- Pneumococcal conjugate (PCV13): 1 dose
- Pneumococcal polysaccharide (PPSV23): 1 or 2 doses age-dependent based on risk factors
- Hepatitis A and hepatitis B: 2 or 3 doses depending on vaccine
- Meningococcal A, C, W, Y (MenACWY): 1 or 2 doses depending on indication
- Meningococcal B (MenB): 2 or 3 doses depending on vaccine and indication
- Haemophilus influenzae type b (Hib): 1 or 2 doses depending on indication
- Varicella (VAR): 2 doses if born in 1980 or later
- COVID-19: Based on CDC recommendations and if not previously administered, 1 or 2 doses followed by a booster, depending on manufacturer

19-45 years:

- Human papillomavirus (HPV): 2 or 3 doses depending on age at initial vaccination or condition

19-64 years:

- Measles, mumps, rubella (MMR): 1 or 2 doses depending on indication if born in 1957 or later

50+ years:

- Zoster recombinant (RZV): 2 doses

65+ years:

- PCV13: 1 dose
- PPSV23: 1 dose

From Centers for Disease Control and Prevention (CDC): *Immunization schedules*, Atlanta, 2021, CDC. Available at <https://www.cdc.gov/vaccines/schedules/hcp/imz/adult.html#table-age>.

8. For more information, visit <https://www.cdc.gov/vaccines/covid-19/eua/index.html>

X. Adulthood Immunizations (Box 19.6)

XI. Reactions to a Vaccine

A. Local reactions

1. Tenderness, erythema, swelling at injection site
2. Low-grade fever
3. Behavioral changes such as drowsiness, unusual crying, decreased appetite

B. Minimizing local reactions

1. Select a needle of adequate length to deposit vaccine deep into the muscle or subcutaneous mass (see Box 19.4).
2. Inject into the appropriate recommended site.

C. Anaphylactic reactions

 Individuals are monitored for 15 to 30 minutes after vaccine administration for a reaction.

1. Goals of treatment are to secure and protect the airway, restore adequate circulation, and prevent further exposure to the antigen.
2. For a mild reaction with no evidence of respiratory distress or cardiovascular compromise, a subcutaneous injection of an antihistamine, such as diphenhydramine, and epinephrine may be administered.
3. For moderate or severe distress, establish an airway; provide cardiopulmonary resuscitation if the child is not breathing; elevate the head; administer epinephrine, fluids, and vasopressors as prescribed; monitor vital signs; and monitor urine output.

- D. Refer to Chapter 64 for additional information on allergic responses and anaphylactic reactions.

XII. Developmental Characteristics

A. Infant

1. Physical

- a. Height increases by 1 inch per month in the first 6 months, and by 1 year the length has increased by 50%.
- b. Weight is doubled at 5 to 6 months and tripled at 12 months.
- c. At birth, head circumference is 33 to 35 cm (13.2 to 14 inches), approximately 2 to 3 cm more than chest circumference.
- d. By 1 to 2 years of age, head circumference and chest circumference are equal.
- e. Anterior fontanel (soft spot in a normal infant) closes by 18 months of age.
- f. Posterior fontanel (soft spot in a normal infant) closes by 4 months of age.
- g. The first primary teeth to erupt are the lower central incisors at approximately 6 to 10 months of age. Children at risk for development of dental caries should see a dentist 6 months after the first tooth erupts or by 1 year of age.
- h. Sleep patterns vary among infants; in general, by 3 to 4 months of age, most infants have developed a nocturnal pattern of sleep that lasts 9 to 11 hours.

2. Vital signs (Box 19.7)

3. Nutrition

- a. The infant may breast-feed/chest-feed or bottle-feed (with iron-fortified formula), depending on the parent's choice; however, breast milk is the preferred form of nutrition for all infants, especially during the first 6 months.

BOX 19.7 Vital Signs: Newborn and 1-Year-Old Infant**Newborn**

Temperature: Axillary, 96.8° F to 99.0° F (36° C to 37.2° C)

Apical Heart Rate: 120–160 beats per minute

Respirations: 30–60 (average 40) breaths per minute

Blood Pressure: 80/90/40–50 mm Hg

1-Year-Old Infant

Temperature: Axillary, 97° F to 99° F (36.1° C to 37.2° C)

Apical Heart Rate: 90–130 beats per minute

Respirations: 20–40 breaths per minute

Blood Pressure: 90/56 mm Hg

- b. Exclusively breast-fed/chest-fed infants and infants ingesting less than 1000 mL of vitamin D–fortified formula or milk per day should receive daily vitamin D supplementation (400 IU), starting in the first few days of life, to prevent rickets and vitamin D deficiency.
- c. Iron stores from birth are depleted by 4 months of age; if the infant is being breast-fed only, iron supplementation, usually with a liquid iron supplement, is needed. Premature babies are at higher risk for iron deficiency due to smaller iron stores and often need additional supplementation. Infants should be screened at 12 months of age for iron deficiency.
- d. Whole milk, low-fat milk, skim milk, other animal milk, or imitation milk should not be given to infants as a primary source of nutrition, because these food sources lack the necessary components needed for growth and have limited digestibility. If introduced, cow’s milk should not be given to infants until 12 months of age.
- e. Fluoride supplementation may be needed at about 6 months of age, depending on the infant’s intake of fluoridated tap water.
- f. Solid foods (strained, pureed, or finely mashed) are introduced at about 5 to 6 months of age; introduce solid foods one at a time, usually at intervals of 4 to 5 days, to identify food allergens.
- g. Sequence of the introduction of solid foods varies depending on the pediatrician’s preference and usually is as follows: iron-fortified rice cereal, vegetables, fruits, then meats.
- h. At 12 months of age, eggs can be given (introduce egg whites in small quantities to detect an allergy); cheese may be used as a substitute for meat.
- i. Avoid solid foods that place the infant at risk for choking, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.
- j. Avoid microwaving baby bottles and baby food because of the potential for uneven heating.

BOX 19.8 Infant Skills**2 to 3 Months**

- Smiles
- Turns head side to side
- Follows objects
- Holds head in midline

4 to 5 Months

- Grasps objects
- Switches objects from hands
- Rolls over for the first time
- Enjoys social interaction
- Begins to show memory
- Aware of unfamiliar surroundings

6 to 7 Months

- Creeps
- Sits with support
- Imitates
- Exhibits fear of strangers
- Holds arms out
- Frequent mood swings
- Waves “bye-bye”

8 to 9 Months

- Sits steadily unsupported
- Crawls
- May stand while holding on
- Begins to stand without help

10 to 11 Months

- Can change from prone to sitting position
- Walks while holding on to furniture
- Stands securely
- Entertains self for periods of time

12 to 13 Months

- Walks with one hand held
- Can take a few steps without falling
- Can drink from a cup

14 to 15 Months

- Walks alone
- Can crawl up stairs
- Shows emotions such as anger and affection
- Will explore away from parent in familiar surroundings

- k. Never mix food or medications with formula.
 1. Infants under 12 months should not be fed honey. Avoid adding honey to formula, water, or other fluid to prevent botulism.
- m. Offer fruit juice from a cup (12 to 13 months or at a prescribed age) rather than a bottle to prevent nursing (bottle-mouth) caries; fruit juice is limited because of its high sugar content.
4. Skills (Box 19.8)
5. Play
 - a. Solitary

- b. Birth to 3 months: Verbal, visual, and tactile stimuli
- c. 4 to 6 months: Initiation of actions and recognition of new experiences
- d. 6 to 12 months: Awareness of self, imitation, repetition of pleasurable actions
- e. Enjoyment of soft stuffed animals, crib mobiles with contrasting colors, squeeze toys, rattles, musical toys, water toys during the bath, large picture books, and push toys after the infant begins to walk

6. Safety

- a. Parents must baby-proof the home.
- b. Guard the infant when on a bed or changing table.
- c. Use gates to protect the infant from stairs.
- d. Be sure that bath water is not hot; do not leave the infant unattended in the bath.
- e. Do not hold the infant while drinking or working near hot liquids or items, such as a stove.
- f. Use cool vaporizers instead of steam vaporizers, if needed, to prevent burn injuries.
- g. Avoid offering food that is round and similar to the size of the airway to prevent choking.
- h. Be sure that toys have no small pieces.
- i. Toys or mobiles hanging over the crib should be well out of reach, to prevent strangulation.
- j. Avoid placing large toys in the crib, because an older infant may use them as steps to climb.
- k. Cribs should be positioned away from curtains and blind cords.
- l. Cover electrical outlets.
- m. Remove hazardous objects from low, reachable places.
- n. Remove medications, poisons, plants, and chemicals, such as cleaning supplies or other household products, from the infant's reach.
- o. Keep the Poison Control Center number available.

 Never shake an infant because of the risk of causing a closed head injury known as shaken baby syndrome, which is a life-threatening injury.

B. Toddler

1. Physical

- a. Height and weight increase in phases, reflecting growth spurts and lags.
- b. Head circumference increases about 1 inch (25.5 mm) between ages 1 and 2 years; thereafter head circumference increases about ½ inch (12.5 mm) per year until age 5 years.
- c. Anterior fontanel closes between ages 12 and 18 months.
- d. Weight gain is slower than in infancy; by age 2 years, the average weight is 22 to 27 pounds (10 to 12 kg).

BOX 19.9 The Toddler's Vital Signs

Temperature: Axillary, 97.5° F to 98.6° F (36.4° C to 37° C)

Apical Heart Rate: 80–120 beats per minute

Respirations: 20–30 breaths per minute

Blood Pressure: Average, 92/55 mm Hg

- e. Normal height changes include a growth of about 3 inches (7.5 cm) per year; the average height of the toddler is 34 inches (86 cm) at age 2 years.
 - f. Lordosis (potbelly) is noted.
 - g. Regular dental care is essential, and the toddler will require assistance with brushing and flossing of teeth (fluoride supplements may be necessary if the water is not fluoridated).
 - h. A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries.
 - i. Typically, the toddler sleeps through the night and has one daytime nap; the daytime nap is normally discontinued at about age 3 years.
 - j. A consistent bedtime ritual helps prepare the toddler for sleep.
 - k. Security objects at bedtime may assist in sleep.
2. Vital signs (Box 19.9)
3. Nutrition
- a. The MyPlate food guide (see Fig. 11.1) provides dietary guidelines and applies to children as young as 2 years of age (see www.choosemyplate.gov).
 - b. The toddler should average an intake of two to three servings of milk daily (24 to 30 oz [700 to 800 mL]) to ensure an adequate amount of calcium and phosphorus (low-fat milk may be given after 2 years of age).
 - c. Trans-fatty acids and saturated fats need to be restricted; otherwise, fat restriction is inappropriate for a toddler (parents should be taught about the types of fat-containing foods that should be selected).
 - d. Iron-fortified cereal and a high-iron diet, adequate amounts of calcium and vitamin D, and vitamin C are essential components for the toddler's diet. No fruit juice should be given to children under the age of 1 year since it offers no nutritional benefits in this age-group. Fresh fruit and water are preferred over juice.
 - e. Most toddlers prefer to feed themselves.
 - f. The toddler generally does best by eating several small nutritious meals each day rather than three large meals.
 - g. Offer a limited number of foods at any one time.

- h. Offer finger foods, and avoid concentrated sweets and empty calories.
 - i. The toddler is at risk for aspiration of small foods that are not chewed easily, such as nuts, raisins, popcorn, grapes, foods with seeds, and hot dog pieces.
 - j. Physiological anorexia may occur and is normal because of the alternating stages of fast and slow growth.
 - k. Sit the toddler in a high chair at the family table for meals.
 - l. Allow sufficient time to eat, but remove food when the toddler begins to play with it.
 - m. The toddler drinks well from a cup held with both hands.
 - n. Avoid using food as a reward or punishment.
4. Skills
- a. The toddler begins to walk with one hand held by age 12 to 13 months.
 - b. The toddler runs by age 2 years and walks backward and hops on one foot by age 3 years.
 - c. The toddler usually cannot alternate feet when climbing stairs.
 - d. The toddler begins to master fine motor skills for building, undressing, and drawing lines.
 - e. The young toddler often uses “no” even when they mean “yes” to assert independence.
 - f. The toddler begins to use short sentences and has a vocabulary of about 300 words by age 2 years.
5. Bowel and bladder control
- a. Certain signs indicate that a toddler is ready for toilet training (Box 19.10).
 - b. Bowel control develops before bladder control.
 - c. By age 3 years, the toddler achieves fairly good bowel and bladder control.
 - d. The toddler may stay dry during the day but may need a diaper at night until about age 4 years.
6. Play
- a. The major socializing mechanism is parallel play, and therapeutic play can begin at this age.
 - b. The toddler has a short attention span, causing the toddler to change toys often.
 - c. The toddler explores body parts of self and others.
 - d. Typical toys include push-pull toys, blocks, sand, finger paints and bubbles, large balls, crayons, trucks and dolls, containers, Play-Doh, toy telephones, cloth books, and wooden puzzles.
7. Safety

 Toddlers are eager to explore the world around them; they need to be supervised at play to ensure safety.

BOX 19.10 Signs of Readiness for Toilet Training

Child is able to stay dry for 2 hours.
 Child is waking up dry from a nap.
 Child is able to sit, squat, and walk.
 Child is able to remove clothing.
 Child recognizes the urge to defecate or urinate.
 Child expresses willingness to please a parent.
 Child is able to sit on the toilet for 5 to 10 minutes without fussing or getting off.

Data from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 404.

- a. Use back burners on the stove to prepare a meal; turn pot handles inward and toward the middle of the stove.
 - b. Keep dangling cords from small appliances or other items away from the toddler.
 - c. Place inaccessible locks on windows and doors, and keep furniture away from windows.
 - d. Secure screens on all windows.
 - e. Place safety gates at stairways.
 - f. Do not allow the toddler to sleep or play in an upper bunk bed.
 - g. Never leave the toddler alone near a bathtub, pail of water, swimming pool, or any other body of water.
 - h. Keep toilet lids closed.
 - i. Keep all medicines, poisons, household plants, and toxic products in high areas and locked out of reach.
 - j. Keep the Poison Control Center number available.
- C. Preschooler
1. Physical
- a. The preschooler grows 2.5 to 3 inches (6.5 to 7.5 cm) per year.
 - b. Average height is 37 inches (94 cm) at age 3 years, 40.5 inches (103 cm) at age 4 years, and 43 inches (110 cm) at age 5 years.
 - c. The preschooler gains approximately 5 pounds (2.25 kg) per year; average weight is 40 pounds (18 kg) at age 5 years.
 - d. The preschooler requires about 12 hours of sleep each day.
 - e. A security object and a night-light help with sleeping.
 - f. At the beginning of the preschool period, the eruption of the deciduous (primary) teeth is complete.
 - g. Regular dental care is essential, and the preschooler may require assistance with brushing and flossing of teeth; fluoride supplements may be necessary if the water is not fluoridated.

BOX 19.11 The Preschooler's Vital Signs

Temperature: Axillary, 97.5° F to 98.6° F (36.4° C to 37° C)

Apical Heart Rate: 70–110 beats per minute

Respirations: 16–22 breaths per minute

Blood Pressure: Average, 95/57 mm Hg

2. Vital signs (Box 19.11)

3. Nutrition

- Nutritional needs are similar to those required for the toddler, although the daily amounts of minerals, vitamins, and protein may increase with age.
- The MyPlate food guide is appropriate for preschoolers (see www.choosemyplate.gov).
- The preschooler exhibits food fads and certain taste preferences and may exhibit picky eating.
- By 5 years old, the child tends to focus on social aspects of eating, table conversations, manners, and willingness to try new foods.

4. Skills

- The preschooler has good posture.
- The child develops fine motor coordination.
- The child can hop, skip, and run more smoothly.
- Athletic abilities begin to develop.
- The preschooler demonstrates increased skills in balancing.
- The child alternates feet when climbing stairs.
- The child can tie shoelaces by age 6 years.
- The child may talk continuously and ask many “why” questions.
- Vocabulary increases to about 900 words by age 3 years and to 2100 words by age 5 years.
- By age 3 years, the preschooler usually talks in three- or four-word sentences and speaks in short phrases.
- By age 4 years, the preschooler speaks five- or six-word sentences, and by age 5 years, speaks in longer sentences that contain all parts of speech.
- The child can be understood readily by others and can understand clearly what others are saying.

5. Bowel and bladder control

- By age 4 years, the preschooler has daytime control of bowel and bladder but may experience bed-wetting accidents at night.
- By age 5 years, the preschooler achieves bowel and bladder control, although accidents may occur in stressful situations.

6. Play

- The preschooler is cooperative.
- The preschooler has imaginary playmates.
- The child likes to build and create things, and play is simple and imaginative.

- The child understands sharing and is able to interact with peers.
- The child requires regular socialization with playmates of similar age.
- Play activities include a large space for running and jumping.
- The preschooler likes dress-up clothes, paints, paper, and crayons for creative expression.
- Swimming and sports aid in growth development.
- Puzzles and toys aid with fine motor development.

7. Safety

- Preschoolers are active and inquisitive.
- Because of their magical thinking, they may believe that daring feats seen in cartoons are possible and may attempt them.
- Preschoolers can learn simple safety practices because they can follow simple verbal directions and their attention span is longer.
- Teach the preschooler basic safety rules to ensure safety when playing in a playground, such as near swings and ladders.
- Teach the preschooler never to play with matches or lighters.
- The preschooler should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the preschooler.
- Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
- Teach the preschooler their full name, address, parents' names, and telephone number.
- Teach the preschooler how to dial 911 in an emergency situation.
- Keep the Poison Control Center number available.

 Teach a preschooler and school-age child to leave an area immediately if a gun is visible and to tell an adult. The preschooler should also be taught never to point a toy gun at another person.

D. School-age child

1. Physical

- Growth is about 2 inches (5 cm) per year between ages 6 and 12 years.
- Height ranges from 45 inches (115 cm) at age 6 years to 59 inches (150 cm) at age 12 years.
- School-age children gain weight at a rate of about 4.5 to 6.5 pounds (2 to 3 kg) per year.
- Average weight is 46 pounds (21 kg) at age 6 years and 88 pounds (40 kg) at age 12 years.
- The first permanent (secondary) teeth erupt around age 6 years, and deciduous teeth are lost gradually.

BOX 19.12 The School-Age Child's Vital Signs

Temperature: Oral, 97.5° F to 98.6° F (36.4° C to 37° C)

Apical Heart Rate: 60–100 beats per minute

Respirations: 18–20 breaths per minute

Blood Pressure: Average, 107/64 mm Hg

- f. Regular dental visits are necessary, and the school-age child needs to be supervised with brushing and flossing teeth; fluoride supplements may be necessary if the water is not fluoridated.
 - g. For school-age children with primary and permanent dentition, the best toothbrush is one with soft nylon bristles and an overall length of about 6 inches (15 cm).
 - h. Sleep requirements range from 10 to 12 hours a night.
2. Vital signs (Box 19.12)
 3. Nutrition
 - a. School-age children will have increased growth needs as they approach adolescence.
 - b. Children require a balanced diet from foods in the MyPlate food guide; healthy snacks should continue to be emphasized to prevent childhood obesity (see www.choosemyplate.gov).
 - c. Children still may be picky eaters but are usually willing to try new foods.
 4. Skills
 - a. School-age children exhibit refinement of fine motor skills.
 - b. Development of gross motor skills continues.
 - c. Strength and endurance increase.
 5. Play
 - a. Play is more competitive.
 - b. Rules and rituals are important aspects of play and games.
 - c. The school-age child enjoys drawing, collecting items, dolls, pets, guessing games, board games, listening to the radio, TV, reading, watching videos or DVDs, and computer games.
 - d. The child participates in team sports.
 - e. The child may participate in secret clubs, group peer activities, and scout organizations.
 6. Safety
 - a. The school-age child experiences less fear in play activities and frequently imitates real life by using tools and household items.
 - b. Major causes of injuries include bicycles, skateboards, and team sports as the child increases in motor abilities and independence.
 - c. Children should always wear a helmet when riding a bike or using in-line skates or skateboards.

- d. Teach the child water safety rules.
- e. Instruct the child to avoid teasing or playing roughly with animals.
- f. Teach the child never to play with matches or lighters.
- g. The child should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the child.
- h. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
 - i. Teach the child traffic safety rules.
 - j. Teach the child how to dial 911 in an emergency situation.
- k. Keep the Poison Control Center number available.

 Teach the preschooler and school-age child that if another person touches their body in an inappropriate way, an adult should be told. Also teach the child to avoid speaking to strangers and never to accept a ride, toys, or gifts from a stranger.

E. Adolescent

1. Physical
 - a. **Puberty** is the maturational, hormonal, and growth process that occurs when the reproductive organs begin to function and the secondary sex characteristics develop.
 - b. Body mass increases to adult size.
 - c. Sebaceous and sweat glands become active and fully functional.
 - d. Body hair distribution occurs.
 - e. Increases in height, weight, breast development, and pelvic girth
 - f. In those with a vagina, menstrual periods occur about 2.5 years after the onset of puberty.
 - g. In those with a penis, increases in height, weight, muscle mass, and penis and testicle size occur; voice deepens.
 - h. Careful brushing and care of the teeth are important, and many adolescents need to wear braces.
 - i. Sleep patterns include a tendency to stay up late; therefore, in an attempt to catch up on missed sleep, adolescents sleep late whenever possible; an overall average of 8 hours per night is recommended.
2. Vital signs (Box 19.13)
3. Nutrition (see Chapter 11 for more information)
 - a. Teaching about the MyPlate food guide is important (see www.choosemyplate.gov).
 - b. Adolescents typically eat whenever they have a break in activities.
 - c. Calcium, zinc, iron, folic acid, and protein are especially important nutritional needs.

BOX 19.13 The Adolescent's Vital Signs

Temperature: Oral, 97.5° F to 98.6° F (36.4° C to 37° C)

Apical Heart Rate: 55–90 beats per minute

Respirations: 12–20 breaths per minute

Blood Pressure: Average, 121/70 mm Hg

- d. Adolescents tend to snack on empty calories, and the importance of adequate and healthy nutrition needs to be stressed.
- e. Body image is important.
4. Skills
 - a. Gross and fine motor skills are well developed.
 - b. Strength and endurance increase.
5. Play
 - a. Games and athletic activities are the most common forms of play.
 - b. Competition and strict rules are important.
 - c. Adolescents enjoy activities such as sports, videos, movies, reading, parties, dancing, hobbies, computer games, music, communicating via the Internet, and experimenting, such as with makeup and hairstyles.
 - d. Friends are important, and adolescents like to gather in small groups.
6. Safety
 - a. Adolescents are risk takers.
 - b. Adolescents have a natural urge to experiment and to be independent.
 - c. Reinforce instructions about the dangers related to cigarette smoking, caffeine ingestion, alcohol, and drugs, including opioids.
 - d. Help adolescents to recognize that they have choices when difficult or potentially dangerous situations arise.
 - e. Ensure that the adolescent uses a seat belt.
 - f. Instruct adolescents in the consequences of injuries that motor vehicle accidents can cause.
 - g. Instruct adolescents in water safety and emphasize that they should enter the water feet first as opposed to diving, especially when the depth of the water is unknown or shallow.
 - h. Instruct adolescents about the dangers associated with guns, violence, and gangs.
 - i. Instruct adolescents about the complications associated with body piercing, tattooing, and tanning.

 Discuss issues such as acquaintance rape, sexual relationships, and transmission of sexually transmitted infections with the adolescent. Also discuss the dangers of the Internet and social media related to communicating and setting up meetings (dates) with unknown persons.

F. Early adulthood

1. Description: Period between the late teens and mid to late 30s

2. Physical changes
 - a. Person has completed physical growth by the age of 20 years.
 - b. Person is active.
 - c. Severe illnesses are less common than in older age-groups.
 - d. Person tends to ignore physical symptoms and postpone seeking health care.
 - e. Lifestyle habits such as smoking, stress, lack of exercise, poor personal hygiene, and family history of disease increase the risk of future illness.
 3. Cognitive changes
 - a. Person has rational thinking habits.
 - b. Conceptual, problem-solving, and motor skills increase.
 - c. Person identifies preferred occupational areas.
 4. Psychosocial changes
 - a. Person separates from family of origin.
 - b. Person gives much attention to occupational and social pursuits to improve socioeconomic status.
 - c. Person makes decisions regarding career, marriage, and parenthood.
 - d. Person is able to adapt to new situations.
 5. Sexuality
 - a. Person has the emotional maturity to develop mature sexual relationships.
 - b. Person is at risk for sexually transmitted infections.
- #### G. Middle adulthood
1. Description: Period between the mid- to late 30s and mid-60s
 2. Physical changes
 - a. Physical changes occur between 40 and 65 years of age.
 - b. Individual becomes aware that changes in reproductive and physical abilities signify the beginning of another stage in life.
 - c. Menopause occurs in women and climacteric occurs in men.
 - d. Physiological changes often have an impact on self-concept and body image.
 - e. Physiological concerns include stress, level of wellness, and the formation of positive health habits.
 3. Cognitive changes
 - a. Person may be interested in learning new skills.
 - b. Person may become involved in educational or vocational programs for entering the job market or for changing careers.
 4. Psychosocial changes
 - a. Changes may include expected events, such as children moving away from home (post-parental family stage), or unexpected events, such as the death of a close friend.

- b. Time and financial demands decrease as children move away from home, and couples face redefining their relationship.
 - c. Adults may become grandparents.
 - d. Adults are achieving generativity.
5. Sexuality
- a. Many couples renew their relationships and find increased marital and sexual satisfaction.
 - b. The onset of menopause and climacteric may affect sexual health.
 - c. Stress, health, and medications can affect sexuality.
- H. Later adulthood (period between 65 years and death): Refer to [Chapter 20](#).

XIII. Gender Identity

- A. Gender identity defined
1. Gender identity is one's personal sense of one's own gender.
 2. It can be the same as the assigned sex at birth or it can be different.
- B. Gender expression
1. Gender expression is how one expresses their gender to others.
 2. Characteristics in personality, appearance, behavior, or the name one chooses to be called can relate to gender expression.
- C. Sexual orientation
1. Sexual orientation refers to the gender to whom one is typically sexually attracted.
 2. A person can be attracted to someone of the same gender and/or different gender(s).
- D. Children: Children may express their gender by their choices of toys, sports, preferred name, clothing, hairstyle, social behavior, and manner of behavior, such as through physical gestures.
- E. Adolescents
1. Adolescents continue to develop their gender identity through their own personal sense of gender and from involvement with their social environment, such as family and friends.
 2. Some adolescents are confident in their gender identity, whereas others need time to develop their identities.
 3. At puberty, some adolescents may realize that their gender identity is different from their assigned birth sex, and sometimes they need to figure out who they are and their place in the world.
- F. Family support interventions
1. Encourage the child to express self as to their sense of gender; avoid pressuring the child to change their self-expression.
 2. Encourage love and unconditional support for the child, and accept the child.
 3. Suggest that the parents ask the school about how it supports gender expression and what is taught about gender identity.

4. Support the child and prepare the child for possible bullying or negative reactions from other children and the importance of sharing if bullying or negative reactions surface against them.
5. Watch for signs of **depression**, anxiety, or other behaviors that affect the emotional health of the child.
6. Seek out medical professional assistance if concerned about the child's emotional health or if family members are having difficulty accepting the child's decision about personal gender.
7. For additional information refer to: Rafferty, J. (2020). *Gender identity in children*. American Academy of Pediatrics at <https://www.healthychildren.org/English/ages-stages/gradeschool/Pages/Gender-Identity-and-Gender-Confusion-In-Children.aspx>

XIV. End-of-Life Care

- A. Description: End-of-life care relates to death and dying.
- B. Legal and ethical issues
1. Outcomes related to care during illness and the dying experience should be based on the client's wishes.
 2. Issues for consideration may include organ and tissue donations, advance directives or other legal documents, withholding or withdrawing treatment, and cardiopulmonary resuscitation.
- C. Cultural and religious considerations ([Box 19.14](#))
- D. Palliative and hospice care
1. Focuses on caring interventions and symptom management rather than cure for diseases or conditions that no longer respond to treatment and can be required at any age, depending on the condition and prognosis
 2. Pain and symptoms are controlled; the dying client should be as pain-free and as comfortable as possible.
 3. Provides support and care for clients of any age in the last phases of incurable diseases so that they might live as fully and as comfortably as possible; client and family needs are the focus of any intervention.
- E. Near-death physiological manifestations
1. As death approaches, **metabolism** is reduced, and the body gradually slows down until all functions end.
 2. Sensory: The client experiences blurred vision, decreased sense of taste and smell, decreased pain and touch perception, and loss of blink reflex and appears to stare (hearing is believed to be the last sense lost).
 3. Respirations
 - a. Respirations may be rapid or slow, shallow, and irregular.
 - b. Respirations may be noisy and wet sounding ("death rattle").

BOX 19.14 Religion and End-of-Life Care

End-of-life care and practices may vary among members of each religious group. Therefore, culturally sensitive care requires that the nurse identify the specific preferences and needs of each individual. The nurse must ask the client and/or family what these preferences are and develop a plan of care that addresses these individualized preferences.

Buddhism

The decision to forgo life-sustaining efforts is an individual matter that requires consultation with the client and the client's family.

Disposition of the body varies with the culture and denomination, and the family needs to be consulted.

Beliefs on autopsy vary; therefore, the client or the client's family must be consulted.

Guidelines for health care providers interacting with patients of the Buddhist religion and their families at: <https://www.advocatehealth.com/assets/documents/faith/cgbuddhist.pdf>

Catholic

Members look to a priest for prayers and support and comfort. Sacraments before death include reconciliation and Holy Communion.

The teachings of the Catholic Church: Caring for people at the end of life at: https://www.chausa.org/docs/default-source/ethics/3058_cha_end_of_life_guide_tcc_lores.pdf?sfvrsn=6

Church of Jesus Christ of Latter-Day Saints (Mormons)

Members look to church leaders for support and comfort. Some may want to be blessed by the Mormon priesthood.

Caring for a Mormon patient at: <https://sites.google.com/site/culturalsensitivitytomormons/home/values-beliefs-norms/health-practices/caring-for-a-mormon-patient>

Islam

A Muslim chaplain, a volunteer, or an Imam may be preferred to be present at the time of death to offer support to the family, read the Quran, and comfort the dying client.

Preference may be that the client face Mecca (west or south-west in the United States).

Ziyara, Muslim spiritual care: End of life care at: https://ziyara.org/programs/end_of_life_care/

Jehovah Witness'

Likely to refuse a blood transfusion whatever the possible consequences.

Congregational support is important.

Caring for the Jehovah Witness patient at: <https://www.ashfordstpeters.info/images/other/PAS09.pdf>

Judaism

A dying person should not be left alone (a rabbi's presence is desired).

For clients who are mentally competent, Jewish tradition encourages them to reflect on their lives, pass on wisdom, make amends if needed, and say goodbye.

The culture connection: Judaism at end-of-life at: <https://www.crossroadshospice.com/hospice-palliative-care-blog/2015/august/10/the-culture-connection-judaism-at-end-of-life/>

Hinduism

Special prayers are said, and often a relative must be present at the moment of death. A pandit (priest) may be called in to do a puja (prayer). Pujas may involve adorning the person's head with sandalwood paste, holy ash, and red kum kum powder.

A red or yellow string may be tied around the wrist. After death, close family members will wash the body, close the eyes, and straighten the legs. A death needs to be registered as soon as possible and the body cremated within 24 hours.

Health care providers' handbook on Hindu patients at: https://www.health.qld.gov.au/multicultural/health_workers/hbook-hindu; *Guidelines for health care providers interacting with patients of the Hindu religion and their families* at: <https://www.advocatehealth.com/assets/documents/faith/cghindu.pdf>

Protestant

Some prefer specific rituals and practices at the time of one's dying and death.

Many prefer family members, friends, and their own clergy to be present for comfort and prayers at this time. Consult with the family regarding their preference.

Guidelines for health care providers interacting with patients and their families who are members of Protestant religious groups at: <https://www.advocatehealth.com/assets/documents/faith/cgprotestant.pdf>

- c. Cheyne-Stokes respiration is alternating periods of apnea and deep, rapid breathing.
4. Circulation
 - a. Heart rate slows, and blood pressure falls progressively.
 - b. Skin is cool to the touch, and the extremities become pale, mottled, and cyanotic.
 - c. Skin is waxlike very near death.
5. Urinary output decreases; incontinence may occur.
6. Gastrointestinal motility and peristalsis diminish, leading to constipation, gas accumulation, and distention; incontinence may occur.
7. Musculoskeletal system: The client gradually loses ability to move, has difficulty speaking and swallowing, and loses the gag reflex.
8. Integumentary: Kennedy terminal ulcer, which usually signals the start of the dying process; normally occurs on the sacrum and is a dark sore that develops rapidly and is commonly mistaken for a deep tissue injury.
- F. Death
 1. Death occurs when all vital organs and body systems cease to function.
 2. In general, respirations cease first; then the heart-beat stops a few minutes thereafter.

3. Brain death occurs when the cerebral cortex stops functioning or is irreversibly damaged.
- G. Nursing care
 1. Frequency of assessment depends on the client's stability (at least every 4 hours); as changes occur, assessment needs to be done more frequently.
 2. Physical care (Box 19.15)
 3. Psychosocial care
 - a. Monitor for anxiety and depression.
 - b. Monitor for fear (Box 19.16).
 - c. Encourage the client and family to express feelings.
 - d. Provide support and **advocacy** for the client and family.
 - e. Provide privacy for the client and family.
 - f. Provide a private room for the client.
4. See **Chapter 68** for information on grief and loss.
5. Postmortem care (Box 19.17)
 - a. Maintain respect and dignity for the client.
 - b. Determine whether the client is an organ donor; if so, follow appropriate procedures related to the donation.
 - c. Consider cultural and religious rituals, state laws, and agency procedures when performing postmortem care.
 - d. Prepare the body for immediate viewing by the family.
 - e. Provide privacy and time for the family to be with the deceased person.
 - f. Medical examiner jurisdiction guidelines are determined by each state and usually include unnatural or traumatic deaths, or deaths in which there is a question of criminal involvement; any forensic evidence is preserved, and the body is not cleaned or prepared prior to transfer to the morgue.

BOX 19.15 Physical Care of the Dying Client

Pain

Administer pain medication.
Do not delay or deny pain medication.

Dyspnea

Elevate the head of the bed or position the client on their side.
Administer supplemental oxygen for comfort.
Suction uids from the airway as needed.
Administer medications as prescribed.

Skin

Assess color and temperature.
Assess for Kennedy terminal ulcer and skin breakdown.
Implement measures to prevent breakdown.

Dehydration

Maintain regular oral care.
Encourage taking ice chips and sips of uid.
Do not force the client to eat or drink.
Use moist cloths to provide moisture to the mouth.
Apply lubricant to the lips and oral mucous membranes.

Anorexia, Nausea, and Vomiting

Provide antiemetics before meals.
Have family members provide the client's favorite foods.
Provide frequent small portions of favorite foods.

Elimination

Monitor urinary and bowel elimination.
Place absorbent pads under the client and check frequently.

Weakness and Fatigue

Provide rest periods.
Assess tolerance for activities.
Provide assistance and support as needed for maintaining bed or chair positions.

Restlessness

Maintain a calm, soothing environment.
Do not restrain.
Limit the number of visitors at the client's bedside (consider cultural practices).
Allow a family member to stay with the client.

BOX 19.16 Fear Associated With Dying

Fear of Pain

Fear of pain may occur, based on anxieties related to dying. Do not delay or deny pain relief measures to a terminally ill client.

Fear of Loneliness and Abandonment

Allow family members to stay with the client. Holding hands, touching (if culturally acceptable), and listening to the client are important.

Fear of Being Meaningless

Client may feel hopeless and powerless. Encourage life reviews and focus on the positive aspects of the client's life.

Adapted from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Elsevier. p. 130.

BOX 19.17 General Postmortem Procedures

Close the client's eyes.
Replace dentures.
Wash the body and change bed linens if needed.
Place pads under the perineum.
Remove tubes and dressings.
Straighten the body and place a pillow under the head in preparation for family viewing.

PRACTICE QUESTIONS

- A 4-year-old child diagnosed with leukemia is hospitalized for chemotherapy. The child is fearful of the hospitalization. Which nursing intervention would be implemented to alleviate the child's fears?
 - Encourage the child's parents to stay with the child.
 - Encourage play with other children of the same age.
 - Advise the family to visit only during the scheduled visiting hours.
 - Provide a private room, allowing the child to bring favorite toys from home.
- A 16-year-old client is admitted to the hospital for acute appendicitis, and an appendectomy is performed. Which nursing intervention is most appropriate to facilitate normal growth and development postoperatively?
 - Encourage the client to rest and read.
 - Encourage the parents to room in with the client.
 - Allow the family to bring in the client's favorite computer games.
 - Allow the client to interact with others in their same age group.
- Which car safety device should be used for a child who is 8 years old and 4 feet tall?
 - Seat belt
 - Booster seat
 - Rear-facing convertible seat
 - Front-facing convertible seat
- The nurse assesses the vital signs of a 12-month-old infant with a respiratory infection and notes that the respiratory rate is 35 breaths per minute. On the basis of this finding, which action is most appropriate?
 - Administer oxygen.
 - Document the findings.
 - Notify the pediatrician.
 - Reassess the respiratory rate in 15 minutes.
- The nurse is monitoring a 3-month-old infant for signs of increased intracranial pressure. On palpation of the fontanel, the nurse notes that the anterior fontanel is soft and flat. On the basis of this finding, which nursing action is most appropriate?
 - Increase oral fluids.
 - Document the finding.
 - Notify the pediatrician.
 - Elevate the head of the bed to 90 degrees.
- The nurse is evaluating the developmental level of a 2-year-old. Which does the nurse expect to observe in this child?
 - Uses a fork to eat
 - Uses a cup to drink
 - Pours own milk into a cup
 - Uses a knife for cutting food
- A 2-year-old child is treated in the emergency department for a burn to the chest and abdomen. The child sustained the burn by grabbing a cup of hot coffee that was left on the kitchen counter. The nurse reviews safety principles with the parents before discharge. Which statement by the parents indicates an understanding of measures to provide safety in the home?
 - "We will be sure not to leave hot liquids unattended."
 - "I guess our children need to understand what the word hot means."
 - "We will be sure that the children stay in their rooms when we work in the kitchen."
 - "We will install a safety gate as soon as we get home so that the children cannot get into the kitchen."
- A parent arrives at a clinic with a toddler and tells the nurse how difficult it is to get the child to go to bed at night. What measure is most appropriate for the nurse to suggest to the parent?
 - Allow the child to set bedtime limits.
 - Allow the child to have temper tantrums.
 - Avoid letting the child nap during the day.
 - Inform the child of bedtime a few minutes before it is time for bed.
- The parent of a 3-year-old is concerned because the child still is insisting on a bottle at nap time and at bedtime. Which is the most appropriate suggestion to the parent?
 - Allow the bottle if it contains juice.
 - Allow the bottle if it contains water.
 - Do not allow the child to have the bottle.
 - Allow the bottle during naps but not at bedtime.
- The nurse is preparing to care for a 5-year-old who has been placed in traction following a fracture of the femur. The nurse plans care, knowing that which is the most appropriate activity for this child?
 - A radio
 - A sports video
 - Large picture books
 - Crayons and a coloring book
- The parent of a 3-year-old asks a clinic nurse about appropriate and safe toys for the child. The nurse would tell the parent that the most appropriate toy for a 3-year-old is which?
 - A wagon
 - A golf set
 - A jack set with marbles
 - A farm set with small animals

12. Which interventions are appropriate for the care of an infant? Select all that apply.
- 1. Provide swaddling.
 - 2. Talk in a loud voice.
 - 3. Provide the infant with a bottle of juice at nap time.
 - 4. Hang mobiles with black and white contrast designs.
 - 5. Caress the infant while bathing or during diaper changes.
 - 6. Allow the infant to cry for at least 10 minutes before responding.
13. The nurse is preparing to care for a dying client, and several family members are at the client's bedside. Which therapeutic techniques would the nurse use when communicating with the family? Select all that apply.
- 1. Discourage reminiscing.
 - 2. Make the decisions for the family.
 - 3. Encourage expression of feelings, concerns, and fears.
 - 4. Explain everything that is happening to all family members.
 - 5. Touch and hold the client's or family member's hand if appropriate.
 - 6. Be honest and let the client and family know that they will not be abandoned by the nurse.
14. An infant receives a diphtheria, tetanus, and acellular pertussis (DTaP) immunization at a well-baby clinic. The parent returns home and calls the clinic to report that the infant has developed swelling and redness at the site of injection. Which intervention would the nurse suggest to the parent?
1. Monitor the infant for a fever.
 2. Bring the infant back to the clinic.
 3. Apply a hot pack to the injection site.
 4. Apply a cold pack to the injection site.
15. A child is receiving a series of the hepatitis B vaccine and arrives at the clinic with his parent for the second dose. Before administering the vaccine, the nurse would ask the child and parent about a history of a severe allergy to which substance?
1. Eggs
 2. Penicillin
 3. Sulfonamides
 4. A previous dose of hepatitis B vaccine or component
16. A parent brings a 4-month-old infant to a well-baby clinic for immunizations. The child is up to date with the immunization schedule. The nurse should prepare to administer which immunizations to this infant?
1. Varicella, hepatitis B vaccine (HepB)
 2. Diphtheria, tetanus, acellular pertussis (DTaP); measles, mumps, rubella (MMR); inactivated poliovirus vaccine (IPV)
 3. MMR, Haemophilus influenzae type b (Hib), DTaP
 4. DTaP, Hib, IPV, pneumococcal vaccine (PCV), rotavirus vaccine (RV)
17. The clinic nurse is assessing a child who is scheduled to receive a live virus vaccine (immunization). What are the general contraindications associated with receiving a live virus vaccine? Select all that apply.
- 1. The child has symptoms of a cold.
 - 2. The child had a previous anaphylactic reaction to the vaccine.
 - 3. The parent reports that the child is having intermittent episodes of diarrhea.
 - 4. The parent reports that the child has not had an appetite and has been fussy.
 - 5. The child has a disorder that caused a severely deficient immune system.
 - 6. The parent reports that the child has recently been exposed to an infectious disease.

ANSWERS

1. Answer: 1

Rationale: Although the preschooler already may be spending some time away from parents at a day care center or preschool, illness adds a stressor that makes separation more difficult. The child may ask repeatedly when parents will be coming for a visit or may constantly want to call the parents. Options 3 and 4 increase stress related to separation anxiety. Option 2 is unrelated to the subject of the question; in addition, it may be inappropriate for a child who may be immunocompromised and at risk for infection.

Test-Taking Strategy: Note that the **subject** relates to the child's fear. Options 3 and 4 will increase anxiety and fear further and should be eliminated. Bearing the **subject** of the question in mind and considering the child's diagnosis will assist you in eliminating option 2.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 665.

2. Answer: 4

Rationale: Adolescents often are not sure whether they want their parents with them when they are hospitalized. Because of the importance of their peer group, separation from friends is a source of anxiety. Ideally, the members of the peer group will support their ill friend. Options 1, 2, and 3 isolate the client from the peer group.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Consider the psychosocial needs of the adolescent, and remember that the peer group is very important. Options 1, 2, and 3 are **comparable or alike** in that they isolate the client from their own peer group.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 660.

3. Answer: 2

Rationale: All children whose weight or height is above the forward-facing limit for their car safety seat should use a belt-positioning booster seat until the vehicle seat belt fits properly, typically when they have reached 4 feet, 9 inches in height (145 cm) and are between 8 and 12 years of age. Infants should ride in a car in a semireclined, rear-facing position in an infant-only seat or a convertible seat until they weigh at least 20 pounds (9 kg) and are at least 1 year of age. The transition point for switching to the forward-facing position is defined by the manufacturer of the convertible car safety seat but is generally at a body weight of 9 kilograms (20 pounds) and 1 year of age.

Test-Taking Strategy: Focus on the **subject**, car safety, and note the age and height of the child to identify the appropriate safety device. Remember that children should remain in a booster seat until they are 8 to 12 years old and at least 4 feet, 9 inches (145 cm) tall.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. 414-415; <https://www.healthychildren.org/English/safety-prevention/on-the-go/Pages/Car-Safety-Seats-Information-for-Families.aspx>

4. Answer: 2

Rationale: The normal respiratory rate in a 12-month-old infant is 20 to 40 breaths per minute. The normal apical heart rate is 90 to 130 beats per minute, and the average blood pressure is 90/56 mm Hg. The nurse would document the findings.

Test-Taking Strategy: Focus on the **data in the question** and note the **strategic words**, *most appropriate*. Recalling the normal vital signs of an infant and noting that the respiratory rate identified in the question is within the normal range will direct you to the correct option.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 479, 482, 484.

5. Answer: 2

Rationale: The anterior fontanel is diamond-shaped and located on the top of the head. The fontanel should be soft and flat in a normal infant, and it normally closes by 12 to 18 months of age. The nurse would document the finding because it is normal. There is no useful reason to increase oral fluids, notify the pediatrician, or elevate the head of the bed to 90 degrees.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and the words *soft* and *flat*. This should provide you with the clue that this is a normal finding. A bulging or tense fontanel may result from crying or increased intracranial pressure.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 338.

6. Answer: 2

Rationale: By age 2 years, the child can use a cup and spoon correctly but with some spilling. By age 3 to 4 years, the child begins to use a fork. By the end of the preschool period, the child should be able to pour milk into a cup and begin to use a knife for cutting.

Test-Taking Strategy: Focus on the **subject**, the developmental level of a 2-year-old. Option 4 can be eliminated first because of the word *knife*. Next, think about the fine motor skills that need to be developed in selecting the correct option. With this in mind, eliminate options 1 and 3.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 395.

7. Answer: 1

Rationale: Toddlers, with their increased mobility and development of motor skills, can reach hot water or hot objects placed on counters and stoves and can reach open fires or stove burners above their eye level. The nurse should encourage parents to remain in the kitchen when preparing a meal, use the back burners on the stove, and turn pot handles inward and toward the middle of the stove. Hot liquids should never be left unattended or within the child's reach, and the toddler should always be supervised. The statements in options 2, 3, and 4 do not indicate an understanding of the principles of safety.

Test-Taking Strategy: Note the words *indicates an understanding*. Option 2 can be eliminated because it is mandating that the toddler understand what is and is not safe. The toddler is not developmentally able to understand danger. Options 3 and 4 are **comparable or alike** in that they isolate the child from the environment. The correct option is the only one that reflects an understanding of safety principles by the parents.
Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 774.

8. **Answer: 4**

Rationale: Toddlers often resist going to bed. Bedtime protests may be reduced by establishing a consistent before-bedtime routine and enforcing consistent limits regarding the child's bedtime behavior. Informing the child of bedtime a few minutes before it is time for bed is the most appropriate option. Most toddlers take an afternoon nap and, until their second birthday, also may require a morning nap. Firm, consistent limits are needed for temper tantrums or when toddlers try stalling tactics.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and focus on the **subject**, the toddler. Eliminate options 1, 2, and 3 by using concepts related to growth and development. Remember that preparing the toddler for an event will minimize resistive behavior.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 481.

9. **Answer: 2**

Rationale: A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries. If a bottle is allowed at nap time or bedtime, it should contain only water.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Eliminate options 3 and 4 first because they are **comparable or alike** statements. From the remaining options, recalling that nursing (bottle-mouth) caries are a concern in a child will assist in directing you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 413-414.

10. **Answer: 4**

Rationale: In the preschooler, play is simple and imaginative and includes activities such as crayons and coloring books, puppets, felt and magnetic boards, and Play-Doh. A radio or a sports video is most appropriate for the adolescent. Large picture books are most appropriate for the infant.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Note the age of the child, and think about the age-related activity that would be most appropriate. Eliminate options 1 and 2, knowing that they are most appropriate for the adolescent. From the remaining options, the word *large* in option 3 should provide you with the clue that this activity would be more appropriate for a child younger than age 5 years.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 668-669.

11. **Answer: 1**

Rationale: Toys for the toddler must be strong, safe, and too large to swallow or place in the ear or nose. Toddlers need supervision at all times. Push-pull toys, large balls, large crayons, large trucks, and dolls are some of the appropriate toys. A farm set, a golf set, and jacks with marbles may contain items that the child could swallow.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and focus on the **subject**, the appropriate toy for a 3-year-old. Options 2, 3, and 4 can be eliminated because they are **comparable or alike** and could contain items that the child could swallow. Remember that large and strong toys are safest for the toddler.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 401-402.

12. **Answer: 1, 4, 5**

Rationale: Holding, caressing, and swaddling provide warmth and tactile stimulation for the infant. To provide auditory stimulation, the nurse should talk to the infant in a soft voice and should instruct the parent to do so also. Additional interventions include playing a music box, radio, or television, or having a ticking clock or metronome nearby. Hanging a bright shiny object in midline within 20 to 25 cm of the infant's face and hanging mobiles with contrasting colors, such as black and white, provide visual stimulation. Crying is an infant's way of communicating; therefore, the nurse would respond to the infant's crying. The parent is taught to do so also. An infant or child should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or another sweet liquid because of the risk of nursing (bottle-mouth) caries.

Test-Taking Strategy: Focus on the **subject**, care of the infant. Noting the word *loud* and the words *at least 10 minutes before responding* will assist in eliminating these interventions. Also, recalling the concerns related to dental caries will assist in eliminating option 3.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 351.

13. **Answer: 3, 5, 6**

Rationale: The nurse must determine whether there is a spokesperson for the family and how much the client and family want to know. The nurse needs to allow the family and client the opportunity for informed choices and assist with the decision-making process if asked. The nurse should encourage expression of feelings, concerns, and fears and reminiscing. The nurse needs to be honest and let the client and family know that they will not be abandoned. The nurse should touch and hold the client's or family member's hand, if appropriate.

Test-Taking Strategy: Use **therapeutic communication techniques** and recall client and family rights to assist in directing you to the correct options.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 81, 609-610.

14. **Answer: 4**

Rationale: On occasion, tenderness, redness, or swelling may occur at the site of the DTaP injection. This can be relieved with cold packs for the first 24 hours, followed by warm or cold compresses if the inflammation persists. Bringing the infant back to the clinic is unnecessary. Option 1 may be an appropriate intervention but is not specific to the subject of the question, a localized reaction at the injection site. Hot packs are not applied and can be harmful by causing burning of the skin.

Test-Taking Strategy: Focus on the **subject**, a localized reaction at the injection site. Option 1 can be eliminated first because it does not relate specifically to the subject of the question. Eliminate option 2 next as an unnecessary intervention. From the remaining options, general principles related to the effects of heat and cold will direct you to the correct option. Also noting the word *hot* in option 3 will assist in eliminating this option.

References: Centers for Disease Control and Prevention (CDC), <http://www.cdc.gov/vaccines/schedules/index.html>; Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 176.

15. **Answer: 4**

Rationale: A contraindication to receiving the hepatitis B vaccine is a previous anaphylactic reaction to a previous dose of hepatitis B vaccine or to a component (aluminum hydroxide or yeast protein) of the vaccine. An allergy to eggs, penicillin, or sulfonamides is unrelated to the contraindication to receiving this vaccine.

Test-Taking Strategy: Focus on the **subject**, a contraindication to receiving the hepatitis B vaccine. Note the relationship between the words *hepatitis B vaccine* in the question and the correct option.

References: Centers for Disease Control and Prevention (CDC), <http://www.cdc.gov/vaccines/schedules/index.html>; Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 177.

16. **Answer: 4**

Rationale: DTaP, Hib, IPV, PCV, and RV are administered at 4 months of age. DTaP is administered at 2, 4, and 6 months of age; at 15 to 18 months of age; and at 4 to 6 years of age. Hib

is administered at 2, 4, and 6 months of age and at 12 to 15 months of age. IPV is administered at 2, 4, and 6 months of age and at 4 to 6 years of age. PCV is administered at 2, 4, and 6 months of age and at 12 to 15 months of age. RV is administered at 2, 4, and 6 months of age. The first dose of MMR vaccine is administered at 12 to 15 months of age; the second dose is administered at 4 to 6 years of age (if the second dose was not given by 4 to 6 years of age, it should be given at the next visit). The first dose of HepB is administered at birth, the second dose is administered at 1 month of age, and the third dose is administered at 6 months of age. Varicella-zoster vaccine is administered at 12 to 15 months of age and again at 4 to 6 years of age.

Test-Taking Strategy: Focus on the **subject**, immunization schedule for a 4-month-old infant, and use knowledge regarding the immunization schedule to answer this question. Noting the age of the infant will assist in directing you to the correct option.

References: Centers for Disease Control and Prevention (CDC), <http://www.cdc.gov/vaccines/schedules/index.html>; Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 172-174.

17. **Answer: 2, 5**

Rationale: The general contraindications for receiving live virus vaccines include a previous anaphylactic reaction to a vaccine or a component of a vaccine. In addition, live virus vaccines generally are not administered to individuals with a severely deficient immune system, individuals with a severe sensitivity to gelatin, or pregnant women. A vaccine is administered with caution to an individual with a moderate or severe acute illness, with or without fever. Options 1, 3, 4, and 6 are not contraindications to receiving a vaccine.

Test-Taking Strategy: Focus on the **subject**, contraindications for a live virus vaccine. This indicates that you need to select the situations in which a live virus vaccine cannot be given because doing so can cause harm to the child. Noting the word *anaphylactic* in option 2 and the words *severely deficient* in option 5 will direct you to these options.

CHAPTER 20

Care of the Older Client

Contributor: Lisa Nicholas, MSN, RN

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS Development, Safety

I. Aging and Gerontology

- A. Aging is the biopsychosocial process of change that occurs in a person between birth and death.
- B. Gerontology is the study of the aging process.

II. Physiological Changes and Nursing Considerations

A. Integumentary system

1. Loss of pigment in hair and skin
2. Wrinkling of the skin
3. Thinning of the epidermis and easy bruising and tearing of the skin
4. Decreased skin turgor, elasticity, and subcutaneous fat, which may result in lower tolerance to thermal extremes
5. Increased nail thickness and decreased nail growth
6. Decreased perspiration
7. Dry, itchy, scaly skin
8. Seborrheic dermatitis and keratosis formation (overgrowth and thickening of certain areas of the skin)
9. Inspect nails of all older adults; cut toenails straight across.
10. Encourage a well-balanced diet with protein and adequate hydration.
11. Teach clients to dress for the environmental temperatures.

B. Neurological system

1. Slowed reflexes
2. Slight tremors and difficulty with fine motor movement
3. Loss of balance
4. Increased incidence of awakening after sleep onset
5. Increased susceptibility to hypothermia and hyperthermia
6. Short-term memory decline possible

7. Long-term memory usually maintained

8. Assess the need for an ambulatory aid, such as a cane or walker.
9. Daytime napping is especially common in older adults of advanced age.
10. Do not rush older clients; they may become frustrated if hurried and could sustain a fall.

C. Musculoskeletal system

1. Decreased muscle mass and strength and atrophy of muscles
2. Decreased mobility, range of motion, flexibility, coordination, and stability
3. Change of gait, with shortened step and wider base
4. Posture and stature changes, causing a decrease in height, also known as kyphosis (Fig. 20.1)
5. Increased brittleness of the bones due to demineralization. Postmenopausal persons experience a greater rate of bone demineralization than older men; however, older men with poor nutrition and decreased mobility are also at risk for bone demineralization.
6. Deterioration of joint capsule components
7. Kyphosis and a widened gait cause a shift in the center of gravity, which could lead to an imbalance and falls; teach proper body mechanics.

! The older client is at risk for falls because of the changes that occur in the neurological and musculoskeletal systems.

D. Cardiovascular system

1. Diminished energy and endurance, with lowered tolerance to exercise
2. Decreased compliance of the heart muscle can be due to remodeling of the heart after myocardial infarction or long-standing hypertension,

FIG. 20.1 A normal spine at 40 years of age and osteoporotic changes at 60 and 70 years of age. These changes can cause a loss of as much as 6 inches (15 cm) in height and can result in the so-called dowager's hump (far right) in the upper thoracic vertebrae.

with heart valves becoming thicker and more rigid due to calcification.

3. Decreased cardiac output and decreased efficiency of blood return to the heart
 4. Decreased compensatory response, so less able to respond to increased demands on the cardiovascular system
 5. Decreased resting heart rate, which may be medication-related
 6. Peripheral pulses can be weak due to lower cardiac output.
 7. Increased blood pressure but susceptible to postural hypotension, especially with certain cardiac medications such as diuretics
 8. Assess heart rate and rhythm and heart sounds for murmurs.
- E. Respiratory system
1. Decreased stretch and compliance of the chest wall
 2. Decreased strength and function of respiratory muscles
 3. Decreased size and number of alveoli
 4. Respiratory rate usually unchanged
 5. Decreased depth of respirations
 6. Decreased ability to cough and expectorate sputum
 7. Respiratory infections may be more severe and last longer.
- F. Hematological system
1. Hemoglobin and hematocrit levels average toward the low end of normal.

2. Prone to increased blood clotting
3. Decreased protein available for protein-bound medications

⚠ Pigment loss and skin yellowing are common changes associated with aging.

- G. Immune system
1. Tendency for lymphocyte counts to be low with altered immunoglobulin production
 2. Decreased resistance to infection and disease
 3. Older clients are less able to make new antigens; they need to receive flu shots, pneumococcal vaccination, and the shingles vaccination.
- H. Gastrointestinal system
1. Decreased caloric needs because of lowered basal metabolic rate
 2. Decreased appetite, thirst, and oral intake
 3. Decreased lean body weight
 4. Slowed gastric motility
 5. Increased tendency toward constipation due to poor oral intake and slowed motility
 6. Increased susceptibility for dehydration
 7. Tooth loss
 8. Poor-fitting dentures
 9. Difficulty in chewing and swallowing food
 10. Decreased taste buds, decreased sense of smell, decreased volume of saliva
- I. Endocrine system
1. Decreased secretion of hormones, with specific changes related to each hormone's function
 2. Encourage the use of skin moisturizers.
 3. Decreased metabolic rate
 4. Decreased glucose tolerance, with resistance to insulin in peripheral tissues
 5. Assess family history for obesity and diabetes mellitus.
 6. Teach clients to dress warmly in cool or cold weather.
- J. Renal/urinary system
1. Decreased kidney size, function, and ability to concentrate urine
 2. Decreased glomerular filtration rate
 3. Decreased capacity of the bladder
 4. Increased residual urine and increased incidence of infection and possibly incontinence
 5. Impaired medication excretion
 6. Evaluate prescribed medications for possible contribution to retention.
 7. Monitor hydration status.
 8. Discourage excessive fluid intake for 2 to 4 hours before going to bed; encourage emptying the bladder at least every 2 hours on a regular basis to avoid overflow urinary incontinence.
- K. Reproductive system
1. Decreased testosterone production and decreased size of the testes

2. Changes in the prostate gland, leading to urinary problems such as retention, hesitancy, or stress incontinence, predisposing to urinary tract infections
 3. Decreased secretion of hormones with the cessation of menses
 4. Vaginal changes, including decreased muscle tone and lubrication; teach Kegel exercises to strengthen pelvic muscles.
 5. Impotence or sexual dysfunction for both sexes; sexual function varies and depends on general physical condition, mental health status, and medications.
 6. Discuss normal and expected changes; provide education to help prevent problems with body image.
- L. Special senses
1. Decreased visual acuity
 2. Decreased accommodation in eyes, requiring increased adjustment time to changes in light
 3. Decreased peripheral vision and increased sensitivity to glare
 4. Presbyopia and **cataract** formation
 5. Possible loss of hearing ability; low-pitched tones are heard more easily
 6. Inability to discern taste of food
 7. Decreased sense of smell
 8. Changes in touch sensation
 9. Decreased pain awareness
- III. **Psychosocial Concerns**
- A. Adjustment to deterioration in physical and mental health and well-being
 - B. Threat to independent functioning and fear of becoming a burden to loved ones
 - C. Adjustment to retirement and loss of income
 - D. Loss of skills and competencies developed early in life
 - E. **Coping** with changes in role function and social life
 - F. Diminished quantity and quality of relationships and coping with loss
 - G. Dependence on governmental and social systems
 - H. Access to social support systems
 - I. Costs of health care and medications
 - J. Loss of independence in living, driving, and other daily functions
 - K. Not having a youthful look may affect a person's self image.
- IV. **Mental Health Concerns**
- A. **Depression**: The increased dependency that older adults may experience can lead to hopelessness, helplessness, lowered sense of self-control, and decreased self-esteem and self-worth; these changes can interfere with daily functioning and lead to depression. Depression is a common mental health behavioral problem among older adults in the community.
 - B. **Grief**: Client reacts to the perception of loss, including physical, psychological, social, and spiritual aspects.
 - C. **Isolation**: Client is alone and desires contact with others but is unable to make that contact.
 - D. **Suicide**: Depression can lead to thoughts of self-harm.
 - E. Depression differs from delirium and **dementia** (Table 20.1).
-  Any suicide threat made by an older client should be taken seriously.
- V. **Pain**
- A. Description
1. Pain can occur from numerous causes and most often occurs from degenerative changes in the musculoskeletal system.
 2. The nurse needs to monitor the older client closely for signs of pain; failure to alleviate pain in the older client can lead to functional limitations affecting his or her ability to function independently.
 3. Older adults may be more hesitant to report pain due to their inaccurate assumption that it is part of aging or their fear of further diagnostic testing.
 4. Nurses caring for older adults have to advocate for appropriate and effective pain management with the goal being to maximize and maintain function and improve quality of life.
- B. Assessment
1. Restlessness
 2. Verbal reporting of pain
 3. Agitation
 4. Moaning
 5. Crying
- C. Interventions
1. Monitor the client for signs and symptoms of pain.
 2. Identify the type and pattern of pain.
 3. Identify the precipitating factor(s) for the pain.
 4. Monitor the impact of the pain on activities of daily living.
 5. Set realistic goals for pain management, and use functional outcome as a measure of attaining the goal.
 6. Provide pain relief through measures such as distraction, relaxation, massage, biofeedback, ice, heat, and stretching.
 7. Administer pain medication as prescribed, and instruct the client in its use. Opioid use should be avoided as much as possible.
 8. Over-the-counter preparations such as acetaminophen, ibuprofen, lidocaine patches, and creams may be prescribed.
 9. Evaluate the effects of pain-reducing measures.

TABLE 20.1 Differentiating Delirium, Depression, and Dementia

Characteristic	Delirium	Depression	Dementia
Onset	Sudden, abrupt	Recent, may relate to life change	Insidious, slow, over years and often unrecognized until deficits are obvious
Course over 24 hr	Fluctuating, often worse at night	Fairly stable, may be worse in the morning	Fairly stable, may see changes with stress; sundowning may occur
Consciousness	Reduced/distorted	Awake	Awake
Alertness	Increased, decreased, or variable	Normal	Generally normal
Psychomotor activity	Increased, decreased, or mixed	Variable; agitation or retardation	Normal; may have apraxia or agnosia; agitation can occur
Duration	Hours to weeks	Variable and may be chronic	Years
Attention	Disordered, fluctuates	Little impairment	Generally normal but may have trouble focusing; overwhelmed with multiple stimuli
Orientation	Usually impaired, fluctuates	Usually normal, but may answer "I don't know" to questions or may not try to answer	Generally normal to person but not to place or time; may be impaired and may make up answers or answer close to the right thing, or may confabulate, but tries to answer
Speech	Often incoherent, slow, or rapid; may call out repeatedly or repeat the same phrase	May be slow	Difficulty finding word, perseveration
Affect	Variable but may look disturbed, frightened	Flat	Slowed response, may be labile

Modified from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. p. 182. In Touhy, T., & Jett, K. (2022). *Ebersole and Hess' gerontological nursing & healthy aging*. (6th ed.). St. Louis: Elsevier.

VI. Infection (Box 20.1)

- Altered mental status is a common sign of infection in the older adult, especially infection of the urinary tract.
- Carefully monitor the older adult with infection because of the diminished and altered immune response.
- Nonspecific symptoms may indicate illness or infection (see Box 20.1).
- Risks associated with the development of infections in older adults include lack of proper hygiene, poor nutrition and unintentional weight loss, lack of exercise, poor social support, and low albumin.
- Teach older adults and their families how to reduce the risk for infections.

VII. Medications

- Major problems with prescriptive medications include adverse effects, medication interactions, medication errors, nonadherence, polypharmacy, and cost. See Box 20.2 for information on medications to avoid in the older adult client. This information is based on Beers Criteria from the American Geriatrics Society. Information on this criteria and a full list of medications to avoid can be located at <https://geriatricscareonline.org/ProductAbstract/american-geriatrics-society>

BOX 20.1 Nonspecific Symptoms That Possibly Indicate Illness or Infection

- Anorexia
- Apathy
- Changes in functional status
- Altered mental status, including delirium
- Tachypnea
- Hyperglycemia
- Dyspnea
- Falling
- Fatigue
- Incontinence
- Self-neglect
- Shortness of breath
- Blood pressure below baseline

Adapted from Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 42, 414, 416.

[updated-beers-criteria-for-potentially-inappropriate-medication-use-in-older-adults/CL001](https://www.aacn.org/clinical-practice/updated-beers-criteria-for-potentially-inappropriate-medication-use-in-older-adults/CL001)

- Determine the use of over-the-counter medications.
- Polypharmacy**
 - Routinely monitor the number of prescription and nonprescription medications used and determine whether any can be eliminated or combined.

BOX 20.2 Medications to Avoid in the Older Client**Analgesics**

- Indomethacin
- Ketorolac
- Nonsteroidal antiinflammatory drugs (NSAIDs)
- Meperidine

Antidepressants

- First-generation tricyclic antidepressants

Antihistamines

- First-generation antihistamines

Antihypertensives

- Alpha₁-blockers
- Centrally acting alpha₂-agonists

Urge Incontinence Medications

- Oxybutynin
- Tolterodine

Muscle Relaxants

- Carisoprodol
- Cyclobenzaprine
- Metaxalone
- Methocarbamol

Sedative-Hypnotics

- Barbiturates
- Benzodiazepines

References

Based on Beers Criteria from the American Geriatrics Society. Information on these criteria and a full list of medications to avoid can be located at <https://geriatricscareonline.org/ProductAbstract/american-geriatrics-society-updated-beers-criteria-for-potentially-inappropriate-medication-use-in-older-adults/CL001>

Touhy, T., & Jett, K. (2022). *Ebersole and Hess' gerontological nursing & healthy aging*. (6th ed.). St. Louis: Elsevier. pp. 119–120.

2. Keep the use of medications to a minimum.
 3. Overprescribing medications leads to more side and adverse effects, increased interaction between medications, duplication of medication treatment, diminished quality of life, and increased costs.
- D. Medication dosages normally are prescribed at one-third to one-half of normal adult dosages.
- E. Closely monitor the client for adverse effects and response to therapy because of the increased risk for medication toxicity (see **Box 20.2**).
- F. Assess for medication interactions in the client taking multiple medications.
- G. Advise the client to use one pharmacy and to notify the consulting primary health care provider(s) of the medications taken.

 A common sign of an adverse reaction to a medication in the older client is a sudden change in mental status.

BOX 20.3 Administering Oral Medications to a Client at Risk for Aspiration

- Check the medication prescription and compare against the medical record. Clarify any incomplete prescriptions prior to administration. Check the rights of medication administration.
- Review pertinent information related to the medication and any related nursing considerations, such as laboratory parameters.
- Assess for any contraindications to the administration of oral medications, such as NPO (nothing by mouth) status or decreased level of consciousness.
- Place the client in a sitting position. Assess aspiration risk using a screening tool or per agency policy. Check for an ability to swallow and cough on command. Check for the presence of a gag reflex. Following this assessment, if aspiration is a serious concern, the nurse would collaborate with the primary health care provider and speech therapist before administering the medication.
- Remember to plan to keep the client in an upright position for 30 minutes to prevent aspiration after PO intake.
- Prepare the medication in the form that is easiest to swallow, checking the rights of medication administration again. Mix medications whole, or crush medications and mix with applesauce or pudding if indicated (use sugar-free and low carbohydrate products for clients with diabetes). Do not crush sustained-release tablets, and use liquid preparations when possible. Thicken liquids when indicated, and avoid the use of straws.
- Check the rights of medication administration one more time, and administer the medications one at a time in the prepared form, ensuring that the client has effectively swallowed everything. Ensure that the client is comfortable and safe, and document the medications given using an electronic system or per agency policy.

Adapted from Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 617, 640.

H. Safety measures for medication administration (Box 20.3**)**

1. The client should be in a sitting position when taking medication.
2. The mouth is checked for dryness because medication may stick and dissolve in the mouth.
3. Liquid preparations can be used if the client has difficulty swallowing tablets.
4. Tablets can be crushed if necessary and given with textured food (pudding, applesauce) if not contraindicated.
5. Enteric-coated tablets are not crushed, and capsules are not opened.
6. If administering a suppository, avoid inserting the suppository immediately after removing it from the refrigerator; a suppository may take a while to dissolve because of decreased body core temperature.
7. When administering parenteral solution or medication, monitor the site because it may ooze or bleed because of decreased tissue elasticity; an immobile limb is not used for administering parenteral medication.

8. Monitor client adherence with taking prescribed medications.
9. Monitor the client for **safety** in correctly taking medications, including an assessment of the ability to read the instructions and discriminate among the pills and their colors and shapes.
10. Use a medication case or organizer with checklists/schedules to facilitate proper administration of medication.
11. Encourage clients to keep a complete and up-to-date list of medications with them at all times.
12. Educate the client on each medication, common side effects, and when to notify the primary health care provider.
13. Allow time for the client to ask questions, and use the teach-back method when appropriate. Include support persons in the teaching.

VIII. Mistreatment of the Older Adult (see Clinical Judgment: Take Action Box)

- A. Domestic mistreatment takes place in the home of the older adult and is usually carried out by a family member or significant other; this can include physical, psychological, financial, or sexual maltreatment; **neglect**; or abandonment.
- B. Institutional mistreatment takes place when an older adult experiences **abuse** when hospitalized or living somewhere other than home (e.g., a long-term care facility).
- C. **Self-neglect** is the choice by a mentally competent individual to avoid medical care or other services

CLINICAL JUDGMENT: TAKE ACTION

The home care nurse is caring for an older client who lives with her son and is physically and financially dependent on her son. The nurse notes multiple bruises on the client's arms and asks the client how these bruises occurred. The client confides in the nurse that her son takes out anger on her sometimes. The nurse takes the following actions.

- Performs a thorough assessment of physical injuries.
- Provides confidentiality during the assessment with an empathetic and nonjudgmental approach.
- Reports the abuse to the appropriate authorities and follows state and agency guidelines.
- Reassures the victim that they have done nothing wrong.
- Assists the victim in developing self-protective and problem-solving skills.
- Encourages the victim to develop a specific plan for safety (a fast escape if the violence returns) and for where to obtain help (hotlines, safe houses, and shelters) or to call the police (an abused person is usually reluctant to call the police).

- that could improve optimal function, to not care for oneself, or to engage in actions that negatively affect his or her personal safety; unless declared legally incompetent, an individual has the right to refuse care.
- D. Older adults are a population at risk for being victims of "scams," in which they are approached via e-mail, phone, or other means of communication, asking them to send money for specific causes; teach clients to always verify the legitimacy of the caller and to never provide any information about self, such as bank information, credit card information, passwords, or Social Security number.

 Individuals at most risk for abuse include those who are dependent because of their immobility or altered mental status.

- E. For additional information on abuse of the older client, see Chapter 68

PRACTICE QUESTIONS

1. The nurse is providing medication instructions to an older client with chronic heart failure who is taking digoxin daily. The nurse explains to the client that decreased lean body mass and decreased glomerular filtration rate, which are age-related body changes, could place the client at risk for which complication with medication therapy?
 1. Decreased absorption of digoxin
 2. Increased risk for digoxin toxicity
 3. Decreased therapeutic effect of digoxin
 4. Increased risk for side effects related to digoxin
2. The nurse is caring for an older client in a long-term care facility. Which action does the nurse plan that will contribute to encouraging autonomy in the client?
 1. Planning meals
 2. Decorating the room
 3. Scheduling haircut appointments
 4. Allowing the client to choose social activities
3. The home care nurse is visiting an older client whose spouse died 6 months ago. Which behaviors by the client indicate effective coping? Select all that apply.
 - 1. Neglecting personal grooming
 - 2. Looking at old snapshots of family
 - 3. Participating in a senior citizens program
 - 4. Visiting the spouse's grave once a month
 - 5. Decorating a wall with the spouse's pictures and awards received

4. The nurse is providing instructions to the assistive personnel (AP) regarding care of an older client with hearing loss. What would the nurse tell the AP about older clients with hearing loss?
 1. They are often distracted.
 2. They have middle ear changes.
 3. They respond to low-pitched tones.
 4. They develop moist cerumen production.
5. The nurse is providing an educational session to new employees, and the topic is abuse of the older client. The nurse helps the employees identify which client as most typically a victim of abuse?
 1. A person who has moderate hypertension
 2. A person who has newly diagnosed cataracts
 3. A person who has advanced Parkinson's disease
 4. A person who has early diagnosed Lyme disease
6. The nurse is performing an assessment on an older client who is having difficulty sleeping at night. Which statement by the client indicates the need for further teaching regarding measures to improve sleep?
 1. "I swim 3 times a week."
 2. "I have stopped smoking cigars."
 3. "I drink hot chocolate before bedtime."
 4. "I read for 40 minutes before bedtime."
7. The visiting nurse observes that an older client is confined by their child to the room. When the nurse suggests that he walk to the den and join the family, he says, "I'm in everyone's way; my child needs me to stay here." Which is the most important action for the nurse to take?
 1. Say to the child, "Confining your parent to their room is inhumane."
 2. Suggest to the client and child that they consider a nursing home for the client.
 3. Say nothing, because it is best for the nurse to remain neutral and wait to be asked for help.
 4. Suggest appropriate resources to the client and child, such as respite care and a senior citizens center.
8. The nurse is performing an assessment on an older adult client. Which assessment data would indicate a potential complication associated with the skin?
 1. Crusting
 2. Wrinkling
 3. Deepening of expression lines
 4. Thinning and loss of elasticity in the skin
9. The home health nurse is visiting a client for the first time. While assessing the client's medication history, it is noted that there are 19 prescriptions and several over-the-counter medications that the client has been taking. Which intervention would the nurse take first?
 1. Check for medication interactions.
 2. Determine whether there are medication duplications.
 3. Determine whether a family member supervises medication administration.
 4. Call the prescribing primary health care provider (PHCP) and report polypharmacy.
10. The long-term care nurse is performing assessments on several of the residents. Which are normal age-related physiological changes the nurse would expect to note? Select all that apply.
 1. Increased heart rate
 2. Decline in visual acuity
 3. Decreased respiratory rate
 4. Decline in long-term memory
 5. Increased susceptibility to urinary tract infections
 6. Increased incidence of awakening after sleep onset

ANSWERS

1. Answer: 2

Rationale: The older client is at risk for medication toxicity because of decreased lean body mass and an age-associated decreased glomerular filtration rate. This age-related change is not specifically associated with decreased absorption, decreased therapeutic effect, or increased risk for side effects. Toxicity, or toxic effects, occurs as a result of excessive accumulation of the medication in the body.

Test-Taking Strategy: Focus on the **subject**, age-related body changes that could place the client at risk for medication toxicity. Recall that toxicity occurs as a result of medication accumulation in the body, which usually occurs as a result of decreased renal function. Note that the correct option is the only one that addresses renal excretion.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 71-72.

2. Answer: 4

Rationale: Autonomy is the personal freedom to direct one's own life as long as it does not impinge on the rights of others. An autonomous person is capable of rational thought. This individual can identify problems, search for alternatives, and select solutions that allow continued personal freedom as long as others and their rights and property are not harmed. Loss of autonomy, and therefore independence, is a real fear of older clients. The correct option is the only one that allows the client to be a decision maker.

Test-Taking Strategy: Focus on the **subject**, encouraging autonomy. Recalling the definition of autonomy will direct you to the correct option. Remember that giving the client choices is essential to promote independence.

Reference: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. p. 12.

3. Answer: 2, 3, 4, 5

Rationale: Coping mechanisms are behaviors used to decrease stress and anxiety. In response to a death, ineffective coping is manifested by an extreme behavior that in some cases may be harmful to the individual physically or psychologically. Neglecting personal grooming is indicative of a behavior that identifies ineffective coping in the grieving process. The remaining options identify appropriate and effective coping mechanisms.

Test-Taking Strategy: Note the **strategic word**, *effective*, and focus on the **subject**, effective coping behaviors. Note that options 2, 3, 4, and 5 are **comparable or alike** and are positive activities in which the individual is engaging to get on with their life.

References: Ignatavicius, D., Workman, M., Rebar, C., & Heimgartner, N. (2021). *Concepts for interprofessional collaborative care*. (10th ed.). St. Louis: Saunders. pp. 56-57; Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 743-744, 765, 768.

4. Answer: 3

Rationale: Presbycusis refers to the age-related irreversible degenerative changes of the inner ear that lead to decreased

hearing ability. As a result of these changes, the older client has a decreased response to high-frequency sounds. Low-pitched voice tones are heard more easily and can be interpreted by the older client. Options 1, 2, and 4 are not accurate characteristics related to aging.

Test-Taking Strategy: Focus on the **subject**, age-related changes related to hearing. Think about the physiological changes associated with aging. Recalling that the client with a hearing loss responds to low-pitched tones will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 378, 392.

5. Answer: 3

Rationale: Elder abuse includes physical, sexual, or psychological abuse; misuse of property; and violation of rights. The typical abuse victim is a person of advanced age with few social contacts and at least one physical or mental impairment that limits her ability to perform activities of daily living. In addition, the client usually lives alone or with the abuser and depends on the abuser for care.

Test-Taking Strategy: Focus on the **subject**, elder abuse. Note the **strategic word**, *most*. Read each option carefully, and identify the client who is most defenseless as a result of the disease process. This will direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. p. 66.

6. Answer: 3

Rationale: Many nonpharmacological sleep aids can be used to influence sleep. However, the client should avoid caffeinated beverages and stimulants such as tea, cola, and chocolate. The client needs to exercise regularly, because exercise promotes sleep by burning off tension that accumulates during the day. A 20- to 30-minute walk, swim, or bicycle ride 3 times a week is helpful. Smoking and alcohol need to be avoided. Reading is also a helpful measure and is relaxing.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 are positive statements indicating that the client understands the methods of improving sleep. Remember that chocolate contains caffeine.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 1044-1045, 1052.

7. Answer: 4

Rationale: Assisting clients and families to become aware of available community support systems is a role and responsibility of the nurse. Observing that the client has begun to be confined to their room makes it necessary for the nurse to intervene legally and ethically, so option 3 is not appropriate and is passive in terms of advocacy. Option 2 suggests committing the client to a nursing home and is a premature action on the nurse's part. Although the data provided tell the nurse

that this client requires nursing care, the nurse does not know the extent of the nursing care required. Option 1 is incorrect and judgmental.

Test-Taking Strategy: Note the **strategic words**, *most important*. Using principles related to the ethical and legal responsibility of the nurse and knowledge of the nurse's role will direct you to the correct option. Option 1 is a nontherapeutic statement, option 2 is a premature action, and option 3 avoids the situation.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 65, 67-68.

8. Answer: 1

Rationale: The normal physiological changes that occur in the skin of older adults include thinning of the skin, loss of elasticity, deepening of expression lines, and wrinkling. Crusting noted on the skin would indicate a potential complication.

Test-Taking Strategy: Note the **subject**, a potential complication. Think about the normal physiological changes that occur in the aging process in the integumentary system to direct you to the correct option.

Reference: Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 397-398.

9. Answer: 2

Rationale: Polypharmacy is a concern in the older client. Duplication of medications needs to be identified before medication interactions can be determined, because the nurse

needs to know what the client is taking. Asking about medication administration supervision may be part of the assessment but is not a first action. The phone call to the PHCP is the intervention after all other information has been collected.

Test-Taking Strategy: Note the **strategic word**, *first*. Also note that the nurse is visiting the client for the first time. Options 1, 3, and 4 would be done after possible medication duplication has been identified.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 189-190, 615.

10. Answer: 2, 5, 6

Rationale: Anatomical changes to the eye affect the individual's visual ability, leading to potential problems with activities of daily living. Light adaptation and visual fields are reduced. Although lung function may decrease, the respiratory rate usually remains unchanged. Heart rate decreases and heart valves thicken. Age-related changes that affect the urinary tract increase an older client's susceptibility to urinary tract infections. Short-term memory may decline with age, but long-term memory usually is maintained. Change in sleep patterns is a consistent, age-related change. Older persons experience an increased incidence of awakening after sleep onset.

Test-Taking Strategy: Focus on the **subject**, normal age-related changes. Read each characteristic carefully, and think about the physiological changes that occur with aging to select the correct items.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Mosby. pp. 179-180, 186.

Maternity Nursing

Pyramid to Success

The Pyramid to Success focuses on the physiological and psychosocial aspects related to the experience of pregnancy, birth, and the postpartum period. Pyramid Points begin with assessment and recognizing cues of expected findings of the pregnant client and fetus during the antepartum period. Instructing the pregnant client in measures that promote a healthy environment for the fetus is included. The focus is on the importance of antepartum follow-up, nutrition, and generating solutions for common discomforts that occur during pregnancy. Knowledge of the purpose of the commonly prescribed diagnostic tests and procedures in the antepartum period is also part of the Pyramid to Success. The focus is on disorders that can occur during pregnancy, particularly gestational hypertension and diabetes. The labor and birth process and the immediate interventions for conditions in which the birthing parent or fetal status is compromised, such as prolapsed cord or altered fetal heart rate, are part of the Pyramid to Success. Review of the fetus/newborn of a birthing parent with human immunodeficiency virus or acquired immunodeficiency syndrome or a substance-abusing birthing parent is recommended. The Pyramid to Success also includes a focus on the normal expectations of the postpartum period and the complications that can occur during this time. The normal physical assessment findings and early identification of disorders in the neonate is a focus. The last Pyramid Point in this unit focuses on maternity and newborn medications.

- Maintaining confidentiality
- Prioritizing hypotheses based on client needs
- Providing continuity of client care
- Promoting a safe environment to protect the client from potential teratogenic threats
- Upholding client's rights
- Using surgical asepsis when providing care
- Using standard and transmission-based precautions when providing care

Health Promotion and Maintenance

- Assessing for growth and development
- Discussing expected body image changes with the client
- Discussing family planning and birthing and parenting issues
- Generating solutions to modify at-risk behavior
- Identifying at-risk clients during pregnancy
- Identifying health and wellness concepts and providing health care screening
- Identifying lifestyle choices and high-risk behaviors
- Performing techniques of physical assessment
- Providing antepartum, intrapartum, postpartum, and newborn care
- Teaching regarding antepartum, intrapartum, and postpartum care, and care to the newborn

Psychosocial Integrity

- Considering cultural, religious, and spiritual influences regarding birth and parenting
- Discussing situational role changes in the family
- Ensuring therapeutic interactions within the family
- Identifying available support systems
- Identifying coping mechanisms

Physiological Integrity

- Evaluating outcomes of care
- Instructing the client about prescribed diagnostic tests and procedures
- Monitoring for expected outcomes and effects related to pharmacological and parenteral therapies
- Monitoring for normal expectations during pregnancy

Client Needs: Learning Outcomes

Safe and Effective Care Environment

- Consulting with the interprofessional health care team
- Ensuring that informed consent for diagnostic tests and procedures has been obtained
- Handling hazardous and infectious materials safely

Monitoring for side effects and adverse effects related to prescribed pharmacological and parenteral therapies
Monitoring the client during the labor and birth process
Providing interventions for unexpected events during pregnancy
Providing nonpharmacological comfort interventions and pharmacological pain management during labor

Supporting families who are experiencing fertility issues
Taking action if emergency situations arise
Teaching the client about nutrition during pregnancy and in the postpartum period
Teaching the client about the physiological changes that occur during pregnancy

Reproductive System

Contributor: Margaret Trnka, MSN, RN

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS Reproduction, Sexuality

I. Reproductive Structures and Functions

- A. Ovaries
 1. Form and expel ova
 2. Secrete estrogen and progesterone
- B. Fallopian tubes
 1. Muscular tubes (oviducts) lying near the ovaries and connected to the **uterus**
 2. Tubes that propel the ova from the ovaries to the uterus
- C. Uterus
 1. Muscular, pear-shaped cavity in which the fetus develops
 2. Cavity from which menstruation occurs
- D. Cervix
 1. The internal os of the cervix opens into the body of the uterine cavity.
 2. The cervical canal is located between the internal os and the external os.
 3. The external cervical os opens into the vagina.
 4. It is a passageway sperm can travel through to fertilize eggs.
- E. **Vagina**
 1. Muscular tube that extends from the cervix to the vaginal opening in the perineum that is approximately 3 to 4 in (7.6 to 10 cm) long
 2. Known as the *birth canal*
 3. Passageway for menstrual **blood** flow, for penis for intercourse, and for the fetus
- F. Penis
 1. Structures include the body or shaft, glans penis, and urethra.
 2. Primary functions include pathway for urination, ejaculation, and the organ used for intercourse.
- G. Scrotum
 1. Houses structures including the testes, epididymis, and vas deferens

2. Normal temperature is slightly cooler than body temperature.
- H. Prostate gland
 1. Secrete a milky alkaline fluid that forms part of semen
 2. This milky alkaline fluid enhances sperm movement and neutralizes acidic vaginal secretions.

II. Menstrual Cycle (Box 21.1)

- A. Ovarian hormones
 1. Ovarian hormones, released by the anterior pituitary gland, include follicle-stimulating hormone (FSH) and luteinizing hormone (LH).
 2. The hormones produce changes in the ovaries and in the endometrium.
 3. The menstrual cycle, the regularly recurring physiological changes in the endometrium that culminate in its shedding, may vary in length, with the average length being about 28 days.
- B. Ovarian and uterine phases (Box 21.1)

III. Pelvis and Measurements

- A. True pelvis
 1. Lies below the pelvic brim
 2. Consists of the pelvic inlet, midpelvis, and pelvic outlet
- B. False pelvis
 1. The shallow portion above the pelvic brim
 2. Supports the abdominal viscera
- C. Types of pelvis
 1. Gynecoid
 - a. Normal pelvis
 - b. Transversely rounded or blunt

 The gynecoid pelvis is most favorable for successful labor and birth. If cephalopelvic disproportion (CPD) exists, the normal labor process cannot progress and will most likely result in a cesarean delivery.

BOX 21.1 Menstrual Cycle**Ovarian Changes****Preovulatory Phase**

Hypothalamus releases gonadotropin-releasing hormone through the portal system to the anterior pituitary system. Secretion of follicle-stimulating hormone (FSH) by the anterior lobe of the pituitary gland stimulates growth of follicles. Most follicles die, leaving one to mature into a large graafian follicle. Estrogen produced by the follicle stimulates increased secretions of luteinizing hormone (LH) by the anterior lobe of the pituitary gland. The follicle ruptures and releases an ovum into the peritoneal cavity.

Luteal Phase

Begins with ovulation. Body temperature decreases and then increases by 0.5° F to 1° F around the time of ovulation. Corpus luteum is formed from follicle cells that remain in the ovary after ovulation. Corpus luteum secretes estrogen and progesterone during the remaining 12 to 14 days of the cycle. Corpus luteum degenerates if the ovum is not fertilized, and secretion of estrogen and progesterone declines. Decline of estrogen and progesterone stimulates the anterior pituitary to secrete more FSH and LH, initiating a new reproductive cycle.

Uterine Changes**Menstrual Phase**

Consists of 4 to 6 days of bleeding as the endometrium breaks down because of the decreased levels of estrogen and progesterone. The level of FSH increases, enabling the beginning of a new cycle.

Proliferative Phase

Lasts about 9 days. Estrogen stimulates proliferation and growth of the endometrium. As estrogen increases, it suppresses secretion of FSH and increases secretion of LH. Secretion of LH stimulates ovulation and the development of the corpus luteum. Ovulation occurs between days 12 and 16. Estrogen level is high, and progesterone level is low.

Secretory Phase

Lasts about 12 days and follows ovulation. This phase is initiated in response to the increase in LH level. The graafian follicle is replaced by the corpus luteum. The corpus luteum secretes progesterone and estrogen. Progesterone prepares the endometrium for pregnancy if a fertilized ovum is implanted.

Data from Lewis, S., Harding, M., Kwong, J., Roberts, D., Hagler, D., & Reinisch, C. (2020). *Medical-surgical nursing: Assessment and management of clinical problems*. (11th ed.). St. Louis: Mosby. pp. 1176-1177; Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 55.

2. Anthropoid
 - a. Oval shape
 - b. Adequate outlet, with a narrow pubic arch
 3. Android
 - a. Heart-shaped or angulated
 - b. Not favorable for labor and vaginal birth
 - c. Narrow pelvic planes can cause slow descent and midpelvic arrest.
 4. Platypelloid
 - a. Flat with an oval inlet
 - b. Wide transverse diameter, but short anteroposterior diameter, making labor and vaginal birth difficult
 - D. Pelvic inlet diameters
 1. Anteroposterior diameters
 - a. Diagonal conjugate: Distance from the lower margin of the symphysis pubis to the sacral promontory
 - b. True conjugate or conjugate vera: Distance from the upper margin of the symphysis pubis to the sacral promontory
 - c. Obstetric conjugate: Extends from the sacral promontory to the top of the symphysis pubis. It is the smallest front-to-back distance through which the fetal head must pass in moving through the pelvic inlet.
 2. Transverse diameter: The largest of the pelvic inlet diameters; located at right angles to the true conjugate
 3. Oblique (diagonal) diameter: Not clinically measurable
 4. Posterior sagittal diameter: Distance from the point where the anteroposterior and transverse diameters cross each other to the middle of the sacral promontory
 - E. Pelvic midplane diameters
 1. Transverse (interspinous diameter)
 2. Midplane normally is the largest plane and has the longest diameter.
 - F. Pelvic outlet diameters
 1. Transverse (intertuberous diameter)
 2. Outlet presents the smallest plane of the pelvic canal.
- IV. Fertilization and Implantation**
- A. Fertilization**
1. Fertilization occurs in the ampulla of the fallopian (uterine) tube when sperm and ovum unite.
 2. Fertilization usually takes place within the outer third of the fallopian tubes. An ovum can be fertilized up to 72 hours after its release.

3. When fertilized, the membrane of the ovum undergoes changes that prevent entry of other sperm.
4. Each reproductive cell carries 23 chromosomes.
5. Sperm carry an X or a Y chromosome—XY, male; XX, female. Female carries the X chromosome.

B. Implantation

1. Fertilized egg becomes a zygote.
2. The zygote is propelled toward the uterus and implants 6 to 10 days after ovulation.
3. The blastocyst secretes chorionic gonadotropin to ensure that the corpus luteum remains viable and secretes estrogen and progesterone for the first 2 to 3 months of gestation.

V. Fetal Development (Box ><.)

VI. Fetal Environment (Clinical Judgment: Take Action Box)

A. Amnion

1. Encloses the amniotic cavity
2. Is the inner membrane that forms about the second week of embryonic development
3. Forms a fluid-filled sac that surrounds the embryo and later the fetus

B. Chorion

1. Is the outer membrane enclosing the amniotic cavity
2. Becomes vascularized and forms the fetal part of the placenta

C. Amniotic fluid

1. Consists of 800 to 1200 mL by the end of pregnancy
2. Surrounds, cushions, and protects the fetus and allows for fetal movement
3. Maintains the body temperature of the fetus
4. Contains fetal urine and is a measure of fetal kidney function
5. The fetus modifies the amniotic fluid through the processes of swallowing, urinating, and movement of fluid through the respiratory tract.

D. Placenta

1. The placenta provides for exchange of nutrients and waste products between the fetus and birthing parent.
2. The placenta begins to form at implantation; the structure is complete by week 12.
3. It produces hormones to maintain pregnancy and assumes full responsibility for the production of these hormones by the 12th week of gestation.
4. In the third trimester, transfer of maternal immunoglobulin provides the fetus with passive immunity to certain diseases for the first few months after birth.
5. By week 10 to 12, genetic testing can be done via chorionic villus sampling (CVS).

 Nutrients, medications, alcohol, antibiotics, and bacteria can pass through the placenta.

CLINICAL JUDGMENT: TAKE ACTION

The nurse is performing an initial assessment on a pregnant adolescent, and the adolescent reports consuming small amounts of alcohol on a daily basis. The nurse would take the following actions:

- Consider that an adolescent pregnancy is high risk because of the immaturity of the reproductive system and the high-risk behaviors that some adolescents engage in.
- Provide information to the adolescent regarding the risks associated with drug and alcohol consumption during pregnancy.
- Explain to the adolescent that bacteria, nutrients, drugs, antibodies, and viruses can pass through the placenta to the fetus.
- Discuss measures that need to be taken to minimize exposure to substances such as alcohol that can cross the placental barrier and affect the health of the fetus.
- Decide on an immediate and follow-up plan to address the high-risk behavior of consuming alcohol.

VII. Fetal Circulation

A. Umbilical cord

1. It contains two arteries and one vein.
2. The arteries carry deoxygenated blood and waste products from the fetus.
3. The vein carries oxygenated blood and provides oxygen and nutrients to the fetus.

B. Fetal heart rate (FHR)

1. FHR depends on gestational age; FHR is 160 to 170 beats per minute in the first trimester but slows with fetal growth to 110 to 160 beats per minute.
2. FHR is about twice the maternal heart rate.

C. Fetal circulation bypass (Fig. 21.1)

1. Fetal circulation bypass is present because of nonfunctioning lungs.
2. Bypasses must close after birth to allow blood to flow through the lungs and the liver.
3. The ductus arteriosus connects the pulmonary artery to the aorta, bypassing the lungs.
4. The ductus venosus connects the umbilical vein and the inferior vena cava, bypassing the liver.
5. The foramen ovale is the opening between the right and left atria of the heart, bypassing the lungs.

VIII. Family Planning

A. Description

1. Involves choosing when to have children
2. Includes contraception, prevention of pregnancy, and methods to achieve pregnancy

BOX 21.2 Fetal Development**Preembryonic Period**

First 2 weeks after conception

Embryonic Period

Beginning day 15 through approximately week 8 after conception

Fetal Period

Week 9 after conception to birth

Week 1

Blastocyst is free-floating.

Weeks 2 to 3

Embryo is 1.5 to 2 mm in length.

Lung buds appear.

Blood circulation begins.

Heart is tubular and begins to beat.

Neural plate becomes brain and spinal cord.

Week 5

Embryo is 0.4 to 0.5 cm in length.

Embryo is 0.4 g.

Double heart chambers are visible.

Heart is beating.

Limb buds form.

Week 8

Embryo is 3 cm in length.

Embryo is 2 g.

Eyelids begin to fuse.

Circulatory system through umbilical cord is well established.

Taste buds begin to develop.

Lips are fused.

Every organ system is present.

Week 12

Fetus is 6 to 9 cm in length.

Fetus is 19 g.

Face is well formed.

Limbs are long and slender.

Kidneys begin to form urine.

Spontaneous movements occur.

Sucking reflex is present.

Heartbeat is detected by Doppler transducer between 10 and 12 weeks.

Week 16

Fetus is 11.5 to 13.5 cm in length.

Fetus is 100 g.

Active movements are present.

Fetal skin is transparent.

Lanugo hair begins to develop.

Skeletal ossification occurs.

Fingerprints are developing.

Fetus swallows amniotic fluid.

Sex of fetus is visually recognizable on ultrasound.

Week 20

Fetus is 16 to 18.5 cm in length.

Fetus is 300 g.

Lanugo covers the entire body.

Fetus has nails.

Muscles are developed.

Enamel and dentin are depositing.

Myelination of nerves begins.

Heartbeat is detected by regular (nonelectronic) fetoscope.

Week 24

Fetus is 23 cm in length.

Fetus is 600 g.

Hair on head is well formed.

Skin is reddish and wrinkled.

Reflex hand grasp functions are present.

Vernix caseosa covers entire body.

Fetus has ability to hear.

Surfactant levels begin to increase.

Week 28

Fetus is 27 cm in length.

Fetus is 1100 to 1300 g.

Limbs are well flexed.

Brain is developing rapidly.

Eyelids open and close.

Lungs are developed sufficiently to provide gas exchange (lecithin forming).

If born, neonate can breathe at this time.

Week 32

Fetus is 31 cm in length.

Fetus is 1800 to 2100 g.

Bones are fully developed.

Subcutaneous fat has collected.

Lecithin-to-sphingomyelin (L/S) ratio is 1.2:1.

Week 36

Fetus is 35 cm in length.

Fetus is 2200 to 2900 g.

Skin is pink and body is rounded.

Skin is less wrinkled.

Lanugo is disappearing.

L/S ratio is greater than 2:1.

Lungs are considered mature.

Week 40

Fetus is 40 cm in length.

Fetus is more than 3200 g.

Skin is pinkish and smooth.

Lanugo may be present on upper arms and shoulders.

Vernix caseosa decreases.

Fingernails extend beyond fingertips.

Sole (plantar) creases run down to the heel. At 40 weeks creases cover only two-thirds of the foot; the entire sole is covered with creases after 41 weeks.

Testes are in the scrotum.

Labia majora are well developed.

FIG. 21.1 Fetal circulation. Three shunts (ductus venosus, ductus arteriosus, and foramen ovale) allow most blood from the placenta to bypass the fetal lungs and liver.

B. Birth control

1. The focus of counseling on contraception must meet the needs and feelings of each partner.
2. Several factors should be considered when choosing a method of birth control, including effectiveness, safety, and personal preference.
3. The woman's preferences are most important, and cultural practices or religious or other personal beliefs may affect the choice of contraceptives.
4. Other factors that bear on the selection of a contraceptive method include family planning goals, age, frequency of intercourse, and the individual's capacity to adhere to the prescribed regimen.
5. If family planning goals have already been met, sterilization of either partner may be desirable (it is important for the couple to understand that tubal reconstruction may be unsuccessful).
6. For those who frequently engage in coitus, oral contraceptives or a long-term method such as implants or an intrauterine device (IUD) may be considered.

7. When sexual activity is limited, the use of spermicide, condoms, or a diaphragm may be most appropriate.
8. Because some methods have adverse effects, a signed informed consent form may be needed.
9. For additional information on the use of contraceptives, see [Chapter 29](#).

C. Infertility

1. Infertility is the inability to conceive when desired.
2. Some factors contributing to infertility in men include abnormalities of the sperm, abnormal erections or ejaculations, or abnormalities of the seminal fluid.
3. Some factors that contribute to infertility include disorders of ovulation, abnormalities of the fallopian tubes or cervix, or scarring from previous uterine or fallopian tube infections.
4. Several diagnostic tests are available to determine the probable cause of infertility, and the therapy recommended may depend on the cause of the infertility.

5. Infertility options
 - a. Options include medication, surgical procedures, and artificial insemination.
 - b. Other therapies are available, such as in vitro fertilization, surrogate mothers, and embryo hosts.
 - c. Adoption may also be an option.
6. The nurse needs to provide support to the couple in their decision-making process and during therapy.

PRACTICE QUESTIONS

1. The nurse is preparing to teach a prenatal class about fetal circulation. Which statements would be included in the teaching plan? Select all that apply.
 1. "The ductus arteriosus allows blood to bypass the fetal lungs."
 2. "One vein carries oxygenated blood from the placenta to the fetus."
 3. "The normal fetal heartbeat range is 160 to 180 beats per minute in pregnancy."
 4. "Two arteries carry deoxygenated blood and waste products away from the fetus to the placenta."
 5. "Two veins carry blood that is high in carbon dioxide and other waste products away from the fetus to the placenta."
2. The nursing instructor teaches a group of students about fetal circulation and then asks a student to describe fetal circulation, specifically the ductus venosus. Which statement by the student indicates an understanding of the ductus venosus?
 1. "It connects the pulmonary artery to the aorta."
 2. "It is an opening between the right and left atria."
 3. "It connects the umbilical vein to the inferior vena cava."
 4. "It connects the umbilical artery to the inferior vena cava."
3. A pregnant client tells the clinic nurse that they want to know the sex of the baby as soon as it can be determined. The nurse plans to inform the client that they will be able to find out the sex at 16 weeks' gestation because of which factor?
 1. The appearance of the fetal external genitalia
 2. The beginning of differentiation in the fetal groin
 3. The fetal testes are descended into the scrotal sac.
 4. The internal differences in different genders become apparent.
4. The nurse is performing an assessment on a client who is at 38 weeks' gestation and notes that the fetal heart rate (FHR) is 174 beats per minute. On the basis of this finding, what is the priority nursing action?
 1. Document the finding.
 2. Notify the obstetrician (OB).
 3. Check the mother's heart rate.
 4. Tell the client that the fetal heart rate is normal.
5. The nurse is conducting a prenatal class on the reproductive system. When a client in the class asks why the fertilized ovum stays in the fallopian tube for 3 days, what is the nurse's best response?
 1. "It promotes the fertilized ovum's chances of survival."
 2. "It promotes the fertilized ovum's exposure to estrogen and progesterone."
 3. "It promotes the fertilized ovum's normal implantation in the top portion of the uterus."
 4. "It promotes the fertilized ovum's exposure to luteinizing hormone and follicle-stimulating hormone."
6. The nursing instructor asks a nursing student to explain the characteristics of the amniotic fluid. The student responds correctly by explaining which as characteristics of amniotic fluid? Select all that apply.
 1. Allows for fetal movement
 2. Surrounds, cushions, and protects the fetus
 3. Maintains the body temperature of the fetus
 4. Can be used to measure fetal kidney function
 5. Prevents large particles such as bacteria from passing to the fetus
 6. Provides an exchange of nutrients and waste products between the birthing parent and the fetus
7. A couple comes to the family planning clinic and asks about sterilization procedures. Which question by the nurse would determine whether this method of family planning would be most appropriate?
 1. "Have you ever had surgery?"
 2. "Do you plan to have any other children?"
 3. "Do either of you have diabetes mellitus?"
 4. "Do either of you have problems with high blood pressure?"
8. The nurse would plan to make which statement to a pregnant client found to have a gynecoid pelvis?
 1. "Your type of pelvis has a narrow pubic arch."
 2. "Your type of pelvis is the most favorable for labor and birth."
 3. "Your type of pelvis is a wide pelvis, but it has a short diameter."
 4. "You will need a cesarean section because this type of pelvis is not favorable for a vaginal delivery."

9. Which purposes of placental functioning would the nurse plan to include in a prenatal class? Select all that apply.
- 1. It cushions and protects the baby.
 - 2. It maintains the temperature of the baby.
 - 3. It is the way the baby gets food and oxygen.
 - 4. It prevents all antibodies and viruses from passing to the baby.
 - 5. It provides an exchange of nutrients and waste products between the birthing parent and developing fetus.
10. A 55-year-old client confides in the nurse about being concerned about sexual function. What is the nurse's best response?
- 1. "How often do you have sexual relations?"
 - 2. "Please share with me more about your concerns."
 - 3. "You are still young and have nothing to be concerned about."
 - 4. "You should not have a decline in testosterone until you are in your 80s."

ANSWERS

1. Answer: 1, 2, 4

Rationale: The ductus arteriosus is a unique fetal circulation structure that allows blood to bypass the nonfunctioning fetal lungs. Oxygenated blood is transported to the fetus by one umbilical vein. The normal fetal heartbeat range is considered to be 110 to 160 beats per minute. Two arteries carry deoxygenated blood and waste products from the fetus, and one umbilical vein carries oxygenated blood and provides oxygen and nutrients to the fetus. Blood pumped by the embryo's heart leaves the embryo through two umbilical arteries.

Test-Taking Strategy: Focus on the **subject**, fetal circulation. Recall that three umbilical vessels are within the umbilical cord (two arteries and one vein) and that the vein carries oxygenated blood and the arteries carry deoxygenated blood. Also recalling the normal fetal heartbeat will assist in answering correctly.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 239, 243.

2. Answer: 3

Rationale: The ductus venosus connects the umbilical vein to the inferior vena cava. The foramen ovale is a temporary opening between the right and left atria. The ductus arteriosus joins the aorta and the pulmonary artery.

Test-Taking Strategy: Focus on the **subject**, an understanding of the description of the ductus venosus. Use knowledge of fetal circulation to assist in answering. Also note the relationship of the word *venosus* in the question and *vein* in the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 239.

3. Answer: 1

Rationale: Between weeks 16 and 20, the external genitalia of the fetus have developed to such a degree that the sex of the fetus can be determined visually. Differentiation of the external genitalia occurs at the end of the ninth week. Testes begin to descend into the scrotal sac at the end of the 38th week.

Internal differences in the genders occur at the end of the seventh week.

Test-Taking Strategy: Focus on the **subject**, when the sex of the fetus can be determined. Use knowledge about fetal growth and development. Remember that the sex of the fetus can be recognizable visually on ultrasound by the appearance of the external genitalia between gestational weeks 16 and 20. **Reference:** Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 245.

4. Answer: 2

Rationale: The FHR depends on gestational age and ranges from 160 to 170 beats per minute in the first trimester but slows with fetal growth to 110 to 160 beats per minute. If the FHR is less than 110 beats per minute or more than 160 beats per minute with the uterus at rest, the fetus may be in distress. Because the FHR is increased from the reference range, the nurse would notify the OB. Options 3 and 4 are inappropriate actions based on the information in the question. Although the nurse documents the findings, based on the information in the question, the OB needs to be notified.

Test-Taking Strategy: Focus on the **data in the question** and note the **strategic word**, *priority*. Then, note if an abnormality exists. Also note the FHR and that the client is at 38 weeks of gestation. Remember that the normal FHR is 110 to 160 beats per minute.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 371-373.

5. Answer: 3

Rationale: The tubal isthmus remains contracted until 3 days after conception to allow the fertilized ovum to develop within the tube. This initial growth of the fertilized ovum promotes its normal implantation in the fundal portion of the uterine corpus. Estrogen is a hormone produced by the ovarian follicles, corpus luteum, adrenal cortex, and placenta during pregnancy. Progesterone is a hormone secreted by the corpus luteum of the ovary, adrenal glands, and placenta during pregnancy. Luteinizing hormone and follicle-stimulating hormone are excreted by the anterior pituitary gland.

The survival of the fertilized ovum does not depend on it staying in the fallopian tube for 3 days.

Test-Taking Strategy: Note the **strategic word**, *best*, and use knowledge of the anatomy and physiology of the reproductive system. Remember that fertilization occurs in the fallopian tube and that the fertilized ovum remains in the fallopian tube for about 3 days. This promotes its normal implantation. **Reference:** Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 83.

6. Answer: 1, 2, 3, 4

Rationale: The amniotic fluid surrounds, cushions, and protects the fetus. It allows the fetus to move freely and maintains the body temperature of the fetus. In addition, the amniotic fluid contains urine from the fetus and can be used to assess fetal kidney function. The placenta prevents large particles such as bacteria from passing to the fetus and provides an exchange of nutrients and waste products between the birthing parent and the fetus.

Test-Taking Strategy: Focus on the **subject**, the characteristics of amniotic fluid. Visualizing the location of the amniotic fluid will assist in answering this question.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 94.

7. Answer: 2

Rationale: Sterilization is a method of contraception for couples who have completed their families. It should be considered a permanent end to fertility, because reversal surgery is not always successful. The nurse would ask the couple about their plans for having children in the future. Options 1, 3, and 4 are unrelated to this procedure.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the **subject**, sterilization procedure. Note the relationship between the word *sterilization* and the words *plan to have any other children* in the correct option.

References: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p.160; Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 695.

8. Answer: 2

Rationale: A gynecoid pelvis is a normal pelvis and is the most favorable for successful labor and birth. An android

pelvis would be unfavorable for labor because of the narrow pelvic planes. An anthropoid pelvis has an outlet that is adequate, with a normal or moderately narrow pubic arch. A platypelloid pelvis (flat pelvis) has a wide transverse diameter, but the anteroposterior diameter is short, making the outlet inadequate.

Test-Taking Strategy: Focus on the **subject**, pelvis type. Recalling that the gynecoid pelvis is the normal pelvis will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 324.

9. Answer: 3, 5

Rationale: The placenta provides an exchange of oxygen, nutrients, and waste products between the birthing parent and the fetus. The amniotic fluid surrounds, cushions, and protects the fetus and maintains the body temperature of the fetus. Nutrients, medications, antibodies, and viruses can pass through the placenta.

Test-Taking Strategy: Focus on the **subject**, the purpose of the placenta. Remember that the placenta provides oxygen and nutrients.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 237-239.

10. Answer: 2

Rationale: The nurse needs to establish trust when discussing sexual relationships. The nurse would open the conversation with broad statements to determine the true nature of the client's concerns. The frequency of intercourse is not a relevant first question to establish trust. Testosterone declines with the aging process.

Test-Taking Strategy: Note the **strategic word**, *best*. Determine whether further assessment or validation is needed. In this case, more information is needed to determine the nature of the client's concerns. Keeping these concepts in mind and using **therapeutic communication techniques** will assist in directing you to the correct option.

Prenatal Period

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Development, Reproduction

I. Gestation

- A. Time from **fertilization** of the ovum until the date of **delivery**
- B. About 280 days
- C. **Näegele's rule** for estimating the date of delivery, also known as date of birth (**Box 22.1**)
 1. Use of Näegele's rule requires that the person have a regular 28-day menstrual cycle.
 2. Subtract 3 months and add 7 days to the □rst day of the last menstrual period; then add 1 year if appropriate. Alternatively, add 7 days to the □rst day of the last menstrual period and count forward 9 months.

2. *T* is term births, the number born at term (longer than 37 weeks of gestation).
3. *P* is preterm births, the number born before 37 weeks of gestation.
4. *A* is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks of gestation).
5. *L* is the number of current living children. This number can be greater than the *P* if multiples were delivered, or less than the *P* if a loss occurred. *Note:* Multiples count as a 1 for gravidity, as well as a 1 for term, preterm, or abortions, but are recorded as the actual number for living.

II. Gravidity and Parity

- A. Gravidity
 1. **Gravida** refers to a pregnant person.
 2. *Gravidity* refers to the number of pregnancies.
 3. A nulligravida is a person who has never been pregnant.
 4. A primigravida is a person who is pregnant for the □rst time.
 5. A multigravida is a person in at least the second pregnancy.
- B. Parity
 1. **Parity** is the number of births (not the number of fetuses, e.g., twins) carried past 20 weeks of gestation, whether or not the fetus was born alive.
 2. A nullipara is a person who has not had a birth at more than 20 weeks of gestation.
 3. A primipara is a person who has had one birth that occurred after the 20th week of gestation.
 4. A multipara is a person who has had two or more pregnancies to the stage of fetal viability.
- C. Use of GTPAL: Pregnancy outcomes can be described with the acronym **GTPAL** (**Box 22.2**).
 1. *G* is gravidity, the number of pregnancies, including the present one.

III. Pregnancy Signs

- A. Presumptive signs
 1. Amenorrhea
 2. Nausea and vomiting
 3. Breast tenderness, tingling, feelings of fullness, increased size and pigmentation of the areola
 4. Urinary frequency
 5. **Quickening**: The □rst perception of fetal movement by the pregnant individual may occur at the 16th to 20th week of gestation; every pregnancy is unique, and quickening could happen earlier or later.
 6. Fatigue
 7. Changes to skin pigmentation such as linea nigra, melasma
- B. Probable signs
 1. Uterine enlargement
 2. **Hegar's sign**: Compressibility and softening of the lower uterine segment that occurs at about week 6
 3. **Goodell's sign**: Softening of the cervix that occurs at the beginning of the second month
 4. **Chadwick's sign**: Violet coloration of the mucous membranes of the cervix, **vagina**, and vulva that occurs at about week 6

BOX 22.1 Nägele's Rule for Estimating the Date of Delivery

First day of last menstrual period: September 12, 2023
 Subtract 3 months: June 12, 2023
 Add 7 days: June 19, 2023
 Add 1 year if necessary: June 19, 2024 (if early enough in the year, the year may not change)
 Estimated date of delivery: June 19, 2024

BOX 22.2 Describing Pregnancy Outcome with GTPAL

G = Gravidity
 T = Term births
 P = Preterm births
 A = Abortions or miscarriages
 L = Current living children

Example: A client is pregnant for the fourth time. The client had one elective abortion in the first trimester, a child who was born at 40 weeks of gestation, and a child who was born at 36 weeks of gestation. The client is gravida (G), 4; term (T), 1 (the child born at 40 weeks); preterm (P), 1 (the child born at 36 weeks); abortion (A), 1 (the abortion is counted in the gravidity, but is not included in the parity because it occurred before 20 weeks); living children (L), 2. Parity is the number of births (not the number of fetuses) carried past 20 weeks of gestation, whether or not the fetus was born alive. Therefore, the parity for this client is 2.

GTPAL = 4, 1, 1, 1, 2

5. **Ballottement:** Rebounding of the fetus against the examiner's fingers on palpation
 6. Braxton Hicks contractions (irregular painless contractions that may occur intermittently throughout pregnancy)
 7. Positive pregnancy test for determination of the presence of human chorionic gonadotropin
- C. Positive signs (diagnostic)
1. Fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation
 2. Active fetal movements palpable by examiner
 3. Outline of fetus via radiography or ultrasonography

IV. Fundal Height (Box >>>)

- A. Fundal height is measured to evaluate the gestational age of the fetus.
- B. During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals fetal age in weeks \pm 2 cm (Fig. 22.1).
- C. At 16 weeks, the fundus can be found approximately halfway between the symphysis pubis and the umbilicus.

BOX 22.3 Measuring Fundal Height

1. Place the client in the supine position.
2. Place the end of the tape measure at the level of the symphysis pubis.
3. Stretch the tape to the top of the uterine fundus.
4. Note and record the measurement.

- D. At 20 to 22 weeks, the fundus is approximately at the location of the umbilicus.
- E. At 36 weeks, the fundus is at the xiphoid process.
- F. Ask the client to void before measurement because of possible uterine displacement from a full bladder.

 When assessing fundal height, monitor the client closely for supine hypotension when placed in the supine position after 20 weeks of gestation.

V. Physiological Pregnancy Changes

 Culture often determines health beliefs, values, and family expectations. Therefore, it is important to assess cultural beliefs during care of the pregnant client.

- A. Cardiovascular system
1. Circulating blood volume increases, plasma increases, and total red blood cell volume increases (total volume increases by approximately 40% to 50%).
 2. Physiological anemia occurs as the plasma increase exceeds the increase in production of red blood cells.
 3. Iron requirements are increased.
 4. Heart size increases, and the heart is elevated slightly upward and to the left because of displacement of the diaphragm as the uterus enlarges; changes are minor and reverse soon after childbirth (Fig. 22.2).
 5. Retention of sodium and water may occur.
- B. Respiratory system
1. Oxygen consumption increases by approximately 15% to 20%.
 2. Diaphragm is elevated because of the enlarged uterus (see Fig. 22.2).
 3. Hormonal changes in estrogen and progesterone levels may have an effect on the respiratory system.
 4. Shortness of breath may be experienced.

 During pregnancy, a woman's pulse rate may increase about 10 to 15 beats per minute; the blood pressure slightly decreases in the second trimester, then increases in the third trimester, but not above the prepregnancy level; and the respiratory rate remains unchanged or slightly increases.

FIG. 22.1 Height of fundus by weeks of normal gestation with a single fetus. *Dashed line*, Height after lightening (descent of the fetus toward the pelvic inlet before labor).

FIG. 22.2 Changes in position of heart, lungs, and thoracic cage in pregnancy. *Broken line*, Nonpregnant state. *Solid line*, Change that occurs in pregnancy.

C. Gastrointestinal system

1. Nausea and vomiting may occur as a result of the secretion of human chorionic gonadotropin; this condition typically subsides by the third month.
2. Appetite is often increased during pregnancy. Food intake may increase by 15% to 20% beginning in early pregnancy.
3. Alterations in taste and smell may occur.
4. Poor appetite may occur later in pregnancy because of decreased gastric motility.
5. Constipation may occur because of an increase in progesterone production or pressure from the

uterus, resulting in decreased gastrointestinal motility.

6. Flatulence and heartburn may occur because of decreased gastrointestinal motility and slowed emptying of the stomach caused by an increase in progesterone production.
 7. Hemorrhoids may occur because of increased venous pressure.
 8. Gum tissue may become swollen and easily bleed because of increasing levels of estrogen.
 9. Ptyalism (excessive secretion of saliva) may occur because of increasing levels of estrogen.
- ### D. Renal system
1. Frequency of urination increases by 25% in the first and third trimesters because of increased bladder sensitivity and pressure of the enlarging uterus on the bladder.
 2. Decreased bladder tone may occur and is caused by an increase in progesterone and estrogen levels; bladder capacity increases in response to increasing levels of progesterone.
 3. Renal threshold for glucose may be reduced.
- ### E. Endocrine system
1. Basal metabolic rate increases and metabolic function increases.
 2. The anterior lobe of the pituitary gland enlarges and produces serum prolactin needed for the lactation process.
 3. The posterior lobe of the pituitary gland produces oxytocin, which stimulates uterine contractions.
 4. The thyroid enlarges slightly, and thyroid activity increases.
 5. The parathyroid increases in size.
 6. Aldosterone levels gradually increase.
 7. Body weight increases.
 8. Water retention is increased, which can contribute to weight gain.
 9. The pancreas increases insulin production.
- ### F. Reproductive system
1. Uterus
 - a. Uterus enlarges, increasing in mass from approximately 60 to 1000 g as a result of hyperplasia (influence of estrogen) and hypertrophy.
 - b. Size and number of blood vessels and lymphatics increase.
 - c. Irregular contractions occur, typically beginning after 16 weeks of gestation.
 2. Cervix
 - a. Cervix becomes shorter, more elastic, and larger in diameter.
 - b. Endocervical glands secrete a thick mucus plug, which is expelled from the canal when dilation begins.
 - c. Increased vascularization and an increase in estrogen cause softening and a violet discoloration known as Chadwick's sign, which occurs at about 6 weeks of gestation.

3. Ovaries
 - a. A major function of the ovaries is to secrete progesterone for the first 6 to 7 weeks of pregnancy.
 - b. The maturation of new follicles is blocked.
 - c. The ovaries cease ovum production.
 4. Vagina
 - a. Hypertrophy and thickening of the muscle occur.
 - b. An increase in vaginal secretions is experienced; secretions are usually thick, white, and acidic.
 5. Breasts: Breast changes occur because of the increasing effects of estrogen and progesterone.
 - a. Breast size increases, and breasts may be tender and feel full beginning by the sixth week of pregnancy.
 - b. Nipples become more pronounced.
 - c. The areolae become darker in color.
 - d. Superficial veins become prominent.
 - e. Hypertrophy of Montgomery's follicles occurs.
 - f. Colostrum may leak from the breast.
- G. Skin
1. Some changes occur because the levels of melanocyte-stimulating hormone increase as a result of an increase in estrogen and progesterone levels; these changes include the following:
 - a. Increased pigmentation
 - b. Dark streak down the midline of the abdomen (linea nigra)
 - c. Chloasma (mask of pregnancy)—a blotchy brownish hyperpigmentation over the forehead, cheeks, and nose
 - d. Reddish-purple stretch marks (striae gravidarum) on the abdomen, breasts, thighs, and upper arms
 2. Vascular spider nevi may occur on the neck, chest, face, arms, and legs.
 3. Rate of hair growth may increase.
 4. Skin changes may be emotionally distressing for the expectant individual, but they are clinically insignificant and usually disappear shortly after childbirth.
- H. Musculoskeletal system
1. Changes in the center of gravity begin in the second trimester and are caused by the hormones relaxin and progesterone.
 2. The lumbosacral curve increases, which may cause aching, numbness, and weakness; walking becomes more difficult, and the person develops a waddling gait and is at risk for falls; however, walking is an ideal exercise and stimulates muscular activity, gently increases respiratory and cardiovascular effort, and does not result in fatigue or strain.
 3. Relaxation and increased mobility of pelvic joints occur, which permit enlargement of pelvic dimensions.
 4. Abdominal wall stretches with loss of tone throughout pregnancy, usually regained in postpartum.
 5. Umbilicus flattens or protrudes.
-  During pregnancy, postural changes occur as the increased weight of the uterus causes a forward pull of the bony pelvis. It is important for the nurse to encourage the client to implement measures that maintain safety and correct posture to prevent a backache.
- I. Sensory organs
1. Eyes: Corneal edema may occur and may be uncomfortable for those who wear contact lenses.
 2. Ears: Changes in the mucous membranes of the eustachian tubes occur from increased levels of estrogen and may result in blocked ears and a mild, temporary hearing loss.
- VI. Psychological Pregnancy Changes
- A. Ambivalence
1. Ambivalence may occur early in pregnancy, even when the pregnancy is planned.
 2. The pregnant parent may experience a dependence-independence conflict and ambivalence related to role changes; the client may also feel unsure of the ability to be a good parent.
 3. The partner may experience ambivalence related to the new role being assumed, increased financial responsibilities, and sharing the birthing parent's attention with the child.
- B. Acceptance: Factors that may be related to acceptance of the pregnancy are the person's readiness for the experience and identification with the parenthood role. Specific developmental tasks must be accomplished successfully for positive parental role adaptation. These tasks for the birthing parent include accepting the pregnancy, identifying with the parenting role, solidifying the relationship with the partner, establishing a relationship with the unborn infant, and preparing for the birth experience.
- C. Emotional lability
1. Emotional lability may be manifested by frequent changes of emotional states or extremes in emotional states.
 2. These emotional changes are common, but the individual may think that these changes are abnormal.
- D. Body image changes
1. The changes in a birthing parent's perception of self-image during pregnancy occur gradually and may be positive or negative.
 2. The physical changes and signs and symptoms that the birthing parent experiences during pregnancy contribute to body image.
- E. Relationship with the fetus
1. The birthing parent may daydream to prepare for parenthood and think about the parental qualities desiring to possess.

2. The birthing parent first accepts the biological fact of being pregnant.
3. The birthing parent next accepts the growing fetus as distinct from self and a person to nurture.
4. Finally, the birthing parent prepares realistically for the birth and parenting of the child.

VII. Discomforts of Pregnancy (see Clinical Judgment: Evaluate Outcomes Box)

A. Nausea and vomiting

1. Occurs in the first trimester and usually subsides by the third month
2. Caused by elevated levels of human chorionic gonadotropin and other pregnancy hormones, as well as changes in carbohydrate metabolism
3. Interventions
 - a. Eating dry crackers before arising
 - b. Avoiding brushing teeth immediately after arising
 - c. Eating small, frequent, low-fat meals during the day
 - d. Drinking liquids between meals rather than at meals
 - e. Avoiding fried foods and spicy foods
 - f. Eating a protein snack at bedtime
 - g. Sucking on hard candy
 - h. Asking the primary health care provider (PHCP) about acupressure (some types may require a prescription) or other complementary and alternative medicine (CAM) modalities
 - i. Asking the PHCP about the use of herbal remedies
 - j. Taking antiemetic medications as prescribed

 Pregnant individuals need to be asked about the use of complementary and alternative modalities, including over-the-counter products such as vitamins and herbal preparations.

B. Syncope

1. Usually occurs in the first trimester; supine hypotension occurs particularly in the second and third trimesters.
2. May be triggered hormonally or caused by the increased blood volume, anemia, fatigue, sudden position changes, or lying supine
3. Interventions
 - a. Sitting with the feet elevated
 - b. Risk for falls; teach to change positions slowly

 The nurse needs to instruct the pregnant individual to avoid lying in the supine position, particularly in the second and third trimesters. The supine position places the individual at risk for supine hypotension, which occurs as a result of pressure of the uterus on the inferior vena cava.

CLINICAL JUDGMENT: EVALUATE OUTCOMES

A client who is 6 weeks pregnant is having episodes of morning sickness. The clinic nurse provides information to the client about measures to take to alleviate the episodes of nausea and vomiting. The nurse determines that the client understands these measures when the client makes the following statements:

- “I should keep dry crackers at my bedside and eat them before I get up in the morning.”
 - “It would be best to eat small, frequent meals through the day.”
 - “I need to try to eat low-fat foods and especially avoid any fried foods or spicy foods.”
 - “Eating a protein snack at bedtime may help me.”
 - “I should try to drink fluids between meals. Drinking liquids at meals may fill my stomach too much and make me sick.”
 - “I know that I can try sucking on hard candy. That might help.”
 - “If I feel I need to, I can ask my doctor about some medication that might help or other herbal remedies.”
- C. Urinary urgency and frequency
1. Usually occurs in the first and third trimesters
 2. Caused by pressure of the uterus on the bladder
 3. Interventions
 - a. Drinking no less than 2000 mL of fluid during the day
 - b. Limiting fluid intake in the evening
 - c. Limiting intake of natural diuretics such as coffee, tea, watermelon, lemons
 - d. Voiding at regular intervals
 - e. Sleeping side-lying at night
 - f. Wearing perineal pads, if necessary
 - g. Performing Kegel exercises
- D. Breast tenderness
1. Can occur in the first through the third trimesters
 2. Caused by increased levels of estrogen and progesterone
 3. Interventions
 - a. Wearing a supportive bra
 - b. Avoiding the use of soap on the nipples and areolar area to prevent drying of skin
- E. Increased vaginal discharge
1. Can occur in the first through the third trimesters
 2. Caused by hypertrophy and thickening of the vaginal mucosa and increased mucus production
 3. Interventions
 - a. Using proper cleansing and hygiene techniques

- b. Wearing cotton underwear
 - c. Avoiding douching
 - d. Consulting the PHCP if infection is suspected
- F. Nasal stuffiness
1. Occurs in the first through third trimesters
 2. Results from increased estrogen, which causes edema of the nasal tissues and dryness
 3. Interventions
 - a. Encouraging the use of a humidifier
 - b. Avoiding the use of nasal sprays or antihistamines (the PHCP should be consulted about their use; normal saline nose drops and sprays may be acceptable)
- G. Fatigue
1. Occurs usually in the first and third trimesters
 2. Usually results from hormonal changes
 3. Interventions
 - a. Arranging frequent rest periods throughout the day
 - b. Using correct posture and body mechanics
 - c. Obtaining regular exercise
 - d. Performing muscle relaxation and strengthening exercises for the legs and hip joints
 - e. Avoiding eating and drinking foods containing stimulants throughout the pregnancy
 - f. Eating a well-balanced diet to prevent anemia
- H. Heartburn
1. Occurs in the second and third trimesters
 2. Results from increased progesterone levels, decreased gastrointestinal motility, esophageal reflux, and displacement of the stomach by the enlarging uterus
 3. Interventions
 - a. Eating small, frequent meals
 - b. Sitting upright for 30 minutes after a meal
 - c. Drinking milk between meals
 - d. Avoiding fatty and spicy foods
 - e. Avoiding bending over or lying flat
 - f. Wearing loose-fitting clothes
 - g. Taking deep breaths and sipping water to help relieve the burning sensation
 - h. Eliminating foods and fluids that stimulate acid formation in the stomach, such as carbonated beverages
 - i. Avoiding citrus fruits and juice products, chocolate, and peppermint if they increase symptoms
 - j. Consulting with the PHCP about the use of antacids
- I. Ankle edema
1. Usually occurs in the second and third trimesters
 2. Results from vasodilation, venous stasis, and increased venous pressure below the uterus
 3. Interventions
 - a. Elevating the legs at least twice a day and when resting
 - b. Sleeping in a side-lying position
 - c. Wearing supportive stockings or support hose
 - d. Avoiding sitting or standing in one position for long periods
 - e. Drinking ample amounts of fluid as allowed
- J. Varicose veins
1. Usually occur in the second and third trimesters
 2. Result from weakening walls of the veins or valves and venous congestion
 3. Thrombophlebitis is rare, but it may occur.
 4. Interventions
 - a. Wearing supportive stockings or support hose
 - b. Elevating the feet when sitting
 - c. Lying with the feet and hips elevated
 - d. Avoiding long periods of standing or sitting
 - e. Moving about while standing to improve circulation
 - f. Avoiding leg crossing
 - g. Avoiding constricting articles of clothing such as knee-high stockings
 - h. Teaching leg exercises
 - i. Avoiding lying because of sitting position
- K. Headaches
1. Usually considered benign in the first trimester. May need further investigation if occurring in the second and third trimesters
 2. Result from changes in blood volume and vascular tone
 3. Interventions
 - a. Changing position slowly
 - b. Applying a cool cloth to the forehead or base of neck
 - c. Eating a small salty snack
 - d. Using acetaminophen only if prescribed by the PHCP
- L. Hemorrhoids
1. Usually occur in the second and third trimesters
 2. Result from increased venous pressure and constipation
 3. Interventions
 - a. Soaking in a warm sitz bath
 - b. Sitting on a soft pillow or lying on the side with the hips elevated on a pillow
 - c. Eating high-fiber foods and drinking sufficient fluids to avoid constipation
 - d. Increasing exercise, such as walking
 - e. Applying ointments, suppositories, or compresses as prescribed by the PHCP
- M. Constipation
1. Usually occurs in the second and third trimesters
 2. Results from an increase in progesterone production, decreased intestinal motility, displacement of the intestines, pressure of the uterus, and taking iron supplements
 3. Interventions
 - a. Eating high-fiber foods such as whole grains, fruits, and vegetables; avoiding constipating foods such as cheese

- b. Drinking no less than 2000 mL per day
 - c. Exercising regularly, such as a daily 20-minute walk
 - d. Consulting with the PHCP about interventions such as the use of stool softeners, laxatives, or enemas
 - e. Using a footrest during elimination to provide comfort and decrease straining
- N. Backache
- 1. Usually occurs in the second and third trimesters
 - 2. Caused by an exaggerated lumbosacral curve, resulting from an enlarged uterus
 - 3. Risk for falls; teach to move about slowly
 - 4. Interventions
 - a. Obtaining rest
 - b. Using correct posture and body mechanics
 - c. Avoiding the lifting of heavy objects
 - d. Squatting rather than bending from the waist to pick up objects
 - e. When sitting, using foot supports, arm rests, and pillows behind the back
 - f. Wearing low-heeled, comfortable, and supportive shoes
 - g. Performing pelvic tilt (rock) exercises and conscious relaxation exercises
 - h. Sleeping on a firm mattress
 - i. Performing tailor-sitting exercises
- O. Leg cramps
- 1. Usually occur in the second and third trimesters
 - 2. Result from an altered calcium-phosphorus balance and pressure of the uterus on nerves or from fatigue
 - 3. Interventions
 - a. Getting regular exercise, especially walking
 - b. Dorsi-flexing the foot of the affected leg
 - c. Increasing calcium intake
- P. Shortness of breath
- 1. Can occur in the second and third trimesters
 - 2. Results from pressure on the diaphragm from the enlarged uterus
 - 3. Interventions
 - a. Taking frequent rest periods
 - b. Sitting and sleeping with the head elevated or on the side
 - c. Avoiding overexertion

VIII. Pregnancy Risk Factors

- A. Age: Those younger than 20 years and older than 35 years are at risk for adverse perinatal outcomes.
- B. Adolescent pregnancy
 - 1. Factors that result in adolescent pregnancy include the early onset of menarche, sexual behaviors in this age-group, problems with family relationships, poverty, and lack of knowledge of reproduction and birth control.

- 2. Major concerns related to adolescent pregnancy include poor nutritional status; emotional and behavioral difficulties; lack of support systems; increased risk of stillbirth; low-birth-weight infants; fetal mortality; cephalopelvic disproportion; and increased risk of birthing parent complications, such as hypertension, anemia, prolonged labor, and infections.
 - 3. The role of the nurse in reducing risks and consequences of adolescent pregnancy is twofold: first, to encourage early and continued prenatal care; and second, to refer the adolescent, if necessary, for appropriate assistance, which can help counter the effects of a negative socioeconomic environment on the pregnancy.
 - 4. Adolescents may experience loneliness related to body image changes, and may have a potential for interruption of school progress related to nonattendance at school.
- C. Nutrition: Adequate nutrition is necessary for normal fetal growth and development. Nutritional needs are determined by the stage of pregnancy, and nutrition should support recommended weight gain during the various stages; referral to a dietitian may be needed.

 Those of childbearing age should take folic acid supplements to prevent neural tube defects and orofacial clefts in the fetus.

- D. Genetic considerations: Genetic abnormalities such as defective genes or transmissible inherited disorders can result in congenital anomalies; the nurse should perform a genetic risk assessment to determine an inheritable risk.
- E. Health care: Failure to seek and obtain prenatal care, including dental care, increases the risk for preterm birth and low birth weight.
- F. Abuse and violence: Physical abuse and violence can increase the risk for abruptio placentae, preterm birth, and infections from unwanted and forced sex. On assessment, the nurse should ask the partner, if present, to leave the room because the client may want to disclose experiences of abuse and may fear doing it in the partner's presence. The nurse should assess for injuries to the breasts, the abdomen, and the genitals.
- G. Medical conditions: Concurrent medical conditions, such as, but not limited to, diabetes mellitus, hypertensive disorder, or cardiac disease, increase the risk of complications during pregnancy.
- H. German measles (rubella): Infection in the birthing parent during the first 8 weeks of gestation carries the highest rate of fetal infection and anomalies.
 - I. Sexually transmitted infections (refer to Chapter 23)
 - J. Human immunodeficiency virus (HIV)
 - 1. HIV is transmitted through blood; blood products; and other bodily fluids such as urine, semen,

and vaginal secretions; the virus is also transmitted through exposure to infected secretions during birth and through breast milk.

2. Repeated exposure to the virus during pregnancy through unsafe sex practices or intravenous drug use can increase the risk of transmission to the fetus.
3. Perinatal administration of zidovudine may be recommended to decrease the risk of transmission of HIV from birthing parent to fetus.

K. Substance abuse

1. Substance abuse threatens normal fetal growth and successful term completion of the pregnancy.
2. Substance abuse places the pregnancy at risk for fetal growth restriction, abruptio placentae, and fetal bradycardia.
3. Many substances cross the placenta and can be teratogenic (drugs, tobacco, alcohol, medications, certain foods such as raw fish). No over-the-counter medications should be taken and no other substances (such as psychoactive bath salts) should be used unless prescribed by the PHCP.
4. Smoking (tobacco) can result in low birth weight, a higher incidence of birth defects, and stillbirths.
5. Physical signs of drug abuse may include dilated or contracted pupils, fatigue, track (needle) marks, skin abscesses, inflamed nasal mucosa, and inappropriate behavior by the individual.
6. Consumption of alcohol during pregnancy may lead to fetal alcohol syndrome and can cause jitteriness, physical abnormalities, congenital anomalies, and growth deficits in the newborn.

- L. Viral hepatitis (see Chapters 23, 34, and 49 for information regarding hepatitis B infection)

IX. Antepartum Diagnostic Testing

 The usual schedule for antepartum health care visits is every 4 weeks for the first 28 to 32 weeks, every 2 weeks from 32 to 36 weeks, and every week from 36 to 40 weeks.

A. Blood type and Rh factor

1. ABO typing is performed to determine the woman's blood type in the ABO antigen system.
2. Rh typing is done to determine the woman's blood type in the rhesus antigen system. (*Rh positive* indicates the presence of the antigen; *Rh negative* indicates the absence of the antigen.)
3. If the client is Rh negative and has a negative antibody screen, the client will need repeat antibody screens and should receive Rh_o(D) immune globulin (RhoGAM) at 28 weeks of gestation.

4. The client will also require RhoGAM within 72 hours after delivery if the infant is Rh positive.
5. RhoGAM may also be prescribed following termination of pregnancy, such as following a miscarriage.

B. Rubella titer

1. If the client has a negative titer (less than 1:8), indicating susceptibility to the rubella virus, the client should receive the appropriate immunization postpartum.
2. The client must be using effective birth control at the time of the immunization and must be counseled not to become pregnant for 1 to 3 months after immunization (as specified by the PHCP) and to avoid contact with anyone who is immunocompromised.
3. If the rubella vaccine is administered at the same time as Rh_o(D) immune globulin, it may not be effective.
4. Rubella vaccine is administered postpartum (before discharge) via the subcutaneous route if the titer is less than 1:8; inquire about sensitivity to eggs.

 Rubella vaccine is not given during pregnancy because the live attenuated virus may cross the placenta and present a risk to the developing fetus.

C. Complete blood cell (CBC) count levels

1. White blood cells (WBCs) can be slightly increased during pregnancy.
2. Leukocytosis can be a normal finding in pregnancy.
3. Hemoglobin and hematocrit levels decline during gestation as a result of increased plasma volume.
4. A decrease in the hemoglobin level to less than 10 g/dL (100 mmol/L) or in the hematocrit level to less than 30% indicates anemia.

- D. Papanicolaou's smear may be done during the initial prenatal examination to screen for cervical neoplasia if the individual has not had a screening before or is beyond the recommended timeframe since the last screening.

- E. Sexually transmitted infections (see Chapter 23)

F. Sickle cell screening

1. Screening is indicated for clients at risk for sickle cell disease.
2. A positive test may indicate a need for further screening.

G. Tuberculin skin test

1. The PHCP may prefer to perform this skin test after birth.
2. A positive skin test indicates the need for a chest radiograph (using an abdominal lead shield) to rule out active disease; in a pregnant client, chest radiography would not be performed until after

20 weeks of gestation (after the fetal organs are formed).

- Converters to positive may be referred for treatment with medication after birth.

H. Hepatitis B surface antigens

- Testing for hepatitis antigens is recommended for all pregnant persons because of the prevalence of the disease in the general population.
- Vaccination for hepatitis B antigen may be specifically indicated for the following:
 - Health care workers
 - Intravenous drug users
 - Those born in other countries such as Asia, Africa, Haiti, or the Pacific islands
 - Those with previously undiagnosed jaundice or chronic liver disease
 - Those with tattoos
 - Those with histories of blood transfusions
 - Those with histories of multiple episodes of sexually transmitted infections
 - Those who have been rejected previously as blood donors
 - Clients with histories of dialysis or renal transplantation
 - Clients from households having members infected with hepatitis B or receiving hemodialysis
- Hepatitis B vaccine is not contraindicated during pregnancy and may be recommended by the PHCP.
- See [Chapters 23, 34, and 49](#) for additional information about hepatitis.

I. Glucose challenge test (GCT)

- Screening for gestational diabetes mellitus begins at the initial prenatal visit and is diagnosed by a fasting blood glucose greater than 126 mg/dL (7.0 mmol/L), HbA1c greater than 6.5%, or a random plasma glucose level greater than 200 mg/dL (11.1 mmol/L), then subsequently confirmed by another elevated fasting glucose level or HbA1c. The glucose challenge test is performed between 24 and 28 weeks' gestation.
- According to the American Congress of Obstetricians and Gynecologists (ACOG), a GCT using a two-step approach should be used in screening for gestational diabetes mellitus (GDM).
- A 50-g oral glucose load without regard to time of day is given. After 1 hour a plasma or serum glucose level is drawn and is considered elevated if it is greater than 140 mg/dL (7.8 mmol/L); a 3-hour GCT may also be done.
- If the 3-hour GCT is above 130 to 140 mg/dL (7.2 to 7.8 mmol/L), it is considered a positive result and may be indicative of GDM.
- It is important to note that the GCT has 86% sensitivity, and some false positives may be noted.

J. Urinalysis and urine culture

- A urine specimen for glucose and protein determinations should be obtained at every antepartum visit.
- Glycosuria is a common result of decreased renal threshold that occurs during pregnancy.
- If glycosuria persists, it may indicate diabetes.
- White blood cells in the urine may indicate infection.
- Ketonuria may result from insufficient food intake or vomiting.
- Levels of 2+ to 4+ protein in the urine may indicate infection or preeclampsia.

K. Ultrasonography

- Outlines and identifies fetal and birthing parent structures
- Assists in confirming gestational age and estimated date of delivery and in evaluating amniotic fluid volume (amniotic fluid index), which is done via special measurements
- May be done abdominally or transvaginally during pregnancy
- Can be used to determine the presence of premature dilation of the cervix (incompetent cervix). A transvaginal ultrasound is used during the first trimester to check the length of the cervix.
- Interventions
 - If an abdominal ultrasound is being performed, the client may need to drink water to fill the bladder before the procedure to obtain a better image of the fetus.
 - If a transvaginal ultrasound is being performed, a lubricated probe is inserted into the vagina.
 - The client should be informed that the test presents no known risks to the client or the fetus.

L. Biophysical profile

- Noninvasive assessment of the fetus using ultrasound and electronic fetal monitoring (EFM) that includes fetal breathing movements, fetal movements, fetal tone, amniotic fluid index, and fetal heart rate patterns via a nonstress test
- Normal fetal biophysical activities indicate that the central nervous system is functional and that the fetus is not hypoxic.

M. Doppler blood flow analysis: Noninvasive (ultrasonography) method of studying the blood flow in the fetus and placenta

N. Percutaneous umbilical blood sampling

- Percutaneous umbilical blood sampling is performed if fetal blood sampling is necessary; it involves insertion of a needle directly into the fetal umbilical vessel under ultrasound guidance.
- Fetal heart rate monitoring is necessary for 1 hour after the procedure, and a follow-up ultrasound

to check for bleeding or hematoma formation is done 1 hour after the procedure.

 O. Quad screening

1. Assesses for the presence of four specific substances
2. Screens for other chromosomal defects, including Down's syndrome and neural tube and abdominal wall defects
3. Interventions
 - a. α -Fetoprotein level is determined by a blood sample drawn between 16 and 18 weeks of gestation.
 - b. If the level is abnormal and the gestation is less than 18 weeks, a second sample is drawn and screened.
 - c. An ultrasound is performed for elevated levels to rule out fetal abnormalities or multiple gestation.
 - d. Amniocentesis is performed to diagnose and confirm chromosomal defect and/or neural tube conditions.

P. Deoxyribonucleic acid (DNA) genetic testing

1. Can be used to detect abnormalities related to an inherited condition
2. Assists in determining if the client is at risk for having a fetus with Down's syndrome (trisomy 21), Edwards' syndrome (trisomy 18), or Patau's syndrome (trisomy 13).
3. Interventions: This type of testing can be done as early as 7 weeks of gestation, and a blood sample is used.

 Q. Chorionic villus sampling

1. Performed for the purpose of detecting genetic abnormalities; the PHCP aspirates a small sample of chorionic villus tissue at 10 to 13 weeks of gestation.
2. Interventions
 - a. Ensure informed **consent** was obtained.
 - b. The client may need to drink water to fill the bladder before the procedure to aid in the visualization of the uterus for catheter insertion.
 - c. Obtain baseline vital signs and fetal heart rate; monitor frequently after the procedure.
 - d. Rh-negative individuals may be given Rh₀(D) immune globulin, because chorionic villus sampling increases the risk of Rh sensitization.
 - e. After the procedure, the client is instructed to rest for 24 hours and to avoid exercise, heavy lifting, and sexual intercourse for the amount of time prescribed.

 R. Amniocentesis

1. Aspiration of amniotic fluid by insertion of a needle into the abdomen, guided with ultrasound imaging; best performed between 15 and 20 weeks of pregnancy because amniotic fluid

volume is adequate and many viable fetal cells are present in the fluid by this time

2. Performed to determine genetic disorders, metabolic defects, and fetal lung maturity
3. Risks
 - a. Hemorrhage in the birthing parent
 - b. Miscarriage
 - c. Fetal injury
 - d. Infection
 - e. Rh isoimmunization
 - f. Abruptio placentae
 - g. Amniotic fluid emboli
 - h. Premature rupture of the membranes
4. Interventions
 - a. Ensure that informed consent was obtained.
 - b. If the procedure is performed at less than 20 weeks of gestation, the client should have a full bladder to support the uterus; if performed after 20 weeks of gestation, the client should have an empty bladder to minimize the chance of puncture.
 - c. Prepare the client for ultrasonography, which is performed to locate the placenta and avoid puncture.
 - d. Obtain baseline vital signs and fetal heart rate; monitor every 15 minutes.
 - e. Position the client supine during the examination and on the left side after the procedure.

 After chorionic villus sampling and amniocentesis, instruct the client that it is necessary to notify the PHCP if experiencing chills, a temperature greater than 100.4° F (38° C), bleeding, clot or tissue passage, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping.

S. Kick counts (fetal movement counting)

1. Performed for assessment of fetal well-being
2. Beginning at 28 weeks' gestation, the client sits quietly or lies on the side and counts fetal kicks as instructed.
3. Inform the client that it is necessary to feel at least 10 movements within a 2-hour period or as instructed by the PHCP, because sometimes less movement is felt if the baby is sleeping.

T. Fern test

1. The fern test is a microscopic slide test to determine the presence of amniotic fluid leakage. Using sterile technique, a specimen is obtained from the external os of the cervix and vaginal pool and is examined on a slide under a microscope.
2. A fern-like pattern produced by the effects of salts of the amniotic fluid indicates the presence of amniotic fluid; may be done in conjunction with the nitrazine test.

3. Interventions
 - a. Position the client in the dorsal lithotomy position.
 - b. Instruct the client to cough, which causes the amniotic fluid to leak from the uterus if the membranes are ruptured.

U. Nitrazine test

1. A nitrazine test strip is used to detect the presence of amniotic fluid in vaginal secretions.
2. Vaginal secretions have a pH of 4.5 to 5.5 and do not affect the nitrazine strip or swab.
3. Amniotic fluid has a pH of 7.0 to 7.5 and turns the nitrazine strip or swab blue.
4. Interventions
 - a. Position the client in the dorsal lithotomy position.
 - b. Touch the test tape to the fluid.
 - c. Assess the test tape for a blue-green, blue-gray, or deep blue color, which indicates that the membranes are ruptured, causing leakage of amniotic fluid.

V. Fibronectin test

1. Sampling of cervical and vaginal secretions for fetal fibronectin; done between week 22 and week 34 of pregnancy if the primary health care provider is concerned about preterm labor
2. Positive results may indicate the onset of labor in 1 to 3 weeks; negative test results are more predictive that preterm labor will not begin.
3. The test is used if the client is at risk for preterm labor, before 37 weeks of gestation.
4. Interventions
 - a. Client is placed in lithotomy position for sterile speculum exam.
 - b. Cervical secretions are obtained with cotton swab and placed in an appropriate container labeled with the client's name, age, and estimated weeks of gestation.
 - c. Laboratory tests are done for the presence of fibronectin.

 W. Group B streptococcus (GBS)

1. Leading cause of life-threatening perinatal infections in the United States
 - a. Vaginal or rectal swab to detect the presence of Group B streptococcus; done at or near 36 weeks of pregnancy
 - b. Approximately 20% to 25% of pregnant individuals are colonized by GBS in the vaginal or rectal area.
2. Interventions
 - a. Position client in stirrups.
 - b. Using sterile technique, swab the vaginal opening.
 - c. With a different swab, swab the rectal opening.
 - d. Laboratory screening will determine the presence of GBS.

 X. Nonstress test (Box 22.4)

BOX 22.4 Nonstress Test

Description

Test is performed to assess placental function and oxygenation.

Test determines fetal well-being.

Test evaluates the fetal heart rate (FHR) response to fetal movement.

Interventions

An external ultrasound transducer and tocodynamometer are applied to the client, and a tracing of at least 20 minutes' duration is obtained so that the FHR and uterine activity can be observed.

Baseline blood pressure is obtained, and blood pressure is monitored frequently.

The client is placed in the lateral (side-lying) position to avoid vena cava compression.

The client may be asked to press a button every time the client feels fetal movement; the monitor records a mark at each point of fetal movement, which is used as a reference point to assess the FHR response.

Results

Reactive Nonstress Test (Normal, Negative)

"Reactive" indicates a healthy fetus.

The result requires 2 or more FHR accelerations of at least 15 beats per minute, lasting at least 15 seconds from the beginning of the acceleration to the end, in association with fetal movement, during a 20-minute period.

Nonreactive Nonstress Test (Abnormal)

No accelerations or accelerations of less than 15 beats per minute or lasting less than 15 seconds in duration occur during a 40-minute observation.

Unsatisfactory

The result cannot be interpreted because of the poor quality of the FHR tracing.

Y. Contraction stress test (Box 22.5)

Z. Nutrition

1. General guidelines

- a. Guidelines for health and nutritional information for breast-feeding/chest-feeding and pregnant individuals are located at the U.S. Department of Agriculture ChooseMyPlate website at <https://www.myplate.gov/life-stages/pregnancy-and-breastfeeding>. The client should be assisted with accessing this site and preparing a nutritional plan.
- b. The average expected weight gain during pregnancy is 25 to 35 lb (11 to 16 kg) for those with a normal prepregnancy weight.

BOX 22.5 Contraction Stress Test**Description**

Test assesses placental oxygenation and function. Test determines fetal ability to tolerate labor and determines fetal well-being. Fetus is exposed to the stress of contractions to assess the adequacy of placental perfusion under simulated labor conditions. Test is performed if it is believed that the fetus needs to be delivered and the fetal ability to tolerate labor is unclear due to failed nonstress tests.

Interventions

External fetal monitor is applied to the client, and a 20- to 30-minute baseline strip is recorded. The uterus is stimulated to contract by the administration of a dilute dose of oxytocin or by having the client use nipple stimulation until three palpable contractions with a duration of 40 seconds or more in a 10-minute period have been achieved. Frequent blood pressure readings are done, and the client is monitored closely while increasing doses of oxytocin are given.

Results**Negative Contraction Stress Test (Normal)**

A negative result is represented by no late decelerations of the fetal heart rate (FHR).

Positive Contraction Stress Test (Abnormal)

A positive result is represented by late decelerations of the FHR, with 50% or more of the contractions in the absence of hyperstimulation of the uterus.

Equivocal

An equivocal result contains decelerations, but with less than 50% of the contractions, or uterine activity shows a hyperstimulated uterus.

Unsatisfactory

An unsatisfactory result means that adequate uterine contractions cannot be achieved, or the FHR tracing is of insufficient quality for adequate interpretation.

Reference

Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 581.

- c. An increase of about 300 calories/day is needed during pregnancy.
- d. Calorie needs are greater in the last two trimesters than in the first.
- e. An increase of about 500 calories/day is needed during lactation.
- f. A diet high in folic acid or folic acid supplements is necessary for all persons of child-bearing age to prevent neural tube defects and orofacial clefts in the fetus.
- g. At least 8 to 10 (8-oz) glasses of fluid are needed each day, of which 4 to 6 glasses should be water.

- h. Sodium is not restricted unless specifically prescribed by the PHCP.
2. Vegan and vegetarian diets (see Chapter 11)
 - a. Ensure that the client eats a sufficient amount of varied foods to meet normal nutrient and energy needs.
 - b. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
 - c. Potential deficiencies in vegetarian diets include energy, protein, vitamin B₁₂, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
 - d. Protein consumption can be increased by consumption of a variety of vegetable protein sources based on whole grains, legumes, seeds, nuts, and vegetables combined to provide all essential amino acids.
 - e. To enhance absorption of iron, vegetarians should include a good source of iron and vitamin C with each meal.
 - f. Foods commonly eaten include tofu, tempeh, soy milk and soy products, meat analogs, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.
 3. Lactose intolerance
 - a. Lactose consumed by an individual with lactose intolerance can cause abdominal distention, discomfort, nausea, vomiting, cramps, and loose stools.
 - b. Clients with lactose intolerance need to incorporate sources of calcium other than dairy products into their dietary patterns regularly.
 - c. Milk may be tolerated in cooked form, such as in custards or fermented dairy products.
 - d. Cheese and yogurt sometimes are tolerated.
 - e. Lactase, an enzyme, may be prescribed and is taken before ingesting milk or milk products.
 - f. Lactase-treated milk or lactose-free products are also available commercially.
 - g. The client needs to have a nutritional consult for guidance as to the required foods to maintain appropriate nutrition and the foods that need to be avoided (e.g., bone meal may contain small levels of lead).
 4. Pica
 - a. Pica refers to eating nonfood substances, such as dirt, clay, starch, and freezer frost.
 - b. The cause is unknown. Some cultures may have beliefs regarding the effect of a material on the birthing parent or fetus, making pica a common practice.
 - c. Iron-deficiency anemia may occur as a result of pica.

PRACTICE QUESTIONS

- The nurse is providing instructions to a pregnant client who is scheduled for an amniocentesis. What instruction would the nurse provide?
 - Strict bed rest is required after the procedure.
 - Hospitalization is necessary for 24 hours after the procedure.
 - An informed consent needs to be signed before the procedure.
 - A fever is expected after the procedure because of the trauma to the abdomen.
- A pregnant client in the first trimester calls the nurse at a health care clinic and reports noticing a thin, colorless vaginal drainage. The nurse would make which statement to the client?
 - “Come to the clinic immediately.”
 - “The vaginal discharge may be bothersome, but is a normal occurrence.”
 - “Report to the emergency department at the maternity center immediately.”
 - “Use tampons if the discharge is bothersome, but be sure to change the tampons every 2 hours.”
- A nonstress test is performed on a client who is pregnant, and the results of the test indicate non-reactive findings. The primary health care provider prescribes a contraction stress test, and the results are documented as negative. How would the nurse document this finding?
 - A normal test result
 - An abnormal test result
 - A high risk for fetal demise
 - The need for a cesarean section
- A rubella titer result of a 1-day postpartum client is less than 1:8, and a rubella virus vaccine is prescribed to be administered before discharge. The nurse provides which information to the client about the vaccine? Select all that apply.
 - Breast/chest-feeding needs to be stopped for 3 months.
 - Pregnancy needs to be avoided for 1 to 3 months.
 - The vaccine is administered by the subcutaneous route.
 - Exposure to immunosuppressed individuals needs to be avoided.
 - A hypersensitivity reaction can occur if the client has an allergy to eggs.
 - The area of the injection needs to be covered with a sterile gauze for 1 week.
- The nurse in a health care clinic is instructing a pregnant client how to perform “kick counts.” Which statement by the client indicates a need for further instruction?
 - “I will record the number of movements or kicks.”
 - “I need to lie flat on my back to perform the procedure.”
 - “If I count fewer than 10 kicks in a 2-hour period, it could be because my baby is sleeping.”
 - “I need to place my hands on the largest part of my abdomen and concentrate on the fetal movements to count the kicks.”
- The nurse is performing an assessment of a pregnant client who is at 28 weeks of gestation. The nurse measures the fundal height in centimeters and notes that the fundal height is 30 cm. How would the nurse interpret this finding?
 - The client is measuring large for gestational age.
 - The client is measuring small for gestational age.
 - The client is measuring normal for gestational age.
 - More evidence is needed to determine size for gestational age.
- The nurse is performing an assessment on a client who suspects being pregnant and is checking the client for probable signs of pregnancy. The nurse would assess for which probable signs of pregnancy? Select all that apply.
 - Ballottement
 - Chadwick’s sign
 - Uterine enlargement
 - Positive pregnancy test
 - Fetal heart rate detected by a nonelectronic device
 - Outline of fetus via radiography or ultrasonography
- A pregnant client is seen for a regular prenatal visit and tells the nurse about experiencing irregular contractions. The nurse determines that the client is experiencing Braxton Hicks contractions. On the basis of this finding, which nursing action is appropriate?
 - Contact the primary health care provider.
 - Instruct the client to maintain bed rest for the remainder of the pregnancy.
 - Inform the client that these contractions are common and may occur throughout the pregnancy.
 - Call the maternity unit and inform them that the client will be admitted in a preterm labor condition.
- A client arrives at the clinic for the first prenatal assessment. The client tells the nurse that the first day of the last normal menstrual period was October 19, 2023. Using Nägele’s rule, which expected date of delivery would the nurse plan to document in the client’s chart?
 - July 12, 2024
 - July 26, 2024
 - August 12, 2024
 - August 26, 2024

10. The nurse is collecting data during an admission assessment of a client who is pregnant with twins. The client has a healthy 5-year-old child who was delivered at 38 weeks and tells the nurse that there is no history of any type of abor-

tion or fetal demise. Using GTPAL, what would the nurse document in the client's chart?

1. G = 3, T = 2, P = 0, A = 0, L = 1
2. G = 2, T = 1, P = 0, A = 0, L = 1
3. G = 1, T = 1, P = 1, A = 0, L = 1
4. G = 2, T = 0, P = 0, A = 0, L = 1

ANSWERS

1. Answer: 3

Rationale: Because amniocentesis is an invasive procedure, informed consent needs to be obtained before the procedure. After the procedure, the client is instructed to rest, but may resume light activity after the cramping subsides. The client is instructed to keep the puncture site clean and to report any complications, such as chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping. Amniocentesis is an outpatient procedure and may be done in the obstetrician's office or in a special prenatal testing unit. Hospitalization is not necessary after the procedure.

Test-Taking Strategy: Focus on the **subject**, nursing implications related to amniocentesis. Recalling that this procedure is invasive will direct you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p.190.

2. Answer: 2

Rationale: Leukorrhea begins during the first trimester. Many clients notice a thin, colorless, or yellow vaginal discharge throughout pregnancy. Some clients become distressed about this condition, but it does not require that the client report to the health care clinic or emergency department immediately. If vaginal discharge is profuse, the client may use panty liners, but should not wear tampons because of the risk of infection. If the client uses panty liners, the client needs to change them frequently.

Test-Taking Strategy: Eliminate options 1 and 3 first because they are **comparable or alike**, indicating that the client requires medical attention. From the remaining options, recalling that this manifestation is a normal physiological occurrence or that tampons need to be avoided will assist in directing you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 250-251.

3. Answer: 1

Rationale: Contraction stress test results may be interpreted as negative (normal), positive (abnormal), or equivocal. A negative test result indicates that no late decelerations occurred in the fetal heart rate, although the fetus was stressed by 3

contractions of at least 40 seconds' duration in a 10-minute period. Options 2, 3, and 4 are incorrect interpretations.

Test-Taking Strategy: Read the options carefully. Note that options 2, 3, and 4 are **comparable or alike** in that they indicate an abnormal test result finding.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 191-193.

4. Answer: 2, 3, 4, 5

Rationale: Rubella vaccine is administered to those who have not had rubella or who are not serologically immune. The vaccine may be administered in the immediate postpartum period to prevent the possibility of contracting rubella in future pregnancies. The live attenuated rubella virus is not communicable in breast milk; Breast/chest-feeding does not need to be stopped. The client is counseled not to become pregnant for 1 to 3 months after immunization or as specified by the obstetrician because of a possible risk to a fetus from the live virus vaccine; the client must be using effective birth control at the time of the immunization. The client needs to avoid contact with immunosuppressed individuals because of their low immunity toward live viruses and because the virus is shed in the urine and other body fluids. The vaccine is administered by the subcutaneous route. A hypersensitivity reaction can occur if the client has an allergy to eggs because the vaccine is made from duck eggs. There is no useful or necessary reason for covering the area of the injection with a sterile gauze.

Test-Taking Strategy: Focus on the **subject**, client instructions regarding the rubella vaccine. Recalling that the rubella vaccine is a live virus vaccine will assist in selecting options 2 and 5. Next, recalling the route of administration and the contraindications associated with its use will assist in selecting options 3 and 4.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 465.

5. Answer: 2

Rationale: The client would sit or lie quietly on the side to perform kick counts. Lying flat on the back is not necessary to perform this procedure, can cause discomfort, and presents a risk of vena cava (supine hypotensive) syndrome. The client is instructed to place the hands on the largest part of the abdomen and concentrate on the fetal movements. The client

records the number of movements felt during a specified time period. If the client feels fewer than 10 movements within a 2-hour period it could be because the baby is sleeping.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. If you are unfamiliar with this procedure, recalling that the risk of vena cava (supine hypotensive) syndrome exists when the client lies on the back will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 566-568.

6. Answer: 3

Rationale: During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus's age in weeks ± 2 cm. Therefore, if the client is at 28 weeks' gestation, a fundal height of 30 cm would indicate that the client is measuring normal for gestational age. At 16 weeks, the fundus can be located halfway between the symphysis pubis and the umbilicus. At 20 to 22 weeks, the fundus is at the umbilicus. At 36 weeks, the fundus is at the xiphoid process.

Test-Taking Strategy: Focus on the **subject**, the location of fundal height. Remember that during the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus's age in weeks ± 2 cm.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 273.

7. Answer: 1, 2, 3, 4

Rationale: The probable signs of pregnancy include uterine enlargement, Hegar's sign (compressibility and softening of the lower uterine segment that occurs at about week 6), Goodell's sign (softening of the cervix that occurs at the beginning of the second month), Chadwick's sign (violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about week 4), ballottement (rebounding of the fetus against the examiner's fingers on palpation), Braxton Hicks contractions, and a positive pregnancy test for the presence of human chorionic gonadotropin. Positive signs of pregnancy include fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation, active fetal movements palpable by the examiner, and an outline of the fetus by radiography or ultrasonography.

Test-Taking Strategy: Focusing on the **subject**, probable signs of pregnancy, will assist in answering this question. Remember that detection of the fetal heart rate and an outline of the fetus via radiography or ultrasonography are positive signs of pregnancy.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 262.

8. Answer: 3

Rationale: Braxton Hicks contractions are irregular, painless contractions that may occur intermittently throughout pregnancy. Because Braxton Hicks contractions may occur and are normal in some pregnant individuals during pregnancy, there is no reason to notify the primary health care provider. This client is not in preterm labor; therefore, the client does not need to be placed on bed rest or be admitted to the hospital to be monitored.

Test-Taking Strategy: Options 1 and 4 are **comparable or alike** and can be eliminated first. From the remaining options, knowing that Braxton Hicks contractions are common and normal and can occur throughout pregnancy will assist in directing you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 250.

9. Answer: 2

Rationale: Accurate use of Nägele's rule requires that the pregnant individual have a regular 28-day menstrual cycle. Subtract 3 months and add 7 days to the first day of the last menstrual period, and then add 1 year to that date if necessary: first day of the last menstrual period, October 19, 2023; subtract 3 months, July 19, 2023; add 7 days, July 26, 2023; add 1 year, July 26, 2024.

Test-Taking Strategy: Focus on the **subject**, and use knowledge regarding Nägele's rule to answer this question. This rule requires addition and subtraction, so read all options carefully, noting the dates and years in the options, before selecting an answer.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 264-265.

10. Answer: 2

Rationale: Pregnancy outcomes can be described with the acronym *GTPAL*. *G* is gravidity, the number of pregnancies; *T* is term births, the number born at term (longer than 37 weeks); *P* is preterm births, the number born before 37 weeks of gestation; *A* is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks of gestation; included in parity [number of births] if past 20 weeks of gestation); and *L* is the number of current living children. A person who is pregnant with twins and has a child has a gravida of 2. Because the child was delivered at 38 weeks, the number of term births is 1, and the number of preterm births is 0. The number of abortions is 0, and the number of living children is 1.

Test-Taking Strategy: Focus on the **subject** of the question. Recalling the meaning of the acronym *GTPAL* and focusing on the information in the question will direct you to the correct option.

CLEX@Nepal

CHAPTER 23

Risk Conditions Related to Pregnancy

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Reproduction, Safety

I. Bleeding During Pregnancy

- A. **Implantation** bleeding: Bleeding that occurs 10 to 14 days after conception. Usually lasts 1 to 2 days and is lighter than the typical menstrual period. Often confused with a normal menstrual period. No treatment is necessary.
- B. Other causes include abortion, malignancy, polyps, trauma, ectopic pregnancy, idiopathic infection, molar pregnancy, subchorionic hemorrhage, vaginitis, urinary tract infection, cervicitis, cervical polyps, postcoital bleeding, placenta previa, and abruptio placentae.
- C. Low progesterone may also contribute to bleeding; it is a reversible cause but can lead to miscarriage in early pregnancy if not treated.

II. Abortion

- A. Description: A pregnancy that ends before 20 weeks' gestation, spontaneously or electively
- B. Types (**Box 23.1**)
- C. Risk factors
 1. Advanced age
 2. Previous miscarriage
 3. Previous elective abortion
 4. Uterine abnormalities such as adhesions or fibroids
 5. Prolonged time to achieve pregnancy
 6. Low serum progesterone
 7. Celiac disease
 8. Polycystic ovarian syndrome
 9. Thyroid dysfunction or Cushing's syndrome
 10. Systemic lupus erythematosus
 11. Infection, fever, trauma
 12. Low body mass index (BMI), less than 18.5
 13. Smoking, alcohol, cocaine use, certain medications, high caffeine intake

D. Assessment

1. Spontaneous vaginal bleeding
2. Low uterine cramping or contractions
3. **Blood** clots or tissue through the **vagina**
4. Hemorrhage and shock can result if bleeding is excessive.

E. Interventions

1. Maintain bed rest as prescribed.
2. Monitor vital signs.
3. Monitor for cramping and bleeding.
4. Count and weigh perineal pads to evaluate blood loss (1 g = 1 mL), and save expelled tissues and clots.
5. Maintain intravenous (IV) fluids as prescribed; monitor for signs of hemorrhage or shock.
6. Prepare the client for dilation and curettage as prescribed for incomplete abortion.
7. Administer Rh_o(D) immune globulin, as prescribed, for an Rh-negative pregnant client.
8. Provide psychological support.

III. Cardiac Disease

- A. Description: A pregnant client with cardiac disease may be unable physiologically to cope with the added plasma volume and increased **cardiac output** that occur during pregnancy; blood volume peaks at weeks 32 to 34 and then declines slightly to week 40.
- B. Pregnancy and cardiac disease risk groups (**Box 23.2**)
- C. Assessment
 1. Signs and symptoms of cardiac decompensation
 - a. Cough and respiratory congestion
 - b. Dyspnea and fatigue
 - c. Palpitations and tachycardia
 - d. Peripheral edema
 - e. Chest pain
 2. Signs of respiratory infection
 3. Signs of heart failure and pulmonary edema

BOX 23.1 Types of Abortions

Miscarriage: Commonly termed spontaneous abortion; pregnancy ends because of natural causes.

Induced: Therapeutic or elective reasons exist for terminating pregnancy.

Threatened: Spotting and cramping occur without cervical change.

Inevitable: Spotting and cramping occur and cervix begins to dilate and efface.

Incomplete: Loss of some of the products of conception occurs, with part of the products retained (most often placenta is retained).

Complete: Loss of all products of conception

Missed: Products of conception are retained in utero after fetal death.

Habitual: Miscarriages occur in three or more successive pregnancies.

D. Interventions

1. Monitor vital signs, fetal heart rate, and condition of the fetus.
2. Limit physical activities, and stress the need for sufficient rest.
3. Monitor for signs of cardiac stress and decompensation, such as cough, fatigue, dyspnea, chest pain, and tachycardia; also monitor for signs of heart failure and pulmonary edema.
4. Encourage adequate nutrition to prevent anemia, which would worsen the cardiac status; in addition, a low-sodium diet may be prescribed to prevent fluid retention and heart failure.
5. Avoid excessive weight gain.
6. During labor, prepare to do the following:
 - a. Monitor vital signs frequently.
 - b. Place the client on a cardiac monitor and on an external fetal monitor.
 - c. Maintain bed rest, with the client lying on the side with the head and shoulders elevated.
 - d. Administer oxygen as prescribed.
 - e. Manage pain early in labor. Cardiology clearance may be required for epidural, spinal, or general anesthetic agents.
 - f. Use controlled pushing efforts to decrease cardiac stress.

 Excessive weight gain places stress on the heart. In addition, obesity places the client at increased risk for complications during pregnancy.

IV. Chorioamnionitis**A. Description**

1. Bacterial infection of the amniotic cavity; can result from premature or prolonged rupture of the membranes, vaginitis, amniocentesis, or intrauterine procedures
2. May result in the development of postpartum endometritis and neonatal sepsis

BOX 23.2 Pregnancy and Cardiac Disease Risk Groups**Group I (Mortality Rate, 1%)**

- Atrial septal defect
- Ventricular septal defect (uncomplicated)
- Patent ductus arteriosus
- Pulmonic and tricuspid disease
- Biosynthetic valve prosthesis (porcine and human allograft)
- Tetralogy of Fallot (corrected)
- Mitral stenosis

Group II (Mortality Rate, 5% to 15%)

- Mitral stenosis NYHA class III and IV or with atrial fibrillation
- Aortic stenosis
- Coarctation of aorta (uncomplicated)
- Uncorrected tetralogy of Fallot
- Previous myocardial infarction
- Marfan syndrome with normal aorta
- Artificial heart valve

Group III (Mortality Rate, 25% to 50%)

- Pulmonary hypertension
- Coarctation of the aorta (complicated)
- Endocarditis
- Marfan syndrome with aortic involvement
- Eisenmenger syndrome

Adapted from Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 637.

Original source: Data from Gaddipati S, Troiano NH: Cardiac disorders in pregnancy. In Troiano NH, Harvey CJ, Chez BF, editors: *AWHONN's high risk and critical care obstetrics*, ed 3, Philadelphia, 2013, Lippincott Williams and Wilkins.

B. Assessment

1. Uterine tenderness and contractions
2. Elevated temperature
3. Client or fetal tachycardia
4. Foul odor to amniotic fluid
5. Leukocytosis

C. Interventions

1. Monitor client's vital signs and fetal heart rate.
2. Monitor for uterine tenderness, contractions, and fetal activity.
3. Monitor results of blood cultures.
4. Administer antibiotics as prescribed after cultures are obtained.
5. Prepare to obtain neonatal cultures after birth.

V. Diabetes Mellitus**A. Description**

1. Pregnancy places demands on carbohydrate metabolism and causes insulin requirements to change.
2. Insulin resistance and hyperinsulinemia may predispose some to diabetes.

3. Client's glucose crosses the **placenta**, but insulin does not.
4. The fetus produces its own insulin and pulls glucose from the pregnant individual, which predisposes the pregnant individual to hypoglycemic reactions.
5. The **newborn** of a diabetic birthing parent may be large in size (macrosomia) but has functions related to gestational age rather than size.
6. The newborn of a diabetic birthing parent is at risk for hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, and congenital anomalies.

 During the first trimester, the pregnant client's insulin needs decrease. During the second and third trimesters, increases in placental hormones cause an insulin-resistant state, requiring an increase in the client's insulin dose. After placental delivery, placental hormone levels abruptly decrease and insulin requirements decrease.

B. Gestational diabetes mellitus

1. Gestational diabetes occurs in pregnancy (during the second or third trimester) in clients not previously diagnosed as diabetic and occurs when the pancreas cannot respond to the demand for more insulin.
2. A client may be diagnosed with overt diabetes while pregnant as well, and as a result of personal risk factors such as being overweight or obese, there is an increased likelihood of overt, unrecognized diabetes. An HbA1c level may be helpful in making this determination.
3. There is an increased incidence of gestational diabetes when person also has polycystic ovarian syndrome.
4. Pregnant clients should be screened for gestational diabetes between 24 and 28 weeks of gestation via the 1-hour glucose challenge test.
5. If the 1-hour glucose challenge test is abnormal (140 mg/dL or greater), a 3-hour oral glucose tolerance test is performed to confirm gestational diabetes mellitus.
6. Gestational diabetes frequently can be treated by diet alone; however, some clients may need insulin (selected oral medications that are safe during pregnancy may be prescribed).
7. Most individuals with gestational diabetes return to a euglycemic state after **birth**; however, these individuals have an increased risk of developing diabetes mellitus in their lifetimes.
8. Early screening at an initial prenatal visit is done if the client has predisposing conditions as risk factors. See **Chapter 22** for additional information on screening for gestational diabetes mellitus and interpreting glucose challenge test results.

9. The need for cesarean section is possible, and neonatal hypoglycemia and macrosomia may be evident.

C. Predisposing conditions/risk factors to gestational diabetes

1. Older than 35 years
2. Obesity—BMI greater than 30
3. Nonwhite race
4. Previous unexplained perinatal loss
5. Previous child born with congenital anomalies
6. Polycystic ovarian syndrome
7. Multiple gestation
8. First-degree relative with diabetes mellitus or gestational diabetes
9. Previous **delivery** of a fetus weighing greater than 9 lb
10. Client's own birth weight less than 6 lb or greater than 9 lb
11. Previous pregnancy with gestational diabetes
12. Glycosuria
13. Essential or pregnancy-related hypertension
14. Use of glucocorticoids

D. Assessment

1. Excessive thirst
2. Hunger
3. Weight loss
4. Frequent urination
5. Blurred vision
6. Recurrent urinary tract infections and vaginal yeast infections
7. Glycosuria and ketonuria
8. Signs of gestational hypertension and preeclampsia
9. Polyhydramnios
10. Large for gestational age fetus

E. Interventions

1. Employ diet, medications (if diet cannot control blood glucose levels), exercise, and blood glucose determinations 4 times daily (fasting and 1 to 2 hours after meals) to maintain blood glucose levels as follows: fasting less than 95 mg/dL (5.4 mmol/L), 1-hour postprandial less than 130 to 140 mg/dL (7.4 to 8 mmol/L), 2-hour postprandial less than 120 mg/dL (6.8 mmol/L).
2. Encourage moderate physical activity.
3. Facilitate referral to a diabetic educator and nutritionist.
4. Observe for signs of **hyperglycemia**, glycosuria and ketonuria, and **hypoglycemia**.
5. Monitor weight.
6. Maintain calorie intake as prescribed, with adequate oral medication or insulin therapy so that glucose moves into the cells.
7. Assess for signs of complications such as preeclampsia, a serious disorder that can affect all organs in the body (hypertension is characteristic of the condition).

8. Monitor for signs of infection.
9. Instruct the client to report burning and pain on urination, vaginal discharge or itching, or any other signs of infection to the primary health care provider (PHCP).
10. Assess fetal status, and monitor for signs of fetal compromise.
11. Schedule visits every 2 weeks until 36 weeks, and then every week from 36 weeks and up.

F. Interventions during labor

1. Monitor fetal status continuously for signs of distress. If distress is noted, prepare the client for immediate cesarean section.
2. Carefully regulate insulin and provide glucose intravenously as prescribed because labor depletes glycogen.

G. Interventions during the postpartum period: observe the birthing parent closely for a hypoglycemic reaction because a precipitous decline in insulin requirements normally occurs (the birthing parent may not require insulin for the first 24 hours).

1. Reregulate insulin needs as prescribed after the first day, according to blood glucose testing.
2. Assess dietary needs, based on blood glucose testing and insulin requirements.
3. Monitor for signs of infection or postpartum hemorrhage.

VI. Disseminated Intravascular Coagulation (DIC)

- A. Description: DIC is a condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation (Fig. 23.1).

! The rapid and extensive formation of clots that occurs in DIC causes the platelets and clotting factors to be depleted; this results in bleeding and the potential vascular occlusion of organs from thromboembolus formation.

B. Predisposing conditions (Box 23.3)

C. Assessment

1. Uncontrolled bleeding
2. Bruising, purpura, petechiae, and ecchymosis
3. Presence of occult blood in excretions such as stool
4. Hematuria, hematemesis, or vaginal bleeding
5. Signs of shock
6. Decreased fibrinogen level, platelet count, and hematocrit level
7. Increased prothrombin time and partial thromboplastin time, clotting time, and fibrin degradation products

D. Interventions

1. Remove underlying cause.
2. Monitor vital signs; assess for bleeding and signs of shock.

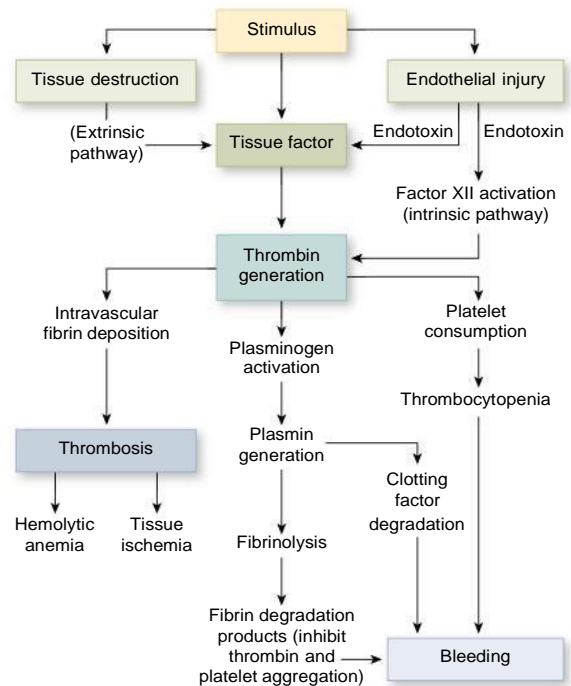

FIG. 23.1 Pathophysiology of disseminated intravascular coagulation.

BOX 23.3 Predisposing Conditions for Disseminated Intravascular Coagulation

- Abruptio placentae
- Amniotic fluid embolism
- Gestational hypertension
- HELLP syndrome
- Intrauterine fetal death
- Liver disease
- Sepsis
- Severe postpartum hemorrhage and blood loss

3. Prepare for oxygen therapy, volume replacement, blood component therapy, and possibly heparin therapy.
4. Monitor for complications associated with fluid and blood replacement and heparin therapy.
5. Monitor urine output and maintain at least 30 mL/hr (renal failure is a complication of DIC).

VII. Ectopic Pregnancy

A. Description

1. Implantation of the fertilized ovum outside of the uterine cavity
2. Most common location is the ampulla of the fallopian tube (Fig. 23.2).

B. Assessment

1. Missed menstrual period
2. Abdominal pain
3. Vaginal spotting to bleeding that is dark red or brown

FIG. 23.2 Sites of tubal ectopic pregnancy. Numbers indicate the order of prevalence.

4. Rupture: Increased pain, referred shoulder pain, signs of shock
- C. Interventions
1. Obtain assessment data and vital signs.
 2. Monitor bleeding and initiate measures to prevent rupture and shock.
 3. Methotrexate, a folic acid antagonist, is used in early ectopic pregnancy to treat the condition without surgery.
 4. Prepare the client for laparotomy and removal of the pregnancy and tube, if necessary, or repair of the tube.
 5. Administer antibiotics; Rh_o(D) immune globulin is prescribed for Rh-negative clients.

VIII. Hepatitis B

A. Description

1. The risks of prematurity, low birth weight, and neonatal death increase if the birthing parent has hepatitis B infection.
2. **Hepatitis** is transmitted through blood, saliva, vaginal secretions, semen, and breast/chest milk and across the placental barrier.

B. Interventions

1. Minimize the risk for intrapartum ascending infections (limit the number of vaginal examinations).
2. Remove birthing parent's blood from the **neonate** immediately after birth.
3. Suction the uids from the neonate immediately after birth.
4. Bathe the neonate before any invasive procedures, including injections.
5. Clean and dry the face and eyes of the neonate before instilling eye prophylaxis.
6. Infection of the neonate can be prevented by the administration of hepatitis B immune globulin and hepatitis B vaccine soon after birth but after the newborn is bathed.
7. Discourage the birthing parent from kissing the neonate until the neonate has received the vaccine.

BOX 23.4 Hematoma: Assessment Findings

- Abnormal, severe pain
- Pressure in perineal area (client states feels as if needs to have a bowel movement)
- Palpable, sensitive swelling in the perineal area, with discolored skin
- Inability to void
- Decreased hemoglobin and hematocrit levels
- Signs of shock, such as pallor, tachycardia, and hypotension, if significant blood loss has occurred

8. Inform the parents that the hepatitis B vaccine will be administered to the neonate and that a second dose should be administered at 1 month after birth and a third dose at 6 months after birth.

▲ Support breast-feeding/chest-feeding after neonatal treatment for hepatitis B; breast-feeding/chest-feeding is not contraindicated if the neonate has been vaccinated.

IX. Vulvar Hematoma

A. Description

1. Hematoma occurs following the escape of blood into the birthing parent's tissue after birth.
2. Predisposing conditions include operative delivery with forceps or injury to a blood vessel.

B. Assessment (Box 23.4)

C. Interventions

1. Monitor vital signs.
2. Monitor client for abnormal pain, especially when forceps delivery has been performed.
3. Visually inspect the perineal area.
4. Apply ice to the hematoma site.
5. Administer analgesics as prescribed.
6. Monitor intake and output.
7. Encourage uids and voiding; prepare for urinary catheterization if the client is unable to void.
8. Administer blood replacements as prescribed.
9. Monitor for signs of infection, such as increased temperature, pulse rate, and white **blood cell** count.
10. Administer antibiotics as prescribed; infection is common after hematoma formation.
11. Prepare for incision and evacuation of the hematoma if necessary.

X. Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS)

A. Description

1. HIV is the causative agent of AIDS.
2. Those infected with HIV may rst show signs and symptoms at the time of pregnancy or possibly develop life-threatening infections because normal pregnancy involves some suppression of the immune system.

3. Repeated exposure to the virus during pregnancy through unsafe sex practices or intravenous (IV) drug use can increase the risk of transmission to the fetus.
4. Three-drug combination HAART (highly active antiretroviral therapy) treatment, which is monitored by an infectious disease specialist, is recommended to reduce birthing parent-to-child transmission (MTCT). Zidovudine is recommended for the prevention of MTCT and is administered based on the following recommendations:
 - a. Antepartum: Orally beginning after 12 weeks of gestation; HAART is given to the pregnant client to reduce the viral load to undetectable.
 - b. Intrapartum: Intravenously during labor; zidovudine is given 1 hour before a vaginal birth and 3 hours before a cesarean section if the HIV RNA is greater than or equal to 400 copies/mL or unknown. Of note, this may not be required if the HIV RNA is less than 400 copies/mL but is given at the discretion of the provider. A vaginal birth is acceptable if the viral load is less than 1000 copies/mL; otherwise, a cesarean section is recommended.
 - c. Postpartum: In the form of syrup to the newborn 2 hours after birth and every 12 hours for 6 weeks; depending on agency procedures, the newborn may need to be placed in the newborn intensive care unit (NICU) to begin initial therapy.

B. Transmission

1. Sexual exposure to genital secretions of an infected person
2. Parenteral exposure to infected blood and tissue
3. Perinatal exposure of an infant to infected birthing parent secretions through birth or breast-feeding/chest-feeding

C. Risks to the pregnant individual: A pregnant individual with HIV is managed as high risk because of vulnerability to infections.

D. Diagnosis

1. Tests used to determine the presence of antibodies to HIV include enzyme-linked immunosorbent assay (ELISA), Western blot, and immunofluorescence assay (IFA).
2. A single reactive ELISA test by itself cannot be used to diagnose HIV, and the test should be repeated with the same blood sample; if the result is again reactive, follow-up tests using Western blot or IFA should be done.
3. A positive Western blot or IFA is considered confirmatory for HIV.
4. A positive ELISA that fails to be confirmed by Western blot or IFA should not be considered negative, and repeat testing should be done in 3 to 6 months.

E. Assessment (see Chapter 63)

F. Interventions

1. Prenatal period
 - a. Institute measures to prevent opportunistic infections.
 - b. Avoid procedures that increase the risk of perinatal transmission, such as amniocentesis and fetal scalp sampling.
2. Intrapartum period
 - a. If the fetus has not been exposed to HIV in utero, the highest risk exists during delivery through the birth canal.
 - b. Avoid the use of internal scalp electrodes for monitoring of the fetus.
 - c. Avoid episiotomy to decrease the amount of the birthing parent's blood in and around the birth canal.
 - d. Avoid the administration of oxytocin, because contractions induced by oxytocin can be strong, causing vaginal tears or necessitating an episiotomy.
 - e. Place heavy absorbent pads under the client's hips to absorb amniotic fluid and blood.
 - f. Minimize the neonate's exposure to the birthing parent's blood and body fluids; promptly remove the neonate from the birthing parent's blood after delivery.
 - g. Suction fluids from the neonate promptly.
 - h. Prepare to administer zidovudine as prescribed to the birthing parent during labor and delivery.
3. Postpartum period
 - a. Monitor for signs of infection.
 - b. Place the birthing parent in protective isolation if immunosuppressed.
 - c. Breast-feeding/chest-feeding is likely to be restricted; follow the PHCP's recommendations regarding breast-feeding/chest-feeding.
 - d. Instruct the birthing parent to monitor for signs of infection, and report any signs if they occur.
 - e. The newborn can room with the birthing parent however, depending on agency procedures, the newborn may be placed in NICU for the first 24 hours of life to complete baseline laboratory studies and receive the initial treatment.

G. The newborn and HIV (refer to Chapter 28 for this information)

XI. Hydatidiform Mole

A. Description

1. Hydatidiform mole is a form of gestational trophoblastic disease that occurs when the trophoblasts, which are the peripheral cells that attach the fertilized ovum to the uterine wall, develop abnormally.
2. The mole manifests as an edematous grapelike cluster that may be nonmalignant or may develop into choriocarcinoma.

B. Assessment

1. Fetal heart rate is not detectable.
2. Hyperemesis is a common finding.
3. Vaginal bleeding, which may occur by the fourth week or not until the second trimester; may be bright red or dark brown in color and may be slight, profuse, or intermittent.
4. Signs of preeclampsia (progressive blood pressure elevations) before the 20th week of gestation; note that preeclampsia usually occurs after 20 weeks of pregnancy, typically in the third trimester.
5. Fundal height greater than expected for gestational date
6. Elevated human chorionic gonadotropin (HCG) levels (>100,000 mIU/mL)
7. Characteristic snowstorm pattern shown on ultrasound

C. Interventions

1. Prepare the client for uterine evacuation (before evacuation, diagnostic tests are done to detect metastatic disease).
2. Evacuation of the mole is done by vacuum aspiration; oxytocin may be administered after evacuation to contract the uterus.
3. Monitor for postprocedure hemorrhage and infection.
4. Tissue is sent to the laboratory for evaluation, and follow-up is important to detect changes suggestive of malignancy.
5. Human chorionic gonadotropin levels are monitored every 1 to 2 weeks until normal prepregnancy levels are attained; levels are checked every 1 to 2 months for 1 year.
6. Instruct the client and partner about birth control measures so that pregnancy can be prevented during the 1-year follow-up period.

XII. Hyperemesis Gravidarum

A. Description: Intractable nausea and vomiting during the first trimester that causes disturbances in nutrition and fluid and electrolyte balance

B. Assessment

1. Nausea most pronounced on arising; may occur at other times during the day
2. Persistent vomiting
3. Weight loss
4. Signs of dehydration
5. Fluid and electrolyte imbalances

C. Interventions

1. Initiate measures to alleviate nausea, including medication therapy; if unsuccessful and if weight loss and fluid and electrolyte imbalances occur, intravenously administered fluid and electrolyte replacement or parenteral nutrition may be necessary.
2. Monitor vital signs, intake and output, weight, and calorie count.

3. Monitor laboratory data and for signs of dehydration and electrolyte imbalances.
4. Monitor urine for ketones.
5. Monitor fetal heart rate, activity, and growth.
6. Encourage intake of small portions of food (low-fat, easily digestible carbohydrates, such as cereals, rice, and pasta).
7. Encourage the intake of liquids between meals to avoid distending the stomach and triggering vomiting.
8. Encourage the client to sit upright after meals.

XIII. Hypertensive Disorders of Pregnancy

A. Description and types: Four major categories include preeclampsia, chronic/preexisting hypertension, chronic hypertension with superimposed preeclampsia, and gestational hypertension.

B. Blood pressure elevations can lead to preeclampsia and then eclampsia (seizures) (Table 23.1).

C. Those who have had preeclampsia, especially those who delivered preterm, have an increased risk later in life of cardiovascular disease and kidney disease, including heart attack, stroke, and high blood pressure.

TABLE 23.1 Classification of Hypertensive Stages of Pregnancy

Type of Hypertension	Description
Normal	Less than 120/80 mm Hg
Elevated	Systolic between 120 and 129 and diastolic less than 80 mm Hg
Stage 1 hypertension	Systolic between 130 and 139 or diastolic between 80 and 89 mm Hg
Stage 2 hypertension	Systolic at least 140 or diastolic at least 90 mm Hg
Chronic hypertension	Hypertension that is present and observable before pregnancy or that occurs in the first half (before 20 weeks) of the pregnancy
Gestational Hypertensive Disorders	
Gestational hypertension	Blood pressure elevation that first occurs in the second half (after 20 weeks) of pregnancy. Although gestational hypertension usually resolves after childbirth, it may increase the risk of developing hypertension in the future.
Preeclampsia	Usually occurs after 20 weeks of pregnancy, typically in the third trimester. When it occurs before 32 weeks of pregnancy, it is called early-onset preeclampsia. It also can occur in the postpartum period.
Eclampsia	Seizures occurring in pregnancy and linked to high blood pressure

From The American College of Obstetricians and Gynecologists, May 2018, at: <https://www.acog.org/Patients/FAQs/Preeclampsia-and-High-Blood-Pressure-During-Pregnancy>

Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 583.

TABLE 23.2 Assessment Findings in Preeclampsia

Parameter Evaluated	Preeclampsia without Severe Features	Preeclampsia with Severe Features
Blood pressure	Greater than or equal to 140 mm Hg systolic or greater than or equal to 90 mm Hg diastolic on two occasions at least 4 hours apart after 20 weeks of gestation in a client with a previously normal blood pressure.	Persistent elevation and greater than or equal to 160 mm Hg systolic or greater than or equal to 110 mm Hg diastolic on two occasions at least 4 hours apart while on bed rest
Proteinuria Note: no longer used as a diagnostic measure	Less than or equal to 0.3 g in 24 hr, less than or equal to 1+ on dipstick, may be normal	Greater than or equal to 5 g in 24 hr, greater than or equal to 3+ on dipstick two times
Refl exes	May be normal	Hyperreflexia
Changes in mentation	Transient or absent	May be present
Placental perfusion	Somewhat reduced	Decreased with possible abnormal fetal heart rate (FHR)
Creatinine, serum (renal function)	May be normal	Elevated (> 1.0 mg/dL [$>76.3 \mu\text{mol/L}$])
Protein/creatinine ratio	>0.3 mg/dL ($>22.89 \mu\text{mol/L}$)	>0.3 mg/dL ($>22.89 \mu\text{mol/L}$)
Platelets	May be decreased	Decreased ($<100,000 \text{ mm}^3$ [$<100 \times 10^9/\text{L}$])
Liver enzymes (alanine aminotransferase or aspartate aminotransferase)	Normal or minimal increase in levels	Elevated levels (double or greater)
Uric acid	May be normal	>5.5 mg/dL ($>330 \mu\text{mol/L}$)
Urine output	Normal	Oliguria common, often <500 mL/day
Severe, unremitting headache not attributable to other cause; mental confusion (cerebral edema)	Absent	Often present, persistent
Persistent right upper quadrant or epigastric pain or pain penetrating to back (distention of liver capsule); nausea and vomiting	Absent	May be present and often precedes seizure
Visual disturbances (spots or "sparkles"; temporary blindness; photophobia)	Absent to minimal	Common
Pulmonary edema; heart failure; cyanosis	Absent	May be present
Fetal growth restriction	Normal growth	Growth restriction; reduced amniotic fluid volume

Adapted from: The American College of Obstetricians and Gynecologists, May 2018 at: <https://www.acog.org/Patients/FAQs/Preeclampsia-and-High-Blood-Pressure-During-Pregnancy>

Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 216, 219.

D. Having preeclampsia once increases the risk of having it again in a future pregnancy.

E. HELLP syndrome can result. HELLP stands for *hemolysis, elevated liver enzymes, and low platelet count*. In this condition, red blood cells are damaged or destroyed, blood clotting is impaired, and the liver can bleed internally, causing chest or abdominal pain. HELLP syndrome is a medical emergency; the client can die from HELLP syndrome or have lifelong health problems as a result.

F. Assessment (Table 23.2)

! Proteinuria is not a reliable indicator of preeclampsia. Evidence demonstrates that kidney or liver dysfunction can occur without signs of protein and that the amount of protein in the urine does not predict how severely the disease will progress.

1. Persistent hypertension
 2. Swelling of the face or hands
 3. Headache
 4. Changes in eyesight
 5. Pain in the upper abdomen or shoulder
 6. Nausea and vomiting (in the second half of pregnancy)
 7. Sudden weight gain
 8. Difficulty breathing
- G. Risk factors
1. Previous preeclampsia or gestational hypertension, previous placental abruption, or fetal demise
 2. Primigravida
 3. Family history or first-degree relative with preeclampsia
 4. Those who are 40 years or older
 5. African American ethnicity

6. Those who are carrying more than one fetus
 7. History of chronic hypertension, kidney disease, or both
 8. Those who have medical conditions such as chronic hypertension, renal disease, connective tissue disease, diabetes mellitus, thrombophilia, or lupus erythematosus
 9. BMI greater than 26
 10. Metabolic syndrome
 11. Multifetal pregnancy
 12. Hydatidiform mole, hydrops fetalis, unexplained intrauterine growth retardation (IUGR)
 13. Those who had IUGR as a newborn.
 14. Those who had in vitro fertilization
- H. Complications of hypertension and gestational hypertension disorders
1. Abruptio placentae
 2. Disseminated intravascular coagulopathy
 3. Fetal growth restriction
 4. Preeclampsia and eclampsia
 5. Intracranial hemorrhage; cerebral hemorrhage or infarction
 6. Subcapsular hepatic hematoma
 7. HELLP (*hemolysis, elevated liver enzyme levels, low platelet count*) syndrome
 8. Oligohydramnios
 9. Placental insufficiency
 10. The need for preterm delivery or cesarean delivery
 11. Birthing parent and/or fetal death
- I. Interventions for hypertension and preeclampsia
1. Close blood pressure and weight monitoring throughout the pregnancy; the client may need to be taught how to take the blood pressure at home.
 2. Weekly or twice weekly health care visits may be necessary; delivery may be recommended at 37 weeks of gestation (earlier if there is evidence of fetal distress).
 3. Monitor fetal activity (teach the client how to perform kick counts) and fetal growth (ultrasounds will be prescribed).
 4. Encourage frequent rest periods, instructing the client to lie in the lateral position; for preeclampsia with severe features, the client may be hospitalized and bed rest may be prescribed (client should be placed in the lateral position).
 5. Administer medications as prescribed to reduce blood pressure; blood pressure should not be reduced rapidly, because placental perfusion can be compromised.
 6. Provide adequate fluids.
 7. Monitor intake and output; a urinary output of 30 mL/hr indicates adequate renal perfusion.
 8. Monitor neurological status, because changes can indicate cerebral hypoxia or impending seizure.

BOX 23.5 Assessment of Reflexes**Biceps**

Position thumb over client's biceps tendon, supporting client's elbow with the palm of the hand.

Strike a downward blow over the thumb with percussion hammer.

Normal response: Flexion of the arm at the elbow

Patellar

Position client with the legs dangling over the edge of the examining table or lying on the back with the legs slightly flexed.

Strike patellar tendon just below kneecap with percussion hammer.

Normal response: Extension or kicking out of the leg

Clonus

Position client with the legs dangling over the edge of examining table.

Support the leg with one hand and sharply dorsiflex client's foot with the other hand.

Maintain the dorsiflexed position for a few seconds and then release foot.

Normal response (negative clonus response):

Foot remains steady in dorsiflexed position.

No rhythmic oscillations or jerking of foot is felt.

When released, foot drops to plantar-flexed position with no oscillations.

Abnormal response (positive clonus response):

Rhythmic oscillations occur when foot is dorsiflexed.

Similar oscillations are noted when foot drops to plantar-flexed position.

Grading Response

0 Reflex absent

1+ Reflex present but hypoactive

Normal reflex

3+ Hyperactive reflex

4+ Hyperactive reflex with clonus present

9. Monitor deep tendon reflexes and for the presence of hyperreflexia or clonus, because hyperreflexia indicates increased central nervous system irritability (Box 23.5).

10. Monitor for HELLP syndrome.

11. Evaluate renal function through prescribed studies such as blood urea nitrogen, serum creatinine, and 24-hour urine levels for creatinine clearance and protein.

12. Magnesium sulfate (use a controlled infusion device) may be prescribed to prevent seizures; magnesium sulfate may be continued for 24 to 48 hours postpartum.

13. Monitor for signs of magnesium toxicity with the administration of magnesium sulfate, including flushing, sweating, hypotension, depressed deep tendon reflexes, decreased urine output, and central nervous system depression

BOX 23.6 Eclampsia

1. Seizure typically begins with twitching around the mouth.
2. Body then becomes rigid in a state of tonic muscular contractions that last 15 to 20 seconds.
3. Facial muscles and then all body muscles alternately contract and relax in rapid succession (clonic phase may last about 1 minute).
4. Respiration ceases during seizure because diaphragm tends to remain fixed (breathing resumes shortly after the seizure).
5. Postictal sleep occurs.

including respiratory depression; keep antidote (calcium gluconate) available for immediate use, if necessary.

14. Corticosteroids may be prescribed to promote fetal lung maturity.
15. Prepare the client for delivery as prescribed.

J. Eclampsia

1. Assessment: Characterized by generalized seizures (Box 23.6)
2. Interventions (see Clinical Judgment: Generate Solutions Box)

**⚡ CLINICAL JUDGMENT:
GENERATE SOLUTIONS**

The nurse creates a plan of care for a client with preeclampsia with severe features who is receiving magnesium sulfate by intravenous infusion. The plan of care focuses on interventions if the client experiences an eclamptic event. The nurse includes the following interventions in the plan:

- Remains with the client and calls for help
- Ensures an open airway, turns the client on the side, and administers oxygen by face mask at 8 to 10 L/minute
- Monitors fetal heart rate patterns
- Administers medications to control the seizures as prescribed
- After the seizure has ended, inserts an oral airway and suctions the client's mouth as needed
- Prepares for delivery of the fetus after stabilization of the client, if warranted
- Documents occurrence, client's response, and outcome

XIV. Incompetent Cervix**A. Description**

1. *Incompetent cervix* refers to premature dilation of the cervix, which occurs most often in the fourth or fifth month of pregnancy and is associated with structural or functional defects of the cervix.
2. Treatment involves surgical placement of a cervical cerclage.

B. Assessment

1. Vaginal bleeding
2. Fetal membranes visible through the cervix

C. Interventions

1. Provide bed rest, hydration, and tocolysis, as prescribed, to inhibit uterine contractions.
2. Prepare for cervical cerclage (at 10 to 14 weeks of gestation as prescribed), in which a band of fascia or nonabsorbable ribbon is placed around the cervix beneath the mucosa to constrict the internal os.
3. After cervical cerclage, the client is told to refrain from intercourse and to avoid prolonged standing and heavy lifting.
4. The cervical cerclage is removed at 37 weeks of gestation or left in place and a cesarean birth is performed; if removed, cerclage needs to be repeated with each successive pregnancy.
5. After placement of the cervical cerclage, monitor for contractions, rupture of the membranes, and signs of infection.
6. Instruct the client to report to the PHCP immediately any postprocedure vaginal bleeding or increased uterine contractions.

XV. Infections (TORCH Complex Acronym)**A. Toxoplasmosis ("T")**

1. Caused by infection with the intracellular protozoan parasite *Toxoplasma gondii*
2. Produces a rash and symptoms of acute, unlike infection in the pregnant client
3. Transmitted to the pregnant client through ingestion of raw meat or handling of cat litter of infected cats
4. Organism is transmitted to the fetus across the placenta.
5. Can cause miscarriage in the first trimester
6. Client education regarding preventing infection is critical.

B. Other Infections ("O," includes HIV—discussed earlier, syphilis—discussed under Sexually Transmitted Infections, parvovirus, hepatitis B virus [HBV], West Nile virus, etc.)**C. Rubella (German measles) ("R")**

1. Teratogenic in the first trimester
2. Organism is transmitted to the fetus across the placenta.
3. Causes congenital defects of the eyes, heart, ears, and brain
4. Blood titer studies will be done. If not immune (titer less than 1:8), the client should be vaccinated in the postpartum period; the client must wait 1 to 3 months (as specified by the PHCP) before becoming pregnant.

D. Cytomegalovirus ("C")

1. Organism is transmitted through close personal contact; it is transmitted across the placenta to the fetus, or the fetus may be infected through the birth canal.
2. The pregnant client may be asymptomatic; most infants are asymptomatic at birth.

3. Cytomegalovirus causes low birth weight, intrauterine growth restriction, enlarged liver and spleen, jaundice, blindness, hearing loss, and seizures.
 4. Antiviral medications may need to be prescribed for severe infections in the pregnant client, but these medications are toxic and may only temporarily suppress shedding of the virus; risk versus benefit will be considered by the PHCP.
 5. Maintain contact precautions.
- E. Herpes simplex virus (“H”)
1. Herpes simplex virus affects the external genitalia, vagina, and cervix and causes draining, painful vesicles.
 2. Acyclovir or valacyclovir may be prescribed to treat recurrent outbreaks during pregnancy or used as suppressive therapy late in pregnancy to prevent an outbreak during labor and birth.
 3. Virus usually is transmitted to the fetus during birth through the infected vagina or via an ascending infection after rupture of the membranes.
 4. No vaginal examinations are done in the presence of active vaginal herpetic lesions.
 5. Herpes can cause death or severe neurological impairment in the newborn.
 6. Delivery of the fetus is usually by cesarean section if active lesions are present in the vagina; delivery may be performed vaginally if the lesions are in the anal, perineal, or inner thigh area (strict precautions are necessary to protect the fetus during delivery).
 7. Maintain contact precautions.
- F. Group B streptococcus (GBS) (may be included as an “O” under TORCH complex)
1. GBS is a leading cause of life-threatening perinatal infections.
 2. The gram-positive bacterium colonizes the rectum, vagina, cervix, and urethra of pregnant and nonpregnant persons.
 3. Meningitis, fasciitis, and intra-abdominal abscess can occur in the pregnant client if infected at the time of birth.
 4. Transmission occurs during vaginal delivery.
 5. Early-onset newborn GBS occurs within the first week after birth, usually within 48 hours, and can include infections such as sepsis, pneumonia, or meningitis; permanent neurological disability can result.
 6. Diagnosis of the client is done via vaginal and rectal cultures at 35 to 37 weeks of gestation.
 7. Antibiotics may be prescribed for the client during labor and birth; IV antibiotics may be prescribed for infected infants.
 8. Maintain contact precautions.

XI. COVID-19 in Pregnancy

- A. Research is continuous regarding the effects of COVID-19 on the pregnant client and developing fetus.
- B. From what is known at this time, pregnant and recently pregnant individuals are at an increased risk for severe illness from COVID-19 compared with nonpregnant individuals.
- C. Additionally, pregnant individuals with COVID-19 are at increased risk for preterm birth and may have an increased risk of other adverse pregnancy outcomes.
- D. See **Chapters 19 and 51** for additional information on COVID-19.
- E. Refer to the CDC web site for the latest updates at <https://www.cdc.gov/coronavirus/2019-ncov/cases-updates/special-populations/pregnancy-data-on-covid-19/what-cdc-is-doing.html> and <https://www.cdc.gov/coronavirus/2019-ncov/cases-updates/special-populations/index.html>

XII. Multiple Gestation

- A. Description
 1. Multiple gestation results from the fertilization of two ova (fraternal or dizygotic) or a splitting of one fertilized ovum (identical or monozygotic).
 2. Complications include miscarriage, anemia, congenital anomalies, hyperemesis gravidarum, intrauterine growth restriction, gestational hypertension, polyhydramnios, postpartum hemorrhage, premature rupture of membranes, and preterm labor and delivery.
- B. Assessment
 1. Excessive fetal activity
 2. Uterus large for gestational age
 3. Palpation of three or four large parts in the uterus
 4. Auscultation of more than one fetal heart rate
 5. Excessive weight gain
- C. Interventions
 1. Monitor vital signs.
 2. Monitor fetal heart rates, activity, and growth.
 3. Monitor for cervical changes.
 4. Prepare the client for ultrasound as prescribed.
 5. Monitor for anemia; administer supplemental vitamins as prescribed.
 6. Monitor for preterm labor, and treat preterm labor promptly.
 7. Prepare for cesarean delivery for abnormal presentations.
 8. Prepare to administer oxytocic medications as prescribed after delivery to prevent postpartum hemorrhage from uterine overdistention.

XIII. Placental Abnormalities

- A. Description: Placenta accreta is an abnormally adherent placenta; placenta increta occurs when the

FIG. 23.3 Three classifications of placenta previa.

placenta penetrates the uterine muscle itself; placenta percreta occurs when the placenta goes all the way through the uterus.

- B. Assessment: May cause hemorrhage immediately after birth because the placenta does not separate easily
- C. Interventions
1. Monitor for hemorrhage and shock.
 2. Prepare the client for a hysterectomy if a large portion of the placenta is abnormally adherent.

XVIX. Placenta Previa

- A. Description
1. Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os (Fig. 23.3).
 2. Total (complete): The internal cervical os is covered entirely by the placenta when the cervix is dilated fully.
 3. Partial: The lower border of the placenta is within 3 cm of the internal cervical os but does not fully cover it.
 4. Marginal (low-lying): The placenta is implanted in the lower uterus, but its lower border is more than 3 cm from the internal cervical os.
 5. Management depends on the classification of the placenta previa and gestational age of the fetus.
- B. Assessment
1. Sudden onset of painless, bright red vaginal bleeding occurs in the last half of pregnancy.
 2. Uterus is soft, relaxed, and nontender.
 3. Fundal height may be more than expected for gestational age.
- C. Interventions
1. Monitor the client's vital signs, fetal heart rate, and fetal activity.

2. Prepare for ultrasound to confirm the diagnosis.
3. Vaginal examinations or any other actions that would stimulate uterine activity are avoided.
4. Maintain bed rest in a side-lying position as prescribed.
5. Monitor amount of bleeding (treat signs of shock).
6. Administer intravenous (IV) fluids, blood products, or tocolytic medications as prescribed; Rh_o(D) immune globulin may be prescribed.
7. If bleeding is heavy, a cesarean delivery may be performed.
8. Complete placenta previa will require a cesarean delivery.

⚠️ Vaginal exams are contraindicated if the client is suspected of having or has a known placenta previa.

XX. Abruptio Placentae

- A. Description: Premature separation of the placenta from the uterine wall after the 20th week of gestation and before the fetus is delivered (Fig. 23.4)
- B. Assessment
1. Dark red vaginal bleeding. If the bleeding is high in the uterus or is minimal, there can be an absence of visible blood.
 2. Uterine pain or tenderness or both
 3. Uterine rigidity
 4. Severe abdominal pain
 5. Signs of fetal distress
 6. Signs of shock if bleeding is excessive
- C. Interventions
1. Monitor the client's vital signs and fetal heart rate.
 2. Assess for excessive vaginal bleeding, abdominal pain, and an increase in fundal height.
 3. Maintain bed rest; administer oxygen, IV fluids, and blood products as prescribed.

FIG. 23.4 Types of abruption placentae.

- Place the client in Trendelenburg's position if indicated to decrease the pressure of the fetus on the placenta, or place in the lateral position with the head of the bed flat if hypovolemic shock occurs.
- Monitor and report any uterine activity.
- Prepare for delivery of the fetus as quickly as possible, with vaginal delivery preferable if the fetus is healthy and stable and the presenting part is in the pelvis; emergency cesarean delivery is performed if the fetus is alive but shows signs of distress.
- Monitor for signs of disseminated intravascular coagulation in the postpartum period.

! Know the differences between placenta previa and abruption placentae. In placenta previa, there is painless, bright red vaginal bleeding, and the uterus is soft, relaxed, and nontender. In abruption placentae, there is dark red vaginal bleeding, uterine pain or tenderness or both, and uterine rigidity.

XXI. Pyelonephritis

A. Description

- Results from bacterial infections that extend upward from the bladder through the blood vessels and lymphatics (also see Section XXIV)

TABLE 23.3 Monitoring for Sexually Transmitted Infections

Disease	Laboratory Test
Gonorrhea	Vaginal culture or urine testing is done during initial prenatal examination to screen for gonorrhea. Vaginal culture or urine test may be repeated during third trimester in high-risk clients.
Syphilis	Venereal Disease Research Laboratory (VDRL) or rapid plasma reagin (RPR) testing is done on all clients prenatally. Culture of lesions (if present) is done during initial prenatal examination to screen for syphilis. Diagnosis depends on microscopic examination of primary and secondary lesion tissue and serology (VDRL or RPR test) during latency and late infection. Culture may be repeated during the third trimester in high-risk clients.
Condyloma acuminatum (human papillomavirus)	Culture is indicated for clients with positive history or with active lesions. Test is performed to determine route of delivery. Weekly cultures may be done at week 35 or 36 of pregnancy until birth.
<i>Chlamydia</i>	Vaginal culture or urine testing is indicated for all pregnant clients if client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia.
Trichomoniasis	Normal saline wet smear of vaginal secretions is checked for presence of protozoa. Associated with premature rupture of membranes and postpartum endometritis.
Genital herpes simplex virus (HSV-2)	Culture is done of lesions (if present) during initial prenatal examination to screen for HSV. Microscopic examination is done to determine presence of virus. Additional screening may be necessary as pregnancy progresses.
HIV	Testing may be done for a high-risk client. Common tests to determine the presence of antibodies include ELISA, Western blot, and immunofluorescence assay (IFA).

ELISA, Enzyme-linked immunosorbent assay; HIV, human immunodeficiency virus.

Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 123-130, 134-135.

- Frequently follows untreated urinary tract infections and is associated with increased incidence of anemia, low birth weight, gestational hypertension, premature labor and delivery, and premature rupture of the membranes

B. Assessment and Interventions (refer to Chapter 55)

XXII. Sexually Transmitted Infections (Table 23.3)

A. Chlamydia

1. Description

- Sexually transmitted pathogen associated with an increased risk for premature birth, stillbirth, neonatal conjunctivitis, and newborn chlamydial pneumonia

- b. Can cause salpingitis, pelvic abscesses, ectopic pregnancy, chronic pelvic pain, and infertility
 - c. Transmission may occur during vaginal birth and can result in neonatal conjunctivitis or pneumonitis.
 - d. Infection can cause premature rupture of the membranes, premature labor, and postpartum endometritis.
 - e. Diagnostic test is culture for *Chlamydia trachomatis*.
2. Assessment
 - a. Usually asymptomatic—may have dysuria or dyspareunia
 - b. Bleeding between periods or after coitus
 - c. Mucoid or purulent cervical discharge
 - d. Dysuria and pelvic pain
 3. Interventions
 - a. Screen the client to determine whether if high risk; this is indicated for all pregnant clients if the client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia.
 - b. Instruct the client in the importance of re-screening, because reinfection can occur as the client nears term.
 - c. Ensure that the sexual partner is treated for the infection.
 - d. Treatment for both gonorrhea and chlamydia should be done, which includes antibiotics.
 - e. Complications in pregnancy may include septic spontaneous abortion or miscarriage, preterm delivery, premature rupture of the membranes (PROM), chorioamnionitis, disseminated gonococcal infection, ophthalmia neonatorum, and postpartum metritis.
- B. Syphilis
1. Description
 - a. Syphilis is a chronic infectious disease caused by the organism *Treponema pallidum*.
 - b. Transmission is by physical contact with syphilitic lesions, which usually are found on the skin, mucous membranes of the mouth, or genitals.
 - c. Organism may cross the **placenta** and is passed to the fetus after the fourth month of pregnancy as congenital syphilis.
 - d. Infection usually leads to spontaneous abortions and increases the incidence of mental subnormality and physical deformities.
 2. Assessment (Box 23.7)
 3. Interventions
 - a. A serum test (Venereal Disease Research Laboratory or rapid plasma reagin) for syphilis is done on the first prenatal visit; prepare to repeat the test at 36 weeks of gestation because the disease may be acquired after the initial visit.

BOX 23.7 Stages of Syphilis**Primary Stage**

- Most infectious stage
- Appearance of ulcerative, painless lesions produced by spirochetes at point of entry into the body

Secondary Stage

- Highly infectious stage
- Appearance of lesions about 6 weeks to 6 months after primary stage; located anywhere on the skin and mucous membranes
- Generalized lymphadenopathy

Tertiary Stage

- Entrance of spirochetes into internal organs, causing permanent damage; symptoms occur 10 to 30 years after untreated primary lesion
- Invasion of central nervous system, causing meningitis, ataxia, general paresis, and progressive mental deterioration
- Deleterious effects on aortic valve and aorta

- b. If the test result is positive, treatment with an antibiotic may be necessary.
- c. Sonographic evaluation is necessary to assess for signs of placental syphilis.
- d. Instruct the client that treatment of the partner is necessary if infection is present, and intercourse should be avoided until treatment is instituted.
- e. Complications include transmission to fetus (100% in primary and secondary stages), congenital anomalies, deafness, neurological impairment (mortality rate is 50%).
- f. Those with syphilis should also be tested for HIV.

C. Gonorrhea**1. Description**

- a. Gonorrhea is an infection caused by *Neisseria gonorrhoeae*, which causes inflammation of the mucous membranes of the genital and urinary tracts.
- b. Client infection may result in postpartum infection of the **neonate**.
- c. Transmission of the organism is by sexual intercourse.
- d. Infection may be transmitted to the newborn's eyes during delivery, causing blindness (ophthalmia neonatorum).
- e. Other risks to the neonate include pneumonia and sepsis.

2. Assessment: Usually asymptomatic; vaginal discharge, urinary frequency, and lower abdominal pain possible

3. Interventions

- a. Testing is done during the initial prenatal examination to screen for gonorrhea; the screening may be repeated during the third trimester in high-risk clients.

- b. Instruct the client that treatment of the partner is necessary if infection is present.
- c. Complications are similar to those of chlamydia.
- D. Condyloma acuminatum (human papillomavirus)
- Description
 - Condyloma acuminatum is caused by human papillomavirus.
 - Infection affects the cervix, urethra, anus, penis, and scrotum.
 - Human papillomavirus is transmitted through sexual contact.
 - Transmission may occur during vaginal birth.
 - Infection is associated with the development of epithelial tumors of the mucous membranes of the larynx in children.
 - Assessment
 - Infection produces small to large wartlike growths on the genitals.
 - Cervical cell changes may be noted because human papillomavirus is associated with cervical malignancies.
 - Interventions
 - Lesions are removed by the use of cytotoxic agents, cryotherapy, electrocautery, and laser, but this is done for symptomatic relief only and is usually delayed until after birth. The genital warts often regress after delivery, and treatment outcomes may be poor until after delivery.
 - Encourage annual Papanicolaou test.
 - Sexual contact should be avoided until lesions are healed (condoms reduce transmission).
 - Cesarean delivery is indicated only if genital warts are obstructing the pelvic outlet or if vaginal delivery would result in excessive bleeding.
- E. Genital herpes simplex virus
- Description: Characterized by painful lesions, fever, chills, malaise, and severe dysuria and may last 2 to 3 weeks
 - Assessment: Includes questioning about signs and symptoms and inspecting the vulvar, perineal, and vaginal areas for vesicles or areas of ulceration or crusting; this is done during pregnancy and at the onset of labor.
 - Interventions
 - Vaginal birth may be acceptable; cesarean birth is required if visible lesions are present.
 - Infants who are born through an infected vagina should be observed carefully, and samples should be taken for culture.
- F. Trichomoniasis
- Description
 - Trichomoniasis is caused by *Trichomonas vaginalis* and is transmitted via sexual contact.
 - A normal saline wet smear of vaginal secretions indicates the presence of protozoa.
 - Infection is associated with premature rupture of the membranes and postpartum endometritis.
 - Assessment
 - Yellowish to greenish, frothy, mucopurulent, copious, malodorous vaginal discharge
 - Inflammation of vulva, vagina, or both may occur.
 - Interventions
 - Metronidazole may be prescribed.
 - Sexual partner may need to be treated.
- G. Bacterial vaginosis
- Description
 - Caused by *Haemophilus vaginalis* (*Gardnerella vaginalis*) and transmitted via sexual contact
 - Associated with premature labor and birth
 - Assessment
 - Client complains of “fishy odor” to vaginal secretions and increased odor after intercourse.
 - Microscopic examination of vaginal secretions identifies the infection.
 - Interventions
 - Metronidazole may be prescribed.
 - Sexual partner may need to be treated.
- H. Vaginal candidiasis
- Description
 - Candida albicans* is the most common causative organism.
 - Predisposing factors include use of antibiotics, diabetes mellitus, and obesity.
 - Vaginal candidiasis is diagnosed by identifying spores of *Candida albicans*.
 - Assessment
 - Vulvar and vaginal pruritus
 - White, lumpy, cottage cheese-like discharge from vagina
 - Interventions
 - An antifungal vaginal preparation may be prescribed. Oral fluconazole should be avoided during pregnancy due to the risk of miscarriage.
 - For extensive irritation and swelling, sitz baths may be helpful.
 - Sexual partner may need to be treated.
- XXIII. Tuberculosis
- A. Description
- Highly communicable disease caused by *Mycobacterium tuberculosis*
 - Transmitted by the airborne route
 - Multidrug-resistant strains of tuberculosis can result from improper compliance, noncompliance with treatment programs, or development of mutations in tubercle bacillus.

- B. Transmission
1. Transplacental transmission is rare.
 2. Transmission can occur during birth through aspiration of infected amniotic fluid.
 3. The newborn can become infected from contact with infected individuals.
- C. Risk to pregnant client: Active disease during pregnancy has been associated with an increase in hypertensive disorders of pregnancy.
-  D. Diagnosis: If a chest radiograph is required for the client, it is done only after 20 weeks of gestation, and a lead shield for the abdomen is required.

 Tuberculin skin testing is safe during pregnancy; however, the PHCP may want to delay testing until after delivery.

-  E. Assessment
1. Pregnant client
 - a. Possibly asymptomatic
 - b. Fever and chills
 - c. Night sweats
 - d. Weight loss
 - e. Fatigue
 - f. Cough with hemoptysis or green or yellow sputum
 - g. Dyspnea
 - h. Pleural pain
 - Newborn
 - a. Fever
 - b. Lethargy
 - c. Poor feeding
 - d. Failure to thrive
 - e. Respiratory distress
 - f. Hepatosplenomegaly
 - g. Meningitis
 - h. Disease may spread to all major organs.
-  F. Interventions
1. Pregnant client
 - a. Administration of isoniazid, pyrazinamide, and rifampin daily for 9 months (as prescribed); ethambutol is added if medication resistance is likely.
 - b. Pyridoxine should be administered with isoniazid to the pregnant client to prevent fetal neurotoxicity caused by isoniazid.
 - c. Promote breast-feeding/chest-feeding only if the client is noninfectious.
 2. Newborn
 - a. Management focuses on preventing disease and treating early infection.
 - b. Skin testing is performed on the newborn at birth, and the newborn may be placed on isoniazid therapy; the skin test is repeated in 3 to 4 months, and isoniazid may be stopped if the skin test results remain negative.

- c. If the skin test result is positive, the newborn should receive isoniazid for at least 6 months (as prescribed).
- d. If the birthing parent's sputum is free of organisms, the newborn does not need to be isolated from the parent while in the hospital.

XXIV. Urinary Tract Infection (Acute Cystitis and Acute Pyelonephritis)

- A. Description: A urinary tract infection can occur during pregnancy (pregnancy is a predisposing factor). A urinary tract infection can be either lower urinary tract (cystitis) or upper urinary tract (pyelonephritis).
- B. Those may also experience asymptomatic bacteriuria.
- C. Predisposing conditions
1. History of urinary tract infections
 2. Urinary tract anomalies
 3. Low socioeconomic status
 4. Sexual activity
 5. Young age
 6. Sickle cell trait
 7. Poor hygiene
 8. Anemia
 9. Diabetes mellitus
 10. Obesity
 11. Catheterization
- D. Screening is done at the first prenatal visit or at 12 to 16 weeks' gestation. Rescreening is done based on risk factors.
- E. Assessment and Interventions (refer to Chapter 55): It is important to differentiate between cystitis and the progression to pyelonephritis. If progressed to pyelonephritis, hospitalization may be required for antibiotic therapy and possible tocolysis.

XXV. Obesity in Pregnancy

- A. Description: Obesity in every population, including adults and children, is a problem in the United States. Obesity in pregnancy places the client at risk for several complications during pregnancy, including gestational diabetes, gestational hypertension, preeclampsia, venous thromboembolism, and increased need for cesarean birth.
- B. Delivery complications can result from difficulty in obtaining IV access, epidural access, or intubation, and from decreased oxygen consumption with associated increased cardiac output, stressing the heart.
- C. Obesity in pregnancy can have negative effects on the newborn, including stillbirth, premature birth, congenital anomalies, future obesity, heart disease, and difficulty with breast-feeding/chest-feeding.
- D. Obese persons have lower prolactin response to suckling in the first week postpartum, contributing to high rates of breast-feeding/chest-feeding failure in this population.

- E. Potential postdelivery complications and associated interventions
1. Thromboembolism formation is a concern; as prescribed, thromboembolism stockings, sequential compression devices (SCDs), and pharmacological venous thromboembolism prophylaxis may be necessary postdelivery.
 2. Postpartum hemorrhage is more common, as well as difficulty in locating the fundus, predisposing further to this problem.
 3. Endometritis is common in this population.
 4. Early ambulation is encouraged to prevent venous thromboembolism formation.
 5. Frequent monitoring and cleaning of surgical incisions (episiotomy or cesarean incision) is needed to prevent infection or dehiscence due to excess abdominal fat.

XXVI. Additional Complications During Pregnancy: See Table 23.4 .

TABLE 23.4 Risk Factors and Management of Additional Complications During Pregnancy

Complication	Risk Factors	Prevention and Management
<ul style="list-style-type: none"> - Dental abscess - Broken or missing teeth - Pregnancy gingivitis - Periodontal disease - Pyogenic granuloma - Oral cancer 	<ul style="list-style-type: none"> - Tobacco use - High sugar consumption - Poor oral hygiene - High stress level - Substance use, particularly methamphetamine - Diabetes - HIV infection - Immunosuppression - Low income - Poor nutrition - Medications that reduce saliva - Hormonal changes - Genetic predisposition - Poor access to oral health provider 	<ul style="list-style-type: none"> - Adequate fluid intake - Teeth brushing twice daily with fluoridated toothpaste - Floss at least once daily - Regular oral health checkups - Avoid tobacco - Avoid high-sugar drinks and sweet snacks - Regular physical exercise - Soft diet - Warm towel or heating pad - Analgesics - Dental consult - Antibiotics for abscess - Surgical drainage as indicated
<ul style="list-style-type: none"> - Iron-deficiency anemia 	<ul style="list-style-type: none"> - Low dietary intake of iron - Adolescence - Pregnancy and breast-feeding/chest-feeding - Low socioeconomic status - African American, Hispanic, Native American, recent immigrant - History of anemia before pregnancy - Underweight before pregnancy - Eating problems - Multiparity - Short interval between pregnancies - Pica - Blood loss - Menorrhagia before pregnancy - Frequent blood donation - Chronic infectious process - Malabsorptive disorder - Strict vegetarian diet - Alcohol and substance abuse - Tobacco use 	<ul style="list-style-type: none"> - Screening during pregnancy: complete blood cell count (CBC) at initial visit, at 24-28 weeks, and at 36 weeks - Iron supplementation in addition to prenatal vitamins as prescribed - Teach to take iron supplementation between meals so that absorption of zinc is not affected - Advise on foods high in iron - Advise on medications inhibiting absorption of iron, such as antacids, proton pump inhibitors (PPIs), certain antibiotics - Referral to dietitian - May need blood transfusion or IV iron if severely anemic
<ul style="list-style-type: none"> - Asthma 	<ul style="list-style-type: none"> - Exposure to allergens, dust mites, animal dander, cockroaches, mold, pollen, grass, flowers, smoke, tobacco, air fresheners, chemical cleaners, sprays - Upper respiratory infections - Sinusitis - Cold temperatures - Physical activity - Sulfites in food and drinks - Gastroesophageal reflux disease (GERD) - Weather changes 	<ul style="list-style-type: none"> - Education on prevention or exacerbation - Avoid triggers and exposures - Asthma action plan education - Asthma medications generally safe during pregnancy - Short-acting beta-agonist (SABA), long-acting beta-agonist (LABA), and inhaled corticosteroid (ICS) use - Instructions on use of inhalers and nebulizers - Oral medications may be needed, depending on severity - Serial growth scans by ultrasound should be done starting at 32 weeks - Frequent nonstress tests are advised, depending on severity - Daily fetal kick counts advised - Influenza vaccine is important - Smoking cessation

TABLE 23.4 Risk Factors and Management of Additional Complications During Pregnancy—cont'd

Complication	Risk Factors	Prevention and Management
- Zika virus	- Recent travel or history of residing in an area with local transmission within the past 6 months	<ul style="list-style-type: none"> - Treatment revolves around symptom relief - Rest - Fluids to prevent dehydration - Acetaminophen for fever and pain - Avoiding aspirin and nonsteroidal antiinflammatory drugs (NSAIDs) - May need serial ultrasounds to monitor fetal well-being - Newborn should be tested within 24 hours - Microcephaly is possible - Birthing parent-fetal specialist referral should be done

Adapted from: Cibulka NJ, Barron ML. *Guidelines for nurse practitioners in ambulatory obstetric settings*, ed 2, New York, 2017, Springer Publishing Company; Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 566.

PRACTICE QUESTIONS

- The nurse is providing instructions to a pregnant client with human immunodeficiency virus (HIV) infection regarding care of the newborn after delivery. The client asks the nurse about the feeding options that are available. Which response would the nurse make to the client?
 - "You will need to bottle-feed your newborn."
 - "You will need to feed your newborn by nasogastric tube feeding."
 - "You will be able to breast/chest-feed for 6 months and then will need to switch to bottle-feeding."
 - "You will be able to breast/chest-feed for 9 months and then will need to switch to bottle-feeding."
- The home care nurse visits a pregnant client who has a diagnosis of preeclampsia. Which assessment finding indicates a worsening of the preeclampsia and the need to notify the primary health care provider (PHCP)?
 - Urinary output has increased.
 - Dependent edema has resolved.
 - Blood pressure reading is at the prenatal baseline.
 - The client complains of a headache and blurred vision.
- The nurse implements a teaching plan for a pregnant client who is newly diagnosed with gestational diabetes mellitus. Which statement made by the client indicates a need for further teaching?
 - "I need to stay on the diabetic diet."
 - "I need to perform glucose monitoring at home."
 - "I need to avoid exercise because of the negative effects on insulin production."
 - "I need to be aware of any infections and report signs of infection immediately to my obstetrician."
- The nurse is performing an assessment on a pregnant client in the last trimester with a diagnosis of preeclampsia. The nurse reviews the assessment findings and determines that which finding is most closely associated with a complication of this diagnosis?
 - Enlargement of the breasts
 - Complaints of feeling hot when the room is cool
 - Periods of fetal movement followed by quiet periods
 - Evidence of bleeding, such as in the gums, petechiae, and purpura
- The nurse in a maternity unit is reviewing the clients' records. Which clients would the nurse identify as being at the most risk for developing disseminated intravascular coagulation (DIC)? Select all that apply.
 - A primigravida with abruptio placentae
 - A primigravida who delivered a 10-lb infant 3 hours ago
 - A gravida 2 who has just been diagnosed with dead fetus syndrome
 - A gravida 4 who delivered 8 hours ago and has lost 500 mL of blood
 - A primigravida at 29 weeks of gestation who was recently diagnosed with gestational hypertension
- The home care nurse is monitoring a pregnant client who is at risk for preeclampsia. At each home care visit, the nurse assesses the client for which sign of preeclampsia?
 - Hypertension
 - Low-grade fever
 - Generalized edema
 - Increased pulse rate

7. The nurse is assessing a pregnant client with type 1 diabetes mellitus about an understanding regarding changing insulin needs during pregnancy. The nurse determines that further teaching is needed if the client makes which statement?
1. "I will need to increase my insulin dosage during the first 3 months of pregnancy."
 2. "My insulin dose will probably need to be increased during the second and third trimesters."
 3. "Episodes of hypoglycemia are more likely to occur during the first 3 months of pregnancy."
 4. "My insulin needs will return to prepregnant levels within 7 to 10 days after birth if I am bottle-feeding."
8. A pregnant client reports to a health care clinic, complaining of loss of appetite, cough, weight loss, and fatigue. After assessment of the client, tuberculosis is suspected. A sputum culture is obtained and identifies *Mycobacterium tuberculosis*. Which instruction would the nurse include in the client's teaching plan?
1. Therapeutic abortion is required.
 2. Isoniazid plus rifampin will be required for 9 months.
 3. The client will have to stay at home until treatment is completed.
 4. Medication will not be started until after delivery of the fetus.
9. The nurse is providing instructions to a pregnant client with a history of cardiac disease regarding appropriate dietary measures. Which statement, if made by the client, indicates an understanding of the information provided by the nurse?
1. "I need to increase my sodium intake during pregnancy."
 2. "I need to lower my blood volume by limiting my fluids."
 3. "I need to maintain a low-calorie diet to prevent any weight gain."
 4. "I need to drink adequate fluids and increase my intake of high-fiber foods."
10. The clinic nurse is performing a psychosocial assessment of a client who is pregnant. Which assessment findings indicate to the nurse that the client is at risk for contracting human immunodeficiency virus (HIV)? Select all that apply.
- 1. The client has a history of intravenous drug use.
 - 2. The client has a significant other who is heterosexual.
 - 3. The client has a history of sexually transmitted infections.
 - 4. The client has had one sexual partner for the past 10 years.
 - 5. The client has a previous history of gestational diabetes mellitus.
11. The nurse evaluates the ability of a hepatitis B-positive birthing parent to provide safe bottle-feeding to the newborn during postpartum hospitalization. Which action best exemplifies the birthing parent's knowledge of potential disease transmission to the newborn?
1. The birthing parent requests that the window be closed before feeding.
 2. The birthing parent holds the newborn properly during feeding and burping.
 3. The birthing parent tests the temperature of the formula before initiating feeding.
 4. The birthing parent washes and dries the hands before and after self-care of the perineum and asks for a pair of gloves before feeding.
12. A client in the first trimester of pregnancy arrives at a health care clinic and reports has been experiencing vaginal bleeding. A threatened abortion is suspected, and the nurse instructs the client regarding management of care. Which statement made by the client indicates a need for further instruction?
1. "I will watch to see if I pass any tissue."
 2. "I will maintain strict bed rest throughout the remainder of the pregnancy."
 3. "I will count the number of perineal pads used on a daily basis and note the amount and color of blood on the pad."
 4. "I will avoid sexual intercourse until the bleeding has stopped and for 2 weeks following the last episode of bleeding."
13. The nurse is planning to admit a pregnant client who is obese. In planning care for this client, which potential client needs would the nurse anticipate? Select all that apply.
- 1. Bed rest as a necessary preventive measure may be prescribed.
 - 2. Administration of subcutaneous heparin post-delivery as prescribed.
 - 3. An overbed lift may be necessary if the client requires a cesarean section.
 - 4. Less frequent cleansing of a cesarean incision, if present, may be prescribed.
 - 5. Thromboembolism stockings or sequential compression devices may be prescribed.

14. The nurse is assessing a pregnant client in the second trimester of pregnancy who was admitted to the maternity unit with a suspected diagnosis of abruption placentae. Which assessment finding would the nurse expect to note if this condition is present?
1. Soft abdomen
 2. Uterine tenderness
 3. Absence of abdominal pain
 4. Painless, bright red vaginal bleeding
15. The maternity nurse is preparing for the admission of a client in the third trimester of pregnancy who is experiencing vaginal bleeding and has a suspected diagnosis of placenta previa. The nurse reviews the primary health care provider's prescriptions and would question which prescription?
1. Prepare the client for an ultrasound.
 2. Obtain equipment for a manual pelvic examination.
 3. Prepare to draw a hemoglobin and hematocrit blood sample.
 4. Obtain equipment for external electronic fetal heart rate monitoring.
16. An ultrasound is performed on a client at term gestation who is experiencing moderate vaginal bleeding. The results of the ultrasound indicate that abruption placentae is present. On the basis of these findings, the nurse would prepare the client for which anticipated prescription?
1. Delivery of the fetus
 2. Strict monitoring of intake and output
 3. Complete bed rest for the remainder of the pregnancy
 4. The need for weekly monitoring of coagulation studies until the time of delivery
17. The nurse in the postpartum unit is caring for a client who has just delivered a newborn infant following a pregnancy with placenta previa. The nurse reviews the plan of care and prepares to monitor the client for which risk associated with placenta previa?
1. Infection
 2. Hemorrhage
 3. Chronic hypertension
 4. Disseminated intravascular coagulation
18. The nurse is performing an assessment on a client diagnosed with placenta previa. Which assessment findings would the nurse expect to note? Select all that apply.
- 1. Uterine rigidity
 - 2. Uterine tenderness
 - 3. Severe abdominal pain
 - 4. Bright red vaginal bleeding
 - 5. Soft, relaxed, nontender uterus
 - 6. Fundal height may be greater than expected for gestational age

ANSWERS

1. Answer: 1

Rationale: Perinatal transmission of HIV can occur during the antepartum period, during labor and birth, or in the postpartum period if the birthing parent is breast/chest-feeding. Clients who have HIV will most likely be advised not to breast/chest-feed; however, the PHCP's recommendations regarding breast/chest-feeding are always followed. There is no physiological reason why the newborn needs to be fed by nasogastric tube.

Test-Taking Strategy: Use knowledge regarding the transmission of HIV. Eliminate options 3 and 4 first because these options are **comparable or alike** in that they both address breast/chest-feeding. From the remaining options, select the correct option, knowing that it is unnecessary to feed the newborn by nasogastric tube.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 674.

2. Answer: 4

Rationale: If the client complains of a headache and blurred vision, the PHCP needs to be notified because these are signs of worsening preeclampsia. Options 1, 2, and 3 are normal findings.

Test-Taking Strategy: Note the word **worsening** in the question. Eliminate options 1, 2, and 3 because these options are **comparable or alike** and indicate normal findings.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 590.

3. Answer: 3

Rationale: Exercise is safe for a client with gestational diabetes mellitus and is helpful in lowering the blood glucose level. Dietary modifications are the mainstay of treatment, and the client is placed on a standard diabetic diet. Many clients are taught to perform blood glucose monitoring. If the client is not performing the blood glucose monitoring at home, it is performed at the clinic or obstetrician's office. Signs of infection need to be reported to the obstetrician.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. These words indicate a **negative event query** and the need to select an incorrect client statement. Also, noting the **closed-ended word** "avoid" in the correct option will assist in answering the question.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 630.

4. Answer: 4

Rationale: Severe preeclampsia can trigger disseminated intravascular coagulation (DIC) because of the widespread damage to vascular integrity. Bleeding is an early sign of DIC and needs to be reported to the primary health care provider if noted on assessment. Options 1, 2, and 3 are normal occurrences in the last trimester of pregnancy.

Test-Taking Strategy: Note the **strategic word**, *most*. Focus on the **subject**, a complication of preeclampsia. Eliminate options 1, 2, and 3 because they are **comparable or alike** and are normal occurrences in the last trimester of pregnancy.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 213-214.

5. Answer: 1, 3, 5

Rationale: In a pregnant client, DIC is a condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation. Predisposing conditions include abruptio placentae, amniotic fluid embolism, gestational hypertension, HELLP syndrome, intrauterine fetal death, liver disease, sepsis, severe postpartum hemorrhage, and blood loss. Delivering a large newborn is not considered a risk factor for DIC. Hemorrhage is a risk factor for DIC; however, a loss of 500 mL is not considered hemorrhage.

Test-Taking Strategy: Note the **strategic word**, *most*. Focus on the **subject**, the client at most risk for DIC. Think about the pathophysiology associated with DIC, and select the options that identify abnormal conditions. This will direct you to the correct options.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 213-214.

6. Answer: 1

Rationale: A sign of preeclampsia is persistent hypertension. A low-grade fever or increased pulse rate is not associated with preeclampsia. Generalized edema may occur but is not a specific sign of preeclampsia because it can occur in many conditions.

Test-Taking Strategy: Focus on the **subject**, a sign of preeclampsia. Thinking about the pathophysiology associated with preeclampsia will direct you to the correct option. Remember that hypertension is associated with preeclampsia.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 2220.

7. Answer: 1

Rationale: Insulin needs decrease in the first trimester of pregnancy because of increased insulin production by the pancreas and increased peripheral sensitivity to insulin. The statements in options 2, 3, and 4 are accurate and signify that the client understands control of the diabetes during pregnancy.

Test-Taking Strategy: Note the **strategic words**, *further teaching is needed*. These words indicate a **negative event query** and the need to select an incorrect client statement. Eliminate options 2, 3, and 4 because they are **comparable or alike** and are accurate statements. Remember that insulin needs decrease in the first trimester of pregnancy.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 233, 236-237.

8. Answer: 2

Rationale: More than one medication may be used to prevent the growth of resistant organisms in a pregnant client with tuberculosis. Treatment must continue for a prolonged period. The preferred treatment for the pregnant client is isoniazid plus rifampin daily for 9 months. Ethambutol is added initially if medication resistance is suspected. Pyridoxine (vitamin B₆) often is administered with isoniazid to prevent fetal neurotoxicity. The client does not need to stay at home during treatment, and therapeutic abortion is not required.

Test-Taking Strategy: Focus on the **subject**, therapeutic management for a client with tuberculosis. Recalling the pathophysiology associated with tuberculosis and its treatment will assist in eliminating options 1, 3, and 4.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 264.

9. Answer: 4

Rationale: Constipation can cause the client to use the Valsalva maneuver. The Valsalva maneuver needs to be avoided in clients with cardiac disease because it can cause blood to rush to the heart and overload the cardiac system. Constipation can be prevented by the addition of fluids and a high-fiber diet. A low-calorie diet is not recommended during pregnancy and could be harmful to the fetus. Sodium needs to be restricted as prescribed by the primary health care provider, because excess sodium would cause an overload to the circulating blood volume and contribute to cardiac complications. Diets low in fluid can cause a decrease in blood volume, which could deprive the fetus of nutrients.

Test-Taking Strategy: Focus on the **subject**, the pregnant client with heart disease. Think about the physiology of the cardiac system, client and fetal needs, and the factors that increase the workload on the heart. This will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 641-643.

10. Answer: 1, 3

Rationale: HIV is transmitted by intimate sexual contact and the exchange of body fluids, exposure to infected blood, and passage from an infected birthing parent to the fetus. Clients who fall into the high-risk category for HIV infection include individuals who have used intravenous drugs, individuals who experience persistent and recurrent sexually transmitted infections, and individuals who have a history of multiple sexual partners. Gestational diabetes mellitus does not predispose the client to HIV. A client with a heterosexual partner, particularly a client who has had only one sexual partner in 10 years, does not have a high risk for contracting HIV.

Test-Taking Strategy: Focus on the **subject**, risk factors for HIV. Recalling that exchange of blood and body fluids places the client at high risk for HIV infection will direct you to the correct options.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 261.

11. **Answer: 4**

Rationale: Hepatitis B virus is highly contagious and is transmitted by direct contact with blood and body fluids of infected persons. The rationale for identifying childbearing clients with this disease is to provide adequate protection of the fetus and the newborn, to minimize transmission to other individuals, and to reduce complications in the birthing parent. The correct option provides the best evaluation of client understanding of disease transmission. Option 1 will not affect disease transmission since hepatitis B does not spread through airborne transmission. Options 2 and 3 are appropriate feeding techniques for bottle-feeding but do not minimize disease transmission for hepatitis B.

Test-Taking Strategy: Note the **strategic word**, *best*. Focus on the **subject**, disease transmission to the newborn. This focus will direct you to the correct option.

Reference(s): Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 261, 674.

12. **Answer: 2**

Rationale: Strict bed rest throughout the remainder of the pregnancy is not required for a threatened abortion. The client needs to watch for the evidence of the passage of tissue. The client is instructed to count the number of perineal pads used daily and to note the quantity and color of blood on the pad. The client is advised to curtail sexual activities until bleeding has ceased and for 2 weeks after the last evidence of bleeding or as recommended by the health care provider.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and the need to select an incorrect client statement. Noting the word *strict* in the correct option will assist in directing you to this option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 202.

13. **Answer: 2, 3, 5**

Rationale: The obese pregnant client is at risk for complications such as venous thromboembolism and increased need for cesarean section. Additionally, the obese client requires special considerations pertaining to nursing care. To prevent venous thromboembolism, particularly in the client who required cesarean section, frequent and early ambulation (not bed rest), prior to and after surgery, is recommended. Routine administration of prophylactic pharmacological venous thromboembolism medications such as heparin is also commonly prescribed. An overbed lift may be needed to transfer a client from an operating table to bed if cesarean section is necessary. Increased monitoring and cleansing of a cesarean incision, if present, is necessary due to the increased risk for infection secondary to increased abdominal fat. Thromboembolism stockings or sequential compression devices will likely be prescribed because of the client's increased risk of blood clots.

Test-Taking Strategy: Note the **subject**, planning care for the pregnant client who is obese. If you can recall the general complications associated with obesity, this will help you choose the correct options. Recall that preventive measures need to be taken to prevent blood clots and infection in clients at higher risk for these complications.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 698.

14. **Answer: 2**

Rationale: Abruptio placentae is the premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered. In abruptio placentae, acute abdominal pain is present. Uterine tenderness accompanies placental abruption, especially with a central abruption and trapped blood behind the placenta. The abdomen feels hard and boardlike on palpation as the blood penetrates the myometrium and causes uterine irritability. A soft abdomen and painless, bright red vaginal bleeding in the second or third trimester of pregnancy are signs of placenta previa. *Test-Taking Strategy:* Focus on the **subject**, assessment findings in abruptio placentae. Remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bleeding with placenta previa.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 210.

15. **Answer: 2**

Rationale: Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Manual pelvic examinations are contraindicated when vaginal bleeding is apparent until a diagnosis is made and placenta previa is ruled out. Digital examination of the cervix can lead to hemorrhage. A diagnosis of placenta previa is made by ultrasound. The hemoglobin and hematocrit levels are monitored, and external electronic fetal heart rate monitoring is initiated. Electronic fetal monitoring (external) is crucial in evaluating the status of the fetus, which is at risk for severe hypoxia.

Test-Taking Strategy: Focus on the **subject**, nursing care of the client with placenta previa. Use knowledge of the pathophysiology associated with placenta previa. Note the words *question which prescription* in the event query. Also, note that the correct option is the only procedure that is invasive to the pregnancy and endangers the physiological safety of the client and the fetus.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 209.

16. **Answer: 1**

Rationale: Abruptio placentae is the premature separation of the placenta from the uterine wall after the 20th week of gestation and before the fetus is delivered. The goal of management in abruptio placentae is to control the hemorrhage and deliver the fetus as soon as possible. Delivery is the treatment of choice if the fetus is at term gestation or if the bleeding

is moderate to severe and the client or fetus is in jeopardy. Because delivery of the fetus is necessary, options 2, 3, and 4 are incorrect regarding management of a client with abruptio placentae.

Test-Taking Strategy: Focus on the **subject**, management of abruptio placentae. Use knowledge regarding the pathophysiology and management of abruptio placentae to answer the question. Note the words *term gestation* and *moderate vaginal bleeding*. Knowing that the goal is to deliver the fetus will direct you easily to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 210.

17. Answer: 2

Rationale: In placenta previa, the placenta is implanted in the lower uterine segment. The lower uterine segment does not contain the same intertwining musculature as the fundus of the uterus, and this site is more prone to bleeding. Options 1, 3, and 4 are not risks that are related specifically to placenta previa.

Test-Taking Strategy: Focus on the **subject**, the risks associated with placenta previa. Thinking about the pathophysiology associated with this disorder and recalling that bleeding is a primary concern in this client will direct you easily to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 610.

18. Answer: 4, 5, 6

Rationale: Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Painless, bright red vaginal bleeding in the second or third trimester of pregnancy is a sign of placenta previa. The client has a soft, relaxed, nontender uterus, and fundal height may be more than expected for gestational age. In abruptio placentae, severe abdominal pain is present. Uterine tenderness accompanies placental abruption. In addition, in abruptio placentae, the abdomen feels hard and boardlike on palpation, as the blood penetrates the myometrium and causes uterine irritability.

Test-Taking Strategy: First, eliminate options 1 and 2 because they are **comparable or alike**. Next, remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bright red bleeding with placenta previa.

Labor and Birth

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Oxygenation, Perfusion

I. Process of Labor—4 Ps

A. Description

1. **Labor:** Coordinated sequence of involuntary, intermittent uterine contractions
2. **Birth:** Actual event of birth

 **B. Four major factors (4 Ps) interact during normal childbirth; the 4 Ps are interrelated and depend on each other for a safe birth and are Powers, Passage-way, Passenger, and Psyche.**

C. Powers: Uterine contractions

1. Forces acting to expel the fetus
2. Effacement: Shortening and thinning of the cervix during the first stage of labor
3. Dilation: Enlargement of cervical os and cervical canal during the first stage of labor
4. Pushing efforts of the client during the second stage

D. Passageway: The client's rigid bony pelvis and the soft tissues of the cervix, pelvic floor, vagina, and introitus (external opening to the vagina)

E. Passenger: The fetus, membranes, and placenta

F. Psyche: A client's emotional structure that can determine their entire response to labor and influence physiological and psychological functioning; the client may experience anxiety or fear.

 **G. Attitude**

1. Attitude is the relationship of the fetal body parts to one another.
2. Normal intrauterine attitude is flexion, in which the fetal back is rounded, the head is forward on the chest, and the arms and legs are folded in against the body. The other attitude, extension, tends to present larger fetal diameters.

 **H. Lie**

1. Relationship of the spine of the fetus to the spine of the pregnant client
2. Longitudinal or vertical (Fig. 24.1)
 - a. Fetal spine is parallel to the client's spine.
 - b. Fetus is in cephalic or breech presentation.

3. Transverse or horizontal (Fig. 24.1)
 - a. Fetal spine is at a right angle, or perpendicular, to the client's spine.
 - b. Presenting part is the shoulder.
 - c. Delivery by cesarean section is necessary.

I. Presentation

1. Portion of the fetus that enters the pelvic inlet first
2. Cephalic: Head first
 - a. Cephalic is the most common presentation.
 - b. Cephalic presentation has four variations: vertex, military, brow, and face.
3. Breech: Buttocks present first
 - a. Delivery by cesarean section may be required, although vaginal birth is often possible.
 - b. Breech presentation has three variations: frank, full (complete), and footling.
4. Shoulder
 - a. Fetus is in a transverse lie, or the arm, back, abdomen, or side could present.
 - b. If the fetus does not spontaneously rotate, or if it is impossible to turn the fetus manually, a cesarean section may need to be performed.

J. Presenting part: The specific fetal structure lying nearest to the cervix

K. Position: Relationship of assigned area of the presenting part or landmark to the maternal pelvis (Fig. 24.2 and Box 24.1)

L. Station

1. The measurement of the progress of descent in centimeters above or below the midplane from the presenting part to the ischial spine
2. Station 0: At ischial spine
3. Minus station: Above ischial spine
4. Plus station: Below ischial spine
5. Engagement: When the widest diameter of the presenting part has passed the inlet; corresponds to a 0 station

II. Mechanisms of Labor (Box 24.3)

A. Assessment

1. Lightening or dropping: Is also known as *engagement* and occurs when the fetus descends into the pelvis about 2 weeks before birth; lightening or dropping is most noticeable in first pregnancies.
2. Braxton Hicks contractions increase.

FIG. 24.1 Fetal lie. A, In a longitudinal lie, the long axis of the fetus is parallel to the long axis of the pregnant client. B, In a transverse lie, the long axis of the fetus is at a right angle to the long axis of the pregnant client. The client's abdomen has a wide, short appearance.

3. The vaginal mucosa is congested, and vaginal discharge increases.
4. Brownish or blood-tinged cervical mucus is passed.
5. Cervix ripens, becomes soft and partly effaced, and may begin to dilate.
6. The pregnant client has a sudden burst of energy, also known as “nesting,” often 24 to 48 hours before onset of labor.
7. Weight loss of 1 to 3 lb results from fluid shifts produced by the changes in progesterone and estrogen levels 24 to 48 hours before the onset of labor.
8. Spontaneous rupture of membranes occurs.
 - a. True labor: Contractions may manifest as back pain in some clients; contractions often resemble menstrual cramps during early labor (Box 24.3).
 - b. False labor: Also known as *prodromal labor*, contractions are felt in the abdomen and groin and may be more annoying than painful (Box 24.3).

! In true labor, contractions increase in duration and intensity and cervical dilation and effacement are progressive, with engagement and descent of the fetus. In false labor, contractions are irregular and do not produce dilation, effacement, or descent.

FIG. 24.2 Fetal vertex (occiput) presentations in relation to the front, back, or side of the maternal pelvis.

BOX 24.1 Fetal Positions

Vertex Presentations

ROA: Right occipitoanterior
 LOA: Left occipitoanterior
 ROP: Right occipitoposterior
 LOP: Left occipitoposterior
 ROT: Right occipitotransverse
 LOT: Left occipitotransverse

Face Presentations

RMA: Right mentoanterior
 LMA: Left mentoanterior
 RMP: Right mentoposterior

Breech Presentations

LSA: Left sacroanterior
 LSP: Left sacroposterior

Other Presentations

Brow presentation
 Shoulder presentation

BOX 24.2 Mechanisms of Labor

Engagement

- Engagement is the mechanism whereby the fetus nestles into the pelvis.
- Engagement occurs when the presenting part reaches the level of the ischial spines.

Descent

- Descent is the process that the fetal head undergoes as it begins its journey through the pelvis.
- Descent is a continuous process, from before engagement until birth, and is assessed by the measurement called *station*.

Flexion

- Flexion is a process of nodding of the fetal head forward toward the fetal chest.

Internal Rotation

- Internal rotation of the fetus occurs most commonly from the occipitotransverse position, assumed at engagement into the pelvis, to the occipitoanterior position while continuously descending.

Extension

- Extension enables the head to emerge when the fetus is in a cephalic position.
- Extension begins after the head crowns.
- Extension is complete when the head passes under the symphysis pubis and occiput, and the anterior fontanel, brow, face, and chin pass over the sacrum and coccyx and are over the perineum.

Restitution

- Restitution is realignment of the fetal head with the body after the head emerges.

External Rotation

- The shoulders externally rotate after the head emerges and restitution occurs so that the shoulders are in the anteroposterior diameter of the pelvis.

Expulsion

- Expulsion is the birth of the entire body.

III. Leopold's Maneuvers

- Description: Methods of palpation to determine presentation and position of the fetus and aid in location of fetal heart sounds
- If the head is in the fundus, a hard, round, movable object is felt. The buttocks feel soft and have an irregular shape and are more difficult to move.
- The fetus's back, which is a smooth, hard surface, should be felt on one side of the abdomen.
- Irregular knobs and lumps, which may be the hands, feet, elbows, and knees, are felt on the opposite side of the abdomen.

IV. Breathing Techniques (Box >v.v.)

- Provide a focus during contractions, interfering with pain sensory transmission.
- Promote relaxation and oxygenation.
- Begin with simple breathing patterns and progress to more complex ones as needed.

BOX 24.3 True Labor Versus False Labor

True Labor

- Contractions occur regularly, become stronger, last longer, and occur closer together.
- Cervical dilation and effacement are progressive.
- The fetus usually becomes engaged in the pelvis and begins to descend.

False Labor

- False labor does not produce dilation, effacement, or descent.
- Contractions are irregular, without progression.
- Activity, such as walking, often relieves false labor.

Example: If a pregnant client has been sleeping and wakes up with contractions, gets up, and moves around, and contractions become stronger and closer together, this is true labor. If the contractions go away, this is false labor.

BOX 24.4 Breathing Techniques**First-Stage Breathing****Cleansing Breath**

Each contraction begins and ends with a deep inspiration and expiration.

Slow-Paced Breathing

Slow-paced breathing promotes relaxation.

Slow-paced breathing is used for as long as possible during labor.

Modified Paced Breathing

Modified paced breathing is used when slow-paced breathing is no longer effective.

Breathing is shallow and fast.

Pattern-Paced Breathing

Pattern-paced breathing sometimes is referred to as *pant-blow*.

After a certain number of breaths (modified-paced breathing), the client exhales with a slight blow and then begins modified-paced breathing again.

Breathing to Prevent Pushing

The client blows repeatedly, using short puffs, when the urge to push is strong.

Second-Stage Breathing

Several variations of breathing can be used in the pushing stage of labor, and the client may grunt, groan, sigh, or moan as the client pushes. Prolonged breath holding while pushing with a closed glottis may result in a decrease in cardiac output. If breath holding while pushing is used, the open glottis method or limiting breath holding to less than 6 to 8 seconds should be done.

 **V. Fetal Monitoring****A. Description**

1. The fetal monitor displays the fetal heart rate (FHR).
2. The device monitors uterine activity.
3. The monitor assesses frequency, duration, and intensity of contractions.
4. The monitor assesses FHR in relation to maternal contractions.
5. Baseline FHR is measured between contractions; the normal FHR at term is 110 to 160 beats per minute.

B. External fetal monitoring

1. External fetal monitoring is noninvasive and is performed with a tocotransducer or Doppler ultrasonic transducer.
2. Leopold's maneuvers are performed to determine on which side the fetal back is located, and the ultrasound transducer is placed over this area (fasten with a belt or stocking tubing).
3. The tocotransducer is placed over the fundus of the **uterus**, where contractions feel the strongest (fasten with a belt or stocking tubing).
4. The client is allowed to assume a comfortable position, avoiding vena cava compression (maternal supine hypotensive syndrome).
5. The preferred position is to have the client lie on the side to increase perfusion.

C. Internal fetal monitoring

1. Internal fetal monitoring is invasive and requires rupturing of the membranes and attaching an electrode (fetal scalp clip [FSC]) to the presenting part of the fetus.
2. The client must be dilated 2 to 3 cm to perform internal monitoring.

 **D. Periodic patterns in FHR**

1. Fetal bradycardia and tachycardia

BOX 24.5 Variability in Fetal Heart Rate

Absent Variability: Undetected variability

Minimal Variability: Greater than undetected but not more than 5 beats per minute

Moderate Variability: Fetal heart rate fluctuations are 6 to 25 beats per minute

Marked Variability: Fetal heart rate fluctuations are greater than 25 beats per minute

- a. Bradycardia: FHR is less than 110 beats per minute for 10 minutes or longer.
- b. Tachycardia: FHR is more than 160 beats per minute for 10 minutes or longer.

 **If fetal bradycardia or tachycardia occurs, change the position of the pregnant client administer oxygen, and assess the client's vital signs. Notify the primary health care provider (PHCP) as soon as possible.**

2. Variability (Box 24.5)

- a. Fluctuations in baseline FHR
- b. Absent or undetected variability is considered nonreassuring.
- c. Decreased variability can result from fetal hypoxemia, acidosis, or certain medications.
- d. A temporary decrease in variability can occur when the fetus is in a sleep state (sleep states do not usually last longer than 30 minutes).

3. Accelerations

- a. Brief, temporary increases in FHR of at least 15 beats per minute more than baseline and lasting at least 15 seconds
- b. Usually are a reassuring sign, reflecting a responsive, nonacidotic fetus
- c. Usually occur with fetal movement

- d. May be nonperiodic (having no relation to contractions) or periodic (with contractions)
- e. May occur with uterine contractions, vaginal examinations, or mild cord compression, or when the fetus is in a breech presentation
4. Early decelerations (Fig. 24.3)
 - a. Early decelerations are decreases in FHR below baseline; the rate at the lowest point of the deceleration usually remains greater than 100 beats per minute.
 - b. Early decelerations occur during contractions as the fetal head is pressed against the client's pelvis or soft tissues, such as the cervix, and return to baseline FHR by the end of the contraction.
 - c. Tracing shows a uniform shape and mirror image of uterine contractions.
 - d. Early decelerations are not associated with fetal compromise and require no intervention.
5. Late decelerations (Fig. 24.3)
 - a. Late decelerations are nonreassuring patterns that reflect impaired placental exchange or uteroplacental insufficiency.

- b. The patterns look similar to early decelerations but begin well after the contraction begins and return to baseline after the contraction ends.
- c. The degree of decline in FHR from baseline is not related to the amount of uteroplacental insufficiency.

! Interventions for late decelerations include immediately improving placental blood flow and fetal oxygenation.

6. Variable decelerations (Fig. 24.3)
 - a. Variable decelerations are caused by conditions that restrict flow through the umbilical cord.
 - b. Variable decelerations do not have the uniform appearance of early and late decelerations.
 - c. The shape, duration, and degree of decline below baseline FHR are variable; these fall and rise abruptly with the onset and relief of cord compression.
 - d. Variable decelerations also may be nonperiodic, occurring at times unrelated to contractions.
 - e. Baseline rate and variability are considered when evaluating variable decelerations.
 - f. Variable decelerations are significant when FHR repeatedly declines to less than 70 beats per minute and persists at that level for at least 60 seconds before returning to baseline.

! If variable decelerations occur, discontinue oxytocin if infusing, change the position of the pregnant client, administer oxygen, and assess the client's vital signs. Notify the PHCP. Assist with amnioinfusion (intrauterine instillation of warmed saline to decrease compression on the umbilical cord) if prescribed.

7. Hypertonic uterine activity
 - a. Assessment of uterine activity includes frequency, duration, and intensity of contractions, and uterine resting tone; assessment is performed either by palpating by hand or with an internal uterine pressure catheter (IUPC).

FIG. 24.3 Deceleration patterns. Top graphs in each pair: Fetal heart rate. Bottom graphs in each pair: Uterine contractions. A, Early decelerations caused by head compression. B, Late decelerations caused by uteroplacental insufficiency. C, Variable decelerations caused by cord compression.

BOX 24.6 Nonreassuring Fetal Heart Rate Patterns

- Bradycardia
- Tachycardia
- Late decelerations
- Prolonged decelerations
- Hypertonic uterine activity
- Decreased or absent variability
- Variable decelerations falling to less than 70 beats per minute for longer than 60 seconds

⚡ CLINICAL JUDGMENT: TAKE ACTION

The nurse is caring for a client in labor who is receiving an oxytocin infusion to induce labor. The nurse notes on the fetal monitor that the fetal heart rate repeatedly declines to 70 beats per minute and persists at that level for at least 60 seconds before returning to baseline. The nurse identifies this pattern as variable decelerations and takes the following actions:

- Discontinues oxytocin infusion.
- Changes the client's position.
- Administers oxygen by face mask at 8 to 10 L/minute and infuses intravenous (IV) fluids as prescribed.
- Identifies the cause of the variable decelerations.
- Prepares to initiate continuous electronic fetal monitoring with internal devices if not contraindicated.
- Prepares for cesarean delivery if necessary.
- Documents the event, actions taken, and the client's response.

- b. The uterus should relax between contractions for 60 seconds or longer.
- c. Uterine contraction intensity is about 50 to 75 mm Hg (with an IUPC) during labor and may reach 110 mm Hg with pushing during the second stage.
- d. The average resting tone is 5 to 15 mm Hg.
- e. In hypertonic uterine activity, the uterine resting tone between contractions is high, reducing uterine blood flow and decreasing fetal oxygen supply.

8. Nonreassuring FHR patterns (Box 24.6)
9. Interventions for nonreassuring patterns (see Clinical Judgment: Take Action Box)

VI. Four Stages of Labor (Table 24.1)

A. Stage 1: Latent phase

1. Description: Stage 1 is the longest. A labor curve, such as the Friedman curve, may be used to iden-

tify whether cervical dilation is progressing at the expected rate (Fig. 24.4).

2. Assessment

- a. Cervical dilation is 1 to 4 cm.
- b. Uterine contractions occur every 15 to 30 minutes, are 15 to 30 seconds in duration, and are of mild intensity.

3. Interventions

- a. Encourage the client and partner to participate in care.
- b. Assist with comfort measures, changes of position, and ambulation.
- c. Keep the client and partner informed of progress.
- d. Offer fluids and ice chips.
- e. Encourage voiding every 1 to 2 hours.

B. Stage 1: Active phase

1. Assessment

- a. Cervical dilation is 4 to 7 cm.
- b. Uterine contractions occur every 3 to 5 minutes, are 30 to 60 seconds in duration, and are of moderate intensity.

2. Interventions

- a. Encourage maintenance of effective breathing patterns.
- b. Provide a quiet environment.
- c. Keep the client and partner informed of progress.
- d. Promote comfort with back rubs, sacral pressure, pillow support, and position changes.
- e. Instruct partner in effleurage (light stroking of abdomen) and in other comfort-promoting procedures as desired.
- f. Offer fluids and ice chips and ointment for dry lips.
- g. Encourage voiding every 1 to 2 hours.

C. Stage 1: Transition phase

1. Assessment

- a. Cervical dilation is 8 to 10 cm.

TABLE 24.1 Four Stages of Labor

First Stage	Second Stage	Third Stage	Fourth Stage
Effacement and dilation of cervix	Expulsion of fetus	Separation of placenta	Physical recovery
Three stages—latent, active, and transition	Pushing stage Latent phase—known as “laboring down” Active phase—pushing	Expulsion of placenta	1-4 hr after expulsion of placenta
Birth parent is talkative and eager in latent phase, becoming tired, restless, and anxious as labor intensifies and contractions become stronger	Birth parent has intense concentration on pushing with contractions; may fall asleep between contractions	Birth parent is relieved after birth of newborn; Birth parent is usually very tired	Birth parent is tired but is eager to become acquainted with the newborn

From Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 314.

FIG. 24.4 A labor curve, often referred to as a partogram or *Friedman's curve*, may be used to identify whether cervical dilation and descent are progressing at the expected rate. The symbol for station (X), which represents descent, may be added to the labor curve. Typical labor curves for a multiparous client and a nulliparous client are illustrated for comparison of patterns.

- b. Uterine contractions occur every 2 to 3 minutes, are 45 to 90 seconds in duration, and are of strong intensity.

2. Interventions

- Encourage rest between contractions.
- Wake the client at beginning of contraction to begin breathing pattern.
- Keep the client and partner informed of progress.
- Provide privacy.
- Offer fluids and ice chips and ointment for dry lips.
- Encourage voiding every 1 to 2 hours.

D. Interventions throughout stage 1

- Monitor maternal vital signs.
- Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.
- Assess FHR before, during, and after a contraction, noting that the normal FHR is 110 to 160 beats per minute.
- Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
- Assess status of cervical dilation and effacement.
- Assess fetal station presentation and position by Leopold's maneuvers.
- Assist with pelvic examination and prepare for a fern test.

⚠ If the membranes have ruptured, assess the FHR because of the risk of prolapsed umbilical cord, and assess the color of the amniotic fluid because meconium-stained fluid can indicate fetal distress.

E. Stage 2

1. Assessment

- Cervical dilation is complete.
- Progress of labor is measured by descent of fetal head through the birth canal (change in fetal station).
- Uterine contractions occur every 2 to 3 minutes, lasting 60 to 75 seconds, and are of strong intensity.
- Increase in bloody show occurs.
- Pregnant client feels urge to push (Ferguson reflex); assist the client in pushing efforts.

2. Interventions

- Perform assessments every 5 minutes.
- Monitor maternal vital signs.
- Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.
- Assess FHR before, during, and after a contraction, noting that the normal FHR is 110 to 160 beats per minute.
- Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
- Provide the client with encouragement and praise, and provide for rest between contractions.
- Keep the client and partner informed of progress.
- Maintain privacy.
- Provide ice chips and ointment for dry lips.
- Assist the client into a position that promotes comfort and facilitates pushing efforts, such

as lithotomy, semisitting, kneeling, side-lying, or squatting.

- k. Monitor for signs of approaching birth, such as perineal bulging or visualization of the fetal head.

- l. Prepare for birth (expulsion of the fetus).

F. Stage 3

1. Assessment

- a. Contractions occur until the placenta is expelled.
- b. Placental separation and expulsion occur.
- c. Expulsion of the placenta occurs 5 to 30 minutes after the birth of the **infant**.
- d. Schultze mechanism: Center portion of the placenta separates first, and its shiny fetal surface emerges from the vagina.
- e. Duncan mechanism: Margin of the placenta separates, and the dull, red, rough maternal surface emerges from the vagina first.
- f. Method of placental presentation is of no clinical significance.

2. Interventions

- a. Assess maternal vital signs.
- b. Assess uterine status.
- c. Provide parents with an explanation regarding expulsion of the placenta.
- d. After expulsion of the placenta, uterine fundus remains firm and is located two fingerbreadths below the umbilicus.
- e. Examine placenta for cotyledons and membranes to verify that it is intact.
- f. Assess the client for shivering and provide warmth.
- g. Promote parental-neonatal attachment.

G. Stage 4

1. Description: Period 1 to 4 hours after birth

2. Assessment

- a. **Blood pressure** returns to prelabor level.
- b. Pulse is slightly lower than during labor.
- c. Fundus remains contracted, in the midline, one or two fingerbreadths below the umbilicus.

 **Monitor discharge of lochia. Lochia may be moderate in amount and red in color in stage 4.**

3. Interventions

- a. Perform maternal assessments every 15 minutes for 1 hour, every 30 minutes for 1 hour, and hourly for 2 hours (or as per agency policy).
- b. Provide warm blankets.
- c. Apply ice packs to the perineum.
- d. Massage the uterus if needed, and teach the client to massage the uterus.
- e. Provide breast-feeding/chest-feeding support as needed.
- f. See **Chapter 28** for information on caring for the **newborn**.

VII. Anesthesia

A. Local anesthesia

1. Local anesthesia is used for blocking pain during episiotomy.
2. Local anesthesia is administered just before the birth of the infant.
3. The anesthetic has no effect on the fetus.

B. Lumbar epidural block

1. Injection site is in epidural space at L3 to L4.
2. The block is administered after labor is established or as partial anesthesia just before a scheduled cesarean birth.
3. The anesthetic relieves pain from contractions and numbs the vagina and perineum.
4. The block may cause hypotension, bladder distention, and a prolonged second stage.
5. The anesthetic does not usually cause a headache.
6. Assess maternal blood pressure and assess bladder frequently.
7. Maintain the client in a side-lying position or place a rolled blanket beneath the right hip to displace the uterus from the vena cava.
8. Administer intravenous (IV) fluids as prescribed; maintain urinary catheter if in place.
9. Increase fluids as prescribed if hypotension occurs.
10. Observe for any adverse effects from opioid epidurals, such as nausea and vomiting, pruritus, or respiratory depression.

C. Intrathecal opioid analgesics

1. The medication is injected into the subarachnoid space and has a rapid onset of action.
2. It may be used in combination with a lumbar epidural block.

D. Subarachnoid (spinal) block

1. Injection site is in the spinal subarachnoid space at L3 to L5.
2. The block is administered just before birth.
3. The anesthetic relieves uterine and perineal pain and numbs the vagina, perineum, and lower extremities.
4. The anesthetic may cause maternal hypotension.
5. The anesthetic may cause postpartum headache.
6. The client must lie flat for 8 to 12 hours after spinal injection.
7. Administer IV fluids as prescribed.

E. General anesthesia

1. General anesthesia may be used for some surgical interventions.
2. The client is not awake.

 **General anesthesia presents a maternal danger of respiratory depression, vomiting, and aspiration.**

VIII. Obstetrical Procedures

A. Bishop score (Table 24.2)

1. The Bishop score is used to determine maternal readiness for labor and evaluates cervical status and fetal position.

TABLE 24.2 Factors of the Bishop Score

	Score			
	v	<	>	^
Dilation of cervix (cm)	0	1-2	3-4	>5
Eacement of cervix (%)	0-30	40-50	60-70	>80
Consistency of cervix	Firm	Medium	Soft	—
Position of cervix	Posterior	Midposition	Anterior	—
Station of presenting part	-3	-2	-1	+1, +2

From Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 406.

- The Bishop score is indicated before the induction of labor.
- The 5 factors are assigned a score of 0 to 3, and the total score is calculated.
- A score of 8 or greater indicates that the chance of a successful vaginal delivery is good and that the cervix is favorable for induction.

B. Induction

- Induction is a deliberate initiation of uterine contractions that stimulates labor.
- Elective induction may be accomplished by oxytocin infusion.
- Obtain a baseline tracing of uterine contractions and FHR.
- Increase the IV dosage of oxytocin as prescribed only after assessing contractions, FHR, and maternal blood pressure and pulse.
- Do not increase the rate of oxytocin when the desired contraction pattern is obtained (contraction frequency of 2 to 3 minutes and lasting 60 seconds).

! An oxytocin infusion is discontinued if uterine contraction frequency is less than 2 minutes or duration is longer than 90 seconds, or if fetal distress is noted.

C. Amniotomy

- Artificial rupture of the membranes is performed by the obstetrician or nurse-midwife to stimulate labor.
- Amniotomy is performed if the fetus is at 0 or a plus station.
- Amniotomy increases the risk of prolapsed cord and infection.
- Monitor FHR before and after amniotomy.
- Record time of amniotomy, FHR, and characteristics of the fluid.
- Meconium-stained amniotic fluid may be associated with fetal distress.
- Bloody amniotic fluid may indicate abruptio placentae or fetal trauma.

- An unpleasant odor to amniotic fluid is associated with infection.
- Polyhydramnios is associated with maternal diabetes and certain congenital disorders.
- Oligohydramnios is associated with intrauterine growth restriction and congenital disorders.
- Expect more variable decelerations after rupture of the membranes as a result of possible cord compression during contractions.
- Limit client activity if prescribed.

D. External version

- External version is the manipulation of the fetus from an unfavorable presentation into a favorable presentation for birth.
- External version is indicated for an abnormal presentation that exists after the 34th week.
- Monitor vital signs.
- If the pregnant client is Rh-negative, ensure that Rh_o(D) immune globulin was given at 28 weeks of gestation.
- Prepare for a nonstress test to evaluate fetal well-being.
- IV fluids and tocolytic therapy may be administered to relax the uterus and permit easier manipulation of the fetus.
- Ultrasound is used during the procedure to evaluate fetal position and placental placement and guide direction of the fetus.
- The abdominal wall is manipulated to direct the fetus into a cephalic presentation if possible.
- Monitor blood pressure to identify vena cava compression.
- Monitor for unusual pain.
- After the procedure, do the following:
 - Perform a nonstress test to evaluate fetal well-being.
 - Monitor for uterine activity, bleeding, ruptured membranes, and decreased fetal activity.
 - With Rh-negative clients, perform Kleihauer-Betke test as prescribed to detect the presence and amount of fetal blood in the maternal circulation and to identify clients who need additional Rh_o(D) immune globulin.

E. Episiotomy

- An episiotomy is an incision made into the perineum to enlarge the vaginal outlet and facilitate birth.
- The use of this procedure has declined dramatically in recent years.
- Check the episiotomy site.
- Institute measures to relieve pain.
- Provide ice packs during the first 24 hours.
- Instruct the client in the use of an ice pack for the first 24 hours, and then sitz baths thereafter.
- Apply analgesic spray or ointment as prescribed.
- Provide perineal care, using clean technique.

9. Instruct the client in the proper care of the incision.
10. Instruct the client to dry the perineal area from front to back and to blot the area rather than wipe it.
11. Instruct the client to shower rather than bathe in a tub.
12. Apply a perineal pad without touching the inside surface of the pad.
13. Report any bleeding or discharge from the episiotomy site to the PHCP.

 F. Forceps delivery.

1. Two double-crossed, spoon-like articulated blades are used to assist in the delivery of the fetal head.
2. Reassure the client and explain the need for forceps.
3. Monitor the client and fetus during delivery.
4. Check the **neonate** and client after delivery for any possible injury.
5. Assist with repair of any lacerations.

 G. Vacuum extraction

1. A cap-like suction device is applied to the fetal head to facilitate extraction.
2. Suction is used to assist in delivery of the fetal head.
3. Traction is applied during uterine contractions until descent of the fetal head is achieved.
4. The suction device should not be kept in place any longer than 25 minutes.
5. Monitor FHR frequently; fetal monitoring should be used.
6. Assess infant at birth and throughout the postpartum period for signs of cerebral trauma.
7. Monitor for developing cephalhematoma.
8. Caput succedaneum is normal and resolves in 24 hours.

 H. Cesarean delivery

1. Cesarean section is delivery of the fetus usually through a transabdominal, low-segment incision of the uterus.
2. Preoperative
 - a. If planned, prepare the client and partner.
 - b. If an emergency, quickly explain the need and procedure to the pregnant client and partner.
 - c. Obtain **informed consent**.
 - d. Ensure that the preoperative diagnostic tests are done, including Rh factor determination.
 - e. Prepare to insert an IV line and an indwelling urinary catheter.
 - f. Prepare the abdomen as prescribed.
 - g. Monitor the client and fetus continuously.
 - h. Provide emotional support.
 - i. Administer preoperative medications as prescribed.
3. Postoperative
 - a. Monitor vital signs.
 - b. Perform a fundal assessment; evaluate incision.

- c. Provide pain relief.
- d. Encourage turning, coughing, and deep breathing.
- e. Encourage ambulation.
- f. Encourage bonding and attachment with newborn.
- g. Provide psychological support.
- h. Monitor for signs of infection and bleeding.
- i. Burning and pain on urination may indicate a bladder infection.
- j. A tender uterus and foul-smelling **lochia** may indicate endometritis.
- k. A productive cough or chills may indicate pneumonia.
 - l. Pain, redness, or edema of an extremity may indicate thrombophlebitis.

PRACTICE QUESTIONS

1. The nurse is caring for a client in labor. Which assessment findings indicate to the nurse that the client is beginning the second stage of labor? Select all that apply.
 - a. The contractions are regular.
 - b. The membranes have ruptured.
 - c. The cervix is dilated completely.
 - d. The client begins to expel clear vaginal fluid.
 - e. The Ferguson reflex is initiated from perineal pressure.
2. The nurse in the labor room is caring for a client in the active stage of the first phase of labor. The nurse is assessing the fetal patterns and notes a late deceleration on the monitor strip. What is the most appropriate nursing action?
 1. Administer oxygen via face mask.
 2. Place the client in a supine position.
 3. Increase the rate of the oxytocin intravenous infusion.
 4. Document the findings and continue to monitor the fetal patterns.
3. The nurse is performing an assessment of a client who is scheduled for a cesarean delivery at 39 weeks of gestation. Which assessment finding indicates the need to contact the primary health care provider (PHCP)?
 1. Hemoglobin of 11 g/dL (110 mmol/L)
 2. Fetal heart rate of 180 beats per minute
 3. Maternal pulse rate of 85 beats per minute
 4. White blood cell count of 12,000/mm³ (12 × 10⁹/L)
4. A client arrives at a birthing center in active labor. After examination, it is determined that the client's membranes are still intact and the client is at a -2 station. The primary health care provider prepares to perform an amniotomy. What will the nurse relay

- to the client as the most likely outcomes of the amniotomy? Select all that apply.
- Less pressure on the cervix
 - Decreased number of contractions
 - Increased efficiency of contractions
 - The need for increased maternal blood pressure monitoring
 - The need for frequent fetal heart rate monitoring to detect the presence of a prolapsed cord
5. The nurse is monitoring a client in labor. The nurse suspects umbilical cord compression if which is noted on the external monitor tracing during a contraction?
 1. Variability
 2. Accelerations
 3. Early decelerations
 4. Variable decelerations
 6. A client in labor is transported to the delivery room and prepared for a cesarean delivery. After the client is transferred to the delivery room table, the nurse would place the client in which position?
 1. Supine position with a wedge under the right hip
 2. Trendelenburg's position with the legs in stirrups
 3. Prone position with the legs separated and elevated
 4. Semi-Fowler's position with a pillow under the knees
 7. The nurse is monitoring a client in active labor and notes that the client is having contractions every 3 minutes that last 45 seconds. The nurse notes that the fetal heart rate between contractions is 100 beats per minute. Which nursing action is most appropriate?
 1. Notify the primary health care provider (PHCP).
 2. Continue to monitor the fetal heart rate.
 3. Encourage the client to continue pushing with each contraction.
 4. Instruct the client's coach to continue to encourage breathing techniques.
 8. The nurse is caring for a client in labor and is monitoring the fetal heart rate patterns. The nurse notes the presence of episodic accelerations on the electronic fetal monitor tracing. Which action is most appropriate?
 1. Notify the primary health care provider of the findings.
 2. Reposition the client and check the monitor for changes in the fetal tracing.
 3. Take the client's vital signs and tell the client that bed rest is required to conserve oxygen.
 4. Document the findings and tell the client that the pattern on the monitor indicates fetal well-being.
 9. The nurse is admitting a pregnant client to the labor room and attaches an external electronic fetal monitor to the client's abdomen. After attachment of the electronic fetal monitor, what is the next nursing action?
 1. Identify the types of accelerations.
 2. Assess the baseline fetal heart rate.
 3. Determine the intensity of the contractions.
 4. Determine the frequency of the contractions.
 10. The nurse is reviewing true and false labor signs with a multiparous client. The nurse determines that the client understands the signs of true labor if the client makes which statement?
 1. "I won't be in labor until my baby drops."
 2. "My contractions will be felt in my abdominal area."
 3. "My contractions will not be as painful if I walk around."
 4. "My contractions will last longer and be more intense."
 11. Which assessment finding after an amniotomy needs to be conducted first?
 1. Cervical dilation
 2. Bladder distention
 3. Fetal heart rate pattern
 4. Maternal blood pressure
 12. The nurse has been working with a laboring client and notes that the client has been pushing effectively for 1 hour. What is the client's primary physiological need at this time?
 1. Ambulation
 2. Rest between contractions
 3. Change positions frequently
 4. Consume oral food and fluids
 13. The nurse is assisting a client undergoing induction of labor at 41 weeks of gestation. The client's contractions are moderate and occurring every 2 to 3 minutes, with a duration of 60 seconds. An internal fetal heart rate monitor is in place. The baseline fetal heart rate has been 120 to 122 beats per minute for the past hour. What is the priority nursing action?
 1. Discontinue the infusion of oxytocin.
 2. Notify the primary health care provider.
 3. Place oxygen on at 8 to 10 L/minute via face mask.
 4. Contact the client's primary support person(s) if not currently present.

ANSWERS

1. Answer: 3, 5

Rationale: The second stage of labor begins when the cervix is dilated completely and ends with birth of the neonate. The client has a strong urge to push in stage 2 when the Ferguson reflex is activated. Options 1, 2, and 4 are not specific assessment findings of the second stage of labor and occur in stage 1.

Test-Taking Strategy: Eliminate options 2 and 4 first because they are **comparable or alike**. From the remaining options, recalling that regular contractions occur before the second stage of labor will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 326, 399.

2. Answer: 1

Rationale: Late decelerations are due to uteroplacental insufficiency and occur because of decreased blood flow and oxygen to the fetus during the uterine contractions. Hypoxemia results; oxygen at 8 to 10 L/minute via face mask is necessary. The supine position is avoided because it decreases uterine blood flow to the fetus. The client needs to be turned onto the side to displace pressure of the gravid uterus on the inferior vena cava. An intravenous oxytocin infusion is discontinued when a late deceleration is noted. The oxytocin would cause further hypoxemia because of increased uteroplacental insufficiency resulting from stimulation of contractions by this medication. Although the nurse would document the occurrence, option 4 would delay necessary treatment.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Use the **ABCs—airway, breathing, and circulation**—and knowledge related to the significance of a late deceleration to answer this question.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 369.

3. Answer: 2

Rationale: A normal fetal heart rate is 110 to 160 beats per minute. A fetal heart rate of 180 beats per minute could indicate fetal distress and would warrant immediate notification of the PHCP. By full term, a normal maternal hemoglobin range is 11 to 13 g/dL (110 to 130 mmol/L) because of the hemodilution caused by an increase in plasma volume during pregnancy. The maternal pulse rate during pregnancy increases 10 to 15 beats per minute over prepregnancy readings to facilitate increased cardiac output, oxygen transport, and kidney filtration. White blood cell counts in a normal pregnancy begin to increase in the second trimester and peak in the third trimester, with a normal range of 11,000 to 15,000/mm³ (11 to 15 × 10⁹/L) up to 18,000/mm³ (18 × 10⁹/L). During the immediate postpartum period, the white blood cell count may be 25,000 to 30,000/mm³ (25 to 30 × 10⁹/L) because of increased leukocytosis that occurs during delivery.

Test-Taking Strategy: Focus on the **subject**, normal assessment and laboratory findings and those that indicate the need to contact the PHCP. Knowledge regarding the normal and abnormal findings in a pregnant client and fetus will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 330, 708-709.

4. Answer: 3, 5

Rationale: Amniotomy (artificial rupture of the membranes) can be used to induce labor when the condition of the cervix is favorable (ripe) or to augment labor if the progress begins to slow. Rupturing of the membranes allows the fetal head to contact the cervix more directly and may increase the efficiency of contractions. Increased monitoring of maternal blood pressure is unnecessary after this procedure. The fetal heart rate needs to be monitored frequently, as there is an increased likelihood of a prolapsed cord with ruptured membranes and a high presenting part.

Test-Taking Strategy: Note the **strategic words**, *most likely*. Focus on the **subject**, an amniotomy. Recalling that amniotomy is performed to augment labor if the progress begins to slow will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 702.

5. Answer: 4

Rationale: Variable decelerations occur if the umbilical cord becomes compressed, reducing blood flow between the placenta and the fetus. Variability refers to fluctuations in the baseline fetal heart rate. Accelerations are a reassuring sign and usually occur with fetal movement. Early decelerations result from pressure on the fetal head during a contraction.

Test-Taking Strategy: Focus on the **subject**, umbilical cord compression. Recalling that variable decelerations occur if the umbilical cord becomes compressed will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 368.

6. Answer: 1

Rationale: Vena cava and descending aorta compression by the pregnant uterus impedes blood return from the lower trunk and extremities. This leads to decreasing cardiac return, cardiac output, and blood flow to the uterus and subsequently the fetus. The best position to prevent this would be side-lying, with the uterus displaced off the abdominal vessels. Positioning for abdominal surgery necessitates a supine position, however; a wedge placed under the right hip provides displacement of the uterus. Trendelenburg's position places pressure from the pregnant uterus on the diaphragm and lungs, decreasing respiratory capacity and oxygenation. A prone or semi-Fowler's position is impractical for this type of abdominal surgery.

Test-Taking Strategy: Focus on the **subject**, positioning the pregnant client. Visualizing each of the positions identified in the options and considering the effect that the position may have on the birthing parent and the fetus will direct you to the correct option.

References: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 253; Murray, S., McKinney, E.,

Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 418.

7. Answer: 1

Rationale: A normal fetal heart rate is 110 to 160 beats per minute, and the fetal heart rate should be within this range between contractions. Fetal bradycardia between contractions may indicate the need for immediate medical management, and the PHCP needs to be notified. Options 2, 3, and 4 are inappropriate nursing actions in this situation and delay necessary intervention.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the **data in the question**. Knowledge that the normal fetal heart rate is 110 to 160 beats per minute will assist you to recognize that fetal bradycardia is present.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 330, 391.

8. Answer: 4

Rationale: Accelerations are transient increases in the fetal heart rate that often accompany contractions or are caused by fetal movement. Episodic accelerations are thought to be a sign of fetal well-being and adequate oxygen reserve. Options 1, 2, and 3 are inaccurate nursing actions and are unnecessary.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Options 1, 2, and 3 are **comparable or alike** in that they indicate the need for further intervention. Also, knowing that accelerations indicate fetal well-being will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 366-367.

9. Answer: 2

Rationale: Assessing the baseline fetal heart rate is important so that abnormal variations of the baseline rate can be identified if they occur. The intensity of contractions is assessed by an internal fetal monitor, not an external fetal monitor. Options 1 and 4 are important to assess, but not as the first priority. Fetal heart rate is evaluated by assessing baseline and periodic changes. Periodic changes occur in response to the intermittent stress of uterine contractions and the baseline beat-to-beat variability of the fetal heart rate.

Test-Taking Strategy: Note the **strategic word**, *next*. Use the **ABCs—airway, breathing, and circulation**. Fetal heart rate reflects the ABCs.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 352-353.

10. Answer: 4

Rationale: True labor is present when contractions increase in duration and intensity. Lightening or dropping leads to *engagement* (presenting part reaches the level of the ischial spine) and occurs when the fetus descends into the pelvis about 2 weeks before delivery. Contractions felt in the abdominal area and contractions that ease with walking are signs of false labor.

Test-Taking Strategy: Focus on the **subject**, the signs of true labor. Noting the word *true* in the question and its relationship to the words *increase in duration and intensity* in the correct option will direct you to this option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 310.

11. Answer: 3

Rationale: Fetal heart rate is assessed immediately after amniotomy to detect any changes that may indicate cord compression or prolapse. When the membranes are ruptured, minimal vaginal examinations would be done because of the risk of infection. Bladder distention or maternal blood pressure would not be the first thing to check after an amniotomy.

Test-Taking Strategy: Note the **strategic word**, *first*. Because of the risk of a prolapsed cord after an amniotomy, the first action is to check the fetal heart rate for signs of nonreassuring fetal heart rate patterns.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 702.

12. Answer: 2

Rationale: The birth process expends a great deal of energy, particularly during the transition stage. Encouraging rest between contractions conserves maternal energy, facilitating voluntary pushing efforts with contractions. Uteroplacental perfusion also is enhanced, which promotes fetal tolerance of the stress of labor. Ambulation is encouraged during early labor. Ice chips should be provided. Changing positions frequently is not the primary physiological need. Food and fluids are likely to be withheld at this time.

Test-Taking Strategy: Note the **strategic word**, *primary*. Also, noting the words *pushing effectively* will assist in directing you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 394, 396-397.

13. Answer: 1

Rationale: The priority nursing action is to stop the infusion of oxytocin. Oxytocin can cause forceful uterine contractions and decrease oxygenation to the placenta, resulting in decreased variability. After stopping the oxytocin, the nurse would reposition the laboring client. Notifying the primary health care provider, applying oxygen, and increasing the rate of the intravenous (IV) fluid (the solution without the oxytocin) are also actions that are indicated in this situation, but not the priority action. Contacting the client's primary support person(s) is not the priority action at this time.

Test-Taking Strategy: Focus on the **strategic word**, *priority*. Focus on the **data in the question** and note the relationship between the words *undergoing induction* and the correct option. Also recall that physiological needs are prioritized over psychosocial needs.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 703-704.

CHAPTER 25

Problems with Labor and Birth

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Reproduction, Safety

I. Premature Rupture of the Membranes

A. Description

1. Premature rupture of the membranes refers to spontaneous rupture of the amniotic membranes before the onset of labor.
2. Gestational age usually determines the plan and intervention.
3. When the rupture of membranes is before term and birth will be delayed, infection becomes a risk.

B. Assessment

1. Presence of fluid pooling in vaginal vault; nitrazine test is positive.
2. Amount, color, consistency, and odor of fluid need to be assessed.
3. Vital signs are monitored; an elevated temperature may indicate infection.
4. Fetal monitoring is necessary; tachycardia in the fetus may indicate maternal infection.

C. Interventions

1. Assist with tests to assess gestational age.
2. Avoid vaginal examinations because of the risk of infection.
3. Monitor maternal and fetal status for signs of compromise or infection.
4. Administer antibiotics as prescribed.

II. Prolapsed Umbilical Cord

A. Description

1. The umbilical cord is displaced between the presenting part and the amnion or protruding through the cervix, causing compression of the cord and compromising fetal circulation (Fig. 25.1).

B. Assessment

1. The client has a feeling that something is coming through the vagina.
2. Umbilical cord is visible or palpable.

3. Fetal heart rate is irregular and slow.

4. Fetal heart monitor shows variable decelerations or bradycardia after rupture of the membranes.

5. If fetal hypoxia is severe, rapid fetal activity may occur and then cease.

C. Interventions (see **Clinical Judgment: Take Action Box**)

⚡ CLINICAL JUDGMENT: TAKE ACTION

The nurse is caring for a client who is in stage 1 labor, transition phase, and is 8 cm dilated. The client tells the nurse that it feels as if something is coming out through the vagina. The nurse notes on the fetal monitor that the fetal heart rate is slow and irregular. The nurse checks the client and sees the umbilical cord protruding from the vagina and takes the following actions.

- Elevates the fetal presenting part that is lying on the cord by applying finger pressure with a sterile gloved hand to relieve cord pressure
- Places the client into extreme Trendelenburg's or modified left lateral position or a knee-chest position
- Stays with the client
- Calls for assistance and asks another person to notify the obstetrical health care provider immediately
- Administers oxygen, 8 to 10 L/minute, by face mask to the client
- Wraps the umbilical cord loosely in a sterile towel saturated with warm sterile normal saline
- Monitors fetal heart rate and assesses the fetus for hypoxia
- Prepares to start intravenous fluids or increase the rate of administration of an existing appropriate solution
- Prepares for immediate birth via cesarean section
- Documents the event, actions taken, and the client's response

FIG. 25.1 Prolapse of umbilical cord. Note the pressure of the presenting part on the umbilical cord, which endangers fetal circulation. A, Occult (hidden) prolapse of cord. B, Complete prolapse of cord. Membranes are intact. C, Cord presenting in front of the fetal head may be seen in the vagina. D, Frank breech presentation with prolapsed cord.

1. The goal is to relieve cord pressure immediately so that the fetus receives adequate oxygenation.
2. The nurse never attempts to push the cord into the uterus.
3. This situation is an emergency and delivery must occur, usually via a cesarean section.

III. Supine Hypotension (Vena Cava Syndrome)

A. Description

1. Supine hypotension (also known as vena cava syndrome) occurs when the venous return to the heart is impaired by the weight of the **uterus** on the vena cava.
2. The syndrome results in partial occlusion of the vena cava and aorta and in reduced cardiac return, cardiac output, and blood pressure.

B. Assessment

1. Pallor
2. Faintness, dizziness, breathlessness
3. Tachycardia, hypotension
4. Sweating, cool and damp skin
5. Fetal distress

C. Interventions

1. Position the client on the side to shift the weight of the fetus off the vena cava until the client's signs and symptoms subside and vital signs stabilize.
2. Monitor vital signs and fetal heart rate.

▲ To prevent supine hypotension, avoid the supine position; position the client by placing a pillow or wedge under the client's hip to displace the gravid uterus off the vena cava.

IV. Preterm Labor

A. Description

1. Preterm labor occurs after the 20th week but before the 37th week of gestation.

B. Assessment

1. Uterine contractions (painful or painless)
2. Abdominal cramping (may be accompanied by diarrhea)
3. Low back pain
4. Pelvic pressure or heaviness
5. Change in character and amount of usual discharge—may be thicker or thinner, bloody, brown or colorless, odorous
6. Rupture of amniotic membranes
7. Presence of fetal λ bronectin in cervical canal
8. Shortening of cervical length

C. Interventions

1. Focus on stopping the labor: Identify and treat infection, restrict activity, and ensure hydration.
2. Maintain bed rest and a lateral position.
3. Monitor fetal status.
4. Administer λ uids.
5. Administer medications as prescribed, and monitor for side effects of tocolytics (see [Table 29.1](#) for a description of medications used to treat preterm labor).
6. Use 17 alpha-hydroxyprogesterone caproate, known as 17P injection, as prescribed to decrease risk of preterm delivery.

V. Precipitous Labor and Delivery

A. Description: Labor lasting less than 3 hours

B. Interventions

1. Ensure that a precipitous delivery tray is available (hemostats, scissors, and cord clamp).

2. Stay with the client at all times.
3. Provide emotional support and keep the client calm.
4. Encourage the client to pant between contractions.
5. Prepare for rupturing membranes when the head crowns, if they are not already ruptured.
6. Do not try to prevent the fetus from being delivered.
7. If delivery is necessary before the arrival of the primary health care provider, do the following:
 - a. Apply gentle pressure to the fetal head upward toward the vagina to prevent damage to the fetal head and vaginal lacerations; support the perineal area. Both actions constitute the Ritgen maneuver.
 - b. Support the infant's body during delivery.
 - c. During delivery of the **infant**, check for the cord around the neck.
 - d. Use restitution to deliver the posterior shoulder.
 - e. Use gentle downward pressure to move the anterior shoulder under the pubic symphysis.
 - f. Bulb suction the infant's mouth rst and then suction each naris.
 - g. Dry and cover the infant to keep the body warm.
 - h. Allow the **placenta** to separate naturally.
 - i. Place the infant on the birthing parent's abdomen or breast/chest to induce uterine contractions.

VI. Dystocia

A. Description

1. Dystocia is difficult labor that is prolonged or more painful.
2. It occurs because of problems caused by uterine contractions, the fetus, or the bones and tissues of the maternal pelvis.
3. The fetus may be excessively large, malpositioned, or in an abnormal presentation.
4. Contractions may be hypotonic or hypertonic.
5. Hypotonic contractions are short, irregular, and weak; amniotomy and oxytocin infusion may be treatment measures.
6. Hypertonic contractions are painful, occur frequently (six or more in a 10-minute time period), and are uncoordinated; treatment depends on the cause and includes pain-relief measures and rest.
7. Can result in maternal dehydration, infection, fetal injury, or death

B. Assessment

1. Excessive abdominal pain
2. Abnormal contraction pattern
3. Fetal distress
4. Maternal or fetal tachycardia
5. Lack of progress in labor

C. Interventions

1. Assess fetal heart rate; monitor for fetal distress.
2. Monitor uterine contractions.
3. Monitor maternal temperature and heart rate.
4. Assist with pelvic examination, measurements, ultrasound, and other procedures.
5. Administer prophylactic antibiotics if prescribed to prevent infection.
6. Administer IV uids as prescribed.
7. Monitor intake and output.
8. Maintain hydration.
9. Instruct the client in breathing techniques and relaxation exercises.
10. Perform fetal monitoring per protocol if oxytocin is prescribed for hypotonic uterine contractions (oxytocin is not prescribed for hypertonic uterine contractions); refer to **Chapter 29** for information on oxytocin.
11. Change maternal position frequently.
12. Monitor color of **amniotic fluid**.
13. Provide rest and comfort as with a normal delivery, such as back rubs and position changes.
14. Assess client's fatigue and pain, and administer sedatives and pain medications as prescribed.
15. Assess for prolapse of the cord after membranes rupture.

VII. Anaphylactoid Syndrome of Pregnancy (ASP)

A. Description

1. ASP, previously known as amniotic uid embolism, is the escape of amniotic uid into the maternal circulation.
2. The debris-containing amniotic uid deposits in the pulmonary arterioles, causing an anaphylactic-like reaction and is usually fatal to the client.

B. Assessment

1. Abrupt onset of respiratory distress and chest pain
2. Cyanosis
3. Fetal bradycardia and distress if delivery has not occurred at the time of the embolism

C. Interventions

1. Institute emergency measures to maintain life.
2. Administer oxygen, 8 to 10 L/minute, by face mask or resuscitation bag delivering 100% oxygen.
3. Prepare for intubation and mechanical ventilation.
4. Position the client on the side.
5. Administer IV uids, blood products, and medications as prescribed to correct coagulation failure.
6. Monitor fetal status.
7. Prepare for emergency delivery when the client is stabilized.
8. Provide emotional support to the client, partner, and family.

VIII. Fetal Distress

A. Assessment

1. Fetal heart rate less than 110 beats per minute or greater than 160 beats per minute
2. Meconium-stained amniotic fluid
3. Fetal hypoactivity or hyperactivity
4. Progressive decrease in baseline variability
5. Severe variable decelerations
6. Late decelerations

B. Interventions

1. This is an emergency situation.
2. Discontinue oxytocin if infusing.
3. A tocolytic may be prescribed if fetal distress from contractions persists.
4. Place the client in a lateral position.
5. Administer oxygen, 8 to 10 L/minute, via face mask.
6. Administer IV fluids (usually as a bolus).
7. Monitor maternal and fetal status.

 In the event of fetal distress, prepare the client for emergency cesarean delivery.

IX. Intrauterine Fetal Demise, Fetal Death in Utero

A. Description

1. *Intrauterine fetal demise* or *fetal death in utero* refers to the death of a fetus after the twentieth week of gestation and before birth.
2. The client can develop disseminated intravascular coagulation (DIC) if the dead fetus is retained in the uterus for 3 to 4 weeks or longer.

B. Assessment

1. Loss of fetal movement
2. Absence of fetal heart tones
3. Maternal weight loss
4. Lack of fetal growth or decrease in fundal height
5. No evidence of fetal cardiac activity
6. Other characteristics suggestive of fetal death noted on ultrasound
7. Disseminated intravascular coagulation (DIC) screen: coagulation abnormalities because DIC is a complication related to intrauterine fetal demise
8. Low hemoglobin and hematocrit; low platelet count; prolonged bleeding and clotting time
9. Bleeding from puncture sites (could indicate DIC)

C. Interventions

1. Prepare for the birth of the fetus.
2. Support the client's decision about labor, birth, and the postpartum period.
3. Incorporate religious, spiritual, and cultural health care beliefs and practices in the plan of care.
4. Monitor for maternal signs of infection or DIC; administer IV fluids, medications, and blood and blood products as prescribed if DIC occurs.

5. Encourage the client and family to verbalize feelings; provide emotional support.
6. Provide support and ask what can be helpful; provide assistance as appropriate and requested.
7. Expect and accept behaviors such as sadness, anger, and hostility from the parents.
8. Refer the parents to an appropriate support group.

 Cultural, spiritual, and religious practices and beliefs are important to consider when caring for the parents of a fetus who has died. The nurse needs to be aware of these cultural, spiritual, and religious practices and beliefs and ensure that the client's beliefs are respected and implemented as appropriate.

X. Rupture of the Uterus

A. Description

1. Complete or incomplete separation of the uterine tissue as a result of a tear in the wall of the uterus from the stress of labor
2. Complete: Direct communication between the uterine and peritoneal cavities
3. Incomplete: Rupture into the peritoneum covering the uterus, but not into the peritoneal cavity
4. Manifestations vary with the degree of rupture.
5. Risk factors: Labor after previous cesarean section, overdistended uterus (e.g., multiple fetuses or hydramnios) after cesarean section, abdominal trauma

B. Assessment

1. Abdominal pain or tenderness
2. Chest pain
3. Contractions may stop or fail to progress
4. Rigid abdomen
5. Absent fetal heart rate
6. Signs of maternal shock
7. Fetus palpated outside the uterus (complete rupture)

C. Interventions

1. Monitor for and treat signs of shock (administer oxygen, IV fluids, and blood products).
2. Prepare the client for cesarean delivery (possible hysterectomy may be necessary).
3. Provide emotional support for the client and partner.

XI. Uterine Inversion

A. Description

1. Uterus completely or partly turns inside out.
2. This can occur during delivery or after delivery of the placenta.
3. Risk factors: Fundal implantation of the placenta, manual extraction of the placenta, short umbilical cord, uterine atony, leiomyomas, and abnormally adherent placental tissue

- B. Assessment**
1. A depression in the fundal area of the uterus is noted.
 2. The interior of the uterus may be seen through the cervix or protruding through the vagina.
 3. The client has severe pain.
 4. Hemorrhage is evident.
 5. The client shows signs of shock.
- C. Interventions**
1. Monitor for hemorrhage and signs of shock, and treat shock.
 2. Prepare the client for a return of the uterus to the correct position via the vagina; if unsuccessful, laparotomy with replacement to the correct position is done.

PRACTICE QUESTIONS

1. The nurse is performing an assessment on a client who has just been told that a pregnancy test is positive. Which assessment finding indicates that the client is at risk for preterm labor?
 1. The client is a 35-year-old primigravida.
 2. The client has a history of cardiac disease.
 3. The client's hemoglobin level is 13.5 g/dL (135 mmol/L).
 4. The client is a 20-year-old primigravida of average weight and height.
2. The nurse is monitoring a client who is in the active stage of labor. The nurse documents that the client is experiencing labor dystocia. The nurse determines which risk factors in the client's history places the client at risk for this complication? Select all that apply.
 1. Age 45 years
 2. Body mass index of 28
 3. Previous difficulty with fertility
 4. Administration of oxytocin for induction
 5. Potassium level of 3.6 mEq/L (3.6 mmol/L)
3. The nurse in a birthing room is monitoring a client with dystocia for signs of fetal or maternal compromise. Which assessment finding would alert the nurse to a compromise?
 1. Maternal fatigue
 2. Coordinated uterine contractions
 3. Progressive changes in the cervix
 4. Persistent nonreassuring fetal heart rate
4. The nurse in a labor room is preparing to care for a client with hypertonic uterine contractions. The nurse is told that the client is experiencing uncoordinated contractions that are erratic in their frequency, duration, and intensity. What is the priority nursing action?
 1. Provide pain relief measures.
 2. Prepare the client for an amniotomy.
 3. Promote ambulation every 30 minutes.
 4. Monitor the oxytocin infusion closely.
5. The nurse is reviewing the primary health care provider's (PHCP's) prescriptions for a client admitted for premature rupture of the membranes. Gestational age of the fetus is determined to be 37 weeks. Which prescription would the nurse question?
 1. Monitor fetal heart rate continuously.
 2. Monitor maternal vital signs frequently.
 3. Perform a vaginal examination every shift.
 4. Administer an antibiotic per prescription and per agency protocol.
6. The nurse has created a plan of care for a client experiencing dystocia and includes several nursing actions in the plan of care. What is the priority nursing action?
 1. Providing comfort measures
 2. Monitoring the fetal heart rate
 3. Changing the client's position frequently
 4. Keeping the significant other informed of the progress of the labor
7. Fetal distress is occurring with a laboring client. As the nurse prepares the client for a cesarean birth, what is the most important nursing action?
 1. Slow the intravenous flow rate.
 2. Continue the oxytocin drip if infusing.
 3. Place the client in a high Fowler's position.
 4. Administer oxygen, 8 to 10 L/minute, via face mask.
8. The nurse in a labor room is performing a vaginal assessment on a pregnant client in labor. The nurse notes the presence of the umbilical cord protruding from the vagina. What is the first nursing action with this finding?
 1. Gently push the cord into the vagina.
 2. Place the client in Trendelenburg's position.
 3. Find the closest telephone and page the primary health care provider stat.
 4. Call the delivery room to notify the staff that the client will be transported immediately.

ANSWERS

1. Answer: 2

Rationale: Preterm labor occurs after the 20th week but before the 37th week of gestation. Several factors are associated with preterm labor, including a history of medical conditions, present and past obstetrical problems, social and environmental factors, and substance abuse. Other risk factors include a multifetal pregnancy, which contributes to overdistention of the uterus; anemia, which decreases oxygen supply to the uterus; and age younger than 18 years or first pregnancy at age older than 40 years.

Test-Taking Strategy: Options 1, 3, and 4 are **comparable or alike** and are average and normal findings. Also note that the correct option is the only option that identifies an abnormal condition.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 134.

2. Answer: 1, 2, 3

Rationale: Risk factors that increase a woman's risk for dystocia include the following: advanced maternal age, being overweight, electrolyte imbalances, previous difficulty with fertility, uterine overstimulation with oxytocin, short stature, prior version, masculine characteristics, uterine abnormalities, malpresentations and position of the fetus, cephalopelvic disproportion, maternal fatigue, dehydration, fear, administration of an analgesic early in labor, and use of epidural analgesia. Age 45 years is considered advanced maternal age, and a body mass index of 28 is considered overweight. Previous difficulty with fertility is another risk factor for labor dystocia. A potassium level of 3.6 mEq/L (3.6 mmol/L) is normal, and administration of oxytocin alone is not a risk factor; risk exists only if uterine hyperstimulation occurs.

Test-Taking Strategy: Focus on the **subject**, risk factors for labor dystocia. Additionally, focus on the **data in the question**, look at each option, and determine whether these are normal assessment findings.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 693-694.

3. Answer: 4

Rationale: Signs of fetal or maternal compromise include a persistent, nonreassuring fetal heart rate, fetal acidosis, and the passage of meconium. Maternal fatigue and infection can occur if the labor is prolonged but do not indicate fetal or maternal compromise. Coordinated uterine contractions and progressive changes in the cervix are a reassuring pattern in labor.

Test-Taking Strategy: Focus on the **subject**, signs of fetal or maternal compromise. Eliminate options 1, 2, and 3 because they are **comparable or alike** and are normal expectations during labor.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 390.

4. Answer: 1

Rationale: Hypertonic uterine contractions are painful, occur frequently, and are uncoordinated. Management of hypertonic labor depends on the cause. Relief of pain is the primary intervention to promote a normal labor pattern. An amniotomy and oxytocin infusion are not treatment measures for hypertonic contractions; however, these treatments may be used in clients with hypotonic dysfunction. A client with hypertonic uterine contractions would not be encouraged to ambulate every 30 minutes but would be encouraged to rest.

Test-Taking Strategy: Focus on the **strategic word**, **priority**. Also note that options 2, 3, and 4 are **comparable or alike** and are therapeutic measures for hypotonic dysfunction.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 694.

5. Answer: 3

Rationale: Vaginal examinations should not be done routinely on a client with premature rupture of the membranes because of the risk of infection. The nurse would expect to monitor fetal heart rate, monitor maternal vital signs, and administer an antibiotic.

Test-Taking Strategy: Note the word **question**. This word indicates the activity that the nurse should not implement without clarification. Options 1, 2, and 4 are **comparable or alike** and are expected activities for the nurse to perform for a client with premature rupture of the membranes. Performing a vaginal examination every shift should not be done on a client with premature rupture of the membranes because of the risk of infection, so the nurse would question this prescription.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 437.

6. Answer: 2

Rationale: Dystocia is difficult labor that is prolonged or more painful than expected. The priority is to monitor the fetal heart rate. Although providing comfort measures, changing the client's position frequently, and keeping the significant other informed of the progress of the labor are components of the plan of care, the fetal status would be the priority.

Test-Taking Strategy: Note the **strategic word**, **priority**. Use **Maslow's Hierarchy of Needs theory** and the **ABCs—airway, breathing, and circulation**—to assist in answering the question. These strategies will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 697.

7. Answer: 4

Rationale: Oxygen is administered, 8 to 10 L/minute, via face mask to optimize oxygenation of the circulating blood. Option 1 is incorrect, because the intravenous infusion needs to be increased (per primary health care provider prescription) to increase the maternal blood volume. Option 2 is incorrect, because oxytocin stimulation of the uterus is discontinued if fetal heart rate patterns change for any reason. Option 3 is incorrect because the client is placed in the lateral position

with the legs raised to increase maternal blood volume and improve fetal perfusion.

Test-Taking Strategy: Note the **strategic words**, *most important*. Use the **ABCs—airway, breathing, and circulation**. Oxygen is the only option that would improve cardiac output and improve perfusion to the fetus. The other options would not improve perfusion to the fetus.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 409-410.

8. Answer: 2

Rationale: When cord prolapse occurs, prompt actions are taken to relieve cord compression and increase fetal oxygenation. The client would be positioned with the hips higher than the head to shift the fetal presenting part toward the diaphragm. The nurse would push the call light to summon help, and other staff members would call the primary health care

provider and notify the delivery room. If the cord is protruding from the vagina, no attempt is made to replace it because to do so could traumatize it and reduce blood flow further. Also as a first action, the examiner would place a gloved hand into the vagina and hold the presenting part off the umbilical cord. Oxygen, 8 to 10 L/minute, by face mask is administered to the client to increase fetal oxygenation.

Test-Taking Strategy: Note the **strategic word**, *first*, and that the umbilical cord is protruding from the vagina. Options 3 and 4 can be eliminated first because these actions delay necessary and immediate treatment. Recalling that the goal is to relieve cord compression and to increase fetal oxygenation will direct you to the correct option. Also remember that the cord would not be pushed back into the vagina.

CLEX@Nepal

Postpartum Period

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Health Promotion, Reproduction

I. Postpartum

- A. Description: Period when the reproductive tract returns to the normal, nonpregnant state
- B. The postpartum period starts immediately after birth and is usually completed by week 6 following birth.

- a. Rubra is bright red discharge that occurs from day of birth to day 3.
- b. Serosa is brownish pink discharge that occurs from days 4 to 10.
- c. Alba is white discharge that occurs from days 11 to 14.
- d. Discharge should smell like normal menstrual flow.
- e. Discharge decreases daily in amount.
- f. Discharge may increase with ambulation.
- g. To determine most accurately the amount of lochia flow, weigh the perineal pad before and after use and identify the amount of time between pad changes; also note the color,

II. Physiological Maternal Changes

A. Involution

- 1. Description
 - a. Involution is the rapid decrease in the size of the uterus as it returns to the nonpregnant state.
 - b. Clients who breast-feed/chest-feed may experience a more rapid involution because of the release of oxytocin during breast-feeding/chest-feeding.
- 2. Assessment
 - a. The weight of the uterus decreases from approximately 2 lb (900 g) to 2 oz (57 g) in 6 weeks.
 - b. The endometrium regenerates.
 - c. The fundus steadily descends into the pelvis.
 - d. Fundal height decreases about 1 cm/day (Fig. 26.1).
 - e. By 10 days postpartum, the uterus cannot be palpated abdominally.
 - f. A hard fundus indicates uterine atony, and it should be massaged until firm; a tender fundus indicates an infection.
 - g. Afterpains decrease in frequency after the first few days.

B. Lochia

- 1. Description: Discharge from the uterus that consists of blood from the vessels of the placental site and debris from the decidua
- 2. Assessment (Box 26.1) (Clinical Judgment: Analyze Cues Box)

**CLINICAL JUDGMENT:
ANALYZE CUES**

The nurse is monitoring a postpartum client. The client appears pale and restless and the blood pressure is 100/60 mm Hg and pulse rate is 110 beats per minute. Baseline postpartum blood pressure was 122/80 mm Hg with pulse rate of 84 beats per minute. The nurse checks the lochia flow and notes that the perineal pad applied 15 minutes ago was saturated with blood that contained several small clots. The nurse analyzes these cues as indicating excessive bleeding. If this occurred, the nurse would check the uterus for atony, massage it if necessary, and contact the obstetrician.

odor, and the presence and characteristics of clots if any are noted.

- C. Cervix: Cervical involution occurs, and the muscle begins to regenerate after 1 week.
- D. Vagina: Vaginal distention decreases, although muscle

FIG. 26.1 Involution of the uterus. The height of the uterine fundus decreases by approximately 1 cm/day.

BOX 26.1 Amount of Lochia

Scant: Less than 2.5 cm (<1 inch) on menstrual pad in 1 hour

Light: Less than 10 cm (<4 inches) on menstrual pad in 1 hour

Moderate: Less than 15 cm (<6 inches) on menstrual pad in 1 hour

Heavy: Saturated menstrual pad in 1 hour

Excessive: Menstrual pad saturated in 15 minutes

From Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 460

tone is never restored completely to the pregravid state.

E. Ovarian function and menstruation

1. Ovarian function depends on the rapidity with which pituitary function is restored.
2. Menstrual flow resumes within 1 to 2 months in non-breast-feeding/chest-feeding parents.
3. Menstrual flow usually resumes within 3 to 6 months in breast-feeding/chest-feeding parents.
4. Breast-feeding/chest-feeding parents may experience amenorrhea during the entire period of lactation so long as they are exclusively breast-feeding/chest-feeding.

! A postpartum client may ovulate without menstruating, so breast-feeding/chest-feeding should not be considered a form of birth control.

F. Breasts/chest

1. Breasts/chest continue to secrete colostrum for the first 48 to 72 hours after birth.
2. A decrease in estrogen and progesterone levels after birth stimulates increased prolactin levels, which promote breasts/chest milk production.
3. Breasts/chest become distended with milk on the third day.

BOX 26.2 Breast/Chest Care for Non-Breast-Feeding/Chest-Feeding Parents

- Avoid nipple stimulation.
- Apply a breast/chest binder, wear a snug-fitting bra, apply ice packs, or take a mild analgesic for engorgement.
- Engorgement usually resolves within 24 to 36 hours after it begins.

4. Engorgement occurs on approximately day 4 in both breast-feeding/chest-feeding and non-breast-feeding/chest-feeding parents. **Box 26.2** summarizes care of breasts/chest for non-breast-feeding/chest-feeding parents.
5. Breast-feeding/chest-feeding relieves engorgement.
6. See Section VI, A and Box 26.4 for information on breast-feeding/chest-feeding parents.

G. Urinary tract

1. The client may have urinary retention as a result of loss of elasticity and tone and loss of sensation in the bladder from trauma, medications, anesthesia, and lack of privacy.
2. Diuresis usually begins within the first 12 hours after birth.

H. Gastrointestinal tract

1. Clients are usually hungry after birth.
2. Constipation can occur, with bowel movement (soft, formed stool) by the second or third postpartum day.
3. Hemorrhoids are common.

I. Vital signs (**Table 26.1**)

III. Postpartum Interventions

A. Assessment

1. Monitor vital signs.
2. Assess pain level.
3. Assess height, consistency, and location of the fundus (have client empty the bladder before fundal assessment) (**Fig. 26.2**).
4. Monitor color, amount, and odor of lochia.
5. Assess breasts/chest for engorgement.
6. Monitor perineum for swelling or discoloration.
7. Monitor for perineal lacerations or episiotomy for healing.
8. Assess incisions or dressings of client who had a cesarean birth.
9. Monitor bowel status.
10. Monitor intake and output.
11. Encourage frequent voiding.
12. Encourage ambulation.
13. Assess extremities for thrombophlebitis (redness, tenderness, or warmth of the leg).
14. Administer Rh₀(D) immune globulin if prescribed within 72 hours postpartum to Rh-negative client who has given birth to Rh-positive newborn.

TABLE 26.1 Normal Postpartum Vital Signs

Vital Sign	Description
Temperature	May increase to 100.4° F (38.0° C) during the first 24 hr postpartum because of dehydrating effects of labor. Any higher elevation may be caused by infection and must be reported.
Pulse	May decrease to 50 beats per minute (normal puerperal bradycardia). Pulse >100 beats per minute may indicate excessive blood loss or infection.
Blood pressure	Should be normal; suspect hypovolemia if it decreases.
Respirations	Rarely change; if respirations increase significantly, suspect pulmonary embolism, uterine atony, or hemorrhage.

From Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 420.

FIG. 26.2 A full bladder displaces and prevents contraction of the uterus.

15. Evaluate rubella immunity. If not immune, administer rubella immunization.
16. Assess bonding with the newborn.
17. Assess emotional status.

B. Client teaching

1. Demonstrate newborn care skills as necessary.
2. Provide the opportunity for the client to bathe the newborn.
3. Instruct in feeding technique.
4. Instruct the client to avoid heavy lifting for at least 3 weeks.
5. Instruct the client to plan at least one rest period per day.

6. Instruct the client that contraception should begin after birth or with the initiation of intercourse (intercourse should be postponed at least until lochia ceases). With rubella immunization, avoid conception for 1 to 3 months based on primary health care provider (PHCP) or obstetrician/gynecologist (OB/GYN) recommendation.
7. Instruct the client in the importance of follow-up, which should be scheduled at 4 to 6 weeks.
8. Instruct the client to report any signs of chills, fever, increased lochia, or depressed feelings to the PHCP immediately.

IV. Postpartum Discomforts

A. Afterbirth pains

1. Occur as a result of contractions of the uterus
2. Are more common in multiparas, breast-feeding/chest-feeding parents, clients treated with oxytocin, and clients who had an overdistended uterus during pregnancy, such as with carrying twins.

B. Perineal discomfort

1. Apply ice packs to the perineum during the first 24 hours to reduce swelling.
2. After the first 24 hours, apply warmth by sitz baths.

C. Episiotomy

1. If done, instruct the client to administer perineal care after each voiding.
2. Encourage the use of an analgesic spray as prescribed.
3. Administer analgesics as prescribed if comfort measures are unsuccessful.

D. Perineal lacerations

1. Care as for an episiotomy; administer perineal care and use analgesic spray and analgesics for comfort.
2. Rectal suppositories and enemas may be contraindicated (to avoid injury to sutures).

E. Breast/chest discomfort from engorgement (also see Section VI on Breast-feeding/chest-feeding).

1. Encourage the client to wear a support bra at all times, even while sleeping.
2. Encourage the use of ice packs between feedings if the client is not breast-feeding/chest-feeding. Use of ice packs could diminish milk supply in the breast-feeding/chest-feeding parent.
3. Encourage the use of warm soaks or a warm shower before feeding for the breast-feeding/chest-feeding parent.
4. Administer analgesics as prescribed if comfort measures are unsuccessful.

F. Constipation

1. Encourage adequate intake of fluids (2000 mL/day).
2. Encourage diet high in fiber.

BOX 26.3 Signs and Symptoms of Emotional Changes

Postpartum Blues

- Anger
- Anxiety
- Cries easily for no apparent reason
- Emotionally labile
- Expresses a let-down feeling
- Fatigue
- Headache
- Insomnia
- Restlessness
- Sadness

Postpartum Depression

- Anxiety
- Appetite changes
- Crying, sadness
- Difficulty concentrating or making decisions
- Fatigue, unable to sleep
- Feelings of guilt
- Irritability and agitation
- Lack of energy
- Less responsive to the infant
- Loss of pleasure in normal activities
- Suicidal thoughts

Postpartum Psychosis

- Break with reality
- Confusion
- Delirium
- Delusions
- Hallucinations
- Panic

Data from Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 671.

3. Encourage ambulation.
 4. Administer stool softener, laxative, enema, or suppository if needed and prescribed.
- G. Postpartum emotional changes (**Box 26.3**)
1. Acknowledge the client's feelings and demonstrate a caring attitude.
 2. Determine availability of family support and other support systems and resources as needed.
 3. Encourage and assist the client to verbalize feelings.
 4. Monitor the newborn for appropriate growth and development expectations.
 5. Assist the significant other and other appropriate family members to discuss feelings and identify ways to assist the client.

 All clients should be assessed for depression during pregnancy and in the postpartum period.

V. Nutritional Counseling

- A. Discuss caloric intake with breast-feeding/chest-feeding parents.

- B. Nutritional needs depend on prepregnancy weight, ideal weight for height, and whether the client is breast-feeding/chest-feeding.
- C. If the client is breast-feeding/chest-feeding, caloric needs increase by 200 to 500 calories/day, and the client may require increased fluids and the continuance of prenatal vitamins and minerals.

VI. Breast-feeding/chest-feeding**A. Interventions**

1. Put the newborn to the birthing parent's breast/chest as soon as the parent's and newborn's conditions are stable (on delivery table, if possible).
2. Stay with the client each time the client nurses until the client feels secure and confident with the newborn and own feelings.
3. Assess *LATCH* (latch achieved by newborn; audible swallowing; type of nipple; comfort of parent; hold or position of baby).
4. Uterine cramping may occur the first day after birth while the client is nursing, when oxytocin stimulation causes the uterus to contract.
5. Instruct the client to use general hygiene and wash the breasts/chest once daily.
6. If engorgement occurs, breast-feed/chest-feed frequently, use warm soaks, apply warm packs before feeding, apply ice packs between feedings, and massage the breasts/chest.
7. The client should not use soap on the breasts/chest because it tends to remove natural oils, which increases the chance of cracked nipples.
8. If cracked nipples develop, the client should expose the nipples to air for 10 to 20 minutes after feeding, rotate the position of the baby for each feeding, and ensure that the baby is latched on to the areola, not just the nipple. Colostrum can also be expressed after the feeding as a moisturizer for the nipple to prevent cracked, dry skin.
9. The bra should be well fitted and supporting; avoid an underwire bra. The supportive bra should be worn at all times, including while sleeping.
10. Breasts/chest may leak between feedings or during coitus; place breast/chest pad in bra.
11. Calories should be increased by 200 to 500 calories/day, and the diet should include additional fluids; prenatal vitamins should be taken as prescribed.
12. Newborn's stools are usually light yellow, seedy, watery, and frequent.
13. Medications, including over-the-counter medications, need to be avoided unless prescribed because they may be unsafe when breast-feeding/chest-feeding.
14. Gas-producing foods and caffeine should be avoided.
15. Oral contraceptives containing estrogen are not recommended for breast-feeding/chest-feeding

BOX 26.4 Breast-Feeding/Chest-Feeding Procedure for the Parent

1. Wash hands and assume a comfortable position.
2. Start with the breast/chest with which the last feeding ended.
3. Brush the newborn's lower lip with nipple.
4. Tickle the lips to have the newborn open the mouth wide.
5. Guide the nipple and surrounding areola into the newborn's mouth.
6. Encourage the newborn to nurse on each side for 15 to 20 minutes.
7. After the newborn has nursed, release suction by depressing the newborn's chin or inserting a clean finger into the newborn's mouth.
8. Burp the newborn after the first breast/chest.
9. Repeat the procedure on the second breast/chest until the newborn stops nursing.
10. Burp the newborn again.
11. Listen for audible sucking and swallowing.

parents; progestin-only birth control pills are less likely to interfere with the milk supply.

16. The infant will develop their own feeding schedule.
- B. Breast-feeding/chest-feeding procedure for the parent (Box 26.4)

PRACTICE QUESTIONS

1. The postpartum nurse is taking the vital signs of a client who delivered a healthy newborn 4 hours ago. The nurse notes that the client's temperature is 100.2° F (37.8°C). What is the priority nursing action?
 1. Document the findings.
 2. Notify the obstetrician.
 3. Retake the temperature in 15 minutes.
 4. Increase hydration by encouraging oral fluids.
2. The nurse is assessing a client who is 6 hours postpartum after delivering a full-term healthy newborn. The client complains to the nurse of feelings of dizziness. Which nursing action is most appropriate?
 1. Raise the head of the client's bed.
 2. Obtain hemoglobin and hematocrit levels.
 3. Instruct the client to request help when getting out of bed.
 4. Inform the nursery room nurse to avoid bringing the newborn to the client until the client's symptoms have subsided.
3. The postpartum nurse is providing instructions to a client after the birth of a healthy newborn. Which time frame would the nurse relay to the client regarding the return of bowel function?
 1. 3 days postpartum
 2. 7 days postpartum
 3. On the day of birth
 4. Within 2 weeks postpartum
4. The nurse is planning care for a postpartum client who had a vaginal delivery 2 hours ago. The client required an episiotomy and has several hemorrhoids. What is the priority nursing consideration for this client?
 1. Client pain level
 2. Inadequate urinary output
 3. Client perception of body changes
 4. Potential for imbalanced body fluid volume
5. The nurse is providing postpartum instructions to a client who will be breast-feeding/chest-feeding the newborn. The nurse determines that the client has understood the instructions if the client makes which statements? Select all that apply.
 1. "I need to wear a bra that provides support."
 2. "Drinking alcohol can affect my milk supply."
 3. "I will start my estrogen birth control pills again as soon as I get home."
 4. "I know if my breasts/chest get engorged, I will limit my breast-feeding/chest-feeding and supplement the baby."
 5. "I plan on having bottled water available in the refrigerator so I can get additional fluids easily."
6. The nurse is teaching a postpartum client about breast-feeding/chest-feeding. Which instruction would the nurse plan to include in the teaching session?
 1. The diet needs to include additional fluids.
 2. Prenatal vitamins need to be discontinued.
 3. Soap needs to be used to cleanse the breasts/chest.
 4. Birth control measures are unnecessary while breast-feeding/chest-feeding.
7. The nurse is preparing to assess the uterine fundus of a client in the immediate postpartum period. After locating the fundus, the nurse notes that the uterus feels soft and boggy. Which nursing intervention is appropriate?
 1. Elevate the client's legs.
 2. Massage the fundus until it is firm.
 3. Ask the client to turn on the left side.
 4. Push on the uterus to assist in expressing clots.
8. The nurse is caring for four 1-day postpartum clients. Which client assessment requires the need for follow-up?
 1. The client with mild afterpains
 2. The client with a pulse rate of 60 beats per minute

3. The client with colostrum discharge from both breasts/chest
 4. The client with lochia that is red and has a foul-smelling odor
9. When performing a postpartum assessment on a client, the nurse notes the presence of clots in the lochia. The nurse examines the clots and notes that they are larger than 1 cm. Which nursing action is most appropriate?
1. Document the findings.
 2. Notify the obstetrician (OB).
 3. Reassess the client in 2 hours.
 4. Encourage increased oral intake of fluids.
10. The nurse is monitoring the amount of lochia drainage in a client who is 2 hours postpartum and notes that the client has saturated a perineal pad in 15 minutes. What action would the nurse take initially?
1. Document the finding.
 2. Encourage the client to ambulate.
 3. Encourage the client to increase fluid intake.
 4. Contact the obstetrician (OB) to report this finding.
11. The nurse has provided discharge instructions to a client who delivered a healthy newborn by cesarean delivery. Which statement made by the client indicates a need for further instruction?
1. "I will begin abdominal exercises immediately."
 2. "I will notify my obstetrician if I develop a fever."
 3. "I will turn on my side and push up with my arms to get out of bed."
 4. "I will lift nothing heavier than my newborn baby for at least 2 weeks."

ANSWERS

1. Answer: 4

Rationale: The client's temperature would be taken every 4 hours while awake. Temperatures up to 100.4° F (38° C) in the first 24 hours after birth often are related to the dehydrating effects of labor. The appropriate action is to increase hydration by encouraging oral fluids, which should bring the temperature to a normal reading. Although the nurse also would document the findings, the appropriate action would be to increase hydration. Taking the temperature in another 15 minutes is an unnecessary action. Contacting the obstetrician is not necessary.

Test-Taking Strategy: Note the **strategic word**, *priority*, and use knowledge regarding the physiological findings in the immediate postpartum period to answer this question. Recalling that a temperature elevation often is related to the dehydrating effects of labor will direct you to the correct option. Also, increasing hydration relates to a physiological client need.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 466.

2. Answer: 3

Rationale: Orthostatic hypotension may be evident during the first 8 hours after birth. Feelings of dizziness are signs that caution the nurse to focus interventions on the client's safety. The nurse would advise the client to get help the first few times getting out of bed. Option 1 is not a helpful action in this situation and would not relieve the symptoms. Option 2 requires a prescription. Option 4 is unnecessary.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the **subject**, client safety. Option 4 is unnecessary and is eliminated first. Elevating the client's head is not a helpful intervention. To select from the remaining options, recall that safety is a primary issue.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 466.

3. Answer: 1

Rationale: After birth, the nurse would auscultate the client's abdomen in all four quadrants to determine the return of bowel sounds. Normal bowel elimination usually returns 2 to 3 days postpartum. Surgery, anesthesia, and the use of opioids and pain control agents also contribute to the longer period of altered bowel functions. Options 2, 3, and 4 are incorrect.

Test-Taking Strategy: Focus on the **subject** and use general principles related to postpartum care. Eliminate options 2 and 4 first because of the length of time stated in these options. From the remaining options, eliminate option 3, because it would seem unreasonable that bowel function would return that quickly in the postpartum client.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 462.

4. Answer: 1

Rationale: The priority nursing consideration for a client who delivered 2 hours ago and who has an episiotomy and hemorrhoids is client pain level. Most clients have some degree of discomfort during the immediate postpartum period. There are no data in the question that indicate inadequate urinary output, the presence of client perception of body changes, and potential for imbalanced body fluid volume.

Test-Taking Strategy: Note the **strategic word**, *priority*. Use **Maslow's Hierarchy of Needs theory** to eliminate option 3, because this is a psychosocial, not a physiological, need. To select from the remaining options, focus on the **data in the question**.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 428-429.

5. Answer: 1, 2, 5

Rationale: The postpartum client needs to wear a bra that is well fitted and supportive. Common causes of decreased milk supply include formula use; inadequate rest or diet; smoking by the birthing parent or others in the home; and use of alcohol or medications. Breast-feeding/chest-feeding clients need to

increase their daily fluid intake; having bottled water available indicates that the postpartum client understands the importance of increasing fluids. If engorgement occurs, the client should not limit breast-feeding/chest-feeding but should breast-feed/chest-feed frequently. Oral contraceptives containing estrogen are not recommended for breast-feeding/chest-feeding parents.

Test-Taking Strategy: Focus on the **subject** and note the words *understood the instructions*. Think about the physiology associated with milk production and the complications of breast-feeding/chest-feeding to answer correctly.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 551-552.

6. Answer: 1

Rationale: The diet for a breast-feeding/chest-feeding client needs to include additional fluids. Prenatal vitamins need to be taken as prescribed, and soap would not be used on the breasts/chest because it tends to remove natural oils, which increases the chance of cracked nipples. Breast-feeding/chest-feeding is not a method of contraception, so birth control measures should be resumed.

Test-Taking Strategy: Note the **subject**, teaching for the breast-feeding/chest-feeding client. Remember that fluids and calories should be increased when the client is breast-feeding/chest-feeding.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 551.

7. Answer: 2

Rationale: If the uterus is not contracted firmly, the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated in the uterus. Elevating the client's legs and positioning the client on the side would not assist in managing uterine atony. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage.

Test-Taking Strategy: Focus on the **subject**, a soft and boggy uterus. Visualize the situation and recall the therapeutic management for uterine atony. Remember that a full bladder displaces the uterus.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 467.

8. Answer: 4

Rationale: Lochia, the discharge present after birth, is red for the first 1 to 3 days and gradually decreases in amount. Normal lochia has a fleshy odor or an odor similar to menstrual flow. Foul-smelling or purulent lochia usually indicates infection, and these findings are not normal. The other options are normal findings for a 1-day postpartum client.

Test-Taking Strategy: Note the **strategic words**, *need for follow-up*. These words indicate a **negative event query** and the need to select the abnormal assessment finding. Note the words *foul-smelling* in the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 459-460.

9. Answer: 2

Rationale: Normally, a few small clots may be noted in the lochia in the first 1 to 2 days after birth from pooling of blood in the vagina. Clots larger than 1 cm are considered abnormal. The cause of these clots, such as uterine atony or retained placental fragments, needs to be determined and treated to prevent further blood loss. Although the findings would be documented, the appropriate action is to notify the OB. Reassessing the client in 2 hours would delay necessary treatment. Increasing oral intake of fluids would not be a helpful action in this situation.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the words *larger than 1 cm*. Think about the significance of lochial clots in the postpartum period to answer correctly.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 459-460.

10. Answer: 4

Rationale: Lochia is the discharge from the uterus in the postpartum period; it consists of blood from the vessels of the placental site and debris from the decidua. The following can be used as a guide to determine the amount of flow: scant = less than 2.5 cm (<1 inch) on menstrual pad in 1 hour; light = less than 10 cm (<4 inches) on menstrual pad in 1 hour; moderate = less than 15 cm (<6 inches) on menstrual pad in 1 hour; heavy = saturated menstrual pad in 1 hour; and excessive = menstrual pad saturated in 15 minutes. If the client is experiencing excessive bleeding, the nurse would contact the OB in the event that postpartum hemorrhage is occurring. It may be appropriate to encourage increased fluid intake, but this is not the initial action. It is not appropriate to encourage ambulation at this time. Documentation should occur once the client has been stabilized.

Test-Taking Strategy: Note the **strategic word**, *initially*. Focus on the **data in the question**, a saturated perineal pad in 15 minutes. Next, **determine if an abnormality exists**. The data and the use of guidelines to determine the amount of lochial flow will help you determine that this is abnormal and warrants notification of the OB.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 460.

11. Answer: 1

Rationale: A cesarean delivery requires an incision made through the abdominal wall and into the uterus. Abdominal exercises would not start immediately after abdominal surgery; the client needs to wait at least 3 to 4 weeks postoperatively to allow for healing of the incision. Options 2, 3, and 4 are appropriate instructions for the client after a cesarean delivery.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Keeping in mind that the client had a cesarean delivery and noting the word *immediately* in the correct option will assist in directing you to this option.

CHAPTER 27

Postpartum Complications

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Caregiving, Reproduction

I. Cystitis

- A. Description: Cystitis, an infection of the bladder, can occur in the postpartum period, and the postpartum client should be encouraged to consume adequate fluids and void frequently to avoid bladder distention.
- B. Assessment and interventions (refer to Chapter 55)

! If a urine specimen for culture and sensitivity is prescribed, obtain the specimen as prescribed (by voiding or straight catheterization) before initiating antibiotic therapy.

II. Hematoma

- A. Description
1. A hematoma is a localized collection of blood in the tissues and can occur internally, involving the vaginal sulcus or other organs; vulvar hematomas are the most common (Fig. 27.1).
 2. Predisposing conditions include operative delivery with forceps and injury to a blood vessel.
 3. Small hematomas usually reabsorb on their own. Large hematomas may require incision, evacuation of the clots, and location and ligation of the bleeding vessel.
 4. A hematoma can result in shock.

B. Assessment

1. Abnormal, severe pain not relieved with treatment or comfort measures
2. Pressure in the perineal area
3. Sensitive, bulging mass in the perineal area with discolored skin
4. Inability to void
5. Decreased hemoglobin and hematocrit levels
6. Restlessness; changes in vital signs indicating shock, such as tachycardia and hypotension

C. Interventions

1. Monitor client for abnormal pain or perineal pressure, especially when forceps delivery has occurred.

2. Monitor vital signs and for signs of shock.
3. Place ice at the hematoma site.
4. Administer analgesics as prescribed.
5. Prepare for urinary catheterization if the client is unable to void.
6. Administer intravenous (IV) fluids as prescribed to replace loss of fluids.
7. Administer blood products as prescribed.
8. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
9. Administer antibiotics as prescribed because infection is common after hematoma formation.
10. Prepare for incision and evacuation of hematoma if necessary.

III. Uterine Atony

- A. Description: A poorly contracted uterus that does not adequately compress large open vessels at the placental site; this can result in hemorrhage. This can involve the anterior, posterior, or both areas of the uterus.
- B. Assessment: A soft (boggy) uterus noted on palpation of the uterine fundus
- C. Interventions
1. Massage the uterus until firm (Fig. 27.2).
 2. Empty the client's bladder (by voiding or catheterization) if that is contributing to the uterine atony.
 3. Notify the obstetrician (OB) or primary health care provider (PHCP) if interventions do not resolve the atony, because this could be an indication of hemorrhage.

IV. Hemorrhage and Shock

A. Description

1. Bleeding of greater than 1000 mL or more after a cesarean delivery or greater than 500 mL in a vaginal delivery or a 10% drop in hemoglobin

FIG. 27.1 A vulvar hematoma is caused by rapid bleeding into soft tissue. It causes severe pain and feelings of pressure.

FIG. 27.2 Technique for fundal massage.

and hematocrit from admission to postdelivery with signs and symptoms of hemorrhage

2. Can occur early (during the first 24 hours after delivery) or later (after the first 24 hours following delivery)
3. Early postpartum hemorrhage is within the first 24 hours postpartum.
4. Late postpartum hemorrhage is anything beyond 24 hours postpartum.
5. While postpartum hemorrhage can occur any time during the postpartum period, the greatest risk is during the 4 hours immediately after delivery, and the second greatest risk is the first 24 hours following delivery.
6. Causes and predisposing factors (Box 27.1)

B. Assessment

1. Persistent significant bleeding: Perineal pad is soaked within 15 minutes.

BOX 27.1 Postpartum Hemorrhage

Causes

- Uterine atony
- Laceration of the cervix or vagina
- Hematoma development in the cervix, perineum, or labia
- Retained placental fragments
- Obesity

Predisposing Factors

- Previous history of postpartum hemorrhage
- Coagulation disorders
- Chorioamnionitis
- Uterine subinvolution
- Placenta previa
- Abruptio placentae
- Overdistention of the uterus—polyhydramnios, multiple gestation, large neonate
- Infection
- Multiparity
- Dystocia or labor that is prolonged
- Operative delivery—cesarean or forceps delivery, intrauterine manipulation, general anesthesia

2. Weigh perineal pads and other pads used such as blue pads; subtract the weight of the dry items from the weight of the wet items: 1 g = 1 mL.
3. Restlessness and increased pulse rate (earlier signs), rapid and shallow respirations, decrease in blood pressure, cool and clammy skin, ashen or grayish color, decreased urine output, change in level of consciousness
4. Complaints of weakness, light-headedness, dyspnea

- C. Interventions: See [Clinical Judgment: Take Action Box](#).

V. Infection

- A. Description: Any infection of the reproductive organs that occurs within 28 days of delivery or abortion; endometritis is inflammation/infection of the inner lining of the uterus.

B. Assessment

1. Fever
2. Chills
3. Anorexia
4. Body aches, general malaise
5. Pelvic discomfort or pain
6. Vaginal discharge that is malodorous; normal vaginal discharge has a fleshy odor or an odor similar to a menstrual period.
7. Elevated white blood cell count

⚠ A temperature up to 100.4° F (38° C) is normal during the first 24 hours postpartum because of dehydration; a temperature of 100.4° F (38° C) or greater after 24 hours postpartum indicates infection.

⚡ CLINICAL JUDGMENT: TAKE ACTION

A nurse is monitoring a client in the postpartum period. Three hours after the delivery of the newborn, the nurse notes that the client is restless and difficult to rouse. The client's color is ashen and skin feels cool and clammy. The nurse notes that the client's peripad and the underpad are saturated with bright red blood. The nurse calls for assistance and takes vital signs, which reveal a pulse of 128 beats per minute, shallow respirations at 24 breaths per minute, a blood pressure of 88/50 mm Hg, and a pulse oximetry reading of 90%. The nurse takes the following actions:

- Ensures a patent airway.
- Administers oxygen by nonrebreather face mask at 8 to 10 L/min.
- Notifies the obstetrician (OB); stays with the client and asks another nurse to contact the OB.
- Elevates the client's legs to at least a 30-degree angle.
- Checks the uterus. If atonic, massages firmly to cause it to contract.
- Starts an intravenous infusion per standing orders.
- Administers uterotonic medications (e.g., oxytocin, prostaglandins) as prescribed to increase uterine tone.
- Provides additional or maintains an existing intravenous (IV) infusion of lactated Ringer's solution or normal saline solution to restore circulatory volume (the client should have two patent IV lines; the second IV line should be a 16- to 18-gauge IV catheter).
- Monitors vital signs and inserts an indwelling urinary catheter to monitor perfusion of kidneys.
- Administers blood or blood products as prescribed.
- Administers emergency medications as prescribed.
- Prepares for possible surgery or other emergency treatments or procedures.
- Records event, interventions instituted, and the client's response to interventions.
- Prepares for transfer to a critical care unit for stabilization and ongoing care and monitoring if required.

C. Interventions

1. Monitor vital signs and temperature every 2 to 4 hours.
2. Make the client as comfortable as possible; position the client to promote vaginal drainage.
3. Keep the client warm if chilled.
4. Isolate the newborn from the client only if the client can infect the newborn, such as with an airborne illness.
5. Provide a nutritious high-calorie, high-protein diet.
6. Encourage fluids to 3000 to 4000 mL/day, if not contraindicated.
7. Encourage frequent handwashing and frequent voiding and perineal hygiene.
8. Monitor intake and output.
9. Monitor culture results if cultures were prescribed.

FIG. 27.3 Mastitis.

10. Antipyretics and analgesics may be prescribed.
11. Administer antibiotics according to identified organism, as prescribed.

! After giving birth many birthing parents are discharged home before an infection develops. Teach the birthing parent about the ways to prevent infections, the common signs and symptoms, and when it is necessary to call the primary health care provider.

VI. Mastitis

A. Description

1. Mastitis is inflammation of the breast/chest as a result of a blocked duct and infection.
2. Mastitis occurs primarily in breast-feeding/chest-feeding parents 2 to 3 weeks after delivery but may occur at any time during lactation.

B. Assessment (Fig. 27.3)

1. Localized heat and swelling
2. Pain; tender axillary lymph nodes
3. Elevated temperature
4. Complaints of flu-like symptoms

C. Interventions

1. Instruct the client in good handwashing and breast/chest hygiene techniques.
2. Promote comfort.
3. Apply heat to the site as prescribed.
4. Instruct the client that fluid intake should be 2500 to 3000 mL per day.
5. Maintain lactation in breast-feeding/chest-feeding parent.
6. Encourage manual expression of human milk or use of a breast/chest pump every 3 to 4 hours.
7. Encourage the client to support the breasts/chest by wearing a supportive bra; avoid wearing an underwire bra and avoid continuous pressure on the breast/chest from tight bras and infant carriers.
8. Administer analgesics as prescribed.
9. Administer antibiotics as prescribed.

VII. Endometritis

- A. Description
1. Infection of the lining of the uterus occurring in the postpartum period; caused by bacteria that invade the uterus at the placental site
 2. The infection may spread, involve the entire endometrium, and cause peritonitis or pelvic thrombophlebitis.
- B. Assessment
1. Chills and fever
 2. Increased pulse
 3. Decreased appetite
 4. Headache
 5. Backache
 6. Prolonged, severe afterpains
 7. Tender, large uterus
 8. Foul odor to lochia or reddish-brown lochia
 9. Ileus
 10. Elevated WBC count
- C. Interventions
1. Monitor vital signs.
 2. Place the client in Fowler's position to facilitate the drainage of lochia.
 3. Provide a private room for the client.
 4. Inform the client that it is not necessary to isolate the newborn.
 5. Instruct the client in proper handwashing techniques.
 6. Initiate contact precautions, as necessary.
 7. Monitor I&O and encourage fluid intake.
 8. Intravenous antibiotics may be prescribed.
 9. Administer comfort measures, such as back rubs, position changes, and pain medications, as prescribed, and provide emotional support.
 10. Oxytocic medications may be prescribed to improve uterine tone.

VIII. Pulmonary Embolism

- A. Description: Passage of a thrombus, often originating in a uterine or other pelvic vein, into the lungs, where it disrupts the circulation of the blood
- B. Assessment
1. Sudden dyspnea and chest pain
 2. Tachypnea and tachycardia
 3. Cough and lung crackles
 4. Hemoptysis
 5. Feeling of impending doom
- C. Interventions
1. Administer oxygen.
 2. Position the client with the head of the bed elevated.
 3. Monitor vital signs frequently, especially respiratory and heart rate and breath sounds.
 4. Monitor for signs of respiratory distress and for signs of increasing hypoxemia.
 5. Administer intravenous fluids as prescribed.
 6. Administer anticoagulants as prescribed.

7. Prepare to assist the primary health care provider to administer medications to dissolve the clot, if prescribed.

IX. Subinvolution

- Description: Incomplete involution or failure of the uterus to return to its normal size and condition
- B. Assessment
1. Uterine pain on palpation
 2. Uterus larger than expected
 3. More than normal vaginal bleeding
 4. Prolonged lochia rubra
- C. Interventions
1. Assess vital signs.
 2. Assess uterus and fundus.
 3. Monitor for uterine pain and vaginal bleeding.
 4. Elevate legs to promote venous return.
 5. Encourage frequent voiding.
 6. Monitor hemoglobin and hematocrit.
 7. Prepare to administer methylergonovine maleate, which provides sustained contraction of the uterus, as prescribed.

X. Thrombophlebitis

- A. Description
1. A clot forms in a vessel wall as a result of inflammation of the vessel wall.
 2. A partial obstruction of the vessel can occur.
 3. It most commonly occurs in the legs and can be superficial or deep; pulmonary embolism is a concern.
 4. Increased blood-clotting factors in the postpartum period place the client at risk.
 5. Early ambulation in the postoperative period after cesarean section is a preventive measure.
- B. Assessment (Box 27.2)
- C. Interventions
1. Specific therapies may depend on the location of thrombophlebitis.
 2. Assess the lower extremities for edema, tenderness, varices, and increased skin temperature.
 3. Implement bed rest; gradual ambulation is allowed when symptoms have resolved.
 4. Elevate the affected leg.

BOX 27.2 Assessment: Thrombophlebitis

- Palpable thrombus that feels bumpy and hard
- Tenderness and pain in affected extremity
- Warm and pinkish red color over the thrombus area
- Malaise
- Chills and fever
- Diminished peripheral pulses
- Shiny white skin over affected area
- Pain, stiffness, and swelling of affected extremity

BOX 27.3 Client Education for Thrombophlebitis

- Never massage the leg.
- Avoid crossing the legs and prolonged sitting.
- Avoid constrictive clothing and anything that could cause pressure behind the knees.
- Know how to apply elastic stockings (support hose) if prescribed.
- Stop smoking because it causes vasoconstriction of blood vessels.
- Understand the importance of adherence to anticoagulant therapy if prescribed.
- Understand the importance of follow-up with the health care provider.

5. Sitting with the legs dependent needs to be avoided.
6. Apply a bed cradle and keep bedclothes off the affected leg.
7. Never massage the leg.
8. Monitor for manifestations of pulmonary embolism.
9. Apply hot packs or moist heat to the affected site as prescribed to alleviate discomfort.
10. Apply elastic stockings (support hose) if prescribed.
11. Administer analgesics and antibiotics as prescribed.
12. Heparin sodium intravenously may be prescribed for femoral or pelvic thrombophlebitis to prevent further thrombus formation.
13. Medications containing aspirin are not given to clients on anticoagulant therapy because aspirin inhibits synthesis of the clotting factors and can lead to prolonged clotting time and increase the risk for bleeding.

 D. Client education (Box 27.3)

XI. Perinatal Loss**A. Description**

1. Perinatal loss is associated with miscarriage, neonatal death, stillbirth, and therapeutic abortion.
2. Loss and grief also may occur with the birth of a preterm baby, a **newborn** with complications of birth, or a newborn with congenital anomalies; it also may occur in a client who is giving up a child for adoption.

 B. Interventions

 Not all interventions related to the experience of perinatal loss are appropriate for every birthing parent and family. It is crucial to consider religious, spiritual, and cultural health care practices and beliefs when planning care for a client and family who have experienced perinatal loss.

1. Communicate therapeutically and actively listen, providing parents time to grieve.
2. Notify the hospital chaplain or other religious person as appropriate.
3. Discuss with the parents options such as seeing, holding, bathing, or dressing the deceased infant; visitation by other family members or friends; religious, spiritual, or cultural rituals; and funeral arrangements.
4. Prepare a special memories box with keepsakes such as footprints, handprints, locks of hair, and pictures, if appropriate.
5. Admit the birthing parent to a private room; if possible, mark the door to the room with a special card (per agency procedure and maintaining confidentiality) that denotes to hospital staff that this family has experienced a loss.
6. Provide family with information to attend a support group if appropriate and information about other health care professionals for counseling and care.
7. See **Chapter 25** for additional information on intrauterine fetal demise.

PRACTICE QUESTIONS

1. The nurse is monitoring a client in the immediate postpartum period for signs of hemorrhage. Which sign, if noted, would be an early sign of excessive blood loss?
 1. A temperature of 100.4° F (38° C)
 2. An increase in the pulse rate from 88 to 102 beats per minute
 3. A blood pressure change from 130/88 to 124/80 mm Hg
 4. An increase in the respiratory rate from 18 to 22 breaths per minute
2. The nurse is preparing a list of self-care instructions for a postpartum client who was diagnosed with mastitis. Which instructions would be included on the list? Select all that apply.
 - 1. Wear a supportive bra.
 - 2. Rest during the acute phase.
 - 3. Maintain a fluid intake of at least 3000 mL/day.
 - 4. Take the prescribed antibiotics until the soreness subsides.
 - 5. Continue to breast-feed/chest-feed if the breasts/chest are not too sore.
 - 6. Avoid decompression of the breasts/chest by breast/chest-feeding or breast/chest pump.

3. The nurse is providing instructions about measures to prevent postpartum mastitis to a client who is breast-feeding/chest-feeding the newborn. Which client statement would indicate a need for further instruction?
 1. "I need to breast-feed/chest-feed every 2 to 3 hours."
 2. "I need to change the breast/chest pads frequently."
 3. "I need to wash my hands well before breast-feeding/chest-feeding."
 4. "I need to wash my nipples daily with soap and water."
4. The postpartum nurse is assessing a client who delivered a healthy infant by cesarean section for signs and symptoms of superficial venous thrombosis. Which sign would the nurse note if superficial venous thrombosis were present?
 1. Paleness of the calf area
 2. Coolness of the calf area
 3. Enlarged, hardened veins
 4. Palpable dorsalis pedis pulses
5. A client in a postpartum unit complains of sudden sharp chest pain and dyspnea. The nurse notes that the client is tachycardic and the respiratory rate is elevated. The nurse suspects a pulmonary embolism. Which would be the initial nursing action?
 1. Initiate an intravenous line.
 2. Assess the client's blood pressure.
 3. Prepare to administer morphine sulfate.
 4. Administer oxygen, 8 to 10 L/minute, by face mask.
6. The nurse is assessing a client in the fourth stage of labor and notes that the fundus is firm but that bleeding is excessive. Which would be the initial nursing action?
 1. Record the findings.
 2. Massage the fundus.
 3. Notify the obstetrician (OB).
 4. Place the client in Trendelenburg's position.
7. The nurse is preparing to care for four assigned clients. Which client is at most risk for hemorrhage?
 1. A primiparous client who delivered 4 hours ago
 2. A multiparous client who delivered 6 hours ago
 3. A multiparous client who delivered a large baby after oxytocin induction
 4. A primiparous client who delivered 6 hours ago and had epidural anesthesia
8. A postpartum client is diagnosed with cystitis. The nurse would plan for which priority action in the care of the client?
 1. Providing sitz baths
 2. Encouraging fluid intake
 3. Placing ice on the perineum
 4. Monitoring hemoglobin and hematocrit levels
9. The nurse is monitoring a postpartum client, who delivered 1 hour ago and received epidural anesthesia for delivery, for the presence of a vulvar hematoma. Which assessment finding would best indicate the presence of a hematoma?
 1. Changes in vital signs
 2. Signs of heavy bruising
 3. Complaints of intense pain
 4. Complaints of a tearing sensation
10. The nurse is creating a plan of care for a postpartum client with a small vulvar hematoma. The nurse would include which specific action during the first 12 hours after delivery?
 1. Encourage ambulation hourly.
 2. Assess vital signs every 4 hours.
 3. Measure fundal height every 4 hours.
 4. Prepare an ice pack for application to the area.
11. On assessment of a postpartum client, the nurse notes that the uterus feels soft and boggy. The nurse would take which initial action?
 1. Document the findings.
 2. Elevate the client's legs.
 3. Massage the fundus until it is firm.
 4. Push on the uterus to assist in expressing clots.

ANSWERS

1. Answer: 2

Rationale: During the fourth stage of labor, the birth parent blood pressure, pulse, and respiration should be checked every 15 minutes during the first hour. An increasing pulse is an early sign of excessive blood loss because the heart pumps faster to compensate for reduced blood volume. A slight increase in temperature is normal. The blood pressure decreases as the blood volume diminishes, but a

decreased blood pressure would not be the earliest sign of hemorrhage. The respiratory rate is slightly increased from normal.

Test-Taking Strategy: Note the **strategic word**, *early*. Think about the physiological occurrences of hemorrhage and shock and the expected findings in the postpartum period. This will assist in directing you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 501.

2. Answer: 1, 2, 3, 5

Rationale: Mastitis is an inflammation of the lactating breast/chest as a result of infection. Client instructions include resting during the acute phase, maintaining a fluid intake of at least 3000 mL/day (if not contraindicated), and taking analgesics to relieve discomfort. Antibiotics may be prescribed and are taken until the complete prescribed course is finished. They are not stopped when the soreness subsides. Additional supportive measures include the use of moist heat or ice packs and wearing a supportive bra. Continued decompression of the breast/chest by breast/chest-feeding or breast/chest pump is important to empty the breast/chest and prevent the formation of an abscess.

Test-Taking Strategy: Focus on the **subject**, treatment measures for mastitis. Think about the pathophysiology associated with mastitis to answer correctly. Recalling that supportive measures include rest, moist heat or ice packs, antibiotics, analgesics, increased fluid intake, breast/chest support, and decompression of the breasts/chest will assist in answering the question.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 511-512.

3. Answer: 4

Rationale: Mastitis is inflammation of the breast/chest as a result of infection. It generally is caused by an organism that enters through an injured area of the nipples, such as a crack or blister. Measures to prevent the development of mastitis include changing nursing pads when they are wet and avoiding continuous pressure on the breasts/chest. Soap is drying and could lead to cracking of the nipples, and the client needs to be instructed to avoid using soap on the nipples. The client is taught about the importance of handwashing and the need to breast/chest-feed every 2 to 3 hours.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and the need to select the option that identifies the incorrect client statement. Recalling that the use of soap is drying to the skin and could cause cracking and provide an entry point for organisms will direct you easily to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 512.

4. Answer: 3

Rationale: Thrombosis of superficial veins usually is accompanied by signs and symptoms of inflammation, including swelling, redness, tenderness, and warmth of the involved extremity. It also may be possible to palpate the enlarged, hard vein. Clients sometimes experience pain when they walk. Palpable dorsalis pedis pulses are a normal finding.

Test-Taking Strategy: Eliminate option 4 first because this is a normal and expected finding. Next, eliminate options 1 and 2 because they are **comparable or alike**.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 505.

5. Answer: 4

Rationale: If pulmonary embolism is suspected, oxygen should be administered, 8 to 10 L/minute, by face mask.

Oxygen is used to decrease hypoxia. The client also is kept on bed rest with the head of the bed slightly elevated to reduce dyspnea. Morphine sulfate may be prescribed for the client, but this would not be the initial nursing action. An intravenous line also will be required, and vital signs need to be monitored, but these actions would follow the administration of oxygen.

Test-Taking Strategy: Note the **strategic word**, *initial*. Use the **ABCs—airway, breathing, and circulation**—to assist in directing you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 507-508.

6. Answer: 3

Rationale: If bleeding is excessive, the cause may be laceration of the cervix or birth canal. Massaging the fundus if it is firm would not assist in controlling the bleeding. Trendelenburg's position needs to be avoided because it may interfere with cardiac and respiratory function. Although the nurse would record the findings, the initial nursing action would be to notify the OB.

Test-Taking Strategy: Note the **strategic word**, *initial*. Focus on the **data in the question**, noting the clinical manifestations identified in the question. Eliminate option 2 first because if the uterus is firm, it would not be necessary to perform fundal massage. Knowing that Trendelenburg's position interferes with cardiac and respiratory function will assist in eliminating option 4. From the remaining options, noting the words *bleeding is excessive* will assist in directing you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 412.

7. Answer: 3

Rationale: The causes of postpartum hemorrhage include uterine atony; laceration of the vagina; hematoma development in the cervix, perineum, or labia; and retained placental fragments. Predisposing factors for hemorrhage include a previous history of postpartum hemorrhage, placenta previa, abruptio placentae, overdistention of the uterus from polyhydramnios, multiple gestation, a large neonate, infection, multiparity, dystocia or labor that is prolonged, operative delivery such as a cesarean or forceps delivery, and intrauterine manipulation. The multiparous client who delivered a large fetus after oxytocin induction has more risk factors associated with postpartum hemorrhage than do the other three clients. In addition, there are no specific data in the client descriptions in options 1, 2, and 4 that present a risk for hemorrhage.

Test-Taking Strategy: Note the **strategic word**, *most*. Focus on the **subject**, the client at most risk for hemorrhage. Read the client description in each option. Noting the words *large* and *oxytocin* in the correct option will direct you to this option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 721-722.

8. Answer: 2

Rationale: Cystitis is an infection of the bladder. The client need to consume 3000 mL of fluids per day if not contraindicated.

Sitz baths and ice would be appropriate interventions for perineal discomfort. Hemoglobin and hematocrit levels would be monitored with hemorrhage.

Test-Taking Strategy: Focus on the **subject**, measures to treat cystitis, and note the **strategic word**, *priority*. Remember that increased fluids are a priority intervention.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 511.

9. **Answer: 1**

Rationale: Because the client has had epidural anesthesia and is anesthetized, the client cannot feel pain, pressure, or a tearing sensation. Changes in vital signs indicate hypovolemia in an anesthetized postpartum client with vulvar hematoma. Option 2 (heavy bruising) may be seen, but vital sign changes indicate hematoma caused by blood collection in the perineal tissues.

Test-Taking Strategy: Note the **strategic word**, *best*. Also note that the client received epidural anesthesia. With this in mind, eliminate options 3 and 4. From the remaining options, use the **ABCs—airway, breathing, and circulation**—to direct you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 499.

10. **Answer: 4**

Rationale: A hematoma is a localized collection of blood in the tissues of the reproductive tissues after delivery. Vulvar

hematoma is the most common. Application of ice reduces swelling caused by hematoma formation in the vulvar area. Options 1, 2, and 3 are not interventions that are specific to the plan of care for a client with a small vulvar hematoma. Ambulation hourly increases the risk for bleeding. Client assessment every 4 hours is too infrequent.

Test-Taking Strategy: Focus on the **subject**, a small vulvar hematoma. Think about the effect of each action in the options; this focus will assist in directing you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 501.

11. **Answer: 3**

Rationale: If the uterus is not contracted firmly (i.e., it is soft and boggy), the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated in the uterus. Elevating the client's legs would not assist in managing uterine atony. Documenting the findings is an appropriate action but is not the initial action. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage.

Test-Taking Strategy: Note the **strategic word**, *initial*, in the question. Focus on the **subject**, that the uterus is soft and boggy. Recalling the therapeutic management for uterine atony will assist in directing you to the correct option.

CHAPTER 28

Care of the Newborn

Contributor: Margaret Trnka, MSN, RN

PRIORITY CONCEPTS Development, Health Promotion

I. Initial Care of the Newborn

A. Assessment

1. Observe or assist with initiation of respirations.
2. Assess Apgar score.
3. Note characteristics of cry.
4. Monitor for nasal flaring, grunting, retractions, or abnormal respirations, such as a seesaw respiratory pattern (rise and fall of the chest and abdomen do not occur together).
5. Assess for central cyanosis and acrocyanosis.
6. Obtain vital signs.
7. Observe the newborn for signs of hypothermia or hyperthermia.
8. Assess for gross anomalies.
9. Estimate gestational age.

B. Interventions

! After newborns are dried at birth, remember that their skin is contaminated with blood and amniotic fluid. Gloves need to be worn when handling a newborn until they are bathed and all blood is removed from skin and hair.

1. Suction the mouth first and then the nares if needed with a bulb syringe.
2. Dry the newborn and stimulate crying by rubbing the back.
3. Maintain temperature stability; wrap the newborn in warm blankets and place a stockinette cap on the newborn's head.
4. Keep the newborn with the birthing parent to facilitate bonding.
5. Place the newborn at the birthing parent's breast/chest if breast-feeding/chest-feeding is planned, or place the newborn on the birthing parent's chest for skin-to-skin contact.
6. Place the newborn in a radiant warmer.

7. Ensure the newborn's proper identification.

8. Footprint the newborn and fingerprint the birthing parent on the identification sheet per agency policies and procedures; initiate other agency identification and safety procedures.

9. Place matching identification bracelets on the birthing parent and the newborn.

C. Apgar scoring system

1. Assess each of five items to be scored, and add the points to determine the newborn's total score.
2. Five vital indicators (Table 28.1)
3. Interventions: Apgar score (Table 28.2)

! The newborn's Apgar score is routinely assessed and recorded at 1 minute and 5 minutes after birth, and may be repeated later if the score is and remains low.

II. Initial Physical Examination

A. General guidelines

1. Keep the newborn warm during the examination.
2. Begin with general observations; then perform assessments that are least disturbing to the newborn first. Initiate nursing interventions for abnormal findings, and document findings.
3. The Ballard Scale may be used for gestational age assessment; in this scale, scores are assigned to physical and neurological criteria.

! The phases of newborn instability occur during the first 6 to 8 hours after birth and are known as the transition period between intrauterine and extrauterine existence. These phases include the first period of reactivity, period of decreased responsiveness, and second period of reactivity.

TABLE 28.1 Five Vital Indicators of Apgar Scoring

Indicator	□ Points	□ Point	□ Points
Heart rate	Absent	<100 beats per minute	≥100 beats per minute
Respiratory rate and effort	Absent	Slow, irregular breathing; weak cry	Good rate and effort; vigorous cry
Muscle tone	Flaccid, limp	Minimal flexion of extremities	Good flexion, active motion
Reflex irritability	No response	Minimal response (grimace) to suction or to gentle slap on soles	Responds promptly with a cry or active movement
Skin color	Pallor or cyanosis	Body skin color normal, extremities blue	Body and extremity skin color normal

Adapted from Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 420.

TABLE 28.2 Apgar Score Interventions

Score	Intervention
8-10	No intervention required except to support newborn's spontaneous efforts
4-7	Stimulate; rub newborn's back; administer oxygen to newborn; rescore at specific intervals
0-3	Newborn requires full resuscitation; rescore at specific intervals

Adapted from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 199.

B. Vital signs

- Heart rate (resting): 110 to 160 beats per minute (apical), 90 to 110 beats per minute (if sleeping), up to 180 beats per minute (if crying); auscultate at the fourth intercostal space for 1 full minute to detect abnormalities.
- Respirations: 30 to 60 breaths per minute; assess for 1 full minute.
- Assess heart rate and respiratory rate before assessing other vital signs while the newborn is resting or sleeping.
- Axillary temperature: 97.7° F (36.5° C) to <99.5° F (37.5° C)
- Blood pressure: Usually not done in term newborn unless a cardiac issue is suspected; 80 to 90/40 to 50 mm Hg

C. Body measurements (approximate)

- Length: 18 to 22 inches (45 to 55 cm)
- Weight: 2500 to 4000 g (5.5 to 8.75 lb)
- Head circumference: 33 to 35 cm (13.2 to 14 inches)

D. Head

- Head should be one-fourth of the body length (cephalocaudal development).
- Bones of the skull are not fused.
- Sutures (connective tissue between the skull bones) are palpable and may be overlapping because of head molding but should not be widened.

TABLE 28.3 Fontanels

Fontanel	Characteristics	Closure
Anterior	Soft, flat, diamond-shaped; 3-4 cm wide × 2-3 cm long	Between 12 and 18 mo of age
Posterior	Triangular; 0.5-1 cm wide Located between occipital and parietal bones	Between birth and 2-3 mo of age

Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 539.

- Fontanels are unossified membranous tissue at the junction of the sutures (Table 28.3). The size of fontanels can vary because of molding and individual differences.
- Molding is asymmetry of the head resulting from pressure in the birth canal; molding disappears in about 72 hours (Fig. 28.1).
- Masses from birth trauma
 - Caput succedaneum is edema of the soft tissue over bone (crosses over suture line); it subsides within a few days.
 - Cephalhematoma is swelling caused by bleeding into an area between the bone and its periosteum (does not cross over suture line); it usually is absorbed within 6 weeks with no treatment.
- Head lag
 - Common when pulling the newborn to a sitting position
 - When prone, the newborn should be able to lift the head slightly and turn the head from side to side.
 - After 6 months old, significant head lag indicates cerebral injury and further evaluation is necessary.

E. Eyes

- Slate-gray (light skin), dark-blue, or brown-gray (dark skin)
- Symmetrical and clear
- Pupils equal, round, react to light and accommodation

FIG. 28.1 Molding. A, Significant molding after vaginal birth. B, Schematic of bones of skull when molding is present. (A, From Perry et al, 2010. Courtesy Kim Malloy, Knoxville, Iowa.)

4. Blink reflex present
 5. Eyes cross because of weak extraocular muscles
 6. Ability to track and fixate momentarily
 7. Red reflex present
 8. Eyelids often edematous as a result of pressure during the birth process and the effects of eye medication
- F. Ears
1. Symmetrical
 2. Firm cartilage with recoil
 3. Top of pinna on or above line drawn from outer canthus of eye
 4. Low-set ears associated with Down's syndrome, renal anomalies, or other genetic or chromosomal syndromes
- G. Nose
1. Flat, broad, in center of face
 2. Obligatory nose breathing
 3. Occasional sneezing to remove obstructions
 4. Nares are patent and should not flare (flaring is an indication of respiratory distress).
- H. Mouth
1. Pink, moist gums
 2. Soft and hard palates intact
 3. Epstein's pearls (small, white cysts) may be present on hard palate.
 4. Uvula in midline
 5. Freely moving tongue, symmetrical, has short frenulum
 6. Sucking and crying movements symmetrical
 7. Able to swallow
 8. Root and gag reflexes present
- !** When assessing the newborn's mouth, look for the presence of thrush (*Candida albicans*), which is characterized by white patchy areas on the tongue or gums that cannot be removed with a washcloth; these may be painful.
- I. Neck
1. Short and thick
 2. Head held in midline
 3. Trachea midline
 4. Good range of motion and ability to flex and extend
 5. Assess for torticollis (head inclined to one side as a result of contraction of muscles on that side of the neck).
- J. Chest
1. Circular appearance because anteroposterior and lateral diameters are about equal (approximately 30 to 33 cm [12 to 13.2 inches] at birth)
 2. Diaphragmatic respirations—chest and abdomen should rise and fall in synchrony, not in a seesaw pattern.

3. Bronchial sounds heard on auscultation
4. Nipples prominent and often edematous; milky secretion (witch's milk) common
5. Breast tissue present
6. Clavicles need to be palpated to assess for fractures.

K. Skin

1. Pinkish red (light-skinned newborn) to pinkish brown or pinkish yellow (dark-skinned newborn)
2. Nail beds pink, with transient cyanosis immediately after birth
3. Vernix caseosa, a cheesy white substance, on entire body in preterm newborns, but is more prominent between folds closer to term; may be absent after 42 weeks of gestation
4. Lanugo, fine body hair, might be seen, especially on the back.
5. Milia, small white sebaceous glands, appear on the forehead, nose, and chin.
6. Dry, peeling skin, increased in postmature newborns
7. Dark-red (plethoric) color is common in premature newborns.
8. Cyanosis may be noted with hypothermia, infection, and hypoglycemia and with cardiac, respiratory, or neurological abnormalities.
9. Acrocyanosis (peripheral cyanosis of hands and feet) is normal in the first few hours after birth and may be noted intermittently for the next 7 to 10 days (Fig. 28.2).
10. Assess for ecchymosis and petechiae resulting from trauma of birth.
11. Check for Mongolian spots.
12. Check for edema around eyes, face, legs, dorsa of hands, feet, and scrotum or labia.
13. Assess skin turgor over the abdomen to determine hydration status.
14. Observe for forceps marks.
15. Harlequin sign
 - a. Deep pink or red color develops over one side of newborn's body while the other side remains pale or of normal color.

FIG. 28.2 Acrocyanosis. (From McKinney et al., 2013. Courtesy Todd Shiros, Santa Fe Springs, California.)

- b. Harlequin sign may indicate shunting of blood that occurs with a cardiac problem or may indicate sepsis.

16. Birthmarks (Table 28.4)

L. Abdomen

1. Umbilical cord

- a. Umbilical cord should have three vessels—two arteries and one vein; if fewer than three vessels are noted, notify the primary health care provider (PHCP).
- b. While a two-vessel cord (one artery, one vein) may present no problems or concerns, there is a higher correlation to intrauterine growth restriction (IUGR) and genetic or chromosomal problems.
- c. Small, thin cord may be associated with poor fetal growth.
- d. Assess for intact cord, and ensure that the cord clamp is secured.
- e. Cord should be clamped for at least the first 24 hours after birth; clamp can be removed when the cord is dried and occluded and is no longer bleeding.

TABLE 28.4 Birthmarks

Birthmark	Characteristics
Telangiectatic nevi (stork bites)	Pale pink or red, flat, dilated capillaries On eyelids, nose, lower occipital bone, and nape of neck Blanch easily More noticeable during crying periods Disappear by age 2 yr
Nevus flammeus (port-wine stain)	Capillary angioma directly below epidermis Nonelevated, sharply demarcated, red to purple, dense areas of capillaries Commonly appear on face No fading with time May require future surgery
Nevus vasculosus (strawberry mark)	Capillary hemangioma Raised, clearly delineated, dark red, with rough surface Common in head region Disappears by age 7-9 yr
Mongolian spots	Bluish-black pigmentation On lumbar dorsal area and buttocks Gradually fade during first and second years of life Common in Asian and dark-skinned individuals

Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 553-554.

- f. Note any bleeding or drainage from the cord.
 - g. Cleansing of the cord needs to be done; hospital protocol and PHCP's preference determine the frequency, technique, and skin preparation used for cord care.
 - h. If signs of infection, such as moistness, oozing, discharge, and a reddened base, occur, antibiotic treatment is prescribed.
2. Gastrointestinal
 - a. Monitor cord for meconium staining.
 - b. Assess for umbilical hernia.
 - c. Assess for abdominal depression associated with diaphragmatic hernia.
 - d. Assess for abdominal distention associated with obstruction, mass, or sepsis.
 - e. Monitor bowel sounds (present within the first hour after birth).
 3. Anus
 - a. Ensure that the anal opening is present.
 - b. First stool meconium should pass within first 24 hours (may be delayed in premature births).
- M. Genitals
1. Newborn with a vagina
 - a. Labia may be swollen; clitoris may be enlarged.
 - b. Smegma may be present (thick, white mucous discharge).
 - c. Pseudomenstruation, caused by the withdrawal of the hormone estrogen, is possible (blood-tinged mucus).
 - d. Hymen tag may be visible.
 - e. First voiding should occur within 24 hours.
 2. Newborn with a penis
 - a. Prepuce (foreskin) covers glans penis.
 - b. Scrotum may be edematous, pendulous, and covered with rugae.
 - c. Verify meatus at tip of penis.
 - d. Testes are descended but may retract with cold.
 - e. Assess for hernia or hydrocele; a hernia is easier to detect when the newborn is crying.
 - f. First voiding should occur within 24 hours.
- N. Spine
1. Straight
 2. Posture flexed
 3. Supportive of head momentarily when prone
 4. Chin flexed on upper chest
 5. Well-coordinated, sporadic movements
 6. A degree of hypotonicity or hypertonicity may indicate central nervous system damage.
 7. Assess for hair tufts and dimples along the spinal column (may be indicative of a possible opening).
- O. Extremities
1. Flexed
 2. Full range of motion; symmetrical movements and equal muscle tone
 3. Fists clenched
 4. Ten fingers and 10 toes, all separate
 5. Legs bowed
 6. Major gluteal folds even
 7. Creases on soles of feet
 8. Assess for fractures (especially clavicle) or dislocations (hip) from birth trauma.
 9. Assist PHCP to assess for developmental dysplasia of the hip; when thighs are rotated outward, no clicks should be heard (Ortolani's sign and Barlow's sign are the two assessment tools for developmental dysplasia of the hip).
 10. Pulses palpable (radial, brachial, femoral)
-  Slight tremors noted in the newborn may be a common finding but could also be a sign of hypoglycemia, hypocalcemia, or drug withdrawal.
- ### III. Body Systems Assessment and Interventions
- A. Cardiovascular system
1. Keep the newborn warm.
 2. Measure the apical heart rate for 1 full minute.
 3. Listen for murmurs; assess oxygen saturation via pulse oximetry if a murmur is heard.
 4. Palpate pulses.
 5. Assess for cyanosis; blanch the skin on the trunk and extremities to assess circulation.
 6. Observe for cardiac distress when the newborn is feeding.
- B. Respiratory system
1. Suction the airway as necessary: Use a bulb syringe for upper airway suctioning (compress bulb before insertion) and a French catheter for deeper suctioning.
 2. Observe for respiratory distress and hypoxemia.
 - a. Abnormal breath sounds
 - b. Nasal flaring
 - c. Increasingly severe retractions
 - d. Grunting
 - e. Pallor
 - f. Cyanosis
 - g. Bradycardia and periods of apnea lasting longer than 15 seconds
 3. Administer oxygen if necessary and as prescribed.
- C. Hepatic system
1. Normal or physiological jaundice appears after the first 24 hours in full-term newborns and after the first 48 hours in premature newborns; jaundice occurring before this time (pathological jaundice) may indicate early hemolysis of red blood cells and must be reported to the PHCP.
 2. Physiological jaundice peaks on about the fifth day of life (indirect bilirubin levels 6 to 7 mg/dL [90 to 105 mcumol/L]).
 3. Feed early to stimulate intestinal activity and to keep the bilirubin level low.

4. Prevent chilling because hypothermia can cause acidosis that interferes with bilirubin conjugation and excretion.
 5. Liver stores the iron passed from the birthing parent for 5 to 6 months.
 6. Glycogen storage occurs in the liver.
 7. The newborn is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on vitamin K, which is not synthesized until intestinal bacteria are present.
 8. Handle the newborn carefully, and monitor for any bruising or bleeding episodes.
 9. Watch for meconium stool and subsequent stools.
 10. Administer intramuscular dose of phytonadione to the newborn as prescribed to prevent hemorrhagic disorders (usually 0.5 to 1 mg is prescribed); administer in lateral aspect of the middle third of the vastus lateralis muscle on the left leg (see [Chapter 42](#)).
 11. Assess the newborn's hemoglobin and blood glucose levels.
- D. Renal system
1. The immature kidneys are unable to concentrate urine.
 2. A weight loss of 5% to 10% during the first week of life occurs as a result of water loss and limited intake; birth weight should be regained by 10 to 14 days after birth.
 3. Weigh the newborn daily.
 4. Monitor intake and output; weigh diapers if necessary (1 g of diaper weight equals 1 mL of urine). By the fourth day of life, six wet diapers can be expected; parents should be informed that six wet diapers indicate the infant is taking in adequate fluid.
 5. If the diaper requires weighing, record the weight before putting it on the newborn; after the newborn voids, reweigh the diaper and subtract the prevoided weight.
 6. Assess for signs of dehydration (dry mucous membranes, sunken eyeballs, poor skin turgor, sunken fontanels).
- E. Immune system
1. Newborn receives passive immunity via the placenta (immunoglobulin G).
 2. Newborn receives passive immunity from colostrum (immunoglobulin A).
 3. Elevations in immunoglobulin M indicate infection in utero.
 4. Use aseptic technique and standard precautions when caring for the newborn.
 5. Ensure meticulous handwashing.
 6. Ensure that an infection-free staff cares for the newborn.
 7. Monitor the newborn's temperature.
8. Observe for any cracks or openings in the skin.
 9. Administer eye medication within 1 hour after birth to prevent ophthalmia neonatorum (see [Chapter 29](#)). A chemical conjunctivitis can occur within 24 hours of instillation of ophthalmic prophylaxis; symptoms include mild lid edema and a sterile, nonpurulent eye discharge, which need to be reported.
 10. Provide cord care.
 - a. Umbilical clamp can be removed after 24 hours if cord is dried and occluded and is not bleeding.
 - b. Teach the parent how to perform cord care.
 - c. Keep the cord clean and dry; alcohol wipes may be prescribed for cleaning the cord only if it becomes soiled.
 - d. Keep the diaper from covering the cord; fold the diaper below the cord.
 - e. Assess the cord for odor, edema, or discharge.
 - f. The newborn is typically washed via a sponge bath until the cord falls off (within 10 to 14 days). Follow alternate instructions if provided by PHCP.
 11. Provide circumcision care if circumcision is done. Only healthy newborns should undergo circumcision; the preterm or sick infant would not be circumcised until healthy enough to tolerate the procedure.

 Circumcision is not an expected part of newborn care. Parents need to be informed that they have a choice with regard to circumcision of their newborn. Parents need to be well informed about the procedure and the risks and benefits.

 - a. Apply petroleum jelly gauze to the penis except when a PlastiBell is used to prevent displacement.
 - b. Remove petroleum jelly gauze, if applied, after the first voiding following circumcision.
 - c. Keep diaper loose to prevent pressure.
 - d. Observe for edema, infection, or bleeding from the circumcision site.
 - e. Teach the parent how to care for the circumcision site.
 - f. Clean the penis after each voiding by squeezing warm water over the penis.
 - g. A milky covering over the glans penis is normal and should not be disrupted.
 - h. Monitor for urinary retention. Educate the parents that the newborn needs to void within 24 hours after the circumcision.
- F. Metabolic system and gastrointestinal system
1. Newborns are able to digest simple carbohydrates but are unable to digest fats because of a lack of lipase.

2. Proteins may be broken down only partially, so they may serve as antigens and provoke an allergic reaction.
 3. The newborn has a small stomach capacity (less than 10 mL at birth, increasing to about 90 mL by day 10), with rapid intestinal peristalsis (bowel emptying time is 2.5 to 3 hours).
 4. Breast-feeding/chest-feeding usually can begin immediately after birth; based on PHCP preference and agency protocols, bottle-fed newborns may be initially offered no more than 30 mL of formula.
 5. Observe feeding reflexes, such as rooting, sucking, and swallowing.
 6. Assist the parent with breast/chest-feeding or formula feeding; breast/chest-feeding should be done every 2 to 3 hours, and formula feeding (minimum of 30 mL, or 1 oz by day 3) should be done every 3 to 4 hours (or per PHCP preference or agency protocols).
 7. Burp the newborn during and after feeding.
 8. Assess for **regurgitation** or vomiting.
 9. Position the newborn on the right side after feeding; however, the side-lying position is not recommended for sleep because this position makes it easy for the newborn to roll to the prone position (prone position is contraindicated because it increases the risk of sudden infant death syndrome). Turning the head to the right is another option.
 10. Observe for normal stool and the passage of meconium.
 - a. Meconium stool, which is greenish black with a thick, sticky, tarlike consistency, usually is passed within the first 24 hours of life (may be delayed in premature infants).
 - b. Transitional stool, the second type of stool excreted by the newborn, is greenish brown and of looser consistency than meconium.
 - c. Seedy, yellow stools are usually noted in newborns who are fed human milk; pale yellow to light-brown stools are usually seen in formula-fed newborns.
 11. Perform a newborn screening test (including the test for phenylketonuria [PKU]) as prescribed before discharge after sufficient protein intake occurs; the newborn should be on formula or human milk for 24 hours before screening.
- G. Neurological system (see **Clinical Judgment: Take Action Box**)
1. Newborn head size is proportionally larger than that of an adult because of cephalocaudal development.
 2. Myelination of nerve fibers is incomplete, so primitive reflexes are present.
 3. Fontanelles are open to allow for brain growth.
 4. Assess for abnormal head size and a bulging or depressed anterior fontanel.
 5. Measure and graph the head circumference in relation to chest circumference and length.
 6. Assess the newborn's movements, noting symmetry, posture, and abnormal movements.
 7. Observe for jitteriness, marked tremors, and seizures.
 8. Test the newborn's reflexes.
 9. Assess for lethargy.
 10. Assess pitch of cry; a high-pitched cry may indicate a neurological or other disorder.

CLINICAL JUDGMENT: TAKE ACTION

The nurse is performing an initial assessment on a newborn and notes that the newborn is experiencing tremors. The nurse would take the following actions:

- Swaddle the newborn.
- Determine the cause immediately.
- Check for hypothermia or hyperthermia.
- Check for hypoglycemia and check other laboratory values, specifically for hypocalcemia.
- Check for possible drug withdrawal.
- Contact the primary health care provider, and initiate treatment as prescribed.

- H. Thermal regulatory system
1. Prevent cold stress (**Fig. 28.3**).
 2. Newborns do not shiver to produce heat.
 3. Newborns have brown fat deposits, which produce heat.
 4. Heat loss can occur via evaporation, radiation, convection, conduction.
 5. Prevent heat loss resulting from evaporation by keeping the newborn dry and well wrapped with a blanket.
 6. Prevent heat loss resulting from radiation by keeping the newborn away from cold objects and outside walls.
 7. Prevent heat loss resulting from convection by shielding the newborn from drafts.
 8. Prevent heat loss resulting from conduction by performing all treatments on a warm, padded surface.
 9. Keep the room temperature warm.
 10. Take the newborn's axillary temperature every 30 minutes for the first 2 hours of life until the newborn is stable, every 4 hours for the remainder of the first 24 hours, and then every shift (as per agency protocol).

 **Cold stress causes oxygen consumption and energy to be diverted from maintaining normal brain cell function and cardiac function, resulting in serious metabolic and physiological conditions.**

FIG. 28.3 Effects of cold stress. When a newborn is stressed by cold, oxygen (O_2) consumption increases and pulmonary and peripheral vasoconstriction occur, decreasing O_2 uptake by the lungs and O_2 delivery to the tissues; anaerobic glycolysis increases; and there is a decrease in partial pressure of oxygen (PO_2) and pH, leading to metabolic acidosis.

I. Reflexes

1. Sucking and rooting
 - a. Touch the newborn's lip, cheek, or corner of the mouth with a nipple.
 - b. The newborn turns the head toward the nipple, opens the mouth, takes hold of the nipple, and sucks.
 - c. The rooting reflex usually disappears after 3 to 4 months, but may persist for 1 year.
2. Swallowing reflex
 - a. Swallowing reflex occurs spontaneously after sucking and obtaining fluids.
 - b. Newborn swallows in coordination with sucking without gagging, coughing, or vomiting.
3. Tonic neck or fencing
 - a. While the newborn is falling asleep or sleeping, gently and quickly turn the head to one side.
 - b. As the newborn faces the left side, the left arm and leg extend outward while the right arm and leg flex.
 - c. When the head is turned to the right side, the right arm and leg extend outward while the left arm and leg flex.
 - d. Response usually disappears within 3 to 4 months.
4. Palmar-plantar grasp
 - a. Place a finger in the palm of the newborn's hand and then place a finger at the base of the toes.
5. Moro reflex
 - a. Hold the newborn in a semisitting position and then allow the head and trunk to fall backward to at least a 30-degree angle.
 - b. The newborn assumes sharp extension and abduction of the arms with the thumbs and forefingers in a "C" position; this is followed by flexion and adduction to an "embrace" position (legs follow a similar pattern).
 - c. The Moro reflex is present at birth and is absent by 6 months of age if neurological maturation is not delayed.
 - d. A body jerk motion may be the response between 8 and 18 weeks.
 - e. A persistent response lasting more than 6 months may indicate a neurological abnormality.
6. Startle reflex (often considered the same as the Moro reflex, but the response is different)
 - a. The response is best elicited if the newborn is at least 24 hours old.
 - b. The examiner makes a loud noise or claps hands to elicit the response.
 - c. The newborn's arms adduct while the elbows flex.
 - d. The hands stay clenched.
 - e. The reflex should disappear within 4 months.
7. Pull-to-sit response
 - a. Pull the newborn up by the wrist while the newborn is in the supine position.
 - b. The head lags until the newborn is in an upright position, and then the head is level with the chest and shoulders momentarily before falling forward.
 - c. The head then lifts for a few minutes.
 - d. The response depends on the newborn's general muscle tone and condition and on maturity level.
8. Babinski's sign: Plantar reflex
 - a. Beginning at the heel of the foot, use a finger to stroke gently upward along the lateral aspect of the sole, and then move the finger along the ball of the foot.
 - b. The newborn's toes hyperextend while the big toe dorsiflexes.
 - c. The reflex disappears after the newborn is 1 year old.
 - d. Absence of this reflex indicates the need for a neurological examination.
9. Stepping or walking
 - a. Hold the newborn in a vertical position, allowing one foot to touch a table surface.

- b. The newborn simulates walking, alternately flexing and extending the feet.
 - c. The reflex is usually present for 3 to 4 months.
10. Crawling
- a. Place the newborn on the abdomen.
 - b. The newborn begins to make crawling movements with the arms and legs.
 - c. The reflex usually disappears after about 6 weeks.

IV. Newborn Safety

A. Newborn identification

1. Information bracelets are applied to the birthing parent and newborn immediately after birth and before the birthing parent and newborn are separated; in addition, identification pictures of the newborn and footprints from the newborn may be obtained before the newborn leaves the birthing parent's side in the delivery room.
2. The bracelets include name, sex, date, time of birth, and identification numbers.
3. Some agencies use identification bracelets that have radiofrequency transmitters that set off alarms if the newborn is removed from a certain area.
4. Agencies also conduct unit and hospital-wide drills to prevent newborn abductions.

B. Newborn abduction

1. The birthing parent is taught to check the identification of any person who comes to remove the infant from the room and is taught other precautions to prevent newborn abduction (nurses must be wearing photo identification or some other security badge) (Box 28.1).
2. Closed-circuit televisions, code-alert bands, computer monitoring systems, or other monitoring systems may be used in some agencies.
3. The newborn is wheeled in a bassinet, not carried in a staff member's arms.

V. Parent Teaching

! Teach parents to never leave infant alone on an unprotected surface, such as a changing table or adult bed, even for a moment.

A. Formula feeding

1. Teach sterilization techniques if the water supply is located in areas where the purification process of the water is questionable.
2. Remind the parents not to heat the bottle of formula in a microwave oven.
3. Inform the parents that formula is a sufficient diet for the first 4 to 6 months.
4. Assess the parents ability to burp the newborn.

B. Breast-feeding/chest-feeding

1. Assess the newborn's ability to attach to the parent's breast/chest and suck (Fig. 28.4).

BOX 28.1 Precautions to Prevent Infant Abduction

- All personnel must wear identification that is easily visible at all times.
- Codes, card keys, or identification badges that allow entrance into the nursing unit must be protected so that unauthorized persons cannot have access.
- Teach parents to allow only hospital staff with proper identification to take their infants from them.
- Question anyone with a newborn near an exit or in an unusual part of the facility.
- Never leave a newborn unattended.
- Teach the parents that the newborn must be observed at all times.
- When the newborn is in the birthing parent's room, position the crib away from the doorway.
- Teach the parents home safety precautions; suggest that the parents not place announcements in the paper or signs in their yard that might alert an abductor that a new infant is in the home.

FIG. 28.4 Correct attachment (latch-on) of a newborn at breast/chest.

2. Teach the parent how to pump breasts/chest and how to store breasts/chest milk properly.
3. Inform the parent that human milk is a sufficient diet for the first 4 to 6 months.
4. Give the parents the phone numbers of local organizations that offer support to breast-feeding/chest-feeding parents.

C. Bathing

1. Parents may choose to delay bathing the newborn for up to 8 hours after birth to help keep the skin conditioned.
2. Bathe the newborn in a warm room before feeding.
3. Have all equipment for bathing available.
4. Use a mild soap (not on the face).
5. Proceed from the cleanest area to the dirtiest.

6. Clean eyes from the inner canthus outward.
7. Special care should be taken to clean under the folds of the neck, underarms, groin, and genitals.
8. Make bath time enjoyable for the newborn and the parent.

D. Clothing

1. Assess diaper and clothing needs for the newborn with the parents.
2. Instruct parents that the newborn's head should be covered in cold weather to prevent heat loss.
3. Instruct parents to layer the newborn's clothing in cooler weather.
4. To be comfortable, the newborn should be dressed in one more layer of clothing than what the parents are wearing.

E. Cord care: See earlier for cord care, "Body Systems Assessment and Interventions."

F. Circumcision: See earlier for circumcision care, "Body Systems Assessment and Interventions."

G. Uncircumcised newborn

1. Inform parents that the foreskin and glans are two similar layers of cells that separate from each other and that the separation process normally is complete by 3 to 6 years of age, although the layers can remain adhered until puberty.
2. Instruct parents not to pull back the foreskin, but to allow natural separation to occur; pulling back on the foreskin could be painful and could cause bleeding, adhesions, and infection.
3. Inform parents that as the process of separation occurs, sloughed cells build up between the layers of the foreskin and the glans, and that when retraction occurs, daily gentle washing of the glans with soap and water is sufficient to maintain adequate cleanliness.

 H. Stimulation: Providing stimulation to the newborn such as touching, cuddling, or talking is an important intervention.

V. Preterm Newborn

A. Description

1. An infant born before 37 weeks of gestation but greater than 20 weeks of gestation; also known as a premature newborn
2. Primary concern relates to immaturity of all body systems.

B. Assessment

1. Respirations are irregular with periods of apnea.
2. Body temperature is below normal.
3. The newborn has poor suck and swallow reflexes.
4. Bowel sounds are diminished.
5. Urinary output is increased or decreased.
6. Extremities are thin, with minimal creasing on soles and palms.
7. The newborn extends extremities and does not maintain flexion.

8. Lanugo, on skin and in the hair on the newborn's head, is present in woolly patches.
9. Skin is thin, with visible blood vessels and minimal subcutaneous fat pads.
10. Skin may appear jaundiced.
11. Testes are undescended in newborns with a penis.
12. Labia majora are narrow in newborns with a vagina.

C. Interventions

1. Monitor vital signs every 2 to 4 hours.
2. Maintain airway and cardiopulmonary functions.
3. Administer oxygen and humidification as prescribed.
4. Monitor intake and output and electrolyte balance.
5. Monitor daily weight.
6. Maintain the newborn in a warming device.
7. Avoid exposure to infections.
8. Perform daily abdominal girth measurements

VI. Postterm Newborn

A. Description: Infant born after 42 weeks of gestation

B. Assessment

1. Hypoglycemia
2. Parchment-like skin (dry and cracked) without lanugo
3. Long fingernails, extended over ends of fingers
4. Profuse scalp hair
5. Long and thin body
6. Wasting of fat and muscle in extremities
7. Meconium staining possibly present on nails and umbilical cord

C. Interventions

1. Provide normal newborn care.
2. Monitor for hypoglycemia.
3. Maintain newborn's temperature.
4. Monitor for dehydration and hypoxemia.
5. Monitor for meconium aspiration.

VII. Small for Gestational Age

A. Description: Newborn who is plotted at or below the 10th percentile on the intrauterine growth curve

B. Assessment

1. Fetal distress
2. Decreased or elevated body temperature
3. Physical abnormalities
4. Hypoglycemia
5. Signs of polycythemia
 - a. Ruddy appearance
 - b. Cyanosis
 - c. Jaundice
6. Signs of infection
7. Signs of aspiration of meconium

C. Interventions

1. Maintain airway and cardiopulmonary function.
2. Maintain body temperature.

3. Observe for signs of respiratory distress.
4. Monitor for infection and initiate measures to prevent sepsis.
5. Monitor for hypoglycemia.
6. Initiate early feedings and monitor for signs of aspiration.

X. Large for Gestational Age

- A. Description: Newborn who is plotted at or above the 90th percentile on the intrauterine growth curve
- B. Assessment
 1. Birth trauma or injury
 2. Respiratory distress
 3. Hypoglycemia
- C. Interventions
 1. Monitor vital signs, and monitor for respiratory distress.
 2. Monitor for hypoglycemia.
 3. Initiate early feedings.
 4. Monitor for infection, and initiate measures to prevent sepsis.

X. Respiratory Distress Syndrome

- A. Description: Serious lung disorder caused by immaturity and inability to produce **surfactant**, resulting in hypoxia and acidosis
- B. Assessment
 1. Respiratory distress; can include tachypnea, nasal flaring, expiratory grunting, retractions, saw-saw respirations, decreased breath sounds, and apnea
 2. Pallor and cyanosis
 3. Hypothermia
 4. Poor muscle tone
- C. Interventions
 1. Monitor color, respiratory rate, and degree of effort in breathing.
 2. Maintain airway and cardiopulmonary function, and support respirations as prescribed.
 3. Monitor arterial blood gases and oxygen saturation levels as prescribed (arterial blood gases from umbilical artery); ensure that oxygen administered to the newborn is at the lowest possible concentration necessary to maintain adequate arterial oxygenation.
 4. Any premature newborn who required oxygen support should be scheduled for an eye examination before discharge to assess for retinal damage.
 5. Position the newborn on the side or back, with the neck slightly extended.
 6. Administer respiratory therapy (percussion and vibration) as prescribed; use padded small plastic cup or small oxygen mask for percussion; use padded electric toothbrush for vibration.
 7. Provide nutrition.

8. Support bonding.
9. Prepare parents for short-term to long-term period of oxygen dependency if necessary.
10. Encourage the parent to pump the breasts/chest for future breast/chest-feeding of the newborn if desired.
11. Encourage as much parental participation in the newborn's care as the condition allows.

 Prepare to administer surfactant replacement therapy (instilled into the endotracheal tube) to a newborn with respiratory distress syndrome.

XI. Meconium Aspiration Syndrome

- A. Description: Obstruction and air trapping caused by meconium in the infant's lungs, which may lead to severe respiratory distress
 1. Occurs in term or postterm newborns
 2. Exact etiology is unknown, but the release of meconium into the **amniotic fluid** is thought to be related to a stressful fetal event initiating a biochemical chain of events.
 3. Aspiration can occur in utero or with the first breath.
- B. Assessment
 1. Respiratory distress is present at birth; tachypnea, cyanosis, retractions, nasal flaring, grunting, crackles, and rhonchi may be present.
 2. The newborn's nails, skin, and umbilical cord may be stained a yellow-green color.
 3. Chest radiographs show uneven distribution of patchy infiltrates, air trapping, hyperexpansion, and atelectasis.
- C. Interventions
 1. If the newborn is delivered in an active, crying state with no evidence of respiratory distress, no intervention is necessary.
 2. If the newborn is delivered and exhibits inactivity and lack of cry, endotracheal suctioning is performed. If the newborn also exhibits lack of respiratory effort and a low heart rate, additional interventions will be needed.
 3. Newborns with severe meconium aspiration syndrome may benefit from extracorporeal membrane oxygenation; this therapy uses a modified heart-lung machine and provides oxygen to the circulation, allowing the lungs to rest and decreasing pulmonary hypertension and hypoxemia.

XI. Bronchopulmonary Dysplasia

- A. Description
 1. This chronic pulmonary condition affects newborns who have experienced respiratory failure or have been oxygen-dependent for more than 28 days.

2. X-ray findings are abnormal, indicating areas of overinflation and atelectasis.

B. Assessment

1. Tachypnea
2. Tachycardia
3. Retractions
4. Nasal flaring
5. Labored breathing
6. Crackles and decreased air movement
7. Occasional expiratory wheezing

C. Interventions

1. Monitor airway and cardiopulmonary function; provide oxygen therapy.
2. Fluid restriction may be prescribed.
3. Medications include surfactant at birth, bronchodilators, and possibly diuretics and corticosteroids.

XII. Transient Tachypnea of the Newborn

A. Description

1. Respiratory condition that results from incomplete reabsorption of fetal lung fluid in full-term newborns
2. Usually disappears within 24 to 48 hours

B. Assessment

1. Tachypnea
2. Expiratory grunting
3. Retractions
4. Nasal flaring
5. Fluid breath sounds per auscultation
6. Cyanosis

C. Interventions

1. Supportive care
2. Oxygen administration

XV. Intraventricular Hemorrhage

A. Description

1. Bleeding within the ventricles of the brain
2. Risk factors include prematurity, respiratory distress syndrome, trauma, and asphyxia.

B. Assessment: Diminished or absent Moro reflex, lethargy, apnea, poor feeding, high-pitched shrill cry, seizure activity

C. Interventions:

1. Supportive treatment
2. Keeping the infant in midline position and elevated 30 degrees decreases cranial pressure.

XV. Retinopathy of Prematurity

A. Description

1. Vascular disorder involving gradual replacement of retina by fibrous tissue and blood vessels
2. Primarily caused by prematurity and use of supplemental oxygen (>30 days)

B. Assessment: Leukocoria (white tissue on the retrolental space), vitreous hemorrhage, strabismus, cata-

acts (check for red reflex)

C. Interventions: Laser photocoagulation surgery

XVI. Necrotizing Enterocolitis (NEC)

A. Description

1. Acute inflammatory disease of the gastrointestinal tract
2. Usually occurs 4 to 10 days after birth but can occur up to 30 days, and is most frequently seen in preterm newborns

B. Assessment: Increased abdominal girth, decreased or absent bowel sounds, bowel loop distention, vomiting, bile-stained emesis, abdominal tenderness, occult blood in stool

C. Prevention

1. Withhold feedings for 24 to 48 hours from infants believed to have suffered birth asphyxia. Human milk is the preferred nutrient after this time period.
2. The use of probiotics with enteral feedings and human milk has shown evidence of prevention of NEC.
3. Administration of corticosteroids to the birthing parent prior to birth to promote early gut closure and maturation of the gut mucosa

D. Interventions

1. Vital signs are monitored for changes that might indicate bowel perforation.
2. Avoid rectal temperatures because of increased danger of perforation.
3. Check the abdomen frequently for distention (measuring abdominal girth and listening for presence of bowel sounds).
4. Hold oral feedings as prescribed.
5. Insert oral gastric tube as prescribed to decompress the abdomen.
6. Intravenous antibiotics may be prescribed.
7. Intravenous fluids may be needed to correct fluid, electrolyte, and acid-base imbalances.
8. Surgery if indicated

XVI. Hyperbilirubinemia

A. Description

1. Elevated serum bilirubin level
2. Evaluation is indicated when serum levels are greater than 12 mg/dL (180 μmol/L) in a term newborn.
3. Therapy is aimed at preventing kernicterus, which results in permanent neurological damage resulting from the deposition of bilirubin in the brain cells.

B. Assessment

1. Jaundice
2. Elevated serum bilirubin levels
3. Enlarged liver

4. Poor muscle tone
5. Lethargy
6. Poor sucking reflex

C. Interventions

1. Monitor for the presence of jaundice; assess skin and sclera for jaundice.
 - a. Examine the newborn's skin color in natural light.
 - b. Press a finger over a bony prominence or tip of the newborn's nose to press out capillary blood from the tissues.
 - c. Note that jaundice starts at the head first and spreads to the chest, abdomen, arms and legs, and hands and feet, which are the last to be jaundiced.
 - d. Use transcutaneous bilirubin testing if available.
2. Keep the newborn well hydrated to maintain blood volume.
3. Facilitate early, frequent feeding to hasten passage of meconium and encourage excretion of bilirubin.
4. Encourage parents to keep a log of number of feedings, wet diapers, and stools.
5. Report to the PHCP any signs of jaundice in the first 24 hours of life and any abnormal signs and symptoms.
6. Prepare for phototherapy (bili-light or bili-blanket), and monitor the newborn closely during the treatment.

 At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process.

D. Phototherapy

1. Description
 - a. Phototherapy is use of light to reduce serum bilirubin levels in the newborn.
 - b. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur.
2. Interventions
 - a. Follow specific instructions for phototherapy and bili-blanket care.
 - b. Assess parents' understanding of treatment involved; parents also need reassurance of their infant's progress.
 - c. Expose as much of the newborn's skin as possible.
 - d. Cover the genital area, and monitor the genital area for skin irritation or breakdown.
 - e. Cover the newborn's eyes with eye shields or patches; ensure that the eyelids are closed when shields or patches are applied.

- f. Remove the shields or patches at least once per shift (during a feeding time) to inspect the eyes for infection or irritation and to allow for eye contact and bonding with the parents.
- g. Measure the lamp energy output to ensure efficacy of the treatment (done with a special device known as a *photometer*).
- h. Monitor skin temperature closely.
 - i. Increase fluids to compensate for water loss.
 - j. Expect loose green stools.
- k. Monitor the newborn's skin color with the fluorescent light turned off, every 4 to 8 hours.
 1. Monitor the skin for bronze baby syndrome, a grayish brown discoloration of the skin, a complication of phototherapy.
- m. Reposition the newborn every 2 hours; monitor the newborn closely.
- n. Provide stimulation.
- o. If treatment is done at home, teach the parents about care and indications of the need to notify the PHCP.
- p. After treatment, continue to monitor for signs of hyperbilirubinemia, because rebound elevations can occur after therapy is discontinued.
- q. Turn off the phototherapy lights before drawing a blood specimen for serum bilirubin levels, and do not leave the blood specimen uncovered under fluorescent lights (to prevent the breakdown of bilirubin in the blood specimen).

XVIII. Erythroblastosis Fetalis

A. Description

1. Erythroblastosis fetalis is the destruction of red blood cells that results from an antigen-antibody reaction.
2. The disorder is characterized by hemolytic anemia or hyperbilirubinemia.
3. Exchange of fetal and birthing parent's blood occurs primarily when the placenta separates at birth (Fig. 28.5).
4. Antibodies are harmless to the birthing parent but attach to the erythrocytes in the fetus and cause hemolysis.
5. Sensitization is rare with the first pregnancy because antibodies do not form until after the birth of the first infant. Once the birthing parent develops those antibodies, they do not leave the body. These antibodies can then cross an intact placenta in future pregnancies and an Rh-positive fetus could be affected if the birthing parent did not receive Rhogam after the birth of a previous Rh-positive infant.

B. Assessment

FIG. 28.5 Development of birthing parent sensitization to Rh antigens. A, Fetal Rh-positive erythrocytes enter the birthing parent system. Birthing parent anti-Rh antibodies are formed. B, Anti-Rh antibodies cross the placenta and attack fetal erythrocytes.

1. Anemia
2. Jaundice that develops rapidly after birth and before 24 hours
3. Edema

C. Interventions

1. Administer Rh₀(D) immune globulin to the birthing parent during the first 72 hours after birth if the Rh-negative birthing parent delivers an Rh-positive fetus but remains unsensitized.
2. Assist with exchange transfusion after birth or intrauterine transfusion as prescribed.
3. The newborn's blood is replaced with Rh-negative blood to stop the destruction of the newborn's red blood cells; the Rh-negative blood is replaced with the newborn's own blood gradually.
4. Monitor for signs of transfusion reaction, maintain neonatal thermoregulation, blood glucose levels, and fluid balance.
5. Provide support to the parents.

XX. Sepsis

- A. Description: Generalized infection resulting from the presence of bacteria in the blood, such as group B streptococcal infection
- B. Assessment
 1. Pallor, cyanosis
 2. Tachypnea, tachycardia
 3. Dyspnea, retractions
 4. Poor feeding
 5. Abdominal distention
 6. Temperature instability
 7. Gastrointestinal disturbances
- C. Interventions
 1. Assess for periods of apnea or irregular respirations.
 2. If apnea is present, stimulate by gently rubbing the chest or foot.

3. Administer oxygen as prescribed.
4. Monitor vital signs; assess for fever.
5. Maintain warmth in a radiant warmer.
6. Provide isolation as necessary.
7. Monitor intake and output, and obtain daily weight.
8. Monitor for diarrhea.
9. Assess feeding and sucking reflex, which may be poor.
10. Assess for jaundice.
11. Assess for irritability and lethargy.
12. Prepare for blood cultures and administer antibiotics as prescribed. Observe carefully for toxicity because a newborn's liver and kidneys are immature.

XX. TORCH Infections (see Chapter <>)

XXI. Syphilis

- A. Description
 1. Syphilis is a sexually transmitted infection.
 2. Congenital syphilis can result in premature birth, skin lesions, and abnormal skeletal development.
 3. The causative organism, *Treponema pallidum*, a spirochete, is able to cross the placenta throughout pregnancy and infect the fetus, usually after 18 weeks' gestation.
 4. Risks include preterm birth, stillbirth, and low birth weight.
 5. Congenital effects are irreversible and may include central nervous system damage and hearing loss.
- B. Assessment
 1. Hepatosplenomegaly
 2. Joint swelling
 3. Palmar rash and lesions (Fig. 28.6)
 4. Anemia
 5. Jaundice

FIG. 28.6 Neonatal syphilitic lesions on hands and feet. (From Lowdermilk et al., 2012. Courtesy Mahesh Kotwal, MD, Phoenix, Arizona.)

6. Snuffles
7. Ascites
8. Pneumonitis
9. Cerebrospinal fluid changes

C. Interventions

1. Monitor the newborn for signs of syphilis.
2. Prepare the newborn for serological testing if prescribed.
3. Administer antibiotic therapy as prescribed.
4. Use standard precautions and drainage and secretion (contact) precautions with suspected congenital syphilis.
5. Wear gloves when handling the newborn until antibiotic therapy has been administered for 24 hours. If the birthing parent was adequately treated before giving birth and serological testing of the infant does not show syphilis, the infant is usually not treated with antibiotics.
6. Provide psychological support to the parents, and provide instructions regarding follow-up care to the newborn.

XXI. Addicted Newborn

A. Description

1. A newborn can become passively addicted to drugs that have passed through the placenta.
2. Assessment findings and withdrawal times may vary depending on the specific addicting drug.
3. See also Fetal Alcohol Spectrum Disorders (FASDs) later.

B. Assessment

1. Irritability
2. Tremors
3. Hyperactivity and hypertonicity
4. Sleep disturbances
5. Respiratory distress, tachypnea
6. Vomiting, often projectile
7. High-pitched cry
8. Sneezing, nasal stuffiness
9. Fever, temperature instability
10. Diarrhea

11. Excessive sweating
12. Poor feeding
13. Extreme sucking of fists
14. Seizures

C. Interventions

1. Monitor respiratory and cardiac status frequently.
2. Monitor temperature and vital signs.
3. Hold newborn firmly and close to the body during feeding and when giving care.
4. Initiate seizure precautions (pad sides of the crib).
5. Provide small frequent feedings and allow a longer period for feeding.
6. Monitor intake and output.
7. Administer intravenous hydration if prescribed.
8. Protect the newborn's skin from injury that can be caused by the constant rubbing from hyperactive jitters.
9. Swaddle the newborn; infants respond to comfort and close contact.
10. Place the newborn in a quiet room and reduce stimulation.
11. Allow the birthing parent to express feelings such as anxiety and guilt.
12. Refer the birthing parent for treatment of the substance abuse problem.

XXII. Fetal Alcohol Spectrum Disorders (FASDs)

A. Description

1. FASDs are a group of conditions caused by birthing parent alcohol use during pregnancy.
2. The disorders are a result of teratogenesis.
3. FASDs cause cognitive and physical delays.
4. Fetal alcohol syndrome is the most severe of the FASDs. The other disorders included in this category are alcohol-related neurodevelopmental disorder (ARND) and alcohol-related birth defects (ARBDs).
5. Can cause motor delays, hearing disorders, or other complications

B. Assessment

1. Facial changes (Fig. 28.7)
 - a. Short palpebral fissures
 - b. Hypoplastic philtrum
 - c. Short, upturned nose
 - d. Flat midface
 - e. Thin upper lip
 - f. Low nasal bridge
2. Abnormal palmar creases
3. Respiratory distress (apnea, cyanosis)
4. Congenital heart disorders
5. Irritability and hypersensitivity to stimuli
6. Tremors
7. Poor feeding
8. Seizures

C. Interventions

FIG. 28.7 Infant with fetal alcohol syndrome. (From Markiewicz, Abrahamson, 1999.)

1. Monitor for respiratory distress.
2. Position the newborn on the side to facilitate drainage of secretions; initiate seizure precautions.
3. Keep resuscitation equipment at the bedside.
4. Monitor for hypoglycemia.
5. Assess suck and swallow reflex.
6. Administer small feedings and burp well.
7. Suction as necessary.
8. Monitor intake and output.
9. Monitor weight and head circumference.
10. Decrease environmental stimuli.
11. Make referral to local early intervention system.

XV. Newborn of a Birthing Parent With Human Immunodeficiency Virus (HIV)

A. Description

1. The fetus of a birthing parent who is positive for HIV antibody should be monitored closely throughout the pregnancy.
2. Serial ultrasound screenings should be done during pregnancy to identify IUGR.
3. Weekly nonstress testing after 32 weeks of gestation and biophysical profiles may be necessary during pregnancy.
4. Newborns born to HIV-positive birthing parents may test positive because the birthing parent's antibodies may persist in the newborn for 18 months after birth.
5. The use of antiviral medication, the reduction of newborn exposure to birthing parent's blood and body fluids, and the early identification of

HIV in pregnancy reduce the risk of transmission to the newborn.

6. All newborns born to HIV-positive birthing parents acquire the antibody to HIV infection, but not all acquire the infection.
 7. The newborn may be asymptomatic for the first several months to years of life.
- B. Transmission
1. Across placental barrier
 2. During labor and birth
 3. Human milk (breast/chest-feeding) is not done if the birthing parent is HIV-positive; follow PHCP prescription regarding feeding.
- C. Assessment
1. Possibly no outward signs at birth
 2. Signs of immunodeficiency
 3. Hepatomegaly
 4. Splenomegaly
 5. Lymphadenopathy
 6. Impairment in growth and development
- D. Interventions
1. Clean the newborn's skin carefully before any invasive procedure, such as the administration of phytonadione, heel sticks, or venipunctures.
 2. Circumcisions are not done on newborns with HIV-positive birthing parents until the newborn's status is determined.
 3. Newborn can room with birthing parent if hospital policies allow.
 4. All HIV-exposed newborns should be treated with medication to prevent infection by *Pneumocystis jiroveci*.
 5. Antiretroviral medications may be administered as prescribed for the first 6 weeks of life or longer if prescribed.
 6. Monitor for early signs of immunodeficiency, such as enlarged spleen or liver, lymphadenopathy, and impairment in growth and development.
 7. Newborns at risk for HIV infection should be seen by the PHCP at birth and at 1 week, 2 weeks, 1 month, and 2 months of age.
 8. Inform the parents that HIV culture is recommended at 1 month and after 4 months of age.
- E. Immunizations
1. Immunizations with live vaccines, such as measles-mumps-rubella and varicella, should not be done until the newborn's, infant's, or child's status is confirmed.
 2. If infected, live vaccine will not be given.
 3. Counseling regarding self-care, care of the infant, and future pregnancies should be provided for the birthing parent and partner.

⚠ Newborns at risk for HIV infection need to receive all recommended immunizations at the regular schedule; however, live vaccines are not administered until HIV status is determined.

XXV. Newborn of a Birthing Parent With Diabetes

- A. Description
 1. Infant born to birthing parent with type 1 or type 2 diabetes or gestational diabetes
 2. Hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, birth trauma, and congenital anomalies may be present.
- B. Assessment
 1. Excessive size and weight as a result of excess fat and glycogen in the tissues
 2. Edema or puffiness in the face and cheeks
 3. Signs of hypoglycemia, such as twitching, apnea, difficulty in feeding, lethargy, seizures, and cyanosis
 4. Hyperbilirubinemia
 5. Signs of respiratory distress, such as tachypnea, cyanosis, retractions, grunting, and nasal flaring
- C. Interventions
 1. Monitor for signs of respiratory distress, birth trauma, and congenital anomalies.
 2. Monitor bilirubin and blood glucose levels.
 3. Monitor weight.
 4. Feed the newborn soon after birth with human milk or formula as prescribed.
 5. Administer glucose intravenously to treat hypoglycemia if necessary and as prescribed.
 6. Monitor for edema.
 7. Monitor for respiratory distress, tremors, or seizures.

XXVI. Hypoglycemia

- A. Description
 1. Hypoglycemia is an abnormally low level of glucose in the blood (<45 mg/dL [<2.5 mmol/L]).
 2. Normal blood glucose reference interval is 45 to 60 mg/dL (2.5 to 3.4 mmol/L) in a 1-day-old newborn and 50 to 90 mg/dL (2.9 to 5.1 mmol/L) in a newborn older than 1 day (institutional values for normal newborn blood glucose levels vary).
- B. Assessment
 1. Increased respiratory rate; irregular respirations
 2. Twitching, nervousness, or tremors
 3. High-pitched cry
 4. Unstable temperature
 5. Lethargy, apnea, seizures, cyanosis
- C. Interventions
 1. Prevent low blood glucose level through early feedings.
 2. Administer formula orally or glucose intravenously as prescribed.
 3. Monitor blood glucose levels as prescribed.
 4. Monitor for feeding problems.
 5. Monitor for apneic periods.
 6. Assess for shrill or intermittent cries.
 7. Evaluate lethargy and poor muscle tone.

8. Give support to family, educate them on the prevention of low blood glucose, and allow them to express feelings and concerns.

XVII. Hypothyroidism

- A. Description: Hypothyroidism is a decrease in the production of thyroid hormone.
- B. Assessment
 1. Protruding or thick tongue
 2. Dull look; swollen face
 3. Slowed reflexes; decreased muscle tone
 4. Hoarse cry
 5. Abdominal distention
 6. Laboratory results reveal low thyroid production.
- C. Interventions: Focus on thyroid replacement

XXVIII. Relief of Choking in an Infant

- A. Description: Choking is also known as foreign body airway obstruction (FBAO).
- B. Assessment
 1. Signs of mild airway obstruction include good air exchange, ability to cough forcefully, and wheezing between coughs.
 2. Signs of severe airway obstruction include poor or no air exchange, weak or ineffective cough or no cough, a high-pitched noise while inhaling or no noise, increased respiratory difficulty, cyanosis, and inability to cry.
- C. Interventions
 1. For mild obstruction, do not interfere with the infant's own attempts to expel the object. Stay with the infant and continue to monitor. If the obstruction persists, activate the emergency response system and relieve the obstruction.
 2. Severe obstruction must be relieved as soon as possible (see [Clinical Judgment: Evaluate Outcomes Box](#)).

XXIX. Cardiopulmonary Resuscitation (CPR) Guidelines for Infants

- A. Infants include individuals who are 1 year of age or less. The basic life support (BLS) sequence for infants is very similar to that used for child and adult CPR.
 1. Location of the pulse check is the brachial artery in infants.
 2. Refer to American Heart Association (2020). Part 4: Pediatric Basic and Advanced Life Support: 2020 American Heart Association Guidelines for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care, *Circulation*. October 20, 2020, Volume 142, Issue 16, suppl 2. <https://www.ahajournals.org/doi/10.1161/CIR.0000000000000901>
- B. Refer to [Chapter 53](#) for additional information on the American Heart Association's recommendations for the CPR sequence.

⚡ CLINICAL JUDGMENT: EVALUATE OUTCOMES

The nurse has provided instructions to the parents of an infant about measures to take if the infant demonstrates signs of choking and cannot relieve the episode with coughing. The nurse asks the parents to demonstrate the procedure on an infant manikin. The nurse determines that the parents can safely and correctly relieve an obstruction based on the following observations of the parents working with the infant manikin.

- Sits or kneels with the manikin in the lap.
- Removes clothing from the manikin's chest if easily removed.
- Holds the manikin face down with the head lower than the chest while resting the manikin on the forearm. The manikin's head and jaw are supported with the hand. The forearm is rested on the thigh to support the manikin (Fig. 28.8).
- Delivers five back slaps between the manikin's shoulder blades using the heel of the other hand with sufficient force. Places the free hand on manikin's back while supporting the back of the manikin's head with the palm of the hand. Cradles the manikin between the two forearms. Turns the manikin as a unit while supporting the head and neck.
- Rests the forearm on the thigh while holding the manikin face up. Delivers five chest thrusts in the middle of the chest over the lower half of the sternum at a rate of 1 per second with enough force to relieve the obstruction.
- Repeats the sequence until the obstruction is relieved.
Note: if the infant becomes unresponsive, the parents need to call for help and activate the emergency response system. Cardiopulmonary resuscitation (CPR) is initiated as necessary. Parents are taught not to perform blind finger sweeps.

FIG. 28.8 Relief of choking in the infant.

Refer to American Heart Association (2020). Part 4: Pediatric Basic and Advanced Life Support: 2020 American Heart Association Guidelines for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care. *Circulation*. October 20, 2020, Volume 142, Issue 16, suppl 2. <https://www.ahajournals.org/doi/10.1161/CIR.0000000000000901>

PRACTICE QUESTIONS

1. The nurse assisted with the birth of a newborn. Which nursing action is most effective in preventing heat loss by evaporation?
 1. Warming the crib pad
 2. Closing the doors to the room
 3. Drying the infant with a warm blanket
 4. Turning on the overhead radiant warmer

2. The parent of a newborn calls the clinic and reports that when cleaning the umbilical cord, it was noted that the cord was moist and that discharge was present. What is the most appropriate nursing instruction for this parent?
 1. Bring the infant to the clinic.
 2. This is a normal occurrence and no further action is needed.
 3. Increase the number of times that the cord is cleaned per day.
 4. Monitor the cord for another 24 to 48 hours, and call the clinic if the discharge continues.

3. The nurse in a neonatal intensive care unit (NICU) receives a telephone call to prepare for the admission of a newborn with Apgar scores of 1 and 4, born at 41 weeks' gestation. In planning for admission of this newborn, what is the nurse's highest priority?
 1. Turn on the apnea and cardiorespiratory monitors.
 2. Connect the resuscitation bag to the oxygen outlet.
 3. Set up the intravenous line with 5% dextrose in water.
 4. Set the radiant warmer control temperature at 36.5° C (97.6° F).

4. The nurse is assessing a newborn after circumcision and notes that the circumcised area is red with a small amount of bloody drainage. Which nursing action is most appropriate?
 1. Apply gentle pressure.
 2. Reinforce the dressing.
 3. Document the findings.
 4. Contact the primary health care provider (PHCP).

5. The nurse in a newborn nursery is monitoring a preterm newborn for respiratory distress syndrome. Which assessment findings would alert the nurse to the possibility of this syndrome? Select all that apply.
 - ✓. Cyanosis
 - <. Tachypnea
 - >. Hypotension
 - ^-. Retractions
 - ✓. Audible grunts
 - +. Presence of a barrel chest

6. The postpartum nurse is providing instructions to the parent of a newborn with hyperbilirubinemia who is being breast/chest-fed. The nurse would provide which instruction to the parent?
1. Feed the newborn less frequently.
 2. Continue to breast/chest-feed every 2 to 4 hours.
 3. Switch to bottle-feeding the infant for 2 weeks.
 4. Stop breast/chest-feeding and switch to bottle-feeding permanently.
7. The nurse is assessing a newborn who was born to a birthing parent who is addicted to drugs. Which findings would the nurse expect to note during the assessment of this newborn? Select all that apply.
- 1. Lethargy
 - 2. Sleepiness
 - 3. Irritability
 - 4. Constant crying
 - 5. Difficult to comfort
 - 6. Cuddles when being held
8. The nurse notes hypotonia, irritability, and a poor sucking reflex in a full-term newborn on admission to the nursery. The nurse suspects fetal alcohol syndrome and is aware that which additional sign would be consistent with this syndrome?
1. Length of 19 inches
 2. Abnormal palmar creases
 3. Birth weight of 6 lb, 14 oz (3120 g)
 4. Head circumference appropriate for gestational age
9. The nurse is creating a plan of care for a newborn diagnosed with fetal alcohol syndrome. The nurse would include which priority intervention in the plan of care?
1. Allow the newborn to establish own sleep-rest pattern.
 2. Maintain the newborn in a brightly lighted area of the nursery.
 3. Encourage frequent handling of the newborn by staff and parents.
 4. Monitor the newborn's response to feedings and weight gain pattern.
10. The nurse administers erythromycin ointment (0.5%) to the eyes of a newborn, and the birthing parent asks the nurse why this is performed. Which explanation is best for the nurse to provide about neonatal eye prophylaxis?
1. Protects the newborn's eyes from possible infections acquired while hospitalized.
 2. Prevents cataracts in the newborn born to a parent who is susceptible to rubella.
 3. Minimizes the spread of microorganisms to the newborn from invasive procedures during labor.
 4. Prevents an infection called ophthalmia neonatorum from occurring after birth in a newborn born to a parent with an untreated gonococcal infection.
11. The nurse is preparing to care for a newborn receiving phototherapy. Which interventions would be included in the plan of care? Select all that apply.
- 1. Avoid stimulation.
 - 2. Decrease fluid intake.
 - 3. Expose all of the newborn's skin.
 - 4. Monitor skin temperature closely.
 - 5. Reposition the newborn every 2 hours.
 - 6. Cover the newborn's eyes with eye shields or patches.
12. The nurse creates a plan of care for a birthing parent with human immunodeficiency virus (HIV) infection and the newborn. The nurse would include which intervention in the plan of care?
1. Monitoring the newborn's vital signs routinely
 2. Maintaining standard precautions at all times while caring for the newborn
 3. Initiating referral to evaluate for blindness, deafness, learning problems, or behavioral problems
 4. Instructing the breast-feeding/chest-feeding parent regarding the treatment of the nipples with nystatin ointment
13. The nurse is planning care for the newborn of a birthing parent with diabetes mellitus. What is the priority nursing consideration for this newborn?
1. Developmental delays because of excessive size
 2. Maintaining safety because of low blood glucose levels
 3. Choking because of impaired suck and swallow reflexes
 4. Elevated body temperature because of excess fat and glycogen
14. Which statement reflects a new birthing parent's understanding of the teaching about the prevention of newborn abduction?
1. "I will place my baby's crib close to the door."
 2. "Some health care personnel won't have name badges."
 3. "It's okay to allow the nurse assistant to carry my newborn to the nursery."
 4. "I will ask the nurse to attend to my infant if I am napping and my partner is not here."
15. The nurse prepares to administer a phytonadione (vitamin K) injection to a newborn, and the parent asks the nurse why the infant needs the injection. What best response would the nurse provide?
1. "Your newborn needs the medicine to develop immunity."
 2. "The medicine will protect your newborn from being jaundiced."
 3. "Newborns have sterile bowels, and the medicine promotes the growth of bacteria in the bowel."
 4. "Newborns are deficient in vitamin K, and this injection prevents your newborn from bleeding."

ANSWERS

1. Answer: 3

Rationale: Evaporation of moisture from a wet body dissipates heat along with the moisture. Keeping the newborn dry by drying the wet newborn at birth prevents hypothermia via evaporation. Hypothermia caused by conduction occurs when the newborn is on a cold surface, such as a cold pad or mattress, and heat from the newborn's body is transferred to the colder object (direct contact). Warming the crib pad assists in preventing hypothermia by conduction. Convection occurs as air moves across the newborn's skin from an open door and heat is transferred to the air. Radiation occurs when heat from the newborn radiates to a colder surface (indirect contact).

Test-Taking Strategy: Note the **strategic words**, *most effective*. Recalling that evaporation of moisture from a wet body dissipates heat along with the moisture will assist in directing you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 421.

2. Answer: 1

Rationale: Signs of umbilical cord infection are moistness, oozing, discharge, and a reddened base around the cord. If signs of infection occur, the client needs to be instructed to notify the primary health care provider (PHCP). If these symptoms occur, antibiotics may be necessary. Options 2, 3, and 4 are not the most appropriate nursing interventions for an umbilical cord infection as described in the question.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*. Focus on the clinical manifestations provided in the question to assist in answering. Noting the word *discharge* in the question will assist in directing you to the option that indicates that the newborn needs to be seen by the PHCP.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 220-221.

3. Answer: 2

Rationale: The highest priority on admission to the nursery for a newborn with a low Apgar score is the airway, which would involve preparing respiratory resuscitation equipment and oxygen. The remaining options are also important, although they are of lower priority. The newborn would be placed on an apnea and cardiorespiratory monitor. Setting up an intravenous line with 5% dextrose in water would provide circulatory support. The radiant warmer would provide an external heat source, which is necessary to prevent further respiratory distress.

Test-Taking Strategy: Note the **strategic words**, *highest priority*. This question asks you to prioritize care on the basis of information about a newborn's condition. Although all options are correct, use the **ABCs—airway, breathing, and circulation**. A method of planning for airway support is to have the resuscitation bag connected to an oxygen source.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 199.

4. Answer: 3

Rationale: The penis is normally red during the healing process after circumcision. A yellow exudate may be noted in 24 hours, and this is part of normal healing. The nurse would expect that the area would be red with a small amount of bloody drainage. Only if the bleeding were excessive would the nurse apply gentle pressure with a sterile gauze. If bleeding cannot be controlled, the blood vessel may need to be ligated, and the nurse would notify the PHCP. Because the findings identified in the question are normal, the nurse would document the assessment findings.

Test-Taking Strategy: Note the **strategic words**, *most appropriate*, and focus on the assessment findings in the question. This will assist in directing you to the correct option, because this is a normal occurrence after circumcision.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 581-582.

5. Answer: 1, 2, 4, 5

Rationale: A newborn infant with respiratory distress syndrome may present with clinical signs of cyanosis, tachypnea or apnea, nasal flaring, chest wall retractions, or audible grunts. Hypotension and a barrel chest are not clinical manifestations associated with respiratory distress syndrome.

Test-Taking Strategy: Focus on the **subject**, signs of respiratory distress syndrome. Eliminate hypotension, as this is not a finding associated with respiratory distress syndrome. Also, respiratory distress syndrome is an acute occurrence, and a barrel chest develops with a chronic condition. In addition, note the relationship between the diagnosis and the signs noted in the correct options.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 657.

6. Answer: 2

Rationale: Hyperbilirubinemia is an elevated serum bilirubin level. At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process. Early and frequent feeding hastens the excretion of bilirubin. Breast/chest-feeding needs to be initiated within 2 hours after birth and every 2 to 4 hours thereafter. The infant should not be fed less frequently. Switching to bottle-feeding for 2 weeks or stopping breast/chest-feeding permanently is unnecessary.

Test-Taking Strategy: Eliminate options 3 and 4 because they are **comparable or alike**. These options discourage the continuation of breast/chest-feeding and should be eliminated. From the remaining options, recalling the pathophysiology associated with hyperbilirubinemia will assist you in eliminating option 1.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 528.

7. Answer: 3, 4, 5

Rationale: A newborn of a birthing parent who uses drugs is irritable. The infant is overloaded easily by sensory stimulation. The infant may cry incessantly and be difficult to console.

The infant would hyperextend and posture rather than cuddle when being held. This infant is not lethargic or sleepy.

Test-Taking Strategy: Lethargy and sleepiness are **comparable or alike** in that they indicate hypoactivity of the newborn; therefore, these options can be eliminated. From the remaining options, recalling the pathophysiology associated with an infant born to a drug-addicted parent and that such an infant is irritable will assist you in eliminating option 6, that this infant will cuddle when being held.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 322-323.

8. Answer: 2

Rationale: Fetal alcohol syndrome, a diagnostic category of fetal alcohol spectrum disorders (FASDs), is caused by birthing parent alcohol use during pregnancy. Features of newborns diagnosed with fetal alcohol syndrome include craniofacial abnormalities, intrauterine growth restriction, cardiac abnormalities, abnormal palmar creases, and respiratory distress. Options 1, 3, and 4 are normal assessment findings in the full-term newborn infant.

Test-Taking Strategy: Use knowledge regarding normal assessment findings in the full-term newborn infant to answer this question. Length, birth weight, and head circumference are **comparable or alike** in that all are physical measurements assessed on a newborn and represent normal findings in a full-term newborn.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 326; Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 777.

9. Answer: 4

Rationale: Fetal alcohol syndrome, a diagnostic category delineated under fetal alcohol spectrum disorders (FASDs), is caused by birthing parent alcohol use during pregnancy. A primary nursing goal for the newborn diagnosed with fetal alcohol syndrome is to establish nutritional balance after birth. These newborns may exhibit hyperirritability, vomiting, diarrhea, or an uncoordinated sucking and swallowing ability. A quiet environment with minimal stimuli and handling would help establish appropriate sleep-rest cycles in the newborn as well. Options 1, 2, and 3 are inappropriate interventions.

Test-Taking Strategy: Note the **strategic word**, *priority*. Think about the pathophysiology that occurs in a newborn with this condition. Also, use **Maslow's Hierarchy of Needs theory** to direct you to the correct option. Remember that nutrition is a priority.

References: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 326; Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 777.

10. Answer: 4

Rationale: Erythromycin ophthalmic ointment 0.5% is used as a prophylactic treatment for ophthalmia neonatorum, which is caused by the bacterium *Neisseria gonorrhoeae*.

Preventive treatment of gonorrhea is required by law. Options 1, 2, and 3 are not the purposes for administering this medication to a newborn infant.

Test-Taking Strategy: Note the **strategic word**, *best*. Use knowledge of the purpose of administering erythromycin ophthalmic ointment to a newborn infant. Remember that this is done to prevent ophthalmia neonatorum.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 571.

11. Answer: 4, 5, 6

Rationale: Phototherapy (bili-light or bili-blanket) is the use of intense fluorescent light to reduce serum bilirubin levels in the newborn. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur. Interventions include exposing as much of the newborn's skin as possible; however, the genital area is covered. The newborn's eyes are also covered with eye shields or patches, ensuring that the eyelids are closed when shields or patches are applied. The shields or patches are removed at least once per shift to inspect the eyes for infection or irritation and to allow eye contact. The nurse measures the lamp energy output to ensure efficacy of the treatment (done with a special device known as a *photometer*), monitors skin temperature closely, and increases fluids to compensate for water loss. The newborn may have loose green stools and green-colored urine. The newborn's skin color is monitored with the fluorescent light turned off every 4 to 8 hours and is monitored for bronze baby syndrome, a grayish brown discoloration of the skin. The newborn is repositioned every 2 hours, and stimulation is provided. After treatment, the newborn is monitored for signs of hyperbilirubinemia because rebound elevations can occur after therapy is discontinued.

Test-Taking Strategy: Focus on the **subject**, phototherapy. Recalling that adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur will assist in determining the correct interventions.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 671-673.

12. Answer: 2

Rationale: An infant born to a birthing parent infected with HIV must be cared for with strict attention to standard precautions. This prevents the transmission of HIV from the newborn, if infected, to others and prevents transmission of other infectious agents to the possibly immunocompromised newborn. Options 1 and 3 are not associated specifically with the care of a potentially HIV-infected newborn. Parents infected with HIV should not feed their newborn human milk.

Test-Taking Strategy: Eliminate options 1 and 3 first because they are **comparable or alike** and are not associated specifically with the care of a potentially HIV-infected newborn. Recalling that HIV-infected parents should not feed human milk will direct you to the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 772.

13. Answer: 2

Rationale: The newborn of a diabetic birthing parent is at risk for hypoglycemia, so maintaining safety because of low blood glucose levels would be a priority. The newborn would also be at risk for hyperbilirubinemia, respiratory distress, hypocalcemia, and congenital anomalies. Developmental delays, choking, and an elevated body temperature are not expected problems.

Test-Taking Strategy: Note the **strategic word**, *priority*. Read each option thoroughly and eliminate options 1, 3, and 4 because they are **comparable or alike** in that newborns of diabetic birthing parents are not at risk for these problems. Also, note the relationship between the words *diabetes mellitus* in the question and the word *glucose* in the correct option.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 619, 757.

14. Answer: 4

Rationale: Precautions to prevent infant abduction include placing a newborn's crib away from the door, transporting a newborn only in the crib and never carrying the newborn, expecting health care personnel to wear identification that is easily visible at all times, and asking the nurse to attend to the newborn if the parent is napping and no family member is available to watch the newborn (the newborn is never left unattended). If the parent states that the nurse will be asked to watch the newborn while sleeping, this indicates an understanding of the teaching. Options 1, 2, and 3 are incorrect and indicate that the parent needs further teaching.

Test-Taking Strategy: Focus on the **subject**, that the client understands precautions to prevent infant abduction. Read each option carefully, and select the option that provides protection to the infant. This will direct you to the correct option.
Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 578-579.

15. Answer: 4

Rationale: Phytonadione is necessary for the body to synthesize coagulation factors. It is administered to the newborn to prevent bleeding disorders. It also promotes liver formation of the clotting factors II, VII, IX, and X. Newborns are vitamin K-deficient because the bowel does not have the bacteria necessary to synthesize fat-soluble vitamin K. The normal flora in the intestinal tract produces vitamin K. The newborn's bowel does not support the normal production of vitamin K until bacteria adequately colonize it. The bowel becomes colonized by bacteria as food is ingested. Vitamin K does not promote the development of immunity or prevent the infant from becoming jaundiced.

Test-Taking Strategy: Note the **strategic word**, *best*. Because immunity and jaundice are not related to the action of vitamin K, eliminate options 1 and 2. From the remaining options, recall the action of vitamin K to direct you to the correct option. Remember that vitamin K does not promote the growth of bacteria but is administered to prevent bleeding.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 505.

CHAPTER 29

Maternity and Newborn Medications

Contributors: Margaret Trnka, MSN, RN
James Guilbault, PharmD, BS, RPh

PRIORITY CONCEPTS Health Promotion, Safety

The Food and Drug Administration has initiated the Pregnancy and Lactation Labeling Rule (PLLR). This is a revision to the previous system that used Category A, B, C, D, and X; the PLLR has removed pregnancy letter categories. The PLLR provides more information on the risks and benefits of using medications during pregnancy. The PLLR also provides more information to assist the provider and pregnant client to make informed decisions together, so as to not deter medication use during pregnancy when it is necessary.

I. Tocolytics

- A. Description: Tocolytics are medications that produce uterine relaxation and suppress uterine activity (Table 29.1).
- B. Uses: To halt uterine contractions and prevent preterm birth
- C. Adverse effects and contraindications
 1. See Table 29.1 for a description of adverse effects.
 2. Client contraindications include severe preeclampsia and eclampsia, active vaginal bleeding, intrauterine infection, cardiac disease, placental abruption, or poorly controlled diabetes.
 3. Fetal contraindications include estimated gestational age greater than 37 weeks, cervical dilation greater than 4 cm, fetal demise, lethal fetal anomaly, chorioamnionitis, acute fetal distress, and chronic intrauterine growth restriction.
- D. Interventions for the client receiving tocolytic therapy
 1. Position the client on the side to enhance placental perfusion and reduce pressure on the cervix.
 2. Monitor client's vital signs, fetal status, and labor status frequently according to agency protocol.
 3. Monitor for signs of adverse effects to the medication.
 4. Monitor daily weight and input and output status, and provide fluid intake as prescribed.

5. Offer comfort measures and provide psychosocial support to the client and family.
6. See Table 29.1 for interventions specific to each tocolytic medication.

II. Magnesium Sulfate

- A. Description (Table 29.1)
 1. Magnesium sulfate is a central nervous system depressant and antiseizure medication.
 2. The medication causes smooth muscle relaxation.
 3. The antidote is calcium gluconate.
- B. Uses
 1. Stopping preterm labor to prevent preterm birth, although it is less commonly used for this effect in practice
 2. Preventing and controlling seizures in preeclamptic and eclamptic clients
- C. Adverse effects and contraindications
 1. Magnesium sulfate can cause respiratory depression, depressed reflexes, flushing, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.
 2. Continuous intravenous (IV) infusion increases the risk of magnesium toxicity in the newborn.
 3. Magnesium sulfate may be prescribed for the first 12 to 24 hours postpartum if it is used for preeclampsia.
 4. High doses can cause loss of deep tendon reflexes, heart block, respiratory paralysis, and cardiac arrest.
 5. The medication is contraindicated in clients with heart block, myocardial damage, or kidney failure.
 6. The medication is used with caution in clients with kidney impairment.
- D. Interventions
 1. Assess client and fetus to obtain baseline before beginning therapy and then throughout therapy. Follow agency protocol.

TABLE 29.1 Tocolytics

Medication, Classification, and Actions	Adverse Effects	Nursing Interventions
Indomethacin—Nonsteroidal antiinflammatory drug (NSAID); prevents the body from releasing prostaglandins and cytokines; as a result, delays preterm delivery when given at the onset of preterm labor	<i>Client</i> —Indigestion (lessened if taken with food or an antacid); vaginal bleeding <i>Fetus</i> —Reduced urine output; if the fetus produces a reduced amount of urine, the amount of amniotic fluid may also be reduced Ductus arteriosus; the ductus usually doesn't close prematurely when indomethacin is used for less than 48 hours (it is also less likely to be a problem before 32 weeks of pregnancy) Places the fetus at risk for necrotizing enterocolitis, intraventricular hemorrhage, periventricular leukomalacia (a type of brain injury)	In most circumstances, should not be used for more than 2 to 3 days at a time. Should be avoided in those who are more than 32 weeks pregnant because of the risk of ductus arteriosus in the fetus. Needs to be avoided in those with a history of ulcers, bleeding disorders, or kidney or liver disease. Amniotic fluid levels should be checked regularly by an ultrasound; the amount of amniotic fluid almost always returns to normal once indomethacin is discontinued. If a pregnant client takes indomethacin for more than 2 days, an ultrasound of the fetal heart needs to be done to be sure the blood vessel hasn't been affected.
Magnesium sulfate—Central nervous system depressant; relaxes smooth muscle, including the uterus; used to halt preterm labor contractions; used for preeclamptic clients to prevent seizures	<i>Client</i> —Depressed respirations, depressed DTRs, hypotension, extreme muscle weakness, flushing, decreased urine output, pulmonary edema, serum magnesium levels >7.5 mEq/L (>3.75 mmol/L) <i>Fetus</i> —Hypotonia and sleepiness	Always use intravenous controller device for administration Follow agency protocol for administration Discontinue infusion and notify PHCP if adverse effects occur Monitor for respirations <12/min, urine output <100 mL/4 hr (<25-30mL/hr) Monitor DTRs Monitor magnesium levels and report values outside therapeutic range of 4 to 7.5 mEq/L (2 to 3.75 mmol/L) Keep calcium gluconate readily accessible (antidote)
Nifedipine—Calcium channel blocker; relaxes smooth muscles, including the uterus, by blocking calcium entry; in some health care agencies, this may be the first-line agent to halt preterm labor contractions	<i>Client</i> —Tachycardia, hypotension, dizziness, headache, nervousness, facial flushing, fatigue, nausea <i>Fetus</i> —May cause vascular dilation	Follow agency protocol for administration Use with magnesium sulfate is avoided because severe hypotension can occur Monitor for adverse effects

DTRs, Deep tendon reflexes.

Data from Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 687-688; Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 442-443.

2. Monitor client's vital signs, especially respirations, every 30 to 60 minutes.
3. Assess renal function and electrocardiogram for cardiac function.
4. Monitor magnesium levels every 6 hours or if signs and symptoms of toxicity are noted—the target range when used as a tocolytic agent is 4 to 7.5 mEq/L (2 to 3.75 mmol/L); if the magnesium level increases, notify the obstetrician (OB).
5. Always administer by IV infusion via an infusion monitoring device; carefully monitor the dose being administered, and follow agency protocol for administration.
6. Keep calcium gluconate along with syringes and needles readily accessible in case of a magnesium sulfate overdose, because calcium gluconate antagonizes the effect of magnesium sulfate.
7. Place resuscitation equipment (suction and oxygen) in the room.
8. Monitor deep tendon reflexes hourly for signs of developing toxicity.
9. Test the patellar reflex or knee jerk reflex before administering a repeat parenteral dose (used as an indicator of central nervous system depression; suppressed reflex may be a sign of impending respiratory arrest) (Table 29.2).

TABLE 29.2 Assessing Deep Tendon Reflexes

Grade	Deep Tendon Reflex Response
0	No response
1	Sluggish or diminished
2	Active or expected response
3	More brisk than expected, slightly hyperactive
4	Brisk, hyperactive, with intermittent or transient clonus

Data from Ball, J., Dains, J., Flynn, J., Solomon, B., & Stewart, R. (2019). *Seidel's guide to physical examination: An interprofessional approach*. (9th ed.). St. Louis: Elsevier. pp. 587-588.

10. Patellar reflex must be present and respiratory rate must be greater than 12 breaths per minute (or as designated by agency protocol) before each parenteral dose.
11. Monitor intake and output hourly; output should be maintained at 25 to 30 mL/hr because the medication is eliminated through the kidneys.

 **Closely monitor a client receiving magnesium sulfate intravenously for signs of toxicity. Call the obstetrician (OB) or primary health care provider (PHCP) if respirations are 12 breaths per minute or less, indicating respiratory depression, or if any other adverse effects occur.**

III. Betamethasone and Dexamethasone

- A. Description: Corticosteroids that increase the production of **surfactant** to accelerate fetal lung maturity and reduce the incidence or severity of respiratory distress syndrome
- B. Use: For a client in preterm labor between 28 and 32 weeks' gestation whose labor can be inhibited for 48 hours without jeopardizing the pregnant client or fetus
- C. Adverse effects and contraindications
 1. May decrease the client's resistance to infection
 2. Pulmonary edema secondary to sodium and fluid retention can occur.
 3. Elevated blood glucose levels can occur in a client with diabetes mellitus.
- D. Interventions
 1. Monitor client's vital signs and lung sounds, and for edema.
 2. Monitor for signs of infection.
 3. Monitor white blood cell count.
 4. Monitor blood glucose levels.
 5. Administer by deep intramuscular injection.

IV. Analgesics

- A. Description
 1. Used to relieve moderate to severe pain associated with **labor**

2. Commonly used analgesics: systemic nonopioid analgesics and opioid analgesics
3. Regular use of opioids during pregnancy may produce withdrawal symptoms in the newborn (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, and seizures).
4. Antidote for opioids
 - a. Naloxone is usually the treatment of choice because it rapidly reverses opioid toxicity; the dose may need to be repeated every few hours until opioid concentrations have decreased to nontoxic levels.
 - b. Naloxone can cause withdrawal in opioid-dependent clients.
- B. Interventions with use of opioids
 1. Monitor vital signs, particularly respiratory status; if respirations are 12 breaths per minute or less, withhold the medication and contact the PHCP.
 2. Monitor the fetal heart rate and characteristics of uterine contractions.
 3. Monitor for blood pressure changes (hypotension); maintain the client in a recumbent position (elevate the hip with a wedge pillow or other device).
 4. Record the level of pain relief.
 5. Monitor the bladder for distention and retention.
 6. Have the antidote naloxone readily accessible, especially if delivery is expected to occur during peak medication absorption time.

 **Obtain a medication history before the administration of an opioid analgesic. Some medications may be contraindicated if the client has a history of opioid dependency, because these medications can precipitate withdrawal symptoms in the client and newborn once stopped. Alternate pain control measures should be used.**

V. Prostaglandins (Box 29.4)

- A. Description
 1. Ripen the cervix, making it softer and causing it to begin to dilate and efface
 2. Stimulate uterine contractions
 3. Administered vaginally
- B. Uses
 1. Preinduction cervical ripening (ripening of the cervix before the induction of labor when the Bishop score is ≤ 4)
 2. Induction of labor
 3. Induction of abortion (abortifacient agent)
- C. Adverse effects and contraindications
 1. Gastrointestinal effects, including diarrhea, nausea, vomiting, and stomach cramps
 2. Fever, chills, flushing, headache, and hypotension

BOX 29.1 Prostaglandins

Prostaglandin E₁: Misoprostol intravaginal tablet
Prostaglandin E₂: Dinoprostone vaginal gel, insert, or suppository

3. Uterine tachysystole (≥ 12 uterine contractions in 20 minutes without an alteration in the fetal heart rate pattern)
4. Hyperstimulation of the **uterus**
5. Fetal passage of meconium
6. Contraindications (**Box 29.2**)

D. Interventions

1. Monitor client's vital signs, fetal heart rate pattern, and status of pregnancy, including indications for cervical ripening or the induction of labor, contraindications, adverse effects, signs of labor or impending labor, and the Bishop score (see **Chapter 24**, Table 24.2 for information about the Bishop score).
2. Have the client void before administration of medication and then have the client maintain a supine with lateral tilt or side-lying position for 30 to 60 minutes (gel) up to 2 hours (insert) after administration, depending on the medication administered.
3. Treatment is discontinued when the Bishop score is 8 or more (cervix ripens) or an effective contraction pattern is established (three or more contractions in a 10-minute period); in addition, signs of adverse effects indicate that the treatment needs to be discontinued.
4. Follow agency protocol for the induction of labor if cervical ripening has occurred and labor has not begun; oxytocin may be initiated if needed 6 to 12 hours after discontinuation of prostaglandin therapy.

VI. Uterine Stimulants (Oxytocics): Oxytocin**A. Description**

1. Oxytocin stimulates the smooth muscle of the **uterus** and increases the force, frequency, and duration of uterine contractions.
2. Oxytocin also promotes milk letdown.
3. For induction of labor, oxytocin is administered by the IV route (other route of administration is intramuscular); if injecting intramuscularly, aspiration is necessary to avoid injection into a blood vessel.
4. Magnesium sulfate should be readily accessible in case relaxation of the myometrium is necessary.
5. Minimal cervical change usually is noted until the active phase of labor is achieved.

B. Uses

1. Induces or augments labor
2. Controls postpartum bleeding
3. Manages an incomplete abortion

BOX 29.2 Contraindications to the Use of Prostaglandins

- Active cardiac, hepatic, pulmonary, or kidney disease
- Acute pelvic inflammatory disease
- Client fever or infection
- Clients in whom vaginal delivery is not indicated
- Fetal malpresentation
- History of cesarean section or major uterine surgery
- History of difficult labor or traumatic labor
- Hypersensitivity to prostaglandins
- Nonreassuring fetal heart rate pattern
- Placenta previa or unexplained vaginal bleeding
- Regular progressive uterine contractions
- Significant cephalopelvic disproportion

C. Adverse effects and contraindications

1. Adverse effects include allergies, dysrhythmias, changes in blood pressure, uterine rupture, and water intoxication.
2. Oxytocin may produce uterine hypertonicity, resulting in fetal or client adverse effects.
3. High doses may cause hypotension, with rebound hypertension.
4. Postpartum hemorrhage can occur and should be monitored for, because the uterus may become atonic when the medication wears off.
5. Oxytocin should not be used in a client who cannot deliver vaginally or in a client with hypertonic uterine contractions; it is also contraindicated in a client with active genital herpes.

D. Interventions

1. Monitor the client's vital signs (every 15 minutes), especially the blood pressure and heart rate, weight, intake and output, level of consciousness, and lung sounds.
2. Monitor frequency, duration, and force of contractions and resting uterine tone every 15 minutes.
3. Monitor fetal heart rate every 15 minutes, and notify the PHCP if significant changes occur; use of an internal fetal scalp electrode may be prescribed.
4. The medication is administered by IV infusion via an infusion monitoring device (most common route); prescribed additive solution is piggybacked at the port nearest the point of venous insertion (prescribed additive solution may be normal saline, lactated Ringer's, or 5% dextrose in water).
5. Carefully monitor the dose being administered; do not leave the client unattended while the oxytocin is infusing.
6. Administer oxygen if prescribed.
7. Monitor for hypertonic contractions or a nonreassuring fetal heart rate, and notify the PHCP if these occur (see **Clinical Judgment: Take Action**).

⚡ CLINICAL JUDGMENT: TAKE ACTION

A maternity nurse is caring for a pregnant client who is receiving oxytocin to induce labor. The nurse notes absent variability on the fetal heart monitor and takes the following actions:

- Stops the oxytocin infusion.
- Turns the client on the side, stays with the client, and asks another nurse to contact the PHCP.
- Increases the flow rate of the intravenous (IV) solution that does not contain the oxytocin.
- Administers oxygen, 8 to 10 L/minute, by snug face mask.
- Assesses client's vital signs; fetal heart rate and patterns; and frequency, duration, and force of contractions.
- Documents the event, actions taken, and the response.

8. Stop the medication if uterine hyperstimulation or a nonreassuring fetal heart rate occurs; turn the client on the side, increase the IV rate of the prescribed additive solution, and administer oxygen via face mask.
9. Monitor for signs of water intoxication.
10. Have emergency equipment readily accessible.
11. Document the dose of the medication and the time the medication was started, increased, maintained, and discontinued; document the client's response.
12. Keep the client and family informed of the client's progress.
13. Calculating an oxytocin drip (Box 29.3)

VII. Medications Used to Manage Postpartum Hemorrhage (Box 29.4)

A. Ergot alkaloid

1. Description
 - a. Methylergonovine maleate is an ergot alkaloid.
 - b. Directly stimulates uterine muscle, increases the force and frequency of contractions, and produces a firm tetanic contraction of the uterus
 - c. Can produce arterial vasoconstriction and vasospasm of the coronary arteries
 - d. An ergot alkaloid is administered postpartum and is not administered before the birth of the placenta.
2. Uses
 - a. Postpartum hemorrhage
 - b. Postabortal hemorrhage resulting from atony or involution
3. Adverse effects and contraindications
 - a. Can cause nausea, uterine cramping, bradycardia, dysrhythmias, myocardial infarction, and severe hypertension

BOX 29.3 Calculating an Oxytocin Dose

Prescription: Oxytocin 2 milliunits (mU)/minute
Available: 20 units (U) in 1000 mL 5% dextrose in water (D₅W)

How many mL per hour?

Steps for calculating:

1. Do you need to convert? Yes, you need to change mU to U
2. What has been prescribed? Oxytocin 2 mU/minute
3. What do you have available? 1000 mL D₅W containing 20 U oxytocin
4. Set up formula:

Convert:

$$1000\text{mU}:1\text{U} = 2\text{mU}:X$$

How many mU are in 1 U? There are 1000 mU in 1 U. If there are 1000 mU in 1 U, how many units in 2 mU? There are: 0.002 U in 2 mU

Now use the standard formula for calculation.

$$\text{prescribed/Available} \times \text{Volume}$$

$$0.002\text{U}/20\text{U} \times 1000\text{mL} = 0.1\text{mL}$$

Now, determine how many milliliters should be given in 1 hour if the prescription is for 0.1 mL/minute.

$$0.1\text{mL/minute} \times 60\text{minutes (1hour)} = 6\text{mL/hr}$$

Answer: 6 mL/hr

Note: Many electronic pumps allow for programming in units or milliunits per minute, eliminating the need to calculate the milliliters per hour, and this practice is recommended if available because medications are programmed in the pumps with dosage safeguards. If a dose that is too low or too high is programmed into the pump, the pump will flag or will not allow the nurse to proceed with administration. *References:* Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care*. (10th ed.). St. Louis: Elsevier. p. 784; Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 407-408.

BOX 29.4 Medications Used to Manage Postpartum Hemorrhage

- Methylergonovine
- Oxytocin
- Prostaglandin F_{2α}: Carboprost tromethamine

- b. High doses are associated with peripheral vasospasm or vasoconstriction, angina, miosis, confusion, respiratory depression, seizures, or unconsciousness; uterine tetany can occur.
 - c. Contraindicated during pregnancy and in clients with significant cardiovascular disease, peripheral vascular disease, or hypertension
4. Interventions
 - a. Monitor client's vital signs, weight, intake and output, level of consciousness, and lung sounds.
 - b. Monitor the blood pressure closely; the medication produces vasoconstriction, and if an

increase in blood pressure is noted, withhold the medication and notify the PHCP.

- c. Monitor uterine contractions (frequency, strength, and duration).
- d. Assess for chest pain, headache, shortness of breath, itching, pale or cold hands or feet, nausea, diarrhea, and dizziness.
- e. Assess the extremities for color, warmth, movement, and pain.
- f. Assess vaginal bleeding.
- g. Notify the PHCP if chest pain or other adverse effects occur.
- h. Administer analgesics as prescribed; they may be required because the medication produces painful uterine contractions.

 Check the client's blood pressure before administering methylergonovine maleate. This medication can cause severe hypertension and is contraindicated in a client with hypertension.

- B. Prostaglandin F_{2α}: carboprost tromethamine
 1. Description: Contracts the uterus
 2. Uses: Postpartum hemorrhage
 3. Adverse effects and contraindications
 - a. Can cause headache, nausea, vomiting, diarrhea, fever, tachycardia, and hypertension
 - b. Contraindicated if the client has asthma
 4. Interventions
 - a. Monitor vital signs.
 - b. Monitor vaginal bleeding and uterine tone.
- C. Oxytocin: See Section VI on uterine stimulants.

VIII. Rh₀(D) Immune Globulin

- A. Description
 1. Prevention of anti-Rh₀(D) antibody formation is most successful if the medication is administered twice, at 28 weeks' gestation and again within 72 hours after delivery.
 2. Rh₀(D) immune globulin also should be administered within 72 hours after potential or actual exposure to Rh-positive blood and must be given with each subsequent exposure or potential exposure to Rh-positive blood.
- B. Use: To prevent isoimmunization in Rh-negative clients who are negative for Rh antibodies and exposed or potentially exposed to Rh-positive red blood cells by amniocentesis, chorionic villus sampling, transfusion, termination of pregnancy, abdominal trauma, or bleeding during pregnancy or the birth process
- C. Adverse effects and contraindications
 1. Elevated temperature
 2. Tenderness at the injection site
 3. Contraindicated for Rh-positive clients
 4. Contraindicated in clients with a history of systemic allergic reactions to preparations containing human immunoglobulins
 5. Note: Not administered to a newborn

D. Interventions

- Administer to the client by intramuscular injection at 28 weeks' gestation and within 72 hours after delivery.
- Never administer by the IV route.
- Monitor for temperature elevation.
- Monitor injection site for tenderness.

 Rho(D) immune globulin is of no benefit when the client has developed a positive antibody titer to the Rh antigen.

IX. Rubella Vaccine

- A. Given subcutaneously before hospital discharge to a nonimmune postpartum client
- B. Administered if the rubella titer is less than 1:8
- C. Adverse effects: Transient rash, hypersensitivity
- D. Contraindicated in a client with a hypersensitivity to eggs (check with the OB regarding administration)
- E. Interventions
 1. Assess for allergy to duck eggs, and notify the OB before administration if an allergy exists.
 2. Question administration if the client or other family members are immunocompromised.

 The client should avoid pregnancy for 1 to 3 months (or as prescribed) after immunization with rubella vaccine. Inform the client about the need to use a contraception method during this time.

X. Lung Surfactants

- A. Description
 1. Replenish surfactant and restore surface activity to the lungs to prevent and treat respiratory distress syndrome
 2. Administered to the newborn by the intratracheal route
- B. Use: To prevent or treat respiratory distress syndrome in premature newborns
- C. Adverse effects and contraindications
 1. Adverse effects include transient bradycardia and oxygen desaturation; pulmonary hemorrhage, mucous plugging, and endotracheal tube retraction can also occur.
 2. Surfactants are administered with caution in newborns at risk for circulatory overload.
- D. Interventions
 1. Instill surfactant through the catheter inserted into the newborn's endotracheal tube; avoid suctioning for at least 2 hours after administration.
 2. Monitor for bradycardia and decreased oxygen saturation during administration.
 3. Monitor respiratory status and lung sounds and for signs of adverse effects.

XI. Eye Prophylaxis for the Newborn**A. Description**

1. Preventive eye treatment against ophthalmia neonatorum in the newborn is required by law in the United States.
2. Ophthalmic forms of erythromycin are prescribed because it is bacteriostatic and bactericidal and provides prophylaxis against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*.

B. Use: As a prophylactic measure to protect against *N. gonorrhoeae* and *C. trachomatis*

C. Interventions

1. Clean the newborn's eyes before instilling the medication.
2. Do not flush the eyes after instillation.

 **Instillation of eye medication can be delayed for 1 hour after birth to facilitate eye contact and parent-newborn attachment and bonding.**

XII. Phytonadione**A. Description**

1. The newborn is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on phytonadione (also known as vitamin K), which is not synthesized until intestinal bacteria are present.
2. Newborns are deficient in phytonadione for the first 5 to 8 days of life because of the lack of intestinal bacteria.

B. Use: Prophylaxis and treatment of hemorrhagic disease of the newborn

C. Adverse effect: Can cause hyperbilirubinemia in the newborn (occurrence is rare)

D. Interventions

1. Protect the medication from light.
2. Administer during the early newborn period.
3. Administer by the intramuscular route in the lateral aspect of the middle third of the vastus lateralis muscle of the thigh.
4. Monitor for bruising at the injection site and for bleeding from the cord.
5. Monitor for jaundice, and monitor the bilirubin level because, although rare, the medication can cause hyperbilirubinemia in the newborn.

XIII. Hepatitis B Vaccine, Recombinant

A. Description: Given intramuscularly to the newborn before discharge home (refer to [Chapter 19](#) for information on immunizations)

B. Use: Recommended for all newborns to prevent hepatitis B

C. Adverse effects: Rash, fever, erythema, and pain at injection site

D. Interventions

1. Parental consent must be obtained.
2. Administer intramuscularly in the lateral aspect of the middle third of the vastus lateralis muscle.

3. If the infant was born to a birthing parent positive for hepatitis B surface antigen, hepatitis B immune globulin should be given within 12 hours of birth in addition to hepatitis B vaccine. Then follow the regularly scheduled hepatitis B vaccination schedule.

4. Document immunization administration on a vaccination card so that the parents have a record that the vaccine was administered.

XIV. Contraceptives**A. Description**

1. These medications contain a combination of estrogen and a progestin or a progestin alone and come in several different forms, including oral and intramuscular preparations and implants.
2. Estrogen-progestin combinations suppress ovulation and change the cervical mucus, making it difficult for sperm to enter.
3. Medications that contain only progestins are less effective than the combined medications.
4. Contraceptives usually are taken for 21 consecutive days and stopped for 7 days; the administration cycle is then repeated.
5. Contraceptives provide reversible prevention of pregnancy.
6. Contraceptives are useful in controlling irregular or excessive menstrual cycles.
7. Risk factors associated with the development of complications related to the use of contraceptives include smoking, obesity, and hypertension.
8. Contraceptives are contraindicated in those with hypertension, thromboembolic disease, cerebrovascular or coronary artery disease, estrogen-dependent cancers, and pregnancy.
9. Contraceptives should be avoided with the use of hepatotoxic medications.
10. Contraceptives interfere with the activity of bromocriptine mesylate and anticoagulants and increase the toxicity of tricyclic antidepressants.
11. Contraceptives may alter blood glucose levels.
12. Antibiotics may decrease the absorption and effectiveness of oral contraceptives.

B. Side and adverse effects

1. Breakthrough bleeding
2. Excessive formation of cervical mucus
3. Breast/chest tenderness
4. Hypertension
5. Nausea, vomiting

C. Interventions

1. Monitor vital signs and weight.
2. Instruct the client in the administration of the medication (it may take up to 1 week for full contraceptive effect to occur when the medication is begun).

3. Instruct the client with diabetes mellitus to monitor blood glucose levels carefully.
4. Instruct the client to report signs of thromboembolic complications.
5. Instruct the client to notify the OB if vaginal bleeding or menstrual irregularities occur or if pregnancy is suspected.
6. Advise the client to use an alternative method of birth control when taking antibiotics because these may decrease absorption of the oral contraceptive.
7. Instruct the client to perform breast self-examination regularly and about the importance of annual physical examinations.
8. Contraceptive patches
 - a. Designed to be worn for 3 weeks and removed for a 1-week period
 - b. Applied on clean, dry, intact skin on the buttocks, abdomen, upper outer arm, or upper torso
 - c. Instruct the client to peel away half of the backing on a patch, apply the sticky surface to the skin, remove the other half of the backing, and then press down on the patch with the palm for 10 seconds.
 - d. Instruct the client to change the patch weekly, using a new location for each patch.
 - e. If the patch falls off and remains off for less than 24 hours (such as when the client is sleeping or is unaware that it has fallen off), it can be reapplied if still sticky, or it can be replaced with a new patch.
 - f. If the patch is off for more than 24 hours, a new 4-week cycle must be started immediately.
9. Vaginal ring
 - a. Inserted into the vagina by the client, left in place for 3 weeks, and removed for 1 week
 - b. The medication is absorbed through mucous membranes of the vagina.
 - c. Removed rings should be wrapped in a foil pouch and discarded, not flushed down the toilet.
10. Implants and depot injections provide long-acting forms of birth control, from 3 months to 5 years in duration.

 If the client decides to discontinue the contraceptive to become pregnant, recommend that the client use an alternative form of birth control for 2 months after discontinuation to ensure more complete excretion of hormonal agents before conception.

XV. Fertility Medications (Box > .*)

A. Description

1. Fertility medications act to stimulate follicle development and ovulation in functioning ovaries and are combined with human chorionic gonad-

BOX 29.5 Fertility Medications

- Chorionic gonadotropin
- Clomiphene citrate
- Follitropin alfa
- Follitropin beta
- Menotropins
- Urofollitropin
- Cetrorelix
- Ganirelix

otropin to maintain the follicles once ovulation has occurred.

2. Fertility medications are contraindicated in the presence of primary ovarian dysfunction, thyroid or adrenal dysfunction, ovarian cysts, pregnancy, or idiopathic uterine bleeding.
 3. Fertility medications should be used with caution in clients with thromboembolic or respiratory disease.
- B. Side and adverse effects
1. Risk of multiple births and birth defects
 2. Ovarian overstimulation (abdominal pain, distention, ascites, pleural effusion)
 3. Headache, irritability
 4. Fluid retention and bloating
 5. Nausea, vomiting
 6. Uterine bleeding
 7. Ovarian enlargement
 8. Gynecomastia
 9. Rash
 10. Orthostatic hypotension
 11. Febrile reactions
- C. Interventions
1. Instruct the client regarding administration of the medication.
 2. Provide a calendar of treatment days and instructions on when intercourse should occur to increase therapeutic effectiveness of the medication.
 3. Provide information about the risks and hazards of multiple births.
 4. Instruct the client to notify the OB if signs of ovarian overstimulation occur.
 5. Inform the client about the need for regular follow-up for evaluation.

PRACTICE QUESTIONS

1. The nurse is monitoring a client who is receiving oxytocin to induce labor. Which assessment findings would cause the nurse to immediately discontinue the oxytocin infusion? Select all that apply.
 - 1. Fatigue
 - 2. Drowsiness
 - 3. Uterine hyperstimulation

4. Late decelerations of the fetal heart rate
5. Early decelerations of the fetal heart rate
2. A pregnant client is receiving magnesium sulfate for the management of preeclampsia. The nurse determines that the client is experiencing toxicity from the medication if which findings are noted on assessment? Select all that apply.
1. Proteinuria of 3+
2. Respirations of 10 breaths per minute
3. Presence of deep tendon reflexes
4. Urine output of 20 mL in an hour
5. Serum magnesium level of 4 mEq/L (2 mmol/L)
3. The nurse asks a nursing student to describe the procedure for administering erythromycin ointment to the eyes of a newborn. Which student statement indicates that further teaching is needed about administration of the eye medication?
1. "I will flush the eyes after instilling the ointment."
2. "I will clean the newborn's eyes before instilling ointment."
3. "I need to administer the eye ointment within 1 hour after delivery."
4. "I will instill the eye ointment into each of the newborn's conjunctival sacs."
4. A client in preterm labor (31 weeks) who is dilated to 4 cm has been started on magnesium sulfate, and contractions have stopped. If the client's labor can be inhibited for the next 48 hours, the nurse anticipates a prescription for which medication?
1. Nalbuphine
2. Betamethasone
3. Rh_o(D) immune globulin
4. Dinoprostone vaginal insert
5. Methylergonovine is prescribed for a client to treat postpartum hemorrhage. Before administration of methylergonovine, what is the priority assessment?
1. Uterine tone
2. Blood pressure
3. Amount of lochia
4. Deep tendon reflexes
6. The nurse is preparing to administer exogenous surfactant to a premature infant who has respiratory distress syndrome. The nurse prepares to administer the medication by which route?
1. Intradermal
2. Intratracheal
3. Subcutaneous
4. Intramuscular
7. An opioid analgesic is administered to a client in labor. The nurse assigned to care for the client ensures that which medication is readily accessible in the event that respiratory depression occurs?
1. Naloxone
2. Morphine sulfate
3. Betamethasone
4. Hydromorphone hydrochloride
8. Rh_o(D) immune globulin is prescribed for a client after delivery, and the nurse provides information to the client about the purpose of the medication. The nurse determines that the client understands the purpose if the client states that it will protect the next baby from which condition?
1. Having Rh-positive blood
2. Developing a rubella infection
3. Developing physiological jaundice
4. Being affected by Rh incompatibility
9. Methylergonovine is prescribed for a client with postpartum hemorrhage. Before administering the medication, the nurse would contact the obstetrician who prescribed the medication if which condition is documented in the client's medical history?
1. Hypotension
2. Hypothyroidism
3. Diabetes mellitus
4. Peripheral vascular disease
10. The nurse is monitoring a client in preterm labor who is receiving intravenous magnesium sulfate. The nurse would monitor for which adverse effects of this medication? Select all that apply.
1. Flushing
2. Hypertension
3. Increased urine output
4. Depressed respirations
5. Extreme muscle weakness
6. Hyperactive deep tendon reflexes

ANSWERS

1. Answer: 3, 4

Rationale: Oxytocin stimulates uterine contractions and is a pharmacological method to induce labor. Late decelerations, a nonreassuring fetal heart rate pattern, are an ominous sign, indicating fetal distress. Oxytocin infusion must be stopped when any signs of uterine hyperstimulation, late decelerations, or other adverse effects occur. Some obstetricians prescribe the administration of oxytocin in 10-minute pulsed infusions rather than as a continuous infusion. This pulsed method, which is more like endogenous secretion of oxytocin, is reported to be effective for labor induction and requires significantly less oxytocin use. Drowsiness and fatigue may be caused by the labor experience. Early decelerations of the fetal heart rate are a reassuring sign and do not indicate fetal distress.

Test-Taking Strategy: Note the **strategic word**, *immediately*. Focus on the **subject**, an adverse effect of oxytocin. Options 1 and 2 are **comparable or alike** and can be eliminated first. From the remaining options, recalling that early decelerations of the fetal heart rate are a reassuring sign will direct you to the correct options.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 409-410.

2. Answer: 2, 4

Rationale: Magnesium toxicity can occur from magnesium sulfate therapy. Signs of magnesium sulfate toxicity relate to the central nervous system depressant effects of the medication and include respiratory depression, loss of deep tendon reflexes, and a sudden decline in fetal heart rate and client's heart rate and blood pressure. Respiratory rate below 12 breaths per minute is a sign of toxicity. Urine output needs to be at least 25 to 30 mL per hour. Proteinuria of 3+ is an expected finding in a client with preeclampsia. Presence of deep tendon reflexes is a normal and expected finding. Therapeutic serum levels of magnesium are 4 to 7.5 mEq/L (2 to 3.75 mmol/L).

Test-Taking Strategy: Focus on the **subject**, magnesium toxicity. Eliminate option 3 first because it is a normal finding. Next, eliminate option 5, knowing that the therapeutic serum level of magnesium is 4 to 7.5 mEq/L (2 to 3.75 mmol/L). From the remaining options, recalling that proteinuria of 3+ would be noted and expected in a client with preeclampsia will direct you to the correct options.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 223.

3. Answer: 1

Rationale: Eye prophylaxis protects the newborn against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*. The eyes are not flushed after instillation of the medication because the flush would wash away the administered medication. Options 2, 3, and 4 are correct statements regarding the procedure for administering eye medication to the newborn.

Test-Taking Strategy: Note the **strategic words**, *further teaching is needed*. These words indicate a **negative event query**

and ask you to select an option that is an incorrect statement. Eliminate options 3 and 4 first because they are **comparable or alike** and relate to instilling the eye medication. From the remaining options, visualize the effect of each. This will direct you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 571.

4. Answer: 2

Rationale: Betamethasone, a glucocorticoid, is given to increase the production of surfactant to stimulate fetal lung maturation. It is administered to clients in preterm labor at 28 to 32 weeks of gestation if the labor can be inhibited for 48 hours. Nalbuphine is an opioid analgesic. Rh_o(D) immune globulin is given to Rh-negative clients to prevent sensitization. Dinoprostone vaginal insert is a prostaglandin given to ripen and soften the cervix and to stimulate uterine contractions.

Test-Taking Strategy: Focus on the **subject**, a client at 31 weeks' gestation. Recall that the preterm infant is at risk for respiratory distress syndrome because of immaturity and the inability to produce surfactant. Next, recalling the actions of the medications in the options and that betamethasone is used to increase the production of surfactant will direct you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 445.

5. Answer: 2

Rationale: Methylergonovine, an ergot alkaloid, is used to prevent or control postpartum hemorrhage by contracting the uterus. Methylergonovine causes continuous uterine contractions and may elevate the blood pressure. A priority assessment before the administration of the medication is to check the blood pressure. The obstetrician needs to be notified if hypertension is present. Although options 1, 3, and 4 may be components of the postpartum assessment, blood pressure is related specifically to the administration of this medication.

Test-Taking Strategy: Note the **strategic word**, *priority*. Eliminate options 1 and 3 first because they are **comparable or alike** and related to one another. To choose from the remaining options, use the **ABCs—airway, breathing, and circulation**. Blood pressure is a method of assessing circulation. **Reference:** Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 498.

6. Answer: 2

Rationale: Respiratory distress syndrome is a serious lung disorder caused by immaturity and the inability to produce surfactant, resulting in hypoxia and acidosis. It is common in premature infants and may be due to lung immaturity as a result of surfactant deficiency. The mainstay of treatment is the administration of exogenous surfactant, which is administered by the intratracheal route. Options 1, 3, and 4 are not routes of administration for this medication.

Test-Taking Strategy: Focus on the **subject**, route of administration for exogenous surfactant. Note the relationship

between the diagnosis, *respiratory distress syndrome*, and the correct option, *intratracheal*.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. pp. 739-740.

7. Answer: 1

Rationale: Opioid analgesics may be prescribed to relieve moderate to severe pain associated with labor. Opioid toxicity can occur and cause respiratory depression. Naloxone is an opioid antagonist, which reverses the effects of opioids and is given for respiratory depression. Morphine sulfate and hydromorphone hydrochloride are opioid analgesics. Betamethasone is a corticosteroid administered to enhance fetal lung maturity.

Test-Taking Strategy: Focus on the **subject**, the antidote for respiratory depression. Eliminate options 2 and 4 first because they are **comparable or alike** and are opioid analgesics. Next, eliminate option 3, knowing that this medication is a corticosteroid.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 345.

8. Answer: 4

Rationale: Rh incompatibility can occur when an Rh-negative birthing parent becomes sensitized to the Rh antigen. Sensitization may develop when an Rh-negative birthing parent becomes pregnant with a fetus that is Rh positive. During pregnancy and at delivery, some of the fetus's Rh-positive blood can enter the client's circulation, causing the client's immune system to form antibodies against Rh-positive blood. Administration of Rh_o(D) immune globulin prevents the client from developing antibodies against Rh-positive blood by providing passive antibody protection against the Rh antigen.

Test-Taking Strategy: Note the **subject**, the purpose of Rh_o(D) immune globulin. Noting the relationship between the name of the medication, Rh_o(D) immune globulin, and

the word *incompatibility* in the correct option will direct you to this option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. pp. 231-232.

9. Answer: 4

Rationale: Methylergonovine is an ergot alkaloid used to treat postpartum hemorrhage. Ergot alkaloids are contraindicated in clients with significant cardiovascular disease, peripheral vascular disease, hypertension, preeclampsia, or eclampsia. These conditions are worsened by the vasoconstrictive effects of the ergot alkaloids. Options 1, 2, and 3 are not contraindications related to the use of ergot alkaloids.

Test-Taking Strategy: Focus on the **subject**, the purpose, action, and contraindications of methylergonovine. Recalling that ergot alkaloids produce vasoconstriction will direct you to the correct option.

Reference: Murray, S., McKinney, E., Holub, K., & Jones, R. (2019). *Foundations of maternal-newborn and women's health nursing*. (7th ed.). St. Louis: Elsevier. p. 498.

10. Answer: 1, 4, 5

Rationale: Magnesium sulfate is a central nervous system depressant and relaxes smooth muscle, including the uterus. It is used to halt preterm labor contractions and is used for pre-eclamptic clients to prevent seizures. Adverse effects include flushing, depressed respirations, depressed deep tendon reflexes, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.

Test-Taking Strategy: Focus on the **subject**, adverse effects of magnesium sulfate. Recalling that this medication is a central nervous system depressant that relaxes smooth muscle will assist you in choosing the correct options.

Reference: Lowdermilk, D., Perry, S., Cashion, K., Alden, K., & Olshansky, E. (2020). *Maternity & women's health care*. (12th ed.). St. Louis: Elsevier. p. 687.

Pediatric Nursing

Pyramid to Success

Pyramid Points focus on growth and development, safety, and age-appropriate measures to ensure a safe and hazard-free environment for the child; on protection of the child and the prevention of accidents; and on acute health problems that can occur in children. Preventive pediatric health care including immunizations and well-check schedules is a focus along with nutrition, specific feeding techniques, positioning techniques, and interventions that will provide and maintain adequate airway, breathing, and circulation patterns in the child. In addition, neglect and/or abuse of the child is a focus. On the NCLEX-RN® examination, be alert to the age of the child if the age is presented in a question. If an age is presented in the question, think about the specific growth and development characteristics of the age group to answer the question correctly.

Client Needs: Learning Outcomes

Safe and Effective Care Environment

- Communicating with interprofessional health care team members
- Considering issues related to informed consent regarding minors
- Delegating care safely
- Ensuring environmental safety, including home safety and personal safety, related to the developmental age of the child
- Instituting measures related to the spread and control of infectious agents, particularly communicable diseases
- Maintaining confidentiality
- Preventing errors and accidents
- Prioritizing hypotheses based on the child's needs
- Protecting the child and other contacts to prevent illness
- Providing continuity of care
- Providing protective measures
- Upholding parent and child rights

Health Promotion and Maintenance

- Ensuring that immunization schedules are up to date
- Focusing on developmental stages when planning care
- Performing physical assessment techniques specific to the pediatric client
- Preventing disease in the pediatric population
- Providing health promotion programs for the pediatric client such as preventive pediatric health care programs and well-check schedules
- Providing instructions to the child and parents regarding care at home

Psychosocial Integrity

- Communicating with the pediatric client
- Considering concepts of family dynamics when planning care
- Considering cultural, religious, and spiritual beliefs when planning care
- Considering end-of-life issues and grief and loss in the pediatric population
- Identifying family and support systems for the child
- Providing play therapies
- Recognizing cues of neglect and/or abuse

Physiological Integrity

- Evaluating outcomes of care
- Following medication administration procedures
- Following nutritional guidelines for the pediatric population
- Generating solutions for providing appropriate comfort measures for the child
- Maintaining sensitivity for intrusive procedures needed for the pediatric client
- Managing childhood health problems
- Monitoring elimination patterns
- Monitoring for age-appropriate normal body structure and function
- Monitoring for infectious diseases of the pediatric client
- Monitoring for responses to treatments
- Providing for consistent rest and sleep patterns
- Taking action in medical emergencies

CHAPTER 30

Integumentary Problems

Contributor: Necole Leland, DNP, RN, PNP, CPN

PRIORITY CONCEPTS Infection; Tissue Integrity

I. Eczema (Dermatitis)

A. Description

1. Superficial inflammatory process involving primarily the epidermis; there are many types, some of which include atopic dermatitis, contact dermatitis, and stasis dermatitis.
2. Associated with family history of the disorder, allergies, asthma, or allergic rhinitis
3. The major goals of management are to relieve pruritus, lubricate/hydrate the skin, reduce inflammation, and prevent or control secondary infections.

B. Forms of eczema (Box 30.1)

C. Assessment

1. Itching
2. Redness
3. Scaliness
4. Minute papules (firm, elevated, circumscribed lesions <1 cm in diameter) and vesicles (similar to papules but fluid-filled)
5. Weeping, oozing, and crusting of lesions
6. Lesions can occur on scalp and face, creases of elbows and knees, neck, wrists, and ankles. It is uncommon in all age-groups to see lesions in the axillary, gluteal, or groin area.

D. Interventions

1. Baths and moisturizers are important. Oatmeal baths are soothing as oatmeal has emollient characteristics. Bathing water needs to be tepid, with baths limited to 5 to 10 minutes and the skin moisturized immediately afterward. A thick cream or ointment would be used, such as petroleum jelly for the face or a thick moisturizing cream for the body.
2. If topical medications are prescribed, they need to be applied within 3 minutes after the bath. Topical medications are applied before creams or ointments.
3. Antihistamines and topical corticosteroids may be prescribed; corticosteroids are applied in a

thin layer and are rubbed into the area thoroughly.

4. Antibiotics may be prescribed if secondary infections occur.
5. Avoid exposure to skin irritants, such as irritating soaps, detergents, fabric softeners, diaper wipes, and powder.
6. Cool, wet compresses applied for short periods may help soothe the skin and alleviate itching; pat skin dry between cooling treatments.
7. Prevent or minimize scratching; keep nails short and clean, and place gloves or cotton socks over the hands.
8. Eliminate conditions that increase itching, such as wet diapers, excessive bathing, ambient heat, woolen clothes or blankets, and rough fabrics or furry stuffed animals; exposure to latex would also be avoided.
9. Instruct parents to wash clothing in a mild detergent and rinse thoroughly; putting the clothes through a second complete wash cycle without detergent minimizes the residue remaining on the fabric.
10. Instruct parents about measures to prevent skin infections.
11. Instruct parents to monitor lesions for signs of infection (honey-colored crusts with surrounding erythema) and to seek immediate medical intervention if such signs are noted.

BOX 30.1 Forms of Eczema

Infantile: Usually begins at 2 to 6 months of age and decreases in incidence with aging; spontaneous remission may occur by 3 years

Childhood: May follow the infantile form; occurs at 2 to 3 years of age

Preadolescent and Adolescent: Begins at about 12 years of age and may continue into the early adult years or indefinitely

⚠ A child with an integumentary disorder needs to be monitored for signs of either a skin infection or a systemic infection.

II. Impetigo

A. Description

1. Impetigo is a contagious bacterial infection of the skin caused by group A streptococcus (GAS; *Streptococcus pyogenes*) and *Staphylococcus aureus*; it occurs most commonly during hot, humid months.
2. Impetigo can occur because of poor hygiene; it can be a primary infection or occur secondarily at a site that has been injured or sustained an insect bite, or at a site that was originally a rash, such as atopic dermatitis, poison ivy, or poison oak.
3. The most common sites of infection are on the face and around the mouth, and then on the hands, neck, and extremities.
4. The lesions begin as vesicles or pustules surrounded by edema and redness (a pustule is similar to a vesicle except that its fluid content is purulent).
5. The lesions progress to an exudative and crusting stage; after the crusting of the lesions, the initially serous vesicular fluid becomes cloudy, and the vesicles rupture, leaving honey-colored crusts covering ulcerated bases.

B. Assessment (Fig. 30.1)

1. Blisters and honey-colored crusts
2. Erythema
3. Pruritus
4. Burning
5. Secondary lymph node involvement can be present

C. Interventions

1. Institute contact isolation; also use standard precautions and implement agency-specific isolation procedures for the hospitalized child; strict hygiene practices are important, because impetigo is a highly contagious condition.
2. Apply topical antibiotic ointments with a clean/sterile cotton swab without touching the tube opening with fingers or skin, and instruct parents in the ointment and swab use; the infection is still communicable for 24 hours beyond initiation of antibiotic treatment.
3. Cover lesions with gauze bandages and tape to prevent the spread of infection.
4. Assist the child with daily bathing with antibacterial soap, as prescribed.
5. Apply warm water compresses to the lesions 2 or 3 times daily, followed by mild soap and water rinse to soften crusts for removal and to promote healing.

FIG. 30.1 Impetigo contagiosa. (From Weston, Lane, 2007.)

6. May be treated with either topical or oral medications, or a combination, depending on the extent of the lesions; it is extremely important to comply with the prescribed antibiotic regimen, because secondary infections such as glomerulonephritis may result if the infectious agent is of a streptococcal type that can affect the nephrons.
7. To prevent skin cracking, apply emollients and instruct parents in the use of emollients. Keep the child's fingernails short.
8. Instruct parents in the methods to prevent the spread of the infection, especially careful hand-washing.
9. Inform parents that the child needs to use separate towels, linens, and eating utensils and dishes. Bleach the bathtub after each use.
10. Inform parents that all linens and clothing used by the child need to be washed with detergent in hot water separately from the linens and clothing of other household members.

III. Pediculosis capitis (Lice)

A. Description

1. *Pediculosis capitis* refers to an infestation of the hair and scalp with lice.
2. The most common sites of involvement are the occipital area, behind the ears at the nape of the neck, and occasionally the eyebrows and eyelashes.
3. The female louse lays eggs (nits) on the hair shaft, close to the scalp.
4. Lice can survive for 48 hours away from the host; nits shed in the environment can hatch in 7 to 10 days.
5. Head lice live and reproduce only on humans and are transmitted by direct and indirect contact, such as sharing of brushes, hats, towels, and bedding.

BOX 30.2 Assessment Findings: Pediculosis Capitis (Lice)

- Child scratches scalp excessively.
- Pruritus is caused by the crawling insect and insect saliva on the skin.
- Nits (white eggs) are observable on the hair shaft (it is important to differentiate nits from lint or dandruff, which flakes away easily).
- Adult lice are difficult to see and appear as small tan or grayish specks, which may crawl quickly.

6. All contacts of the infested child, especially siblings, need to be examined for lice infestation and referred for treatment as appropriate.

B. Assessment (Box 30.2)

C. Interventions

1. Use a pediculicide product as prescribed; follow package instructions for timing the application and for contraindications for use in children (most products used to treat pediculosis cannot be used on children younger than 6 months of age).
2. One product known as lindane shampoo would not be used in children younger than 2 years because of the risk of neurotoxicity and seizures; all other products have contraindications regarding their use, and it is critical to know these contraindications.
3. Daily removal of nits with an extra-fine-tooth metal nit comb needs to be done as a control measure after use of the pediculicide product (gloves need to be worn for removal of nits); hairbrushes or combs would be discarded or soaked in boiling water for 10 minutes.
4. Instruct parents that siblings may also need treatment; grooming items would not be shared, and a single comb or brush needs to be used for each individual child.
5. Instruct parents that bedding and clothing used by the child for the previous 2 days before diagnosis should be laundered in hot water with detergent and dried in a hot dryer for 20 minutes; bedding and clothing need to be changed daily and laundered.
6. Instruct parents that nonessential bedding and clothing can be stored in a tightly sealed plastic bag for 2 weeks and then washed.
7. Instruct parents to seal toys that cannot be washed or dry-cleaned in a plastic bag for 2 weeks.
8. Instruct parents that furniture and carpets need to be vacuumed frequently and that the dust bag from the vacuum should be discarded after vacuuming.

9. Teach the child not to share clothing, headwear, brushes, and combs.
10. Lice on the eyelashes or eyebrows may need to be removed manually.

IV. Scabies

A. Description

1. Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite).
2. Scabies is endemic among schoolchildren and institutionalized populations as a result of close personal contact.
3. Incubation period
 - a. The female mite burrows into the epidermis, lays eggs, and dies in the burrow after 4 to 5 weeks.
 - b. The eggs hatch in 3 to 5 days, and larvae mature and complete their life cycle.
4. Infectious period: During the entire course of the infestation

B. Assessment (Box 30.3 and Fig. 30.2)

 Scabies is transmitted by close personal contact with an infected person. Household members and contacts of an infected child need to be treated simultaneously.

C. Interventions

1. Topical application of a scabicide is needed to kill the mites.
2. Various products are available, and a prescription is needed for the product.
3. Instruct parents in the application of the scabicide, because each product has different application methods; the scabicide is not applied to the face or head, only from the neck down.
4. When permethrin is prescribed, it is applied to cool, dry skin at least 30 minutes after bathing; the cream is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of the feet (avoid contact with the eyes), left on the skin for 8 to 14 hours, and then removed by bathing; a repeat treatment may be necessary.
5. Instruct the parents about the importance of frequent handwashing.
6. Treatment also is recommended for all household members.
7. Instruct the parents that all clothing, bedding, and pillowcases used by the child need to be changed daily, washed in hot water with detergent, dried in a hot dryer, and ironed before re-use; this process should continue for at least 1 week.
8. Instruct parents that nonwashable toys and other items would be sealed in plastic bags for at least 4 days.

BOX 30.3 Assessment Findings: Scabies

- Pruritic papular rash
- Burrows into the skin (□ne grayish red lines that may be dif□cult to see)

FIG. 30.2 Scabies rash on an infant. (From Calen et al., 1993. Courtesy Dr. Steve Estes.)

9. Anti-itch topical treatment may be necessary, and antibiotics may be prescribed if a secondary infection develops.

V. Burn Injuries (see Clinical Judgment: Take Action Box)

⚡ CLINICAL JUDGMENT: TAKE ACTION

A nurse is called to a neighbor's house when the neighbor frantically screams that their toddler climbed on a chair and spilled a bowl of hot soup on their chest. The actions that the nurse would take include the following:

- Protect the child from further harm and stop the burning process.
- Assess for a patent airway.
- Begin resuscitation measures if necessary using CAB—compressions, airway, and breathing.
- Remove burned clothing and other restrictive items if not stuck to the skin.
- Cool the burned area under cool (not cold) running water or apply a clean cool, wet compress until the pain eases.
- Cover the wound with a clean cloth (sterile dressings are used on arrival to the health care facility).
- Keep the child warm.
- Call emergency medical services as soon as possible for transporting the child to the emergency department.

▲ A. Pediatric considerations

1. Very young children who have been burned severely have a higher mortality rate than older children and adults with comparable burns.

2. Lower burn temperatures and shorter exposure to heat can cause a more severe burn in a child than in an adult, because a child's skin is thinner.
 3. The degree of pain experienced by the child and the ability to communicate it are different than in an adult with the same exposure.
 4. Severely burned children are at increased risk for □uid and heat loss, dehydration, and metabolic acidosis compared with adults.
 5. The higher proportion of body □uid to body mass in children increases the risk of cardiovascular problems.
 6. Burns involving more than 10% of the total body surface area require some form of □uid resuscitation.
 7. Infants and children are at increased risk for protein and calorie de□iciency because they have smaller muscle mass and less body fat than adults.
 8. Scarring is more severe in a child; disturbed body image is a distinct issue for a child or adolescent, especially as **growth** continues.
 9. An immature immune system presents an increased risk of infection for infants and young children.
 10. A delay in growth may occur after a burn.
- B. Extent of burn injury
1. The rule of nines, used for adults with burn injuries, gives an inaccurate estimate in children because of the difference in body proportions between children and adults.
 2. In a pediatric client, the extent of the burn is expressed as a percentage of the total body surface area, using age-related charts (Fig. 30.3).
- C. Fluid replacement therapy

⚠ To determine the adequacy of □uid resuscitation, vital signs (especially heart rate), urine output, adequacy of capillary □illing, and sensorium status are assessed.

1. Fluid replacement is necessary during the initial 24-hour period after burn injury because of the □uid shifts that occur as a result of the injury.
2. Several formulas are available to calculate the child's □uid needs, and the formula used depends on the primary health care provider's preference.
3. Crystalloid solutions are likely to be prescribed during the initial phase of therapy; colloid solutions such as albumin, Plasma-Lyte (combined electrolyte solution), or fresh-frozen plasma are useful in maintaining plasma volume.

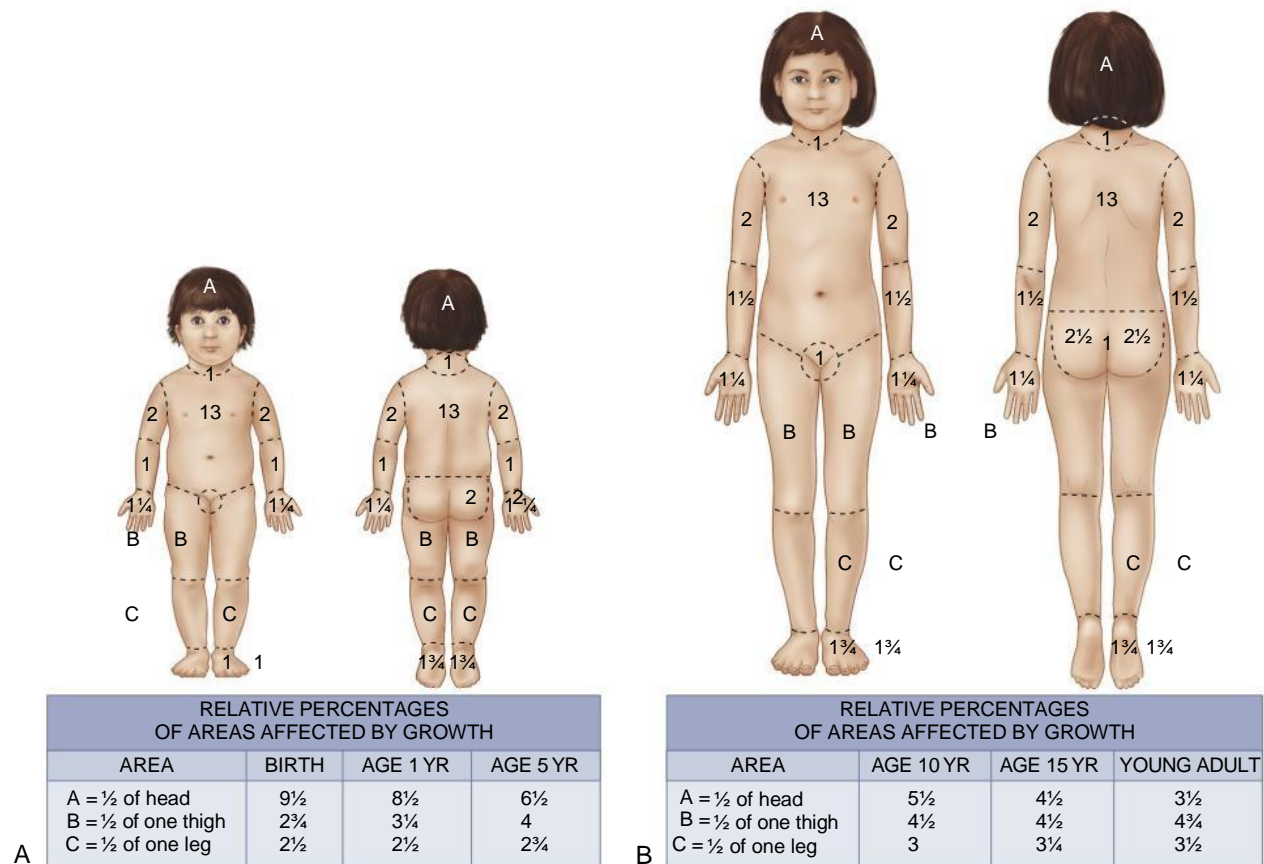

FIG. 30.3 Estimation of distribution of burns in children. A, Children from birth to age 5 years. B, Older children.

PRACTICE QUESTIONS

- The nurse is monitoring a child with burns during treatment. Which assessment provides the most accurate guide to determine the adequacy of fluid resuscitation?
 - Skin turgor
 - Level of edema at burn site
 - Adequacy of capillary filling
 - Amount of fluid tolerated in 24 hours
- The parent of a 3-year-old child arrives at a clinic and tells the nurse that the child has been scratching the skin continuously and has developed a rash. The nurse assesses the child and suspects the presence of scabies. The nurse bases this suspicion on which finding noted on assessment of the child's skin?
 - Fine grayish red lines
 - Purple-colored lesions
 - Thick, honey-colored crusts
 - Clusters of fluid-filled vesicles
- Permethrin is prescribed for a child with a diagnosis of scabies. The nurse would give which instruction to the parents regarding the use of this treatment?
 - Apply the lotion to areas of the rash only.
 - Apply the lotion and leave it on for 6 hours.
 - Avoid putting clothes on the child over the lotion.
 - Apply the lotion to cool, dry skin at least 30 minutes after bathing.
- The school nurse has provided an instructional session about impetigo to parents of the children attending the school. Which statement, if made by a parent, indicates a need for further instruction?
 - "It is extremely contagious."
 - "It is most common in humid weather."
 - "Lesions most often are located on the arms and chest."
 - "It might show up in an area of broken skin, such as an insect bite."
- The clinic nurse is reviewing the pediatrician's prescription for a child who has been diagnosed with lice. Lindane shampoo has been prescribed for the child. The nurse questions the prescription if which is noted in the child's record?
 - The child is 18 months old.
 - The child is being bottle-fed.
 - A sibling is using lindane for the treatment of lice.
 - The child has a history of frequent respiratory infections.

6. A topical corticosteroid is prescribed by the pediatrician for a child with contact dermatitis (eczema). Which instruction would the nurse give the parent about applying the cream?
 1. Apply the cream over the entire body.
 2. Apply a thick layer of cream to affected areas only.
 3. Avoid cleansing the area before application of the cream.
 4. Apply a thin layer of cream and rub it into the area thoroughly.
7. The school nurse is performing pediculosis capitis (head lice) assessments. Which assessment finding indicates that a child has a “positive” head check for lice?
 1. Maculopapular lesions behind the ears
 2. Lesions in the scalp that extend to the hairline or neck
 3. White flaky particles throughout the entire scalp region
 4. White sacs attached to the hair shafts in the occipital area
8. The nurse caring for a child who sustained a burn injury plans care based on which pediatric considerations associated with this injury? Select all that apply.
 - 1. Scarring is less severe in a child than in an adult.
 - 2. A delay in growth may occur after a burn injury.
 - 3. An immature immune system presents an increased risk of infection for infants and young children.
 - 4. Fluid resuscitation is unnecessary unless the burned area is more than 25% of the total body surface area.
 - 5. The lower proportion of body fluid to body mass in a child increases the risk of cardiovascular problems.
 - 6. Infants and young children are at increased risk for protein and calorie deficiency, because they have smaller muscle mass and less body fat than adults.

ANSWERS

1. Answer: 3

Rationale: Parameters such as vital signs (especially heart rate), urinary output volume, adequacy of capillary filling, and state of sensorium determine adequacy of fluid resuscitation. Although options 1, 2, and 4 may provide some information related to fluid volume, in a burn injury, and from the options provided, adequacy of capillary filling is most accurate.

Test-Taking Strategy: Note the **strategic word**, *most*. Use the **ABCs—airway, breathing, and circulation**—to assist in directing you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 766.

2. Answer: 1

Rationale: Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite). Scabies appears as burrows or fine, grayish red, threadlike lines. They may be difficult to see if they are obscured by excoriation and inflammation. Purple-colored lesions may indicate various disorders, including systemic conditions. Thick, honey-colored crusts are characteristic of impetigo or secondary infection in eczema. Clusters of fluid-filled vesicles are seen in herpesvirus infection.

Test-Taking Strategy: Focus on the **subject**, clinical manifestations of scabies. Think about the characteristic of this parasitic skin disorder. Recalling that scabies infestation produces burrows will assist in directing you to the correct option.

Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology*. (7th ed.). St. Louis: Elsevier. p. 1051.

3. Answer: 4

Rationale: Permethrin is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of the feet. Care needs to be taken to avoid contact with the eyes. The lotion would not be applied until at least 30 minutes after bathing and would be applied only to cool, dry skin. The lotion would be kept on for 8 to 14 hours, and then the child would be given a bath. The child would be clothed during the 8 to 14 hours of treatment contact time.

Test-Taking Strategy: Option 3 can be eliminated because the child would be clothed. Eliminate option 1 next because of the **closed-ended word** “only” in this option. From the remaining options, recalling the procedure for the application of this lotion will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1226.

4. Answer: 3

Rationale: Impetigo is a contagious bacterial infection of the skin caused by group A streptococcus (GAS; *Streptococcus pyogenes*) and *Staphylococcus aureus*. Impetigo is most common during hot, humid summer months. Impetigo may begin in an area of broken skin, such as an insect bite or atopic dermatitis. Impetigo is extremely contagious. Lesions usually are located around the mouth and nose but may be present on the hands and extremities.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Think about the pathophysiology associated with impetigo.

Knowledge regarding the cause and manifestations of impetigo will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1216-1217.

5. Answer: 1

Rationale: Lindane shampoo is a pediculicide product that may be prescribed to treat lice. It is contraindicated for children younger than 2 years because they have more permeable skin, and high systemic absorption may occur, placing the children at risk for central nervous system toxicity and seizures. Lindane shampoo also is used with caution in children between the ages of 2 and 10 years. Siblings and other household members can be treated simultaneously. Options 2 and 4 are unrelated to the use of lindane. Lindane is not recommended for use by a breast-feeding/chest-feeding parent because the medication is secreted into human milk.

Test-Taking Strategy: Focus on the **subject**, contraindications of lindane. Recall the concepts related to the treatment of an 18-month-old child, the body surface area of children, and medication administration. These concepts will direct you to the correct option.

Reference: Skidmore-Roth, L. (2021). *2021 Mosby's nursing drug reference*. (34th ed.). St. Louis: Elsevier. pp. 761-762.

6. Answer: 4

Rationale: Contact dermatitis is a superficial inflammatory process involving primarily the epidermis. A topical corticosteroid may be prescribed and would be applied sparingly (thin layer) and rubbed into the area thoroughly. The affected area would be cleaned gently before application. A topical corticosteroid would not be applied over extensive areas. Systemic absorption is more likely to occur with extensive application.

Test-Taking Strategy: Focus on the **subject**, application of a topical corticosteroid. Eliminate option 3 first because it does not make sense not to clean an affected area. Eliminate option 1 because medicated cream would be applied only to areas that are affected. Eliminate option 2 because of the word *thick*.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1219, 1233-1234.

7. Answer: 4

Rationale: Pediculosis capitis is an infestation of the hair and scalp with lice. The nits are visible and attached firmly to the hair shaft near the scalp. The occiput is an area in which nits can be seen. Maculopapular lesions behind the ears or lesions that extend to the hairline or neck are indicative of an infectious process, not pediculosis. White flaky particles are indicative of dandruff.

Test-Taking Strategy: Focus on the **subject**, the characteristics of pediculosis capitis. Option 3 can be eliminated first, because white flaky particles are indicative of dandruff. Recalling that in this infestation nit sacs attach to the hair shaft will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1226-1227.

8. Answer: 2, 3, 6

Rationale: Pediatric considerations in the care of a burn victim include the following: Scarring is more severe in a child than in an adult. A delay in growth may occur after a burn injury. An immature immune system presents an increased risk of infection for infants and young children. The higher proportion of body fluid to body mass in a child increases the risk of cardiovascular problems. Burns involving more than 10% of total body surface area require some form of fluid resuscitation. Infants and young children are at increased risk for protein and calorie deficiencies because they have smaller muscle mass and less body fat than adults.

Test-Taking Strategy: Focus on the **subject**, pediatric considerations in the care of a child who has sustained a burn injury. To answer correctly, read each option carefully and think about the physiology of a child related to body size.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 762.

PRIORITY CONCEPTS Perfusion; Safety

I. Sickle Cell Anemia

A. Description

1. Sickle cell anemia constitutes a group of diseases termed *hemoglobinopathies*, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S.
2. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain.
3. Risk factors include having parents heterozygous for hemoglobin S or being of African American descent.
4. For screening purposes, the sickle turbidity test (Sickledex) is frequently used because it can be performed on blood from a □ngerstick and yields accurate results in 3 minutes. However, if the test result is positive, hemoglobin (Hgb) electrophoresis is necessary to distinguish between children with the trait and those with the disease.
5. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell.
6. Insuf□cient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood □ow (Fig. 31.1).
7. The clinical manifestations occur primarily as a result of obstruction caused by sickled red blood cells and increased red blood cell destruction.
8. Situations that precipitate sickling include fever, dehydration, and emotional or physical stress; any condition that increases the need for oxygen or alters the transport of oxygen can result in sickle cell crisis (acute exacerbation).
9. Sickle cell crises are acute exacerbations of the disease, which vary considerably in severity and

frequency; these include vaso-occlusive crisis, splenic sequestration, hyperhemolytic crisis, and aplastic crisis.

10. The sickling response is reversible under conditions of adequate oxygenation and hydration; after repeated sickling, the cell becomes permanently sickled.
11. An interprofessional approach to care is needed, and care focuses on the prevention (preventing exposure to infection and maintaining normal hydration) and treatment (hydration, oxygen, pain management, and bed rest) of the crisis.

B. Assessment of the crisis (Box 31.1)

C. Interventions

1. Maintain adequate hydration and blood □ow through oral and intravenously (IV) administered □uids. Electrolyte replacement is also provided as needed; without adequate hydration, pain will not be controlled.
2. Administer oxygen and blood transfusions as prescribed to increase tissue perfusion; exchange transfusions, which reduce the number of circulating sickle cells and the risk of complications, may also be prescribed.
3. Administer analgesics as prescribed (around the clock).
4. Assist the child to assume a comfortable position so that the child keeps the extremities extended to promote venous return; elevate the head of the bed no more than 30 degrees, avoid putting strain on painful joints, and do not raise the knee gatch of the bed.
5. Encourage consumption of a high-calorie, high-protein diet, with folic acid supplementation.
6. Administration of hydroxyurea, an antimetabolite, which helps to prevent the formation of

FIG. 31.1 Differences between effects of (A) normal red blood cells and (B) sickled red blood cells on circulation, with related complications.

BOX 31.1 Sickle Cell Crisis

Vaso-Occlusive Crisis

Caused by stasis of blood with clumping of cells in the microcirculation, ischemia, and infarction

Manifestations: Fever; painful swelling of hands, feet, joints, or affected area; and abdominal pain

Splenic Sequestration

Caused by pooling and clumping of blood in the spleen (hypersplenism)

Manifestations: Profound anemia, hypovolemia, and shock

Hyperhemolytic Crisis

Caused by an accelerated rate of red blood cell destruction over a short time

Manifestations: Anemia, jaundice, and reticulocytosis

Aplastic Crisis

Caused by diminished production and increased destruction of red blood cells, triggered by viral infection or depletion of folic acid

Manifestations: Profound anemia and pallor

sickle-shaped red blood cells and to decrease the incidence of vaso-occlusive events.

7. Administer antibiotics as prescribed to prevent infection.
8. Monitor for signs of complications, including increasing anemia, decreased perfusion, and shock (mental status changes, pallor, vital sign changes).

9. Instruct the child and parents about the early signs and symptoms of crisis and the measures to prevent crisis.
10. Ensure that the child receives pneumococcal and meningococcal vaccines and an annual influenza vaccine, because of susceptibility to infection secondary to functional asplenia.
11. A splenectomy may be necessary for clients who experience recurrent splenic sequestration.
12. Inform parents of the hereditary aspects of the disorder.

! Administration of meperidine for pain is avoided because of the risk of normeperidine-induced seizures.

II. Hemophilia

A. Description

1. *Hemophilia* refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins.
2. Identifying the specific coagulation deficiency is important so that definitive treatment with the specific replacement agent can be implemented; aggressive replacement therapy is initiated to prevent the chronic crippling effects from joint bleeding.
3. The most common types are factor VIII deficiency (hemophilia A or classic hemophilia) and factor IX deficiency (hemophilia B or Christmas disease).

4. Hemophilia is transmitted as an X-linked recessive disorder (it may also occur as a result of a gene mutation).
5. Carrier females pass on the defect to males; female offspring are rarely born with the disorder but may be if they inherit an affected gene from their maternal parent and are offspring of a paternal parent with hemophilia.
6. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain or corticosteroids, may be prescribed, depending on the source of bleeding from the disorder.

B. Assessment

1. Abnormal bleeding in response to trauma or surgery (sometimes is detected after circumcision)
2. Epistaxis (nosebleeds)
3. Joint bleeding causing pain, tenderness, swelling, and limited range of motion (hemarthrosis)
4. Tendency to bruise easily
5. Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal.

C. Interventions (See [Clinical Judgment: Take Action](#))

1. Monitor for bleeding, and maintain bleeding precautions.
2. Prepare to administer factor VIII concentrates, either produced through genetic engineering (recombinant) or derived from pooled plasma, as prescribed.
3. DDAVP (1-deamino-8-d-arginine vasopressin), a synthetic form of vasopressin, increases plasma factor VIII and may be prescribed to treat mild hemophilia.
4. Monitor for joint pain; immobilize the affected extremity if joint pain occurs.
5. Assess neurological status (child is at risk for intracranial hemorrhage).
6. Monitor urine for hematuria.
7. Control joint bleeding by immobilization, elevation, and application of ice; apply pressure (15 minutes) for superficial bleeding.
8. Instruct the child and parents about the signs of internal bleeding.
9. Instruct parents in how to control the bleeding.
10. Instruct parents regarding activities for the child, emphasizing the avoidance of contact sports and the need for protective devices while learning to walk; assist in developing an appropriate exercise plan.
11. Instruct the child to wear protective devices such as helmets and knee and elbow pads when participating in sports such as bicycling and skating.

CLINICAL JUDGMENT: TAKE ACTION

A child with hemophilia who has been in a motor vehicle crash is admitted to the pediatric unit. The nurse would take the following actions in the care of the child:

- Assess injuries.
- Check for bleeding.
- Apply pressure for at least 15 minutes to any superficial bleeding areas.
- Monitor vital signs for indications of internal bleeding and hypovolemic shock.
- Place the child on bleeding precautions.
- Monitor for joint pain or joint bleeding.
- Treat joint bleeding with immobilization, elevation, and application of ice.
- Monitor the neurological status for signs of intracranial hemorrhage.
- Monitor the urine for hematuria.
- Administer blood replacement factors as prescribed.

III. Von Willebrand's Disease

A. Description

1. Von Willebrand's disease is a hereditary bleeding disorder that is characterized by a deficiency of or a defect in a protein termed *von Willebrand factor*.
2. The disorder causes platelets to adhere to damaged endothelium; the von Willebrand factor protein also serves as a carrier protein for factor VIII.
3. It is characterized by an increased tendency to bleed from mucous membranes.

B. Assessment

1. Epistaxis
2. Gum bleeding
3. Easy bruising
4. Excessive menstrual bleeding

C. Interventions

1. Treatment and care are similar to measures implemented for hemophilia, including administration of clotting factors.
2. Provide emotional support to the child and parents, especially if the child is experiencing an episode of bleeding.

 A child with a bleeding disorder needs to wear a MedicAlert bracelet.

IV. β -Thalassemia Major

A. Description ([Box 31.2](#))

1. β -Thalassemia major is an autosomal recessive disorder characterized by the reduced production of one of the globin chains in the synthesis

BOX 31.2 Types of β -Thalassemia

Thalassemia Minor: Asymptomatic silent carrier case

Thalassemia Trait: Produces mild microcytic anemia

Thalassemia Intermedia: Manifested as splenomegaly and moderate to severe anemia

Thalassemia Major: Results in severe anemia requiring transfusion support to sustain life (also known as Cooley's anemia)

of hemoglobin (both parents must be carriers to produce a child with β -thalassemia major).

2. The incidence is highest in individuals of Mediterranean descent, such as Italians, Greeks, Syrians, and their offspring.
3. Treatment is supportive; the goal of therapy is to maintain normal hemoglobin levels by the administration of blood transfusions.
4. Bone marrow transplantation may be offered as an alternative therapy.
5. A splenectomy may be performed in a child with severe splenomegaly who requires repeated transfusions (assists in relieving abdominal pressure and may increase the life span of supplemental red blood cells).

B. Assessment

1. Frontal bossing
2. Maxillary prominence
3. Wide-set eyes with a flattened nose
4. Greenish yellow skin tone
5. Hepatosplenomegaly
6. Severe anemia
7. Microcytic, hypochromic red blood cells

C. Interventions

1. Administer blood transfusions as prescribed; monitor for transfusion reactions.
2. Monitor for iron overload; chelation therapy with deferasirox or deferoxamine may be prescribed to treat iron overload and to prevent organ damage from the elevated levels of iron caused by the multiple transfusion therapy.
3. If the child has had a splenectomy, instruct parents to report any signs of infection because of the risk of sepsis.
4. Ensure that parents understand the importance of the child receiving pneumococcal and meningococcal vaccines in addition to an annual influenza vaccine and the regularly scheduled vaccines.
5. Provide genetic counseling to parents.

V. Iron-Deficiency Anemia

- A. In iron-deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells; red blood cells are microcytic and hypochromic.

- B. Excessive cow's milk intake (more than 24 ounces a day) and lack of adequate consumption of foods rich in iron are risk factors for iron-deficiency anemia in children.
- C. If iron supplementation is prescribed, it should not be given with milk because milk affects absorption.
- D. Refer to **Chapter 45** for additional information.

VI. Aplastic anemia

- A. A deficiency of circulating erythrocytes and all other formed elements of blood, resulting from the arrested development of cells within the bone marrow; pancytopenia, a deficiency of erythrocytes, leukocytes, and thrombocytes, occurs.
- B. Refer to **Chapter 45** for additional information.

! Liquid iron preparation may be prescribed to treat iron-deficiency anemia. Teach the parents and child that liquid iron needs to be taken through a straw and that the teeth need to be brushed after administration.

PRACTICE QUESTIONS

1. The nurse analyzes the laboratory results of a child with hemophilia. The nurse understands that which result will most likely be abnormal in this child?
 1. Platelet count
 2. Hematocrit level
 3. Hemoglobin level
 4. Partial thromboplastin time
2. The nurse is preparing home care instructions for the parents of a 10-year-old child with hemophilia. Which sport activity would the nurse suggest for this child?
 1. Soccer
 2. Basketball
 3. Swimming
 4. Field hockey
3. The nursing student is presenting a clinical conference and discusses the cause of β -thalassemia. The nursing student informs the group that a child at greatest risk of developing this disorder is which of these?
 1. A child of Mexican descent
 2. A child of Mediterranean descent
 3. A child whose intake of iron is extremely poor
 4. A breast-fed/chest fed child of a parent with chronic anemia
4. A child with β -thalassemia is receiving long-term blood transfusion therapy for the treatment of the

- disorder. Chelation therapy is prescribed as a result of too much iron from the transfusions. Which medication would the nurse anticipate being prescribed?
1. Dalteparin
 2. Meropenem
 3. Metoprolol
 4. Deferoxamine
5. The clinic nurse instructs parents of a child with sickle cell anemia about the precipitating factors related to sickle cell crisis. Which, if identified by the parents as a precipitating factor, indicates the need for further instruction?
1. Stress
 2. Trauma
 3. Infection
 4. Fluid overload
6. A 10-year-old child with hemophilia A has slipped on the ice and bumped the knee. The nurse would prepare to administer which prescription?
1. Injection of factor X
 2. Intravenous infusion of iron
 3. Intravenous infusion of factor VIII
 4. Intramuscular injection of iron using the Z-track method
7. The nurse is preparing to instruct the parents of a child with iron-deficiency anemia regarding the administration of a liquid oral iron supplement. Which instruction would the nurse give the parents?
1. Administer the iron at mealtimes.
 2. Administer the iron through a straw.
 3. Mix the iron with cereal to administer.
 4. Add the iron to formula for easy administration.
8. Laboratory studies are performed for a child suspected to have iron-deficiency anemia. The nurse reviews the laboratory results, knowing that which result indicates this type of anemia?
1. Elevated hemoglobin level
 2. Decreased reticulocyte count
 3. Elevated red blood cell count
 4. Red blood cells that are microcytic and hypochromic
9. The nurse is reviewing a pediatrician's prescriptions for a child with sickle cell anemia who was admitted to the hospital for the treatment of vaso-occlusive crisis. Which prescriptions documented in the child's record would the nurse question? Select all that apply.
- 1. Restrict fluid intake.
 - 2. Position for comfort.
 - 3. Avoid strain on painful joints.
 - 4. Apply nasal oxygen at 2 L/minute.
 - 5. Provide a high-calorie, high-protein diet.
 - 6. Give meperidine, 25 mg intravenously, every 4 hours for pain.
10. The nurse is conducting staff in-service training on von Willebrand's disease. Which would the nurse include as characteristics of von Willebrand's disease? Select all that apply.
- 1. Easy bruising occurs.
 - 2. Gum bleeding occurs.
 - 3. It is a hereditary bleeding disorder.
 - 4. Treatment and care are similar to that for hemophilia.
 - 5. It is characterized by extremely high creatinine levels.
 - 6. The disorder causes platelets to adhere to damaged endothelium.

ANSWERS

1. Answer: 4

Rationale: Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal. Abnormal laboratory results in hemophilia indicate a prolonged partial thromboplastin time. The platelet count, hemoglobin level, and hematocrit level are normal in hemophilia.

Test-Taking Strategy: Focus on the **subject**, laboratory tests used to monitor hemophilia, and note the **strategic words**, *most likely*. Recalling the pathophysiology associated with this disorder and recalling that it results from a deficiency of specific coagulation proteins will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's Nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1050.

2. Answer: 3

Rationale: Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Children with hemophilia need to avoid contact sports and to take precautions with other sports, such as wearing elbow and knee pads and helmets. The safe activity for them is swimming.

Test-Taking Strategy: Focus on the **subject**, a safe activity. Recalling that bleeding is a major concern in this condition, eliminate options 1, 2, and 4, because these activities are **comparable or alike** in that they present the potential for injury.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1053-1054.

3. Answer: 2

Rationale: β -Thalassemia is an autosomal recessive disorder characterized by the reduced production of one of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β -thalassemia major). This disorder is found primarily in individuals of Mediterranean descent. Options 1, 3, and 4 are incorrect.

Test-Taking Strategy: Focus on the **subject**, the child at greatest risk for β -thalassemia major. Think about the pathophysiology of the disorder. Remember that this disorder occurs primarily in individuals of Mediterranean descent.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1043.

4. Answer: 4

Rationale: β -Thalassemia is an autosomal recessive disorder characterized by the reduced production of one of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β -thalassemia major). The major complication of long-term transfusion therapy is hemosiderosis. To prevent organ damage from too much iron, chelation therapy with either deferasirox or deferoxamine may be prescribed. Deferoxamine is classified as an antidote for acute iron toxicity. Dalteparin is an anticoagulant used as prophylaxis for postoperative deep vein thrombosis. Meropenem is an antibiotic. Metoprolol is a beta blocker used to treat hypertension.

Test-Taking Strategy: Focus on the **subject**, chelation therapy. Specific knowledge regarding the antidote for iron toxicity is needed to answer this question. One way to remember this is to look at the prefix in the generic name of the medication used to treat iron overdose. Remember to associate *defer-* and removal of iron.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1043, 1046.

5. Answer: 4

Rationale: Sickle cell crises are acute exacerbations of the disease, which vary considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, hyperhemolytic crisis, and aplastic crisis. Sickle cell crisis may be precipitated by infection, dehydration, hypoxia, trauma, or physical or emotional stress. The parents of a child with sickle cell disease would encourage fluid intake of 1.5 to 2 times the daily requirement to prevent dehydration.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Recalling that fluids are a main component of treatment in sickle cell anemia to prevent crisis will direct you to the correct option. Remember that fluids are required to prevent dehydration.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1035, 1040-1041.

6. Answer: 3

Rationale: Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain, may be prescribed, depending on the source of bleeding from the disorder. A child with hemophilia A is at risk for joint bleeding after a fall. Factor VIII would be prescribed intravenously to replace the missing clotting factor and minimize the bleeding. Factor X and iron are not used to treat children with hemophilia A.

Test-Taking Strategy: Focus on the child's diagnosis. Eliminate options 2 and 4 because they are **comparable or alike**. Recalling that a child with hemophilia A is missing clotting factor VIII will direct you to the correct option from those remaining.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1050-1051, 1053.

7. Answer: 2

Rationale: In iron-deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. An oral iron supplement needs to be administered through a straw or medicine dropper placed at the back of the mouth, because the iron stains the teeth. The parents would be instructed to brush or wipe the child's teeth or have the child brush the teeth after administration. Iron is administered between meals because absorption is decreased if there is food in the stomach. Iron requires an acid environment to facilitate its absorption in the duodenum. Iron is not added to formula or mixed with cereal or other food items.

Test-Taking Strategy: Eliminate options 3 and 4 first because they are **comparable or alike** and because medication would not be added to formula and food. Next, note the word *liquid* in the question. This would assist you in recalling that iron in liquid form stains teeth.

Reference: Burchum, J., & Rosenthal, L. (2019). *Lehne's pharmacology for nursing care*. (10th ed.). St. Louis: Elsevier. p. 651.

8. Answer: 4

Rationale: In iron-deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. The results of a complete blood cell count in children with iron-deficiency anemia show decreased hemoglobin levels and microcytic and hypochromic red blood cells. The red blood cell count is decreased. The reticulocyte count is usually normal or slightly elevated.

Test-Taking Strategy: Focus on the **subject**, laboratory findings. Eliminate options 1 and 3 first, knowing that the hemoglobin and red blood cell counts would be decreased. From the remaining options, select the correct option over option 2 because of the relationship between anemia and red blood cells.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1031.

9. Answer: 1, 6

Rationale: Sickle cell anemia is one of a group of diseases termed *hemoglobinopathies*, in which hemoglobin A is partly

or completely replaced by abnormal sickle hemoglobin S. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell; insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow. Oral and intravenous fluids are an important part of treatment. Meperidine is not recommended for a child with sickle cell disease because of the risk for normeperidine-induced seizures. Normeperidine, a metabolite of meperidine, is a central nervous system stimulant that produces anxiety, tremors, myoclonus, and generalized seizures when it accumulates with repetitive dosing. The nurse would question the prescription for restricted fluids and meperidine for pain control. Positioning for comfort, avoiding strain on painful joints, oxygen, and a high-calorie and high-protein diet are also important parts of the treatment plan.

Test-Taking Strategy: Focus on the **subject**, identifying the prescriptions that need to be questioned and on the pathophysiology that occurs in sickle cell disease. Recalling that fluids are an important component of the treatment plan will assist in identifying that a fluid restriction prescription would need to be questioned. Also, recalling the effects of meperi-

dine will assist in identifying that this prescription needs to be questioned.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1027, 1041-1042.

10. Answer: 1, 2, 3, 4, 6

Rationale: Von Willebrand's disease is a hereditary bleeding disorder characterized by a deficiency of or a defect in a protein termed *von Willebrand factor*. The disorder causes platelets to adhere to damaged endothelium. It is characterized by an increased tendency to bleed from mucous membranes. Assessment findings include epistaxis, gum bleeding, easy bruising, and excessive menstrual bleeding. Treatment and care are similar to measures implemented for hemophilia, including administration of clotting factors. An elevated creatinine level is not associated with this disorder.

Test-Taking Strategy: Focus on the **subject**, assessment findings, and on the child's diagnosis. Recalling that this disorder is characterized by an increased tendency to bleed from mucous membranes will direct you to the correct options.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1054-1055.

CHAPTER 32

Oncological Problems

Contributor: Necole Leland, DNP, RN, PNP, CPN

PRIORITY CONCEPTS Cellular Regulation; Safety

I. Leukemia

A. Description

1. Leukemia is a **malignant** increase in the number of leukocytes, usually at an immature stage, in the bone marrow.
 2. In **leukemia**, proliferating immature white **blood cells** (WBCs), also known as blast cells, depress the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia).
 3. The cause is unknown; it seems to involve genetic damage of cells, leading to the transformation of cells from a normal state to a malignant state.
 4. Risk factors include genetic, viral, immunological, and environmental factors and exposure to radiation, chemicals, and medications.
 5. Acute lymphocytic leukemia is the most frequent type of cancer in children.
 6. Prognosis depends on various factors, such as age at diagnosis, initial WBC count, type of cell involved, and sex of the child.
 7. Treatment involves chemotherapy and possibly radiation and hematopoietic stem cell transplantation.
 8. The phases of chemotherapy include induction, which achieves a complete remission or disappearance of leukemic cells; intensification or consolidation therapy, which decreases the tumor burden further; central nervous system prophylactic therapy, which prevents leukemic cells from invading the central nervous system; and maintenance, which serves to maintain the remission phase.
1. Signs of infection occur as a result of neutropenia.
 2. The child experiences hepatosplenomegaly and lymphadenopathy.
 3. The child has a normal, elevated, or low WBC count, depending on the presence of infection or of immature versus mature WBCs, and whether the child is currently receiving chemotherapy.
 4. The child has decreased hemoglobin and hematocrit levels.
 5. The child has a decreased platelet count.
 6. A positive bone marrow biopsy specimen identifies leukemic blast (immature)-phase cells. A lumbar puncture is performed to identify blast cells in the spinal fluid, which would indicate central nervous system (CNS) involvement.
 7. Signs of increased intracranial pressure (ICP) occur as a result of central nervous system involvement (**Box 32.1**).
 8. The child shows signs of cranial nerve (cranial nerve VII, or the facial nerve, is most commonly affected) or spinal nerve involvement; clinical manifestations relate to the area involved.
 9. Invasion of leukemic cells to the kidneys, testes, prostate, ovaries, gastrointestinal tract, and lungs is demonstrated through clinical manifestations.

B. Assessment

1. Infiltration of the bone marrow by malignant cells causes fever, pallor, fatigue, anorexia, hemorrhage (usually petechiae), and bone and joint pain; pathological fractures can occur as a result of bone marrow invasion with leukemic cells.

C. Infection (**Box 32.2**)

1. Infection can occur through self-contamination or cross-contamination.
2. The most common sites for infection are the skin (any break in the skin is a potential site for infection), respiratory tract, and gastrointestinal tract.

BOX 32.1 Manifestations of Increased Intracranial Pressure in Infants and Children

Infants

- Tense, bulging fontanel
- Separated cranial sutures
- Macewen's sign (cracked-pot sound on percussion)
- Irritability
- High-pitched cry
- Increased head circumference
- Distended scalp veins
- Poor feeding
- Crying when disturbed
- Setting sun sign (eyes appear downward, with the sclera seen over the iris, part of the lower pupil may be covered by the lower eyelid)

Children

- Headache
- Nausea
- Forceful vomiting
- Diplopia; blurred vision
- Seizures

Personality and Behavioral Signs

- Irritability, restlessness
- Indifference, drowsiness
- Decline in school performance
- Diminished physical activity and motor performance
- Increased sleeping
- Inability to follow simple commands
- Lethargy

Late Signs

- Bradycardia
- Decreased motor response to command
- Decreased sensory response to painful stimuli
- Alterations in pupil size and reaction
- Decerebrate (extension) or decorticate (flexion) posturing
- Cheyne-Stokes respirations
- Papilledema
- Decreased consciousness
- Coma

From Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1111.

3. If a child with cancer develops a fever while neutropenic, cultures and a complete blood cell count (CBC) with differential would be drawn; then antibiotics would be started.
 4. Calculating the Absolute Neutrophil Count (ANC): see [Chapter 46](#)
- D. Bleeding ([Box 32.3](#))
1. **Platelet transfusions** are generally reserved for active bleeding episodes that do not respond to

BOX 32.2 Protecting the Child from Infection

- Initiate protective isolation procedures.
- Maintain frequent and thorough handwashing.
- Maintain the child in a private room with high-efficiency particulate air filtration or laminar air flow system if possible.
- Ensure that the child's room is cleaned daily.
- Use strict aseptic technique for all nursing procedures.
- Limit the number of caregivers entering the child's room, and ensure that anyone entering the child's room wears a mask.
- Keep supplies for the child separate from supplies for other children.
- Reduce exposure to environmental organisms by eliminating raw fruits and vegetables from the diet, by not allowing fresh flowers in the child's room, and by not leaving standing water in the child's room.
- Assist the child with daily bathing, using antimicrobial soap.
- Assist the child to perform oral hygiene frequently.
- Assess for signs and symptoms of infection.
- Monitor temperature, pulse, and blood pressure.
- Change any wound dressings daily, and inspect wounds for redness, swelling, or drainage.
- Assess urine for color and cloudiness.
- Assess the skin and oral mucous membranes for signs of infection.
- Auscultate lung sounds.
- Encourage the child to cough and deep-breathe.
- Monitor white blood cell and neutrophil counts.
- Notify the primary health care provider if signs of infection are present, and prepare to obtain specimens for culture of open lesions, urine, and sputum.
- Maintain a nutritional and calorie-appropriate diet.
- Initiate a bowel program to prevent constipation and rectal trauma.
- Avoid invasive procedures such as injections, rectal temperatures, and urinary catheterization.
- Administer antibiotic, antifungal, and antiviral medications as prescribed.
- Administer granulocyte colony-stimulating factor as prescribed.
- Instruct parents to keep the child away from crowds and individuals with infections.
- Instruct parents that the child would not receive immunization with a live virus (measles, mumps, rubella, polio), because if the immune system is depressed, the attenuated virus can result in a life-threatening infection; also, the child would not receive the varicella vaccine.
- The Salk (inactivated) vaccine for poliomyelitis may be administered.
- Instruct parents to inform the teacher that they need to be notified immediately if a case of a communicable disease occurs in another child at school.

local treatment and that may occur during induction or relapse therapy.

2. Packed red blood cells may be prescribed for a child with severe blood loss.

BOX 32.3 Protecting the Child from Bleeding

- Examine the child for signs and symptoms of bleeding.
- Handle the child gently.
- Measure abdominal girth; an increase can indicate internal hemorrhage.
- Instruct the child to use a soft toothbrush and avoid dental floss.
- Provide soft foods that are cool to warm in temperature.
- Avoid injections, if possible, to prevent trauma to the skin and bleeding.
- Apply firm and gentle pressure to a needlestick site for at least 10 minutes.
- Pad side rails and sharp corners of the bed and furniture.
- Discourage the child from engaging in activities involving the use of objects that can cause injury.
- Instruct the child to avoid constrictive or tight clothing.
- Use caution when taking the blood pressure to prevent skin injury.
- Instruct the child to avoid blowing the nose.
- Avoid the use of rectal suppositories, enemas, and rectal thermometers.
- Examine all body fluids and excrement for the presence of blood.
- Count the number of pads or tampons used if the adolescent is menstruating.
- Instruct the child about the signs and symptoms of bleeding.
- Instruct parents to avoid administering nonsteroidal anti-inflammatory drugs and products that contain aspirin to the child.

-  E. Fatigue and nutrition
1. Assist the parents and child in selecting a well-balanced diet.
 2. Provide small meals that require little chewing and are not irritating to the oral mucosa.
 3. If the child cannot take oral feedings, parenteral nutrition or enteral feedings may be prescribed.
 4. Assist the child in self-care and mobility activities.
 5. Allow adequate rest periods during care.
 6. Do not perform nursing care activities unless they are essential.
-  F. Chemotherapy
1. Monitor for severe bone marrow suppression; during the period of greatest bone marrow suppression (the **nadir**), blood cell counts are extremely low.
 2. Monitor for infection and bleeding.
 3. Protect the child from life-threatening infections.
 4. Monitor for nausea, vomiting, and alteration in bowel function.
 5. Administer stool softeners as prescribed and if needed to prevent straining if constipation occurs.
 6. Provide rectal hygiene gently as needed.

7. Administer antiemetics before, during, and after chemotherapy as prescribed.
8. Monitor for signs of dehydration.
9. Monitor for signs of hemorrhagic cystitis.
10. Monitor for signs of peripheral neuropathy.
11. Assess oral mucous membranes for mucositis; administer frequent mouth rinses per agency procedure and as prescribed to promote healing or prevent infection (local oral anesthetics may also be prescribed).
12. Instruct the parents and child in the signs and symptoms to watch for after chemotherapy and when to notify the primary health care provider (PHCP).
13. Inform the parents and child that hair loss may occur from chemotherapy (hair regrows in about 3 to 6 months and may be a slightly different color or texture).
14. Instruct the parents and child about the care of a central venous access device, as necessary (see [Chapter 70](#)).
15. Listen to the child and family, and encourage them to verbalize their feelings and express their concerns.
16. Introduce the family to other families of children with cancer, as appropriate.
17. Consult social services and chaplains as necessary.

 **Monitor a child receiving chemotherapy closely for signs of infection. Children receiving chemotherapy may not present with typical signs and symptoms of infection because the immune system is suppressed. Infection is a major cause of death in the immunosuppressed child.**

II. Hodgkin's Disease**A. Description**

1. Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes that originates in a single lymph node or a single chain of nodes ([Fig. 32.1](#)).
2. The disease predictably metastasizes to non-nodal or extralymphatic sites, especially the spleen, liver, bone marrow, lungs, and mediastinum.
3. Hodgkin's disease is characterized by the presence of Reed-Sternberg cells noted in a lymph node biopsy specimen. 
4. Peak incidence is in midadolescence.
5. Possible causes include viral infections and previous exposure to alkylating chemical agents.
6. The prognosis is excellent, with long-term survival rates depending on the stage of the disease.
7. The primary treatment modalities are radiation and chemotherapy; each may be used alone or in combination, depending on the clinical stage of the disease.

FIG. 32.1 Main areas of lymphadenopathy and organ involvement in Hodgkin's disease.

6. Monitor for adverse effects related to chemotherapy or radiation; the most common adverse effect of extensive irradiation is malaise, which can be difficult for older children and adolescents to tolerate physically and psychologically (Table 32.1).
7. Monitor for nausea and vomiting, and administer antiemetics as prescribed.

⚡ CLINICAL JUDGMENT: RECOGNIZE CUES

The nurse reviews the physical examination in the medical record of a 10-year-old child who has Hodgkin's disease with advanced lymph node and extralymphatic involvement. The nurse would recognize the following physical assessment findings as characteristic cues of this disease.

Physical Examination

Child complains of loss of appetite and nausea and abdominal pain. Parent states that the child has intermittent low-grade fevers with night sweats. Weight loss of 4 pounds in 1 month. Painless, firm, movable adenopathy in the cervical and supraclavicular areas. Hepatosplenomegaly present. Lymph node biopsy shows presence of Reed-Sternberg cells.

III. Nephroblastoma (Wilms' Tumor)

A. Description

1. Wilms' tumor is the most common intra-abdominal and kidney tumor of childhood; it may manifest unilaterally and localized or bilaterally, sometimes with metastasis to other organs.
2. The peak incidence is 3 years of age.
3. Occurrence is associated with a genetic inheritance and with several congenital anomalies.
4. Therapeutic management includes a combined treatment of surgery (partial to total nephrectomy) and chemotherapy with or without radiation, depending on the clinical stage and the histological pattern of the tumor.

B. Assessment

1. Swelling or mass within the abdomen (mass is characteristically firm, nontender, confined to one side, and deep within the flank)
2. Urinary retention or hematuria, or both
3. Anemia (caused by hemorrhage within the tumor)
4. Pallor, anorexia, and lethargy (resulting from anemia)
5. Hypertension (caused by secretion of excess amounts of renin by the tumor)
6. Weight loss and fever

▲ B. Assessment (see **Clinical Judgment: Recognize Cues Box**)

1. Painless enlargement of lymph nodes
2. Enlarged, firm, nontender, movable nodes in the supraclavicular or cervical area; in children, the "sentinel" node located near the left clavicle may be the first enlarged node.
3. Nonproductive cough as a result of mediastinal lymphadenopathy
4. Abdominal pain as a result of enlarged retroperitoneal nodes
5. Advanced lymph node and extralymphatic involvement that may cause systemic symptoms, such as a low-grade or intermittent fever, anorexia, nausea, weight loss, night sweats, and pruritus
6. Positive biopsy specimen of a lymph node (presence of Reed-Sternberg cells) and positive bone marrow biopsy specimen
7. Computed tomography scan of the liver, spleen, and bone marrow may be done to detect **metastasis**.

▲ C. Interventions

1. Most newly diagnosed or low-risk children are treated with chemotherapy alone or in combination with radiation therapy.
2. With more extensive disease, radiation and multidrug chemotherapy are used.
3. Monitor for medication-induced pancytopenia and an abnormal depression of all cellular components of the blood, which increases the risk for infection, bleeding, and anemia.
4. Monitor for signs of infection and bleeding.
5. Protect the child from infection.

TABLE 32.1 Adverse Effects of Radiation Therapy and Nursing Interventions

Body Area and Adverse Effects	Interventions
Gastrointestinal Tract	
Anorexia	Encourage fluids and foods as best tolerated. Provide small, frequent meals. Monitor for weight loss. Administer appetite stimulants as ordered.
Nausea, vomiting	Administer antiemetics around the clock. Monitor for dehydration.
Mucosal ulceration	Provide soothing oral hygiene and prescribed mouth rinses. Topical anesthetic may be prescribed.
Diarrhea	Administer antispasmodics and antidiarrheal preparations as prescribed. Monitor for dehydration.
Skin	
Alopecia (hair loss)	Introduce idea of a wig or head wraps to child. Provide scalp hygiene. Stress the need for head covering in cold weather.
Dry or moist desquamation	Keep skin clean. Wash skin daily, using a mild soap sparingly. Do not remove skin markings for radiation. Avoid exposure to the sun and other extreme temperature changes. For dryness, apply lubricant as prescribed.
Urinary Bladder	
Cystitis	Encourage fluid intake and frequent voiding. Monitor for hematuria.
Bone Marrow	
Myelosuppression	Monitor for fever. Administer antibiotics as prescribed. Avoid use of suppositories, enemas, and rectal temperatures. Institute neutropenic or bleeding precautions as needed. Monitor for signs of anemia.

Adapted from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1075.

7. Symptoms of lung involvement, such as dyspnea, shortness of breath, and pain in the chest, if metastasis has occurred

C. Preoperative interventions

1. Monitor vital signs, particularly **blood pressure**.
2. Avoid palpation of the abdomen; place a sign at bedside that reads "Do Not Palpate Abdomen."
3. Measure abdominal girth at least once daily.

D. Postoperative interventions

1. Monitor temperature and blood pressure closely.
2. Monitor for signs of hemorrhage and infection.
3. Monitor strict intake and urine output closely.
4. Monitor for abdominal distention; monitor bowel sounds and other signs of gastrointestinal activity because of the risk for intestinal obstruction.

⚠️ Avoid palpation of the abdomen in a child with Wilms' tumor and be cautious when bathing, moving, or handling the child. It is important to keep the encapsulated tumor intact. Rupture of the tumor can cause the cancer cells to spread throughout the abdomen, lymph system, and bloodstream.

IV. Neuroblastoma

A. Description

1. Neuroblastoma is a tumor that originates from the embryonic neural crest cells that normally give rise to the adrenal medulla and the sympathetic ganglia.
2. Most tumors develop in the adrenal gland or the retroperitoneal sympathetic chain; other sites may be within the head, neck, chest, or pelvis.
3. Most children present with neuroblastoma before 10 years of age.
4. Most presenting signs are caused by the tumor compressing adjacent normal tissue and organs.
5. Diagnostic evaluation is aimed at locating the primary site of the tumor; analyzing the breakdown products excreted in the urine, namely vanillylmandelic acid, homovanillic acid, dopamine, and norepinephrine, permits detection of suspected tumor before and after medical-surgical intervention.
6. The prognosis is poor because of the frequency of invasiveness of the tumor and because in most cases a diagnosis is not made until after metastasis has occurred. The younger the child at diagnosis, the better the survival rate.
7. Therapeutic management
 - a. Surgery is performed to remove as much of the tumor as possible and to obtain biopsy specimens; in the early stages, complete surgical removal of the tumor is the treatment of choice.

- b. Surgery usually is limited to biopsy in the later stages because of extensive metastasis.
- c. Radiation is used commonly with later-stage disease and provides palliation for metastatic lesions in bones, lungs, liver, and brain.
- d. Chemotherapy is used for extensive local or disseminated disease.

B. Assessment

1. Firm, nontender, irregular mass in the abdomen that crosses the midline
2. Urinary frequency or retention from compression of the kidney, ureter, or bladder
3. Lymphadenopathy, especially in the cervical and supraclavicular areas
4. Bone pain if skeletal involvement
5. Supraorbital ecchymosis, periorbital edema, and exophthalmos as a result of invasion of retrobulbar soft tissue
6. Pallor, weakness, irritability, anorexia, weight loss
7. Signs of respiratory impairment (thoracic lesion)
8. Signs of neurological impairment (intracranial lesion)
9. Paralysis from compression of the spinal cord

C. Preoperative interventions

1. Monitor for signs and symptoms related to the location of the tumor.
2. Provide emotional support to the child and parents.

D. Postoperative interventions

1. Monitor for postoperative complications related to the location (organ) of the surgery.
2. Monitor for complications related to chemotherapy or radiation if prescribed.
3. Provide support to the parents, and encourage them to express their feelings; many parents feel guilt for not having recognized signs in the child earlier.
4. Refer parents to appropriate community services.

V. Osteosarcoma (Osteogenic Sarcoma)

A. Description

1. The most common bone **cancer** in children; it is also known as *osteogenic sarcoma*.
2. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur.
3. The peak age of incidence in children occurs between the ages of 13 and 16.
4. Symptoms in the earliest stage are almost always attributed to extremity injury or normal growing pains.
5. Treatment may include surgical resection (limb salvage procedure) to save a limb or remove affected tissue, or amputation.
6. Chemotherapy is used to treat the cancer and may be used before and after surgery.

B. Assessment

1. Localized pain at the affected site (may be severe or dull) that may be attributed to trauma or the vague complaint of “growing pains”; pain often is relieved by a fixed position.
2. Palpable mass
3. Limping if weight-bearing limb is affected
4. Progressive limited range of motion and the child’s curtailing of physical activity
5. Child may be unable to hold heavy objects because of their weight and resultant pain in the affected extremity.
6. Pathological fractures occur at the tumor site.

C. Interventions

1. Prepare the child and family for prescribed treatment modalities, which may include surgical resection by limb salvage to remove affected tissue, amputation, and chemotherapy.
2. Communicate honestly with the child and family and provide support.
3. Prepare for prosthetic fitting as necessary.
4. Assist the child in dealing with problems of self-image.
5. Instruct the child and parents about the potential development of phantom limb pain, which may occur after amputation. It is characterized by tingling, itching, and a painful sensation in the area where the limb was amputated.

VI: Brain Tumors

A. Description

1. An infratentorial (below the tentorium cerebelli) tumor, the most common brain tumor, is located in the posterior third of the brain (primarily in the cerebellum or brainstem) and accounts for the frequency of symptoms resulting from increased ICP.
2. A supratentorial tumor is located within the anterior two-thirds of the brain—mainly the cerebrum.
3. The signs and symptoms of a brain tumor depend on its anatomical location and size and, to some extent, on the age of the child; a number of tests may be used in the neurological evaluation, but the most common diagnostic procedure is magnetic resonance imaging (MRI), which determines the location and extent of the tumor.
4. Therapeutic management includes surgery, radiation, and chemotherapy; the treatment of choice is total removal of the tumor without residual neurological damage.

B. Assessment

1. Headache that is worse on awakening and improves during the day
2. Vomiting that is unrelated to feeding or eating
3. Ataxia
4. Seizures

5. Behavioral changes
6. Clumsiness; awkward gait or difficulty walking
7. Diplopia
8. Facial weakness

▲ Monitor for signs of increased ICP in a child with a brain tumor and after a craniotomy. If signs of increased ICP occur, notify the PHCP immediately.

- ▲** C. Preoperative interventions
1. Perform a neurological assessment at least every 4 hours.
 2. Institute seizure precautions and safety measures.
 3. Assess weight loss and nutritional status.
 4. Shave the child's head as prescribed (provide a favorite cap or hat for the child); shaving the head may also be done in the surgical suite.
 5. Prepare the child as much as possible; tell the child that they will wake up with a large head dressing.
- ▲** D. Postoperative interventions
1. Assess neurological and motor function and level of consciousness.
 2. Closely monitor temperature, which may be elevated because of hypothalamus or brainstem involvement during surgery; maintain a cooling blanket by the bedside.
 3. Monitor for signs of respiratory infection.
 4. Monitor for signs of meningitis (opisthotonos, Kernig's and Brudzinski's signs).
 5. Monitor for signs of increased ICP (see Box 32.1; see also Chapter 39).
 6. Monitor for hemorrhage, checking the back of the head dressing for posterior pooling of blood; mark drainage edges with marker, reinforce dressing if needed, and do not change dressing without a specific prescription.
 7. Assess pupillary response; sluggish, dilated, or unequal pupils are reported immediately because they may indicate increased ICP and potential brainstem herniation.
 8. Monitor for colorless drainage on the dressing or from the ears or nose, which indicates cerebrospinal fluid and needs to be reported immediately; assess for the presence of glucose in the drainage (dipstick).
 9. Assess the surgeon's prescription for positioning, including the degree of neck flexion (Box 32.4).
 10. Monitor intravenous fluids closely.
 11. Promote measures that prevent vomiting (vomiting increases ICP and the risk for incisional rupture).
 12. Provide a quiet environment.
 13. Administer analgesics as prescribed.
 14. Provide emotional support to the child and parents, and promote optimal growth and development.

BOX 32.4 Positioning After Craniotomy

- Assess the surgeon's prescription for positioning, including the degree of neck flexion.
- If a large tumor has been removed, the child is not placed on the operative side, because the brain may shift suddenly to that cavity.
- In an infratentorial procedure, the child usually is positioned flat or on either side.
- In a supratentorial procedure, the head usually is elevated above the heart level to facilitate cerebrospinal fluid drainage and to decrease excessive blood flow to the brain to prevent hemorrhage.
- Never place the child in Trendelenburg's position because it increases intracranial pressure and the risk of hemorrhage.

PRACTICE QUESTIONS

1. The nurse is monitoring a child for bleeding after surgery for removal of a brain tumor. The nurse checks the head dressing for the presence of blood and notes a colorless drainage on the back of the dressing. Which action would the nurse perform immediately?
 1. Notify the surgeon.
 2. Reinforce the dressing.
 3. Document the findings and continue to monitor.
 4. Circle the area of drainage and continue to monitor.
2. A child undergoes surgical removal of a brain tumor. During the postoperative period, the nurse notes that the child is restless, the pulse rate is elevated, and the blood pressure has decreased significantly from the baseline value. The nurse suspects that the child is in shock. Which is the most appropriate nursing action?
 1. Notify the surgeon.
 2. Place the child in a supine position.
 3. Place the child in Trendelenburg's position.
 4. Increase the flow rate of the intravenous fluids.
3. The parent of a 4-year-old child tells the pediatric nurse that the child's abdomen seems to be swollen. During further assessment, the parent tells the nurse that the child is eating well and that the activity level of the child is unchanged. The nurse, suspecting the possibility of Wilms' tumor, would plan to avoid which during the physical assessment?
 1. Palpating the abdomen for a mass
 2. Assessing the urine for the presence of hematuria
 3. Monitoring the temperature for the presence of fever
 4. Monitoring the blood pressure for the presence of hypertension

4. The nurse provides a teaching session to the nursing staff regarding osteosarcoma. Which statement by a member of the nursing staff indicates a need for further instruction?
1. "The femur is the most common site of this sarcoma."
 2. "The child does not experience pain at the primary tumor site."
 3. "Limping, if a weight-bearing limb is affected, is a clinical manifestation."
 4. "The symptoms of the disease in the early stage are almost always attributed to normal growing pains."
5. The nurse analyzes the laboratory values of a child with leukemia who is receiving chemotherapy. The nurse notes that the platelet count is $19,500 \text{ mm}^3$ ($19.5 \times 10^9/\text{L}$). On the basis of this laboratory result, which intervention would the nurse include in the plan of care?
1. Initiate bleeding precautions.
 2. Monitor closely for signs of infection.
 3. Monitor the temperature every 4 hours.
 4. Initiate protective isolation precautions.
6. The nurse is monitoring a 3-year-old child for signs and symptoms of increased intracranial pressure (ICP) after a craniotomy. The nurse would plan to monitor for which early sign or symptom of increased ICP?
1. Vomiting
 2. Bulging anterior fontanel
 3. Increasing head circumference
 4. Complaints of a frontal headache
7. A 4-year-old child is admitted to the hospital for abdominal pain. The parents report that the child has been pale and excessively tired and is bruising easily. On physical examination, lymphadenopathy and hepatosplenomegaly are noted. Diagnostic studies are being performed because acute lymphocytic leukemia is suspected. The nurse determines that which laboratory result confirms the diagnosis?
1. Lumbar puncture showing no blast cells
 2. Bone marrow biopsy showing blast cells
 3. Platelet count of $350,000 \text{ mm}^3$ ($350 \times 10^9/\text{L}$)
 4. White blood cell count of 4500 mm^3 ($4.5 \times 10^9/\text{L}$)
8. A 6-year-old child with leukemia is hospitalized and is receiving combination chemotherapy. Laboratory results indicate that the child is neutropenic, and protective isolation procedures are initiated. The grandparent of the child visits and brings a fresh bouquet of flowers picked from the garden and asks the nurse for a vase for the flowers. Which response would the nurse provide to the grandparent?
1. "I have a vase in the utility room, and I will get it for you."
 2. "I will get the vase and wash it well before you put the flowers in it."
 3. "The flowers from your garden are beautiful, but cannot be placed in the child's room at this time."
 4. "When you bring the flowers into the room, place them on the bedside stand as far away from the child as possible."
9. A diagnosis of Hodgkin's disease is suspected in a 12-year-old child. Several diagnostic studies are performed to determine the presence of this disease. Which diagnostic test result will confirm the diagnosis of Hodgkin's disease?
1. Elevated vanillylmandelic acid urinary levels
 2. The presence of blast cells in the bone marrow
 3. The presence of Epstein-Barr virus in the blood
 4. The presence of Reed-Sternberg cells in the lymph nodes
10. Which specific nursing interventions are implemented in the care of a child with leukemia who is at risk for infection? Select all that apply.
- 1. Maintain the child in a semiprivate room.
 - 2. Reduce exposure to environmental organisms.
 - 3. Use strict aseptic technique for all procedures.
 - 4. Ensure that anyone entering the child's room wears a mask.
 - 5. Apply firm pressure to a needlestick area for at least 10 minutes.

ANSWERS

1. Answer: 1

Rationale: Colorless drainage on the dressing in a child after craniotomy indicates the presence of cerebrospinal fluid and needs to be reported to the surgeon immediately. Options 2, 3, and 4 are not the immediate nursing action because they do not address the need for immediate intervention to prevent complications.

Test-Taking Strategy: Note the **strategic word**, *immediately*. Eliminate options 3 and 4 because they are **comparable or alike** and delay necessary intervention. Also, note the words *colorless drainage*. This would alert you quickly to the possibility of the presence of cerebrospinal fluid and direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1094.

2. Answer: 1

Rationale: In the event of shock, the surgeon is notified immediately. After craniotomy, a child is never placed in the supine or Trendelenburg's position because either position could increase intracranial pressure (ICP) and the risk of bleeding. The head of the bed needs to be elevated. Increasing intravenous fluids can cause an increase in ICP.

Test-Taking Strategy: Focus on the **subject**, care for the child following craniotomy, and note the **strategic words**, *most appropriate*. Eliminate options 2 and 3 because these positions could increase ICP. Eliminate option 4 because increasing the flow rate could also increase ICP. In addition, the nurse would not increase intravenous fluids without a surgeon's prescription.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p.1094.

3. Answer: 1

Rationale: Wilms' tumor is the most common intra-abdominal and kidney tumor of childhood. If Wilms' tumor is suspected, the tumor mass would not be palpated by the nurse. Excessive manipulation can cause seeding of the tumor and spread of the cancerous cells. Hematuria, fever, and hypertension are clinical manifestations associated with Wilms' tumor.

Test-Taking Strategy: Focus on the **subject**, the action to avoid. Knowledge that this tumor is an intra-abdominal and kidney tumor will assist in eliminating options 2 and 4 because of the relationship of these options to renal function. Next, thinking about the effect of palpating the tumor will direct you to the correct answer from the remaining options.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1100.

4. Answer: 2

Rationale: Osteosarcoma is the most common bone cancer in children. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur. Osteosarcoma is manifested clinically by progressive, insidious, and intermittent pain at the tumor site. By the time these children receive medical attention, they

may be in considerable pain from the tumor. Options 1, 3, and 4 are accurate regarding osteosarcoma.

Test-Taking Strategy: Note the **strategic words**, *need for further instruction*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Knowledge that osteosarcoma is a malignant tumor of the bone will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1098.

5. Answer: 1

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). If a child has a low platelet count, usually less than 50,000 mm³ (50.0 × 10⁹/L), bleeding precautions need to be initiated because of the increased risk of bleeding or hemorrhage. Precautions include limiting activity that could result in head injury, using soft toothbrushes, checking urine and stools for blood, and administering stool softeners to prevent straining with constipation. In addition, suppositories, enemas, and rectal temperatures are avoided. Options 2, 3, and 4 are related to the prevention of infection rather than bleeding.

Test-Taking Strategy: Note that the platelet count is low, and recall that a low platelet count places the child at risk for bleeding. In addition, note that options 2, 3, and 4 are **comparable or alike** because they relate to prevention of and monitoring for infection.

Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology*. (7th ed.). St. Louis: Elsevier. pp. 525, 558-559.

6. Answer: 1

Rationale: The brain, although well protected by the solid bony cranium, is highly susceptible to pressure that may accumulate within the enclosure. Volume and pressure must remain constant within the brain. A change in the size of the brain, such as occurs with edema or increased volume of intracranial blood or cerebrospinal fluid without a compensatory change, leads to an increase in ICP, which may be life-threatening. Vomiting, an early sign of increased ICP, can become excessive as pressure builds up and stimulates the medulla in the brainstem, which houses the vomiting center. Children with open fontanels (posterior fontanel closes at 2 to 3 months; anterior fontanel closes at 12 to 18 months) compensate for ICP changes by skull expansion and subsequent bulging fontanels. When the fontanels have closed, nausea, excessive vomiting, diplopia, and headaches become pronounced, with headaches becoming more prevalent in older children.

Test-Taking Strategy: Note the **strategic word**, *early*; focus on the age of the child, and use age as the key to principles of growth and development. Knowing when the fontanels close and focusing on the child's age as 3 years eliminates options 2 and 3. The subjective symptom of headache in option 4 is unreliable in a 3-year-old, so eliminate this option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1110.

7. Answer: 2

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. The confirmatory test for leukemia is microscopic examination of bone marrow obtained by bone marrow aspirate and biopsy, which is considered positive if blast cells are present. An altered platelet count occurs as a result of the disease but also may occur as a result of chemotherapy and does not confirm the diagnosis. The white blood cell count may be normal, high, or low in leukemia. A lumbar puncture may be done to look for blast cells in the spinal fluid, which would indicate central nervous system disease.

Test-Taking Strategy: Focus on the **subject**, bone marrow biopsy and leukemia, and note the word *confirms* in the question. This word and knowledge that the bone marrow is affected in leukemia will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1086.

8. Answer: 3

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). For a hospitalized neutropenic child, flowers or plants would not be kept in the room, because standing water and damp soil harbor *Aspergillus* and *Pseudomonas aeruginosa*, to which the child is susceptible. In addition, fresh fruits and vegetables harbor molds and need to be avoided until the white blood cell count increases.

Test-Taking Strategy: Note that options 1 and 2 are **comparable or alike** and would be eliminated first; these options indicate that it is acceptable to place the flowers in the child's room. From the remaining options, select the correct option over option 4 because this response maintains the protective isolation procedures required.

Reference: Huether, S., McCance, K., & Brashers, V. (2020). *Understanding pathophysiology*. (7th ed.). St. Louis: Elsevier. pp. 518-519, 559.

9. Answer: 4

Rationale: Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes. The presence of giant, mul-

tinucleated cells (Reed-Sternberg cells) is the classic characteristic of this disease. Elevated levels of vanillylmandelic acid in the urine may be found in children with neuroblastoma. The presence of blast cells in the bone marrow indicates leukemia. Epstein-Barr virus is associated with infectious mononucleosis.

Test-Taking Strategy: Focus on the **subject**, confirmatory diagnostic tests for Hodgkin's disease. Think about the pathophysiology associated with Hodgkin's disease. Remember that the Reed-Sternberg cell is characteristic of Hodgkin's disease.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1089.

10. Answer: 2, 3, 4

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). A common complication of treatment for leukemia is overwhelming infection secondary to neutropenia. Measures to prevent infection include the use of a private room, strict aseptic technique, restriction of visitors and health care personnel with active infection, strict handwashing, ensuring that anyone entering the child's room wears a mask, and reducing exposure to environmental organisms by eliminating raw fruits and vegetables from the diet and fresh flowers from the child's room and by not leaving standing water in the child's room. Applying firm pressure to a needlestick area for at least 10 minutes is a measure to prevent bleeding.

Test-Taking Strategy: Focus on the **subject**, preventing infection. Reading each intervention carefully and keeping this subject in mind will assist in answering the question. A semi-private room places the child at risk for infection. Applying firm pressure to a needle-stick area is related to preventing bleeding.

Metabolic and Endocrine Problems

Contributor: Necole Leland, DNP, RN, PNP, CPN

WWW.NCLEXATNEPAL.COM

PRIORITY CONCEPTS Glucose Regulation; Thermoregulation

I. Fever

A. Description

1. Fever is an abnormal body temperature elevation.
2. A child's temperature can vary, depending on activity, emotional stress, disease processes, medications, type of clothing the child is wearing, and temperature of the environment.
3. A fever in an **infant** less than 1 month old is considered an emergency, and the pediatrician would be contacted immediately if this occurs.
4. Assessment findings associated with the fever provide important indications of the seriousness of the fever.

B. Assessment

1. Temperature elevation: Normal temperature range for a child is 36.4° C to 37.0° C (97.5° F to 98.6° F); 38.0° C (100.4° F) is considered to be fever.
2. Flushed skin, warm to touch
3. Diaphoresis
4. Chills
5. Restlessness or lethargy

C. Interventions

1. Monitor vital signs; take the temperature via the electronic route or per agency procedures.
2. Remove excess clothing and blankets, reduce the room temperature, and increase the air circulation; use other cooling measures such as the application of a cool compress to the forehead if appropriate.
3. Administer antipyretics such as acetaminophen or, if older than 6 months, ibuprofen, as prescribed.
4. Aspirin would not be administered, unless specifically prescribed, because of the risk of Reye's syndrome.

5. Retake the temperature 30 to 60 minutes after the antipyretic is administered.
6. Provide adequate fluid intake as tolerated and as prescribed.
7. Monitor for signs and symptoms that indicate dehydration and electrolyte imbalances; monitor laboratory values.
8. Instruct the parents in how to take the temperature, how to medicate the child safely, and when it is necessary to call the primary health care provider (PHCP).

II. Dehydration

A. Description

1. Dehydration is a common fluid and electrolyte imbalance in infants and children.
2. In infants and children, the organs that conserve water are immature, placing them at risk for **fluid volume deficit**.
3. Causes can include fever, decreased fluid intake, diaphoresis, vomiting, diarrhea, diabetic ketoacidosis, and extensive burns or other serious injuries.

! Infants and children are more vulnerable to fluid volume deficit because more of their body water is in the extracellular fluid compartment.

B. Assessment (Table 33.1)

C. Interventions

1. Treat and eliminate the cause of the dehydration.
2. Monitor vital signs.
3. Monitor weight and monitor for changes, including fluid gains and losses.
4. Monitor intake and output and urine for specific gravity.
5. Monitor level of consciousness.
6. Monitor skin turgor and mucous membranes for dryness.

TABLE 33.1 Evaluating the Extent of Dehydration

Clinical Signs	Level of Dehydration		
	Mild	Moderate	Severe
Weight loss—infants	3%-5%	6%-9%	≥10%
Weight loss—children	3%-4%	6%-8%	10%
Pulse	Normal	Slightly increased	Very increased
Respiratory rate	Normal	Slight tachypnea (rapid)	Hyperpnea (deep and rapid)
Blood pressure	Normal	Normal to orthostatic (>10 mm Hg change)	Orthostatic to shock
Behavior	Normal	Irritable, more thirsty	Hyperirritable to lethargic
Thirst	Slight	Moderate	Intense
Mucous membranes ^a	Normal	Dry	Parched
Tears	Present	Decreased	Absent; sunken eyes
Anterior fontanel	Normal	Normal to sunken	Sunken
External jugular vein	Visible when supine	Not visible except with supraclavicular pressure	Not visible even with supraclavicular pressure
Skin ^a	Capillary re-fill 2 sec	Slowed capillary re-fill (2-4 sec [decreased turgor])	Very delayed capillary re-fill (>4 sec) and tenting; skin cool, acrocyanotic or mottled
Urine specific gravity	>1.020	>1.020; oliguria	Oliguria or anuria

^aThese signs are less prominent in the child who has hypernatremia.

Data from Josep N, Forbes G: Fluids and electrolytes—clinical aspects, *Pediatr Rev* 17:395–403, 1996; and Steiner MJ, DeWalt DA, Byerley JS: Is this child dehydrated? *JAMA* 291:2746–2754, 2004. Table from Perry, S., Hockenberry, M., Lowdermilk, D., & Wilson, D. (2010). *Maternal child nursing care*. (4th ed.). St. Louis: Mosby. Additional data from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 743.

7. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte or a similar rehydration solution as prescribed; avoid carbonated beverages because they are gas-producing, and fluids that contain high amounts of sugar, such as apple juice. Provide IV hydration if oral hydration methods are ineffective.
8. For severe dehydration, an NPO (nothing by mouth) status may be necessary to rest the bowel; fluid and electrolyte replacement via the IV route may be required. If potassium is prescribed for IV administration, ensure that the child has voided before administering it and that the child has adequate renal function.
9. Reintroduce a normal diet when rehydration is achieved.
10. Provide instructions to the parents about the types and amounts of fluid to encourage, signs of dehydration, and indications of the need to notify the PHCP.

III. Phenylketonuria (see Clinical Judgment: Evaluate Outcomes Box)

A. Description

1. Phenylketonuria is a genetic disorder (autosomal recessive disorder) that results in central

⚡ CLINICAL JUDGMENT: EVALUATE OUTCOMES

The nurse is evaluating the parents' understanding of treatment for their child who has phenylketonuria. The nurse determines that the parents understand the treatment based on the following statements.

- "The correct diet is the primary treatment for this problem."
- "We need to avoid giving our child foods high in protein, such as meats and dairy products, because they contain high levels of phenylalanine."
- "Cereals, pastas and rice, fruits and vegetables are great for my child to eat."
- "We need to read food labels closely because some foods contain aspartame, an artificial sweetener, and this contains phenylalanine."
- "Follow-up doctor appointments are really important for our child."

nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood.

2. It is characterized by blood phenylalanine levels greater than 20 mg/dL (1210 μmol/L); normal level is 0 to 2 mg/dL (0 to 121 μmol/L).

- All 50 states require routine screening of all newborns for phenylketonuria.

B. Assessment

- In all children
 - Digestive problems and vomiting
 - Seizures
 - Musty odor of the urine
 - Intellectual disability
- In older children
 - Eczema
 - Hypertonia
 - Hypopigmentation of the hair, skin, and irises
 - Behavioral abnormalities, including hyperactivity and bizarre or schizoid behavior

C. Interventions

- Screening of **newborn** infants for phenylketonuria: The infant should have begun formula or human milk feeding before specimen collection.
- If initial screening is positive, a repeat test is performed, and further diagnostic evaluation is required to verify the diagnosis.
- Rescreen newborns by 14 days of age if the initial screening was done before 24 hours of age.
- If phenylketonuria is diagnosed, prepare to implement the following:
 - Restrict phenylalanine intake; high-protein foods (meats and dairy products) and aspartame are avoided because they contain large amounts of phenylalanine.
 - Monitor physical, neurological, and intellectual development.
 - Stress the importance of follow-up treatment.
 - Encourage the parents to express their feelings about the diagnosis and discuss the risk of phenylketonuria in future children.
 - Educate the parents about the use of special preparation formulas and about the foods that contain phenylalanine.
 - Consult with social care services to assist the parents with the financial burdens of purchasing special prepared formulas.

IV. Childhood Obesity

A. Description

- A condition in which excess body fat negatively impacts the health and well-being of the child
- Body mass index (BMI) is a screening tool that can be used to measure obesity.
- BMI is defined as a person's body weight in kilograms divided by the square of a person's height in meters.
- As recommended by the Centers for Disease Control and Prevention (CDC), health professionals need to use the BMI percentile when measuring children and adolescents aged 2 to 20 years.
- Overweight is defined as being above the 85th percentile but less than the 95th percentile. Obesity

is defined as having a BMI greater than the 95th percentile. Severe obesity is defined as BMI \geq 120 percent of the 95th percentile or a BMI \geq 35.

B. Effects of obesity

- If obesity is diagnosed in childhood, it can lead to problems later in life, such as physical, social, and emotional health problems.
- Asthma, sleep apnea, bone and joint problems, type 2 diabetes, and risk factors leading to heart disease, such as hyperlipidemia, can occur.
- A child who is obese is more likely to be obese as an adult, which results in the comorbidities associated with obesity later in life, such as type 2 diabetes, heart disease, metabolic syndrome, and **cancer**.

V. Diabetes Mellitus

A. Description (Fig. 33.1)

- Type 1 diabetes mellitus is characterized by the destruction of the pancreatic beta cells, which produce insulin; this results in absolute insulin deficiency.
- Type 2 diabetes mellitus usually arises because of insulin resistance, in which the body fails to use insulin properly, combined with relative (rather than absolute) insulin deficiency.
- The rate of children and teens being diagnosed with prediabetes and type 2 diabetes is increasing. The number one risk factor for developing type 2 diabetes in childhood is being overweight. See **Box 33.1** on prevention strategies for type 2 diabetes in childhood.

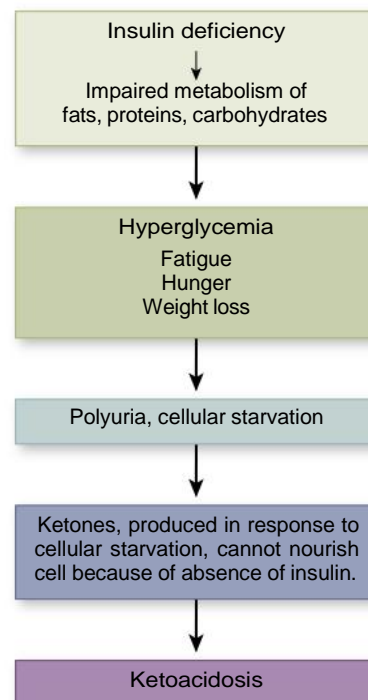

FIG. 33.1 Insulin deficiency leading to ketoacidosis.

BOX 33.1 Preventing Type 2 Diabetes Mellitus in Childhood

Eating Healthy to Lose Weight

- Drink water instead of sugared beverages, such as sodas, juices, and sports drinks.
- Eat more fruits and vegetables—fresh is the best, but frozen fruits and vegetables or those canned in water (not syrup) are acceptable.
- Limit fast food.
- Make healthy snacks, such as grapes, carrots, or plain popcorn.

Increasing Physical Activity to Lose Weight

- Children and adolescents should have 60 minutes a day of physical activity.
- Examples of physical activity include dancing, walking, bike riding, taking the stairs, and playing interactive video games.
- Limit screen time (the use of computers, tablets, or phones) to 60 minutes per day.

Noticing Warning Signs

- Increased thirst
- Increased nighttime urination
- Blurry vision
- Unusual fatigue

Adapted from American Diabetes Association. (2018). *Prevent type 2 diabetes in kids*. Retrieved from <https://www.cdc.gov/diabetes/prevent-type-2/type-2-kids.html> Mayo Foundation for Medical Education and Research (1998-2021). Use these tips to help children prevent diabetes. <https://www.mayoclinic.org/diseases-conditions/type-2-diabetes-in-children/expert-answers/preventing-diabetes-in-children/faq-20424315>

4. Insulin deficiency requires the use of exogenous insulin to promote appropriate glucose use and to prevent complications related to elevated blood glucose levels, such as hyperglycemia, diabetic ketoacidosis, and death.
5. Diagnosis is based on the presence of classic symptoms and an elevated blood glucose level (normal blood glucose level is 70 to 99 mg/dL [4 to 6 mmol/L]); based on PHCP preference, normal level may be a lower range.
6. Children may need to be admitted directly to the pediatric intensive care unit because of the manifestations of diabetic ketoacidosis, which may be the initial occurrence leading to diagnosis of diabetes mellitus.

B. Assessment

1. Polyuria, polydipsia, polyphagia
2. Hyperglycemia
3. Weight loss
4. Unexplained fatigue or lethargy
5. Headaches
6. Occasional enuresis in a previously toilet-trained child
7. Vaginitis in adolescents (caused by *Candida*, which thrives in hyperglycemic tissues)

8. Fruity odor to breath
 9. Dehydration
 10. Blurred vision
 11. Slow wound healing
 12. Changes in level of consciousness
- C. Long-term effects
1. Failure to grow at a normal rate
 2. Delayed maturation
 3. Recurrent infections
 4. Neuropathy
 5. Cardiovascular disease
 6. Retinal microvascular disease
 7. Renal microvascular disease
- D. Complications
1. Hypoglycemia
 2. Hyperglycemia
 3. Diabetic ketoacidosis
 4. Coma
 5. Hypokalemia
 6. Hyperkalemia
 7. Microvascular changes
 8. Cardiovascular changes

 For a child with diabetes mellitus, plan to initiate a consultation with the diabetic specialist to plan the child's care.

E. Diet

1. Normal healthy nutrition is encouraged, and the total number of calories is individualized based on the child's age and growth expectations. For type 2 diabetes, the American Diabetes Association recommendations can be found at http://main.diabetes.org/dorg/PDFs/Type-2-Diabetes-in-Youth/Type-2-Diabetes-in-Youth_14-18.pdf
2. As prescribed by the PHCP, children with diabetes need no special types of foods or supplements. They need sufficient calories to balance daily expenditure for energy and to satisfy the requirement for growth and development.
3. Dietary intake would include three well-balanced meals per day, eaten at regular intervals, plus a midafternoon snack and a bedtime snack; a consistent intake of the prescribed protein, fats, and carbohydrates at each meal and snack is needed (concentrated sweets are discouraged; fat is reduced to 30% or less of the total caloric requirement).
4. Instruct children and parents to carry a source of glucose, such as glucose tablets, with them at all times to treat hyperglycemia if it occurs.
5. Incorporate the diet into the individual child's needs, likes and dislikes, lifestyle, and cultural and socioeconomic patterns.
6. Allow the child to participate in making food choices to provide a sense of control.

F. Exercise

1. Instruct the child in dietary adjustments when exercising.
2. Extra food needs to be consumed for increased activity, usually 10 to 15 g of carbohydrates for every 30 to 45 minutes of activity.
3. Instruct the child to monitor the blood glucose level before and after exercising.
4. Plan an appropriate exercise regimen with the child, taking the developmental stage into account.

G. Insulin

1. Diluted insulin may be required for some infants to provide small enough doses to avoid hypoglycemia; diluted insulin should be labeled clearly to avoid dosage errors.
2. Laboratory evaluation of glycosylated hemoglobin (HbA1c) needs to be performed every 3 months. The reference interval for HbA1c is less than 6%.
3. Illness, infection, and stress increase the need for insulin, and insulin would not be withheld during illness, infection, or stress, because hyperglycemia and ketoacidosis can result.
4. When the child is not receiving anything by mouth for a special procedure, verify with the PHCP the need to withhold the morning insulin, and when food, fluids, and insulin are to be resumed.
5. Instruct the child and parents in the administration of insulin.
6. Instruct the child and parents to recognize symptoms of hypoglycemia and hyperglycemia.
7. Instruct the parents in the administration of glucagon intramuscularly or subcutaneously if the child has a hypoglycemic reaction and is unable to consume anything orally (if semiconscious or unconscious).
8. Instruct the child and parents always to have a spare bottle of insulin available.
9. Advise the parents to obtain a MedicAlert bracelet indicating the type and daily insulin dosage prescribed for the child.
10. See Chapter 48 for information on insulin types, administration sites, and administration procedure.

H. Blood glucose monitoring

1. Results provide information needed to maintain good glycemic control.
2. Blood glucose monitoring is more accurate than urine testing.
3. Monitoring requires that the child prick themselves several times a day as prescribed (Box 33.2).
4. Instruct the child and parents about the proper procedure for obtaining the blood glucose level.
5. Inform the child and parents that the procedure must be done precisely to obtain accurate results.

BOX 33.2 Lessening the Pain of Blood Glucose Monitoring

- Hold the finger under warm water for a few seconds before puncture (enhances blood flow to the finger).
- Use the ring finger or thumb to obtain a blood sample because blood flows more easily to these areas; puncture the finger just to the side of the finger pad because there are more blood vessels in this area and fewer nerve endings.
- Press the lancet device lightly against the skin to prevent a deep puncture.
- Use glucose monitors that require very small blood samples for measurement.

Adapted from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children* (11th ed.). St. Louis: Elsevier. pp. 1197-1198.

6. Stress the importance of handwashing before and after performing the procedure to prevent infection.
7. Stress the importance of following the manufacturer's instructions for the blood glucose monitoring device.
8. Instruct the child and parents to calibrate the monitor as instructed by the manufacturer.
9. Instruct the child and parents to check the expiration date on the test strips used for blood glucose monitoring.
10. Instruct the child and parents that if the blood glucose results do not seem reasonable, they should reread the instructions, reassess technique, check the expiration date of the test strips, and perform the procedure again to verify results.

I. Urine testing

1. Instruct the parents and child in the procedure for testing urine for ketones and glucose.
2. Teach the child that the second voided urine specimen is most accurate.
3. The presence of ketones may indicate impending ketoacidosis.

 **Urine glucose testing is an unreliable method of monitoring the glucose level; however, the urine needs to be tested for ketones when the child is ill or when the blood glucose level is consistently greater than 200 mg/dL (greater than 11.4 mmol/L) or as specified by the PHCP.**

J. Hypoglycemia

1. Description
 - a. Hypoglycemia is a blood glucose level of less than 70 mg/dL (4 mmol/L) (or as specified by the PHCP).
 - b. Hypoglycemia results from too much insulin, not enough food, or excessive activity.

BOX 33.3 Food Items to Treat Hypoglycemia

- ½ cup of orange juice or sugar-sweetened carbonated beverage
- 8 oz of milk
- 1 small box of raisins
- 3 or 4 hard candies
- 4 sugar cubes (1 Tbsp of sugar)
- 3 or 4 Life Savers candies
- 1 candy bar
- 1 tsp honey
- 2 or 3 glucose tablets

BOX 33.4 Interventions for Hypoglycemia

- If possible, confirm hypoglycemia with a blood glucose reading.
- Administer glucose immediately (such as ½ cup of fruit juice or other acceptable item); rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker.
- In the hospital, take the child's vital signs.
- Retest the blood glucose level.
- Give an extra snack if the next meal is not planned for more than 30 minutes or if activity is planned.
- If the child becomes unconscious, squeeze cake frosting or glucose paste onto the gums and retest the blood glucose level in 15 minutes (monitor the child closely); if the reading remains low, administer additional glucose.
- If the child remains unconscious, the administration of glucagon may be necessary.
- In the hospital, prepare to administer dextrose intravenously if the child is unable to consume an oral glucose product.
- If hospitalized, document the child's signs and symptoms, actions taken, and outcome.

Adapted from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1199-1200.

2. Signs include headache, nausea, sweating, tremors, lethargy, hunger, confusion, slurred speech, tingling around the mouth, and anxiety.

3. Interventions (**Boxes 33.3 and 33.4**)

K. Hyperglycemia

1. Description: Elevated blood glucose level (>200 mg/dL [11.4 mmol/L], or as specified by the PHCP)
2. Signs include polydipsia, polyuria, polyphagia, blurred vision, weakness, weight loss, and syncope.
3. Interventions (**Box 33.5**)
4. Sick day rules (**Box 33.6**)

L. Diabetic ketoacidosis

1. Description
 - a. Diabetic ketoacidosis is a complication of **diabetes mellitus** that develops when a severe insulin deficiency occurs.
 - b. Diabetic ketoacidosis is a life-threatening condition.

BOX 33.5 Interventions for Hyperglycemia

Instruct the parents to notify the PHCP when the following occur:

- Blood glucose results remain elevated (usually >200 mg/dL [>11.4 mmol/L])
- Moderate or high ketonuria is present
- Child is unable to take food or fluids
- Child vomits more than once
- Illness persists

BOX 33.6 Sick Day Rules for a Diabetic Child

- Always give insulin, even if the child does not have an appetite, or contact the PHCP for specific instructions.
- Test blood glucose levels at least every 4 hours.
- Test for urinary ketones with each voiding.
- Notify the PHCP if moderate or large amounts of urinary ketones are present.
- Follow the child's usual meal plan.
- Encourage liquids to aid in clearing ketones.
- Encourage rest, especially if urinary ketones are present.
- Notify the PHCP if vomiting; fruity odor to the breath; deep, rapid respirations; a decreasing level of consciousness; or persistent hyperglycemia occurs.

Adapted from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1197-1198.

- c. Hyperglycemia that progresses to **metabolic acidosis** occurs.
- d. Diabetic ketoacidosis develops over several hours to days.
- e. The blood glucose level is greater than 300 mg/dL (greater than 17.14 mmol/L), and urine and **serum** ketone tests are positive.

! Manifestations of diabetic ketoacidosis include signs of hyperglycemia, Kussmaul's respirations, acetone (fruity) breath odor, increasing lethargy, and decreasing level of consciousness.

2. Interventions

- a. Restore circulating blood volume, and protect against cerebral, coronary, or renal hypoperfusion.
- b. Correct dehydration with IV infusions of 0.9% or 0.45% saline as prescribed.
- c. Correct hyperglycemia with IV regular insulin administration as prescribed.
- d. Monitor vital signs, urine output, and mental status closely.
- e. Correct acidosis and electrolyte imbalances as prescribed.
- f. Administer oxygen as prescribed.
- g. Monitor blood glucose level frequently.
- h. Monitor potassium level closely, because when the child receives insulin to reduce

the blood glucose level, the serum potassium level changes; if the potassium level decreases, potassium replacement may be required.

- i. The child needs to be voiding adequately before administering potassium; if the child does not have an adequate output, hyperkalemia may result.
- j. Monitor the child closely for signs of fluid overload.
- k. IV dextrose is added as prescribed when the blood glucose reaches an appropriate level.
- l. Treat the cause of hyperglycemia.

2. Hunger and hypertension
 3. Cold, clammy skin and irritability
 4. Fruity breath odor and decreasing level of consciousness
5. A parent brings a 2-week-old infant to a clinic for a phenylketonuria rescreening blood test. The test indicates a serum phenylalanine level of 1 mg/dL (60.5 μmol/L). The nurse reviews this result and makes which interpretation?
 1. It is positive.
 2. It is negative.
 3. It is inconclusive.
 4. It requires rescreening at age 6 weeks.

PRACTICE QUESTIONS

1. A school-age child with type 1 diabetes mellitus has soccer practice, and the school nurse provides instructions regarding how to prevent hypoglycemia during practice. Which would the school nurse tell the child to do?
 1. Eat twice the amount normally eaten at lunch-time.
 2. Take half the amount of prescribed insulin on practice days.
 3. Take the prescribed insulin at noontime rather than in the morning.
 4. Eat a small box of raisins or drink a cup of orange juice before soccer practice.
2. The parents of a 6-year-old child who has type 1 diabetes mellitus call a clinic nurse and tell the nurse that the child has been sick. The parents report that the child's urine is positive for ketones. The nurse would instruct the parents to take which action?
 1. Hold the next dose of insulin.
 2. Come to the clinic immediately.
 3. Encourage the child to drink liquids.
 4. Administer an additional dose of regular insulin.
3. A pediatrician prescribes an intravenous (IV) solution of 5% dextrose and half-normal saline (0.45%) with 40 mEq of potassium chloride for a child with hypotonic dehydration. The nurse performs which priority assessment before administering this IV prescription?
 1. Obtains a weight
 2. Takes the temperature
 3. Takes the blood pressure
 4. Checks the amount of urine output
4. An adolescent client with type 1 diabetes mellitus is admitted to the emergency department for treatment of diabetic ketoacidosis. Which assessment findings would the nurse expect to note?
 1. Sweating and tremors
 2. Hunger and hypertension
 3. Cold, clammy skin and irritability
 4. Fruity breath odor and decreasing level of consciousness
5. A parent brings a 2-week-old infant to a clinic for a phenylketonuria rescreening blood test. The test indicates a serum phenylalanine level of 1 mg/dL (60.5 μmol/L). The nurse reviews this result and makes which interpretation?
 1. It is positive.
 2. It is negative.
 3. It is inconclusive.
 4. It requires rescreening at age 6 weeks.
6. A child with type 1 diabetes mellitus is brought to the emergency department by the parents, who state that the child has been complaining of abdominal pain and has been lethargic. Diabetic ketoacidosis is diagnosed. Anticipating the plan of care, the nurse prepares to administer which type of intravenous (IV) infusion?
 1. Potassium infusion
 2. NPH insulin infusion
 3. 5% dextrose infusion
 4. Normal saline infusion
7. The nurse has just administered ibuprofen to a child with a temperature of 102° F (38.8° C). The nurse would also take which action?
 1. Withhold oral fluids for 8 hours.
 2. Sponge the child with cold water.
 3. Plan to administer salicylate in 4 hours.
 4. Remove excess clothing and blankets.
8. A child has fluid volume deficit. The nurse performs an assessment and determines that the child is improving and the deficit is resolving if which finding is noted?
 1. The child has no tears.
 2. Urine specific gravity is 1.035.
 3. Capillary refill is less than 2 seconds.
 4. Urine output is less than 1 mL/kg/hr.
9. The nurse would implement which interventions for a child older than 2 years with type 1 diabetes mellitus who has a blood glucose level of 60 mg/dL (3.4 mmol/L)? Select all that apply.
 1. Administer regular insulin.
 2. Encourage the child to ambulate.
 3. Give the child a teaspoon of honey.
 4. Provide electrolyte replacement therapy intravenously.
 5. Wait 30 minutes and confirm the blood glucose reading.
 6. Prepare to administer glucagon subcutaneously if unconsciousness occurs.

ANSWERS

1. Answer: 4

Rationale: Hypoglycemia is a blood glucose level of less than 70 mg/dL (4 mmol/L) and results from too much insulin, not enough food, or excessive activity. An extra snack of 15 to 30 g of carbohydrates eaten before activities such as soccer practice would prevent hypoglycemia. A small box of raisins or a cup of orange juice provides 15 to 30 g of carbohydrates. The child or parents would not be instructed to adjust the amount or time of insulin administration. Meal amounts would not be doubled.

Test-Taking Strategy: Use general medication guidelines to eliminate options 2 and 3 first, noting that they are **comparable or alike** and indicate changing the amount of insulin or time of administration. From the remaining options, recalling the definition of hypoglycemia and its manifestations and associated treatment will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1197.

2. Answer: 3

Rationale: When the child is sick, the parents need to test for urinary ketones with each voiding. If ketones are present, liquids are essential to aid in clearing the ketones. The child would be encouraged to drink liquids. Bringing the child to the clinic immediately is unnecessary. Insulin doses would not be adjusted or changed.

Test-Taking Strategy: Use general medication guidelines. Eliminate options 1 and 4, noting that they are **comparable or alike**. Recall that insulin doses would not be adjusted or changed. From the remaining options, note the words *positive for ketones* in the question. Recalling that liquids are essential to aid in clearing the ketones will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1193, 1196.

3. Answer: 4

Rationale: In hypotonic dehydration, electrolyte loss exceeds water loss. The priority assessment before administering potassium chloride intravenously would be to assess the status of the urine output. Potassium chloride would never be administered in the presence of oliguria or anuria. If the urine output is less than 1 to 2 mL/kg/hr, potassium chloride would not be administered. Although options 1, 2, and 3 are appropriate assessments for a child with dehydration, these assessments are not related specifically to the IV administration of potassium chloride.

Test-Taking Strategy: Note the **strategic word**, *priority*. Focus on the IV prescription. Recalling that the kidneys play a key role in the excretion and reabsorption of potassium will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1198.

4. Answer: 4

Rationale: Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Signs of hyperglycemia include fruity breath odor and a decreasing level of consciousness. Hunger can be a sign of hypoglycemia or hyperglycemia, but hypertension is not a sign of diabetic ketoacidosis. Hypotension occurs because of a decrease in blood volume related to the dehydrated state that occurs during diabetic ketoacidosis. Cold, clammy skin; irritability; sweating; and tremors all are signs of hypoglycemia.

Test-Taking Strategy: Focus on the **subject**, the signs of diabetic ketoacidosis, and recall that in this condition the blood glucose level is elevated. Eliminate options 1, 2, and 3 because these signs do not occur with hyperglycemia. Recall that fruity breath odor and a change in the level of consciousness can occur during diabetic ketoacidosis.

Reference: Sweet, V., & Foley, P. (Editors). (2020). *Sheehy's emergency nursing: Principles and practice*. (7th ed.). St. Louis: Elsevier. pp. 300-301.

5. Answer: 2

Rationale: Phenylketonuria is a genetic (autosomal recessive) disorder that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood. It is characterized by blood phenylalanine levels greater than 20 mg/dL (1210 μmol/L); normal level is 0 to 2 mg/dL (0 to 121 μmol/L). A result of 1 mg/dL is a negative test result.

Test-Taking Strategy: Eliminate options 3 and 4 first because they are **comparable or alike**, indicating no definitive finding. Note that the level identified in the question is a low level; this would assist in directing you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 963.

6. Answer: 4

Rationale: Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Rehydration is the initial step in resolving diabetic ketoacidosis. Normal saline is the initial IV rehydration fluid. NPH insulin is never administered by the IV route. Dextrose solutions are added to the treatment when the blood glucose level decreases to an acceptable level. Intravenously administered potassium may be required, depending on the potassium level, but would not be part of the initial treatment.

Test-Taking Strategy: Focus on the **subject**, treatment for diabetic ketoacidosis. Eliminate option 3, knowing that dextrose would not be administered in a hyperglycemic state. Eliminate option 2 next, knowing that NPH insulin is not administered by the IV route. Recalling that hydration is the initial treatment in diabetic ketoacidosis will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 1198.

7. Answer: 4

Rationale: After administering ibuprofen, excess clothing and blankets need to be removed. The child would not be sponge-bathed, especially with cold water, because the cold water can cause shivering, which increases metabolic requirements above those already caused by the fever. Aspirin (a salicylate) is not administered to a child with fever because of the risk of Reye's syndrome. Fluids should be encouraged to prevent dehydration, so oral fluids would not be withheld.

Test-Taking Strategy: Focus on the **subject**, interventions for an elevated temperature. Remember that cooling measures such as removing excess clothing and blankets should be done when a child has a fever. Options 1, 2, and 3 are not interventions for a child with a fever.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 693.

8. Answer: 3

Rationale: Indicators that fluid volume deficit is resolving would be capillary refill less than 2 seconds, specific gravity of 1.003 to 1.030, urine output of at least 1 mL/kg/hr, and adequate tear production. A capillary refill time less than 2 seconds is the only indicator that the child is improving. Urine output of less than 1 mL/kg/hr, a specific gravity of 1.035, and no tears would indicate that the deficit is not resolving.

Test-Taking Strategy: Focus on the **subject**, assessment findings indicating that fluid volume deficit is resolving. Recall the parameters that indicate adequate hydration status. The only option that indicates an improving fluid balance is option 3. The other options indicate fluid imbalance.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 744-745, 748.

9. Answer: 3, 6

Rationale: Hypoglycemia is defined as a blood glucose level of less than 70 mg/dL (4 mmol/L). Hypoglycemia occurs as a result of too much insulin, not enough food, or excessive activity. If possible, the nurse needs to confirm hypoglycemia with a blood glucose reading. Glucose is administered orally immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker. An extra snack is given if the next meal is not planned for more than 30 minutes or if activity is planned. If the child becomes unconscious, cake frosting or glucose paste is squeezed onto the gums, and the blood glucose level is retested in 15 minutes; if the reading remains low, additional glucose is administered. If the child remains unconscious, administration of glucagon may be necessary, and the nurse needs to be prepared for this intervention. Encouraging the child to ambulate and administering regular insulin would result in a lowered blood glucose level. Providing electrolyte replacement therapy intravenously is an intervention to treat diabetic ketoacidosis. Waiting 30 minutes to confirm the blood glucose level delays necessary intervention.

Test-Taking Strategy: Focus on the **subject**, a low blood glucose level, and on the information in the question. Think about the pathophysiology associated with hypoglycemia and how it is treated. Recalling that a blood glucose level of 60 mg/dL (3.4 mmol/L) indicates hypoglycemia will assist in determining the correct interventions.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 1197-1198.

CLEX@Nepal

Gastrointestinal Problems

Contributor: Necole Leland, DNP, RN, PNP, CPN

PRIORITY CONCEPTS Elimination; Nutrition

I. Vomiting

A. Description

1. The priority concerns when a child is vomiting are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic alkalosis.
2. Additional priority concerns include aspiration and the development of atelectasis or pneumonia.
3. Causes of vomiting include acute infectious diseases, increased intracranial pressure, toxic ingestions, food intolerance, mechanical obstruction of the gastrointestinal tract, metabolic disorders, and psychogenic disorders.

B. Assessment

1. Character of vomitus
2. Signs of aspiration
3. Presence of pain and abdominal cramping
4. Signs of dehydration and fluid and electrolyte imbalances
5. Signs of metabolic alkalosis

C. Interventions (see **Clinical Judgment: Take Action Box**)

1. Maintain a patent airway.
2. Position the child on the side to prevent aspiration.
3. Monitor the character, amount, and frequency of vomiting.
4. Assess the force of the vomiting; projectile vomiting may indicate pyloric stenosis or increased intracranial pressure.
5. Monitor strict intake and output.
6. Monitor for signs and symptoms of dehydration, such as a sunken fontanel (age-appropriate), nonelastic skin turgor, dry mucous membranes, decreased tear production, changes in vital signs, and oliguria.
7. Monitor electrolyte levels.

8. Provide oral rehydration therapy as tolerated and as prescribed; begin feeding slowly, with small amounts of fluid at frequent intervals.
9. Administer antiemetics as prescribed.
10. Assess for abdominal pain or diarrhea.
11. Advise the parents to inform the primary health care provider (PHCP) if signs of dehydration, blood in the vomitus, forceful vomiting, or abdominal pain is present.

⚡ CLINICAL JUDGMENT: TAKE ACTION

A child who has gastroenteritis has experienced several episodes of diarrhea, developed fluid and electrolyte imbalances, and is lethargic. The child suddenly vomits. The nurse would take the following actions to prevent aspiration:

- Maintain a patent airway.
- Turn the child on the side (or sit the child upright).
- Ask another health care team member to obtain suctioning equipment.
- Check respiratory status and lung sounds.
- Check the character and amount of vomitus.
- Document the episode, including assessment findings and characteristics of the vomitus.
- Notify the primary health care provider if aspiration is suspected.

II. Diarrhea

A. Description

1. Acute diarrhea is a cause of dehydration, particularly in children younger than 5 years.
2. Causes of acute diarrhea include acute infectious disorders of the gastrointestinal tract, antibiotic therapy, rotavirus, and parasitic infestation.

3. Causes of chronic diarrhea include malabsorption syndromes, inflammatory bowel disease, immunodeficiencies, food intolerances, and nonspecific factors.
4. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months old; children younger than 3 months have some protection because of maternally acquired antibodies.

 Many conditions can cause vomiting or diarrhea, such as but not limited to viral gastroenteritis, group B hemolytic streptococcal pharyngitis, food allergies, and foodborne illnesses.

B. Assessment

1. Character of stools
2. Presence of pain and abdominal cramping
3. Signs of dehydration and fluid and electrolyte imbalances
4. Signs of metabolic acidosis

C. Interventions

1. Monitor character, amount, and frequency of diarrhea.
2. Provide enteric isolation as required; instruct the parents in effective handwashing technique (children need to be taught this technique also).
3. Monitor skin integrity.
4. Monitor strict intake and output.
5. Monitor electrolyte levels.
6. Monitor for signs and symptoms of dehydration.
7. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte or a similar rehydration solution as prescribed; avoid carbonated beverages because they are gas-producing, and fluids that contain high amounts of sugar, such as apple juice.
8. For severe dehydration, maintain NPO (nothing by mouth) status to place the bowel at rest, and provide fluid and electrolyte replacement by the intravenous (IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and that the child has adequate renal function.
9. Reintroduce a normal diet when rehydration is achieved.

 The major concerns when a child is having diarrhea are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic acidosis. Orthostatic vital signs are helpful in assessing hydration status.

III. Cleft Lip and Cleft Palate

A. Description

1. Cleft lip and cleft palate are congenital anomalies that occur as a result of failure of soft tissue

or bony structure to fuse during embryonic development.

2. The defects involve abnormal openings in the lip and/or palate that may occur unilaterally or bilaterally and are readily apparent at birth.
3. Causes include **hereditary** and environmental factors—exposure to radiation or rubella virus, chromosomal abnormalities, family history, maternal smoking, and teratogenic factors such as medications taken during pregnancy.
4. Prenatal dietary supplementation of folic acid is important to decrease the risk of cleft lip and palate.
5. Closure of a cleft lip defect precedes closure of the cleft palate and is usually performed by age 3 to 6 months.
6. Cleft palate repair is usually performed around 1 year of age, following the successful repair of cleft lip if present; this allows for the palatal changes that occur with normal **growth**; a cleft palate is closed as early as possible to facilitate speech development.
7. A child with cleft palate is at risk for developing frequent otitis media; this can result in hearing loss.
8. An interprofessional team approach, including audiologists, orthodontists, plastic surgeons, and occupational and speech therapists, is taken to address the many needs of the child.

B. Assessment (Fig. 34.1)

1. Cleft lip can range from a slight notch to a complete separation from the floor of the nose.
2. Cleft palate can include nasal distortion, midline or bilateral cleft, and variable extension from the uvula and soft and hard palate.

C. Interventions

1. Assess the ability to suck, swallow, handle normal secretions, and breathe without distress. 
2. Assess fluid and caloric intake daily.
3. Monitor daily weight.
4. Modify feeding techniques; plan to use specialized feeding techniques, obturators, and special nipples and feeders.
5. Hold the infant in an upright position, and direct the formula to the side and back of the mouth to prevent aspiration. 
6. Feed small amounts gradually and burp frequently.
7. Keep suction equipment and a bulb syringe at the bedside. 
8. Teach the parents special feeding or suctioning techniques.
9. Teach the parents the *ESSR* method of feeding—enlarge the nipple, stimulate the sucking reflex, swallow, rest to allow the infant to finish swallowing what has been placed in the mouth.
10. Encourage parents to express their feelings about the disorder.

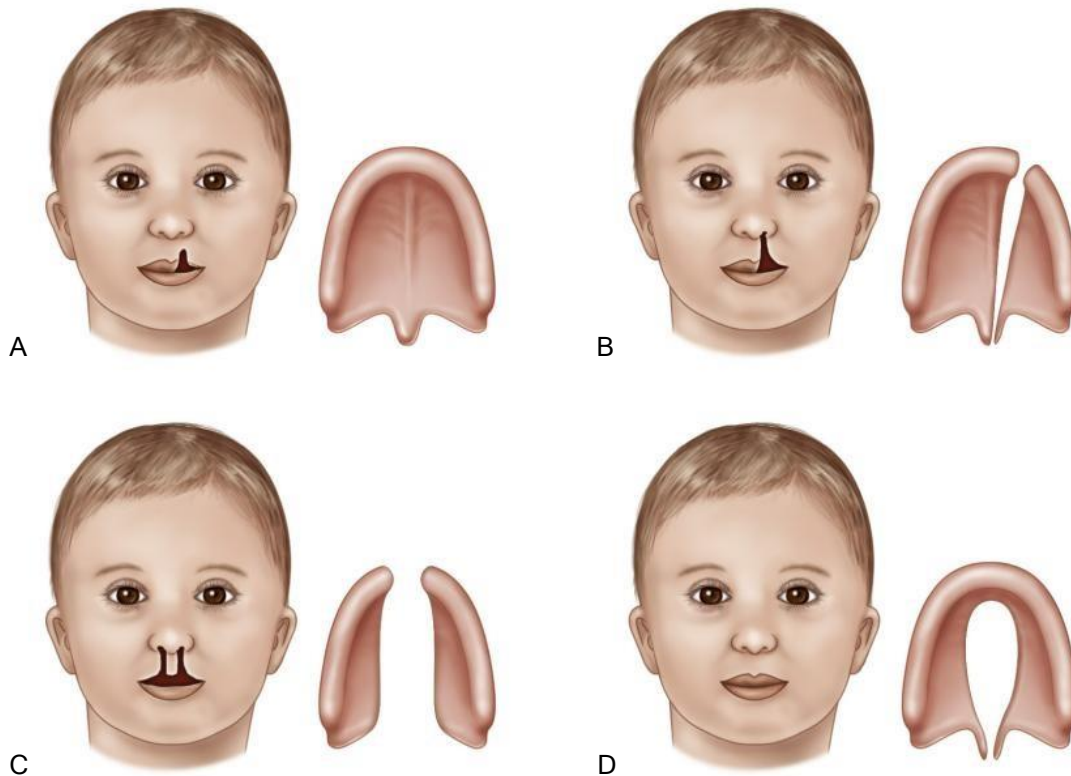

FIG. 34.1 Variations in clefts of lip and palate at birth. A, Notch in vermilion border. B, Unilateral cleft lip and palate. C, Bilateral cleft lip and palate. D, Cleft palate.

11. Encourage parental bonding with the infant, including holding the infant and calling the infant by name.
- D. Postoperative interventions
 1. Cleft lip repair
 - a. Provide lip protection; a metal appliance or adhesive strips may be taped securely to the cheeks to prevent trauma to the suture line.
 - b. Avoid positioning the infant on the side of the repair or in the prone position because these positions can cause rubbing of the surgical site on the mattress (position on the back upright and position to prevent airway obstruction by secretions, blood, or the tongue).
 - c. Keep the surgical site clean and dry; after feeding, gently cleanse the suture line of formula or serosanguineous drainage with a solution such as normal saline or as designated by agency procedure.
 - d. Apply antibiotic ointment to the site as prescribed.
 - e. Elbow restraints would be used to prevent the infant from injuring or traumatizing the surgical site.
 - f. Monitor for signs and symptoms of infection at the surgical site.
 2. Cleft palate repair
 - a. Feedings are resumed by bottle, breast/chest, or cup per surgeon preference; some surgeons prescribe the use of an Asepto syringe for feeding or a soft cup such as a soft-tipped sippy cup.
 - b. Oral packing may be secured to the palate (usually removed in 2 to 3 days).
 - c. A tongue stitch may be used to prevent the tongue from obstructing the airway.
 - d. Instruct the parents to avoid placing anything in the child's mouth that is harsh and could cause disruption of the surgical site.
 3. Soft elbow or jacket restraints may be used (check agency policies and procedures) to keep the child from touching the repair site; remove restraints at least every 1 to 2 hours (or per agency procedure) to assess skin integrity and circulation and to allow for exercising the arms.
 4. Avoid the use of oral suction or placing objects in the mouth such as a tongue depressor, thermometer, straws, spoons, forks, or pacifiers.
 5. Provide analgesics for pain as prescribed.
 6. Instruct the parents in feeding techniques and in the care of the surgical site.
 7. Instruct the parents to monitor for signs of infection at the surgical site, such as redness, swelling, or drainage.
 8. Encourage the parents to hold the child.
 9. Initiate appropriate referrals such as a dental referral and speech therapy referral.

IV. Esophageal Atresia and Tracheoesophageal Fistula (Fig. 34.2)

A. Description

1. The esophagus terminates before it reaches the stomach, ending in a blind pouch, or a fistula is present that forms an unnatural connection with the trachea.
2. The condition causes oral intake to enter the lungs or a large amount of air to enter the stomach, presenting a risk of coughing and choking; severe abdominal distention can occur.
3. Aspiration pneumonia and severe respiratory distress may develop, and death is likely to occur without surgical intervention.
4. Treatment includes maintenance of a patent airway, prevention of aspiration pneumonia, gastric or blind pouch decompression, supportive therapy, and surgical repair.

B. Assessment

1. Frothy saliva in the mouth and nose and excessive drooling
2. The “3 Cs”—coughing and choking during feedings and unexplained cyanosis
3. Regurgitation and vomiting
4. Abdominal distention
5. Increased respiratory distress during and after feeding

C. Preoperative interventions

1. The infant may be placed in a radiant warmer in which humidified oxygen is administered. (Intubation and mechanical ventilation may be necessary if respiratory distress occurs.)
2. Maintain NPO status.
3. Maintain IV fluids as prescribed.
4. Monitor respiratory status closely.
5. Suction accumulated secretions from the mouth and pharynx.

6. Maintain in a supine upright position (at least 30 degrees upright) to facilitate drainage and prevent aspiration of gastric secretions.
7. Keep the blind pouch empty of secretions by intermittent or continuous suction as prescribed; monitor its patency closely, because clogging from mucus can occur easily.
8. If a gastrostomy tube is inserted, it may be left open so that air entering the stomach through the fistula can escape, minimizing the risk of regurgitation of gastric contents into the trachea.
9. Broad-spectrum antibiotics may be prescribed because of the high risk for aspiration pneumonia.

D. Postoperative interventions

1. Monitor vital signs and respiratory status.
2. Maintain IV fluids, antibiotics, and parenteral nutrition as prescribed.
3. Monitor strict intake and output.
4. Monitor daily weight; assess for dehydration and possible fluid overload.
5. Assess for signs of pain.
6. Maintain chest tube if present.
7. Inspect the surgical site for signs and symptoms of infection.
8. Monitor for anastomotic leaks as evidenced by purulent drainage from the chest tube, increased temperature, and increased white blood cell count.
9. If a gastrostomy tube is present, it is usually attached to gravity drainage until the infant can tolerate feedings and the anastomosis is healed (usually postoperative day 5 to 7); then feedings are prescribed.
10. Before oral feedings and removal of the chest tube, prepare for an esophagogram as prescribed to check the integrity of the esophageal anastomosis.

FIG. 34.2 Congenital atresia of esophagus and tracheoesophageal fistula. A, Upper and lower segments of esophagus end in blind sac (occurring in 5% to 8% of such infants). B, Upper segment of esophagus ends in atresia and connects to trachea by fistulous tract (occurring rarely). C, Upper segment of esophagus ends in blind pouch; lower segment connects with trachea by small fistulous tract (occurring in 80% to 95% of such infants). D, Both segments of esophagus connect by fistulous tracts to trachea (occurring in less than 1% of such infants). Infant may aspirate with first feeding. E, Esophagus is continuous but connects by fistulous tract to trachea (known as *H-type*).

11. Before feeding, elevate the gastrostomy tube, and secure it above the level of the stomach to allow gastric secretions to pass to the duodenum and swallowed air to escape through the open gastrostomy tube.
12. Administer oral feedings with sterile water, followed by frequent small feedings of formula as prescribed.
13. Assess the cervical esophagostomy site, if present, for redness, breakdown, or exudate; remove accumulated drainage frequently, and apply protective ointment, barrier dressing, or a collection device as prescribed.
14. Provide nonnutritive sucking, using a pacifier for infants who remain NPO for extended periods. (A pacifier would not be used if the infant is unable to handle secretions.)
15. Instruct the parents in the techniques of suctioning, gastrostomy tube care and feedings, and skin site care as appropriate.
16. Instruct the parents to identify behaviors that indicate the need for suctioning, signs of respiratory distress, and signs of a constricted esophagus (e.g., poor feeding, dysphagia, drooling, coughing during feedings, regurgitated undigested food).

V. Gastroesophageal Reflux Disease

A. Description

1. Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter.
2. Most infants with gastroesophageal reflux have a mild problem that improves in about 1 year and requires medical therapy only.
3. Gastroesophageal reflux disease occurs when gastric contents reflux into the esophagus or oropharynx and produce symptoms.

B. Assessment

1. Passive regurgitation or emesis
2. Respiratory complications (chronic cough, wheeze, stridor, gagging, choking with feeds, recurrent pneumonia, nocturnal asthma)
3. Poor weight gain
4. Irritability
5. Hematemesis
6. Heartburn (in older children)
7. Noncardiac chest pain
8. Anemia from blood loss due to eructation of stomach acid, causing bleeding

C. Interventions

1. Assess amount and characteristics of emesis.
2. Assess the relationship of vomiting to the times of feedings and infant activity.
3. Monitor breath sounds before and after feedings.

4. Assess for signs of aspiration, such as drooling, coughing, or dyspnea, after feeding.
5. Place suction equipment at the bedside.
6. Monitor intake and output.
7. Monitor for signs and symptoms of dehydration.
8. Maintain IV fluids as prescribed.

 **Complications of gastroesophageal reflux disease include esophagitis, esophageal strictures, tissue damage, failure to thrive (FTT), aspiration of gastric contents, and aspiration pneumonia.**

D. Positioning

1. The infant is placed in the supine position during sleep (to reduce the incidence of sudden infant death syndrome) unless the risk of death from aspiration or other serious complications of gastroesophageal reflux disease greatly outweighs the risks associated with the prone position (check the PHCP's prescription); otherwise, the prone position is acceptable only while the infant is awake and can be monitored.
2. Keeping an infant upright (on a parent's shoulder or lap) for 20 to 30 minutes after feeding can reduce the likelihood of regurgitation. The semisupine position (e.g., in an infant seat) is not recommended as it increases reflux.
3. In children older than 1 year, position with the head of the bed elevated.

E. Diet

1. If the infant is fed using formula, provide small, frequent feedings with predigested formula to decrease the amount of regurgitation.
2. Nutrition via nasogastric tube feedings may be prescribed if severe regurgitation and poor growth are present.
3. For infants, formula may be thickened by adding rice cereal to the formula (follow agency procedure); cross-cut the nipple.
4. Breast-feeding/chest-feeding may continue, and the parent may provide more frequent feeding times or express milk for thickening with rice cereal.
5. Burp the infant frequently when feeding, and handle the infant minimally after feedings; monitor for coughing during feeding and other signs of aspiration.
6. For toddlers, feed solids first, followed by liquids.
7. Instruct the parents to avoid feeding the child fatty foods, chocolate, tomato products, carbonated liquids, fruit juices, citrus products, and spicy foods.
8. Instruct the parents that the child needs to avoid vigorous play after feeding and avoid feeding just before bedtime.

FIG. 34.3 Hypertrophic pyloric stenosis. A, Enlarged muscular area nearly obliterates pyloric channel. B, Longitudinal surgical division of muscle down to submucosa establishes adequate passageway.

F. Medications

1. Antacids for symptom relief
2. Proton pump inhibitors and histamine H_2 receptor antagonists to decrease gastric acid secretion

VI. Hypertrophic Pyloric Stenosis (Fig. 34.3)

A. Description

1. Hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum.
2. The stenosis usually develops in the first few weeks of life, causing projectile vomiting, dehydration, metabolic alkalosis, and failure to thrive.

B. Assessment

1. Vomiting progresses from mild regurgitation to forceful and projectile vomiting; it usually occurs after a feeding.
2. Vomitus contains gastric contents such as milk or formula, may contain mucus, may be blood-tinged, and does not usually contain bile.
3. The child exhibits hunger and irritability.
4. Peristaltic waves are visible from left to right across the epigastrium during or immediately after a feeding.

5. An olive-shaped mass is in the epigastrium just right of the umbilicus.
6. Signs of dehydration and malnutrition
7. Signs of electrolyte imbalances
8. Metabolic alkalosis

C. Interventions

1. Monitor strict intake and output.
2. Monitor vomiting episodes and stools.
3. Obtain daily weights.
4. Monitor for signs of dehydration and electrolyte imbalances.
5. Prepare the child and parents for pyloromyotomy if prescribed.

D. Pyloromyotomy

1. Description: An incision through the muscle fibers of the pylorus; may be performed by laparoscopy
2. Preoperative interventions
 - a. Monitor hydration status by daily weights, intake and output, and urine specific gravity.
 - b. Correct fluid and electrolyte imbalances; administer fluids intravenously as prescribed for rehydration.
 - c. Maintain NPO status as prescribed.
 - d. Monitor the number and character of stools.
 - e. Maintain patency of the nasogastric tube placed for stomach decompression.
3. Postoperative interventions
 - a. Monitor intake and output.
 - b. Begin small, frequent feedings postoperatively as prescribed.
 - c. Gradually increase amount and interval between feedings until a full feeding schedule has been reinstated.
 - d. Feed the infant slowly, burping frequently, and handle the infant minimally after feedings.
 - e. Monitor for abdominal distention.
 - f. Monitor the surgical wound and for signs of infection.
 - g. Instruct the parents about wound care and feeding.

VII. Lactose Intolerance

- #### A. Description:
- Inability to tolerate lactose as a result of an absence or deficiency of lactase, an enzyme found in the secretions of the small intestine that is required for the digestion of lactose

B. Assessment

1. Symptoms occur after the ingestion of milk or other dairy products.
2. Abdominal distention
3. Crampy, abdominal pain; colic
4. Diarrhea and excessive flatulence

C. Interventions

1. Eliminate the offending dairy product, or administer an enzyme tablet replacement.

2. Provide information to the parents about enzyme tablets that predigest the lactose in dairy products or supplement the body's own lactase.
3. Substitute soy-based formulas for cow's milk formula. Breast/chest-fed infants would be continued on human milk.
4. Allow milk consumption as tolerated.
5. Instruct the child and family that the child should drink milk with other foods rather than by itself.
6. Encourage the consumption of hard cheese, cottage cheese, and yogurt, which contain the inactive lactase enzyme.
7. Encourage the consumption of small amounts of dairy foods daily to help colonic bacteria adapt to ingested lactose.
8. Instruct the parents about the foods that contain lactose, including hidden sources.

 **A child with lactose intolerance can develop calcium and vitamin D deficiency. Instruct the parents about the importance of providing these supplements.**

VIII. Celiac Disease

A. Description

1. Celiac disease is also known as gluten enteropathy or celiac sprue.
2. Intolerance to gluten, the protein component of wheat, barley, rye, and oats, is characteristic.
3. Celiac disease results in the accumulation of the amino acid glutamine, which is toxic to intestinal mucosal cells.
4. Intestinal villous atrophy occurs, which affects absorption of ingested nutrients.
5. Symptoms of the disorder occur most often between the ages of 1 and 5 years.
6. There is usually an interval of 3 to 6 months between the introduction of gluten in the diet and the onset of symptoms.
7. Strict dietary avoidance of gluten minimizes the risk of developing malignant lymphoma of the small intestine and other gastrointestinal malignancies.

B. Assessment

1. Acute or insidious diarrhea
2. Steatorrhea
3. Anorexia
4. Abdominal pain and distention
5. Muscle wasting, particularly in the buttocks and extremities
6. Vomiting
7. Anemia
8. Irritability

C. Celiac crisis

1. Precipitated by fasting, infection, or ingestion of gluten
2. Causes profuse watery diarrhea and vomiting

BOX 34.1 Basics of a Gluten-Free Diet

Foods Allowed

Meat such as beef, pork, poultry, and fish; eggs; milk and some dairy products; vegetables, fruits, rice, corn, gluten-free flour, puffed rice, cornflakes, cornmeal, and precooked gluten-free cereals are allowed.

Foods Prohibited

Commercially prepared ice cream; malted milk; prepared puddings; and grains, including anything made from wheat, rye, oats, or barley, such as breads, rolls, cookies, cakes, crackers, cereal, spaghetti, macaroni noodles, beer, and ale, are prohibited.

3. Can lead to rapid dehydration, electrolyte imbalance, and severe acidosis
 4. Emotional disturbance
- #### D. Interventions
1. Maintain a gluten-free diet, substituting corn, rice, and millet as grain sources.
 2. Instruct the parents and child about lifelong elimination of gluten sources such as wheat, rye, oats, and barley.
 3. Administer mineral and vitamin supplements, including iron, folic acid, and fat-soluble vitamins A, D, E, and K.
 4. Teach the child and parents about a gluten-free diet and about reading food labels carefully for hidden sources of gluten (Box 34.1).
 5. Instruct the parents in measures to prevent celiac crisis.
 6. Inform the parents about the Celiac Sprue Association.
 7. Teach parents about possible long-term complications if gluten-free diet is not followed.

IX. Appendicitis

A. Description

1. Inflammation of the appendix
2. When the appendix becomes inflamed or infected, perforation may occur within a matter of hours, leading to peritonitis, sepsis, septic shock, and potentially death.
3. Treatment is surgical removal of the appendix before perforation occurs.

B. Assessment

1. Pain in periumbilical area that descends to the right lower quadrant
2. Abdominal pain that is most intense at McBurney's point
3. Referred pain indicating the presence of peritoneal irritation
4. Rebound tenderness and abdominal rigidity
5. Elevated white blood cell count
6. Side-lying position with abdominal guarding (legs flexed) to relieve pain
7. Difficult walking and pain in the right hip

8. Low-grade fever
 9. Anorexia, nausea, and vomiting after pain develops
 10. Diarrhea
- C. Peritonitis
1. Description: Results from a perforated appendix
 2. Assessment
 - a. Increased fever
 - b. Progressive abdominal distention
 - c. Tachycardia and tachypnea
 - d. Pallor
 - e. Chills
 - f. Restlessness and irritability

▲ An indication of a perforated appendix is the sudden relief of pain and then a subsequent increase in pain accompanied by right guarding of the abdomen.

- D. Appendectomy
1. Description: Surgical removal of the appendix
 2. Interventions preoperatively
 - a. Maintain NPO status.
 - b. Administer IV fluids and electrolytes as prescribed to prevent dehydration and correct electrolyte imbalances.
 - c. Monitor for changes in the level of pain.
 - d. Monitor for signs of a ruptured appendix and peritonitis.
 - e. Client would receive analgesia consistent with the level of pain.
 - f. Administer antibiotics as prescribed.
 - g. Monitor bowel sounds.
 - h. Allow child to take a position of comfort—possibly right side-lying or low to semi-Fowler's position.
 - i. Apply ice packs to the abdomen for 20 to 30 minutes every hour if prescribed.
 - j. Avoid the application of heat to the abdomen.
 - k. Avoid laxatives or enemas.
 3. Postoperative interventions
 - a. Monitor vital signs, particularly temperature.
 - b. Maintain NPO status until bowel function has returned, advancing the diet gradually as tolerated and as prescribed when bowel sounds return.
 - c. Assess the incision for signs of infection such as redness, swelling, drainage, and pain.
 - d. Monitor drainage from the drain, which may be inserted if perforation occurred.
 - e. Position the child in a right side-lying or low to semi-Fowler's position with the legs slightly flexed to facilitate drainage.
 - f. Change the dressing as prescribed, and record the type and amount of drainage.
 - g. Perform wound irrigations if prescribed.

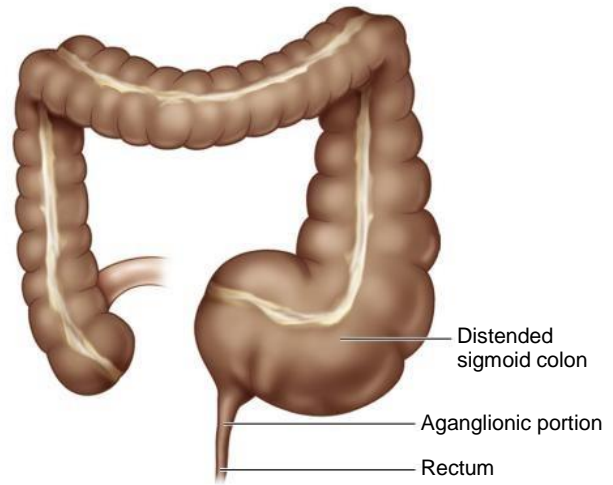

FIG. 34.4 Hirschsprung's disease.

- h. Maintain nasogastric tube suction and patency of the tube if present.
- i. Administer antibiotics and analgesics as prescribed.

X. Hirschsprung's Disease (Fig. 34.4)

- A. Description
1. Hirschsprung's disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon.
 2. The disease occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine.
 3. Mechanical obstruction results because of inadequate motility in an intestinal segment.
 4. The disease may be a familial congenital defect or may be associated with other anomalies, such as Down's syndrome and genitourinary abnormalities.
 5. A rectal biopsy specimen shows histological evidence of the absence of ganglionic cells.
 6. The most serious complication is enterocolitis; signs include fever, severe prostration, gastrointestinal bleeding, and explosive watery diarrhea.
 7. Treatment for mild or moderate disease is based on relieving the chronic constipation with stool softeners and rectal irrigations; however, many children require surgery.
 8. Surgical correction can typically be completed with a single procedure. However, there are instances where the surgery may have to be completed in two to three stages requiring a colostomy diversion.
 - a. If correction using a two- or three-stage process is required, a temporary colostomy is created to relieve obstruction and allow the normally innervated, dilated bowel to return to its normal size.

- b. When the bowel returns to its normal size, a complete surgical repair is performed via a pull-through procedure to excise portions of the bowel; at this time, the colostomy is closed.

FIG. 34.5 Ileocolic intussusception.

B. Assessment

1. Newborns
 - a. Failure to pass meconium stool
 - b. Refusal to suck
 - c. Abdominal distention
 - d. Bile-stained vomitus
2. Children
 - a. Failure to gain weight and delayed growth
 - b. Abdominal distention
 - c. Vomiting
 - d. Constipation alternating with diarrhea
 - e. Ribbon-like and foul-smelling stools

C. Interventions: Medical management

1. Maintain a low-fiber, high-calorie, high-protein diet; parenteral nutrition may be necessary in extreme situations.
2. Administer stool softeners as prescribed.
3. Administer daily rectal irrigations with prescribed fluid/solution to promote adequate elimination and prevent obstruction as prescribed.

D. Surgical management: Preoperative interventions

1. Assess bowel function.
2. Administer bowel preparation as prescribed.
3. Maintain NPO status.
4. Monitor hydration and fluid and electrolyte status; provide fluids intravenously as prescribed for hydration.
5. Administer antibiotics or colonic irrigations with an antibiotic solution as prescribed to clear the bowel of bacteria.
6. Monitor strict intake and output.
7. Obtain daily weight.
8. Measure abdominal girth daily.
9. Avoid taking the temperature rectally.
10. Monitor for respiratory distress associated with abdominal distention.

E. Surgical management: Postoperative interventions

1. Monitor vital signs, avoiding taking the temperature rectally.
2. Measure abdominal girth daily and PRN (as needed).
3. Assess the surgical site for redness, swelling, and drainage.
4. Assess the stoma if present for bleeding or skin breakdown (normal stoma would be red and moist).
5. Assess the anal area for the presence of stool, redness, or discharge.
6. Maintain NPO status as prescribed and until bowel sounds return or flatus is passed, usually within 48 to 72 hours.

7. Maintain nasogastric tube to allow intermittent suction until peristalsis returns.
8. Maintain IV fluids until the child tolerates appropriate oral intake, advancing the diet from clear liquids to regular as tolerated and as prescribed.
9. Assess for dehydration and fluid overload.
10. Monitor strict intake and output.
11. Obtain daily weight.
12. Assess for pain; provide comfort measures as required.
13. Provide the parents with instructions regarding colostomy care and skin care.
14. Teach the parents about the appropriate diet and the need for adequate fluid intake.

XI. Intussusception (Fig. 34.5)

A. Description

1. Telescoping of one portion of the bowel into another portion
2. The condition results in obstruction to the passage of intestinal contents.

B. Assessment

1. Colicky abdominal pain that causes the child to scream and draw the knees to the abdomen, similar to the fetal position
2. Vomiting of gastric contents or bile-stained fecal emesis
3. Currant jelly-like stools containing blood and mucus
4. Hypoactive or hyperactive bowel sounds
5. Tender distended abdomen, possibly with a palpable sausage-shaped mass in the upper right quadrant

C. Interventions

1. Monitor for signs of perforation and shock as evidenced by fever, increased heart rate, changes in level of consciousness or blood pressure, and respiratory distress, and report immediately.
2. Antibiotics, IV fluids, and decompression via nasogastric tube may be prescribed.
3. Monitor for the passage of normal brown stool, which indicates that the intussusception has reduced itself.
4. Prepare for hydrostatic reduction as prescribed, if no signs of perforation or shock occur (in hydrostatic reduction, air or fluid is used to exert pressure on area involved to lessen, diminish, or resolve the prolapse).
5. Posthydrostatic reduction
 - a. Monitor for the return of normal bowel sounds, for the passage of barium, and the characteristics of stool.
 - b. Administer clear fluids, and advance the diet gradually as prescribed.
6. If surgery is required, postoperative care is similar to care after any abdominal surgery; procedure may be done via laparoscope.

XII. Abdominal Wall Defects

A. Omphalocele

1. *Omphalocele* refers to herniation of the abdominal contents through the umbilical ring, usually with an intact peritoneal sac.
2. The protrusion is covered by a translucent sac that may contain bowel or other abdominal organs.
3. Rupture of the sac results in evisceration of the abdominal contents.
4. Immediately after birth, the sac is covered with sterile gauze soaked in normal saline to prevent drying of abdominal contents; a layer of plastic wrap is placed over the gauze to provide additional protection against moisture loss.
5. Monitor vital signs frequently (every 2 to 4 hours), particularly temperature, because the infant can lose heat through the sac.
6. Preoperatively: Maintain NPO status, administer IV fluids as prescribed to maintain hydration and electrolyte balance, monitor for signs of infection, and handle the infant carefully to prevent rupture of the sac.
7. Postoperatively: Control pain, prevent infection, maintain fluid and electrolyte balance, and ensure adequate nutrition.

B. Gastroschisis

1. Gastroschisis occurs when the herniation of the intestine is lateral to the umbilical ring.
2. No membrane covers the exposed bowel.
3. The exposed bowel is covered loosely in saline-soaked pads, and the abdomen is loosely

wrapped in a plastic drape or agency-approved drape; wrapping directly around the exposed bowel is contraindicated, because if the exposed bowel expands, wrapping could cause pressure and necrosis.

4. Preoperatively: Care is similar to that for omphalocele; surgery is performed within several hours after birth because no membrane is covering the sac.
5. Postoperatively: Most infants develop prolonged ileus, require mechanical ventilation, and need parenteral nutrition; otherwise, care is similar to that for omphalocele.

XIII. Umbilical and Inguinal Hernia and Hydrocele

A. Description

1. An umbilical hernia is a protrusion of the bowel through an abnormal opening in the abdominal wall.
2. In children, hernias most commonly occur at the umbilicus and also through the inguinal canal.
3. A hydrocele is the presence of abdominal fluid in the scrotal sac.

B. Assessment

1. Umbilical hernia: Soft swelling or protrusion around the umbilicus that is usually reducible with a finger
2. Inguinal hernia
 - a. Inguinal hernia refers to a painless inguinal swelling that is reducible.
 - b. Swelling may disappear during periods of rest and is most noticeable when the infant cries or coughs.
3. Incarcerated hernia
 - a. Incarcerated hernia occurs when the descended portion of the bowel becomes tightly caught in the hernial sac, compromising blood supply.
 - b. This represents a medical emergency requiring surgical repair.
 - c. Assessment findings include irritability, tenderness at site, anorexia, abdominal distention, and difficulty defecating.
 - d. The protrusion cannot be reduced, and complete intestinal obstruction and gangrene may occur.
4. Noncommunicating hydrocele
 - a. Noncommunicating hydrocele has no connection to the peritoneum; fluid comes from the mesothelial lining of the tunica vaginalis. Hydrocele usually disappears by age 1 year as the fluid is reabsorbed.
5. Communicating hydrocele
 - a. Communicating hydrocele is associated with a hernia that remains open from the scrotum to the abdominal cavity.

- b. Typically develops when the processus vaginalis remains open and allows communication with the peritoneum
 - c. Assessment includes a bulge in the inguinal area or the scrotum that increases with crying or straining and decreases when the infant is at rest. Parents may also report the bulge is smaller in the morning but increases in size throughout the day.
- C. Postoperative interventions (hernia)
1. Monitor vital signs.
 2. Assess for wound infection.
 3. Monitor for redness or drainage.
 4. Monitor input and output and hydration status.
 5. Advance the diet as tolerated.
6. Administer analgesics as prescribed.
- D. Postoperative interventions (hydrocele)
1. Provide ice bags and a scrotal support to relieve pain and swelling.
 2. Instruct the parents that tub bathing needs to be avoided until the incision heals.
 3. Instruct the parents that strenuous physical activities need to be avoided.
 4. Instruct the parents that straddle toys are avoided for 2 to 4 weeks.
 5. Advise parent that the scrotum may not immediately return to normal size.

XIV. Constipation and Encopresis

- A. Description
1. Constipation is the infrequent and difficult passage of dry, hard stools.
 2. Encopresis is constipation with fecal incontinence; children often complain that soiling is involuntary and occurs without warning.
 3. If the child does not have a neurological or anatomical disorder, encopresis is usually the result of fecal impaction and an enlarged rectum caused by chronic constipation.
- B. Assessment
1. Constipation
 - a. Abdominal pain and cramping without distention
 - b. Palpable movable fecal masses
 - c. Normal or decreased bowel sounds
 - d. Malaise and headache
 - e. Anorexia, nausea, and vomiting
 2. Encopresis
 - a. Evidence of soiling of clothing
 - b. Scratching or rubbing of the anal area
 - c. Fecal odor
 - d. Social withdrawal
- C. Interventions
1. Maintain a diet high in fiber and fluids to promote bowel elimination; select fiber foods considering the child's likes and dislikes (Box 34.2).

BOX 34.2 High-Fiber Foods

Bread and Grains

- Whole-grain bread or rolls
- Whole-grain cereals
- Bran
- Pancakes, waffles, and muffins with fruit or bran
- Unrefined (brown) rice

Vegetables

- Raw vegetables, especially broccoli, cabbage, carrots, cauliflower, celery, lettuce, and spinach
- Cooked vegetables, including those listed above and asparagus, beans, brussels sprouts, corn, potatoes, rhubarb, squash, string beans, and turnips

Fruits

- Prunes, raisins, or other dried fruits
- Raw fruits, especially those with skins or seeds, other than ripe banana or avocado

Miscellaneous

- Legumes (beans), popcorn, nuts, and seeds
- High-fiber snack bars

Data from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 840; Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 1122.

2. Monitor treatment regimen for severe encopresis for 3 to 6 months.
3. Decrease sugar and milk intake.
4. Administer enemas as prescribed until impaction is cleared.
5. Monitor for hypernatremia or hyperphosphatemia when administering repeated enemas.
 - a. Signs of hypernatremia include increased thirst; dry, sticky mucous membranes; flushed skin; increased temperature; nausea and vomiting; oliguria; and lethargy.
 - b. Signs of hyperphosphatemia include tetany, muscle weakness, dysrhythmias, and hypotension.
6. Administer stool softeners or laxatives as prescribed.
7. Encourage the child to sit on the toilet for 5 to 10 minutes approximately 20 to 30 minutes after breakfast and dinner to assist with defecation.

XV. Irritable Bowel Syndrome

- A. Description
1. Irritable bowel syndrome results from increased motility, which can lead to spasm and pain.
 2. The diagnosis is based on the elimination of pathological conditions.
 3. The syndrome is a self-limiting, intermittent problem with no definitive treatment.
 4. Stress and emotional factors may contribute to its occurrence.

-  B. Assessment
1. Diffuse abdominal pain unrelated to meals or activity
 2. Alternating constipation and diarrhea with the presence of undigested food and mucus in the stool
- C. Interventions
1. Reassure the parents and child that the problem is self-limiting and intermittent and will resolve.
 2. Anticholinergics may be prescribed (antidepressants may be needed in severe cases).
 3. Encourage the maintenance of a healthy, well-balanced, moderate-fiber, and low-fat diet.
 4. Encourage health promotion activities such as exercise and school activities.
 5. Inform the parents of psychosocial resources if required.

XVI. Imperforate Anus

- A. Description: Incomplete development or absence of the anus in its normal position in the perineum
- B. Types
1. A membrane is noted over the anal opening, with a normal anus just above the membrane.
 2. There is complete absence of the anus (anal agenesis) with a rectal pouch ending some distance above.
 3. Rectum ends blindly or has a fistula connection to the perineum, urethra, bladder, or vagina.
- C. Assessment (Box 34.3)
- D. Preoperative interventions
1. Determine the presence of an anal opening.
 2. Monitor for the presence of stool in the urine and vagina (indicates a fistula) and report immediately.
 3. Administer IV fluids as prescribed.
 4. Prepare the child and parents for the surgical procedures, including the potential for colostomy.
- E. Postoperative interventions
1. Monitor the skin for signs of infection.
 2. The preferred position is a side-lying prone position with the hips elevated or a supine position with the legs suspended at a 90-degree angle to the trunk to reduce edema and pressure on the surgical site.
 3. Keep the anal surgical incision clean and dry, and monitor for redness, swelling, or drainage.

4. Rectal temperatures need to be avoided in the immediate postoperative care due to sutures.
5. Maintain NPO status and nasogastric tube if in place.
6. Maintain IV fluids until gastrointestinal motility returns.
7. Provide care for colostomy, if present, as prescribed.
8. A new colostomy stoma may be red and edematous, but the edema ought to decrease with time.
9. Instruct the parents to perform anal dilation if prescribed to achieve and maintain bowel patency.
10. Instruct the parents to use only anal dilators supplied by the PHCP and a water-soluble lubricant and to insert the dilator no more than 1 to 2 cm into the anus to prevent damage to the mucosa.

XVII. Hepatitis

- A. This section contains specific information regarding hepatitis as it relates to infants and children; see also [Chapters 23 and 49](#).
- B. Description: An acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process
- C. Hepatitis A (HAV)
1. The highest incidence of HAV infection occurs among preschoolers or school-age children younger than 15 years.
 2. Many infected children are asymptomatic, but mild nausea, vomiting, and diarrhea may occur.
 3. Infected children who are asymptomatic still can spread HAV to others.
 4. HepA vaccine is available with a recommended first dose beginning at 12 months of age. It is a two-dose series. The second dose is given 6 to 18 months after the first dose.
- D. Hepatitis B (HBV)
1. Most HBV infection in children is acquired perinatally.
 2. Newborns are at risk if the birth parent is infected with HBV or was a carrier of HBV during pregnancy.
 3. Possible routes of maternal-fetal (newborn) transmission include leakage of the virus across the placenta late in pregnancy or during labor, ingestion of amniotic fluid or maternal blood, and breast-feeding/chest-feeding, especially if the birth parent has cracked nipples.
 4. The severity in the infant varies from no liver disease to fulminant (severe acute course) or chronic active disease.
 5. In children and adolescents, HBV occurs in specific high-risk groups, including children with hemophilia or other disorders requiring multiple blood

BOX 34.3 Assessment Findings: Imperforate Anus

- Failure to pass meconium stool
- Absence or stenosis of the anal rectal canal
- Presence of an anal membrane
- External fistula to the perineum

transfusions, children or adolescents involved in IV drug abuse, institutionalized children, preschool children in endemic areas, and children who have had heterosexual activity or sexual activity with homosexual men.

6. Infection with HBV can cause a carrier state and lead to eventual cirrhosis or hepatocellular carcinoma in adulthood.
 7. Initial dose of HepB vaccine would be given prior to hospital discharge in a newborn. The subsequent two doses are given per vaccine schedule (at 1 month and 6 months of age).
- E. Hepatitis C (HCV)
1. Transmission of HCV is primarily by the parenteral route.
 2. Some children may be asymptomatic, but HCV often becomes a chronic condition and can cause cirrhosis and hepatocellular carcinoma.
- F. Hepatitis D
1. Infection occurs in children already infected with HBV.
 2. Acute and chronic forms tend to be more severe than HBV and can lead to cirrhosis.
 3. Children with hemophilia are more likely to be infected, as are those who are IV drug users.
- G. Hepatitis E
1. Infection is uncommon in children.
 2. Infection is not a chronic condition, does not cause chronic liver disease, and has no carrier state.
- H. Assessment (Box 34.4)
- I. Laboratory diagnostic evaluation: See Chapters 10 and 49.
- J. Prevention
1. Immunoglobulin provides **passive immunity** and may be effective for preexposure prophylaxis to prevent HAV infection.
 2. Hepatitis B immunoglobulin provides passive immunity and may be effective in preventing infection after a onetime exposure (needs to be given immediately after exposure), such as an accidental needle puncture or other contact of contaminated material with mucous membranes; immunoglobulin would also be given to newborns whose birth parents are positive for hepatitis B surface antigen.
 3. Hepatitis A **vaccine** and hepatitis B vaccine: See Chapters 19 and 41.

 Proper handwashing and standard precautions, as well as enteric precautions, can prevent the spread of viral hepatitis.

-  K. Interventions
1. Strict handwashing is required.
 2. Hospitalization is required in the event of coagulopathy or fulminant hepatitis.

BOX 34.4 Assessment Findings: Hepatitis

Prodromal or Anicteric Phase

- Lasts 5 to 7 days
- Absence of jaundice
- Anorexia, malaise, lethargy, easy fatigability
- Fever (especially in adolescents)
- Nausea and vomiting
- Epigastric or right upper quadrant abdominal pain
- Arthralgia and rashes (more likely with hepatitis B virus)
- Hepatomegaly

Icteric Phase

- Jaundice, which is best assessed in the sclera, nail beds, and mucous membranes
- Dark urine and pale stools
- Pruritus

3. Standard precautions and enteric precautions are followed during hospitalization.
4. Provide enteric precautions for at least 1 week after the onset of jaundice with HAV.
5. The hospitalized child usually is not isolated in a separate room unless they are fecally incontinent and items are likely to become contaminated with feces.
6. Children are discouraged from sharing toys.
7. Instruct the child and parents in effective handwashing techniques.
8. Instruct the parents to disinfect diaper-changing surfaces thoroughly with a solution of ¼ cup (60 mL) bleach in 1 gallon (3.8 L) of water.
9. Maintain comfort and provide adequate rest and sleep.
10. Provide a low-fat, well-balanced diet.
11. Inform the parents that because HAV is not infectious 1 week after the onset of jaundice, the child may return to school at that time if feeling well enough.
12. Inform the parents that jaundice may appear worse before it resolves.
13. Caution the parents about administering any medications to the child; explain the role of the liver in detoxification and excretion of medications in understandable terms.
14. Instruct the parents about the signs of the child's condition worsening, such as changes in neurological status, bleeding, and fluid retention.

XVIII. Ingestion of Poisons (see Clinical Judgment: Take Action Box)

- A. Lead poisoning
1. Description: Excessive accumulation of lead in the blood
 2. Causes
 - a. The pathway for exposure may be food, air, or water.

⚡ CLINICAL JUDGMENT: TAKE ACTION

A child is brought to the emergency department, and the parents tell the emergency department nurse that they think the child drank some cleaning fluid from a bottle that was under the kitchen sink. The emergency department nurse would take the following actions:

- Assess the child's airway, breathing, and circulation; begin resuscitation measures as necessary.
- Terminate exposure to the poison.
- Identify the type and amount of poison ingested.
- Prepare to take measures as prescribed to prevent absorption of the poison; measures depend on the type and amount of poison ingested and the time of the ingestion.
- Monitor the child closely, including vital signs and respiratory, cardiovascular, and renal status.
- Document the occurrence, assessment findings, poison ingested, treatment measures, and the child's response.

- b. Dust and soil contaminated with lead may be a source of exposure.
 - c. Lead enters the child's body through ingestion or inhalation or through placental transmission to an unborn child when the birth parent is exposed; the most common route is hand to mouth from lead-contaminated objects, such as loose paint chips, pottery, or ceramic ware coupled with the inhalation of lead dust in the environment.
 - d. When lead enters the body, it affects the erythrocytes, bones and teeth, and organs and tissues, including the brain and nervous system; the most serious consequences are the effects on the central nervous system.
3. Universal screening
 - a. Screening is recommended for children 1 to 2 years old; children at high risk need to be screened earlier.
 - b. Any child between the ages of 3 and 6 years who has not been screened needs to be tested.
 4. Targeted screening
 - a. Targeted screening is acceptable in low-risk areas.
 - b. A child at the age of 1 to 2 years (or a child between the ages of 3 and 6 years who has not been screened) may be targeted for screening if determined to be at risk.
 5. Blood lead level test: Used for screening and diagnosis (Table 34.1)
 6. Erythrocyte protoporphyrin test
 - a. Indicator of anemia
 - b. Normal value for a child: 35 mcg/100 mL of whole blood or lower

TABLE 34.1 Blood Lead Level Test Results and Interventions

Level (mcg/dL)	Intervention
<5	Reassess or rescreen in 1 yr or sooner if exposure status changes
5-14	Provide family education about lead, follow-up testing, and social service referral for home assessment if necessary
15-19	Provide family education about lead, follow-up testing, and social service referral if necessary; on follow-up testing, initiate actions for blood lead level of 20-44 mcg/dL
20-44	Provide coordination of care and clinical management, including treatment, environmental investigation, and lead-hazard control
45-69	Provide coordination of care and clinical management within 48 hr, including treatment, environmental investigation, and lead-hazard control (the child must not remain in a lead-hazardous environment if resolution is necessary)
≥70	Medical treatment is provided immediately, including coordination of care, clinical management, environmental investigation, and lead-hazard control

Data from Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 449; and Centers for Disease Control and Prevention: *Blood lead levels in children* (website): <https://www.cdc.gov/nceh/lead/default.htm>

7. Chelation therapy
 - a. Chelation therapy removes lead from the circulating blood and from some organs and tissues.
 - b. Therapy does not counteract any effects of the lead.
 - c. Medications include calcium disodium edetate, and succimer, an oral preparation; British anti-Lewisite (BAL) is used in conjunction with ethylenediamine tetraacetic acid (EDTA).
 - d. British anti-Lewisite is administered via the IV route or the deep intramuscular route and is contraindicated in children with an allergy to peanuts because the medication is prepared in a peanut oil solution; it is also contraindicated in children with glucose-6-phosphate dehydrogenase (G6PD) deficiency and would not be given with iron.
 - e. The function of the renal, hepatic, and hematological systems must be monitored closely.
 - f. Ensure adequate urinary output before administering the medication, and monitor the output and pH of the urine closely during and after therapy.
 - g. Provide adequate hydration, and monitor kidney function for nephrotoxicity when the medication is given, because the medication is excreted via the kidneys.

- h. Follow-up of lead levels needs to be done to monitor progress.
- i. Provide instructions to parents about safety from lead hazards, medication administration, and the need for follow-up.
- j. Confirm that the child will be discharged to a home without lead hazards.

B. Acetaminophen

1. Description
 - a. Seriousness of ingestion is determined by the amount ingested and the length of time before intervention.
 - b. Toxic dose is 150 mg/kg or higher in children.
2. Assessment
 - a. First 2 to 4 hours: Malaise, nausea, vomiting, sweating, pallor, weakness
 - b. Latent period: 24 to 36 hours; child improves
 - c. Hepatic involvement: May last 7 days and may be permanent; right upper quadrant pain, jaundice, confusion, stupor, elevated liver enzyme and bilirubin levels, prolonged prothrombin time
3. Interventions
 - a. Administer activated charcoal if ingestion to treatment time is less than 4 hours with a known ingestion amount. Activated charcoal would not be administered to an unconscious child unless endotracheal intubation is performed first.
 - b. Administer antidote: *N*-Acetylcysteine (either oral or intravenously).
 - c. Dilute oral antidote in juice or soda because of its offensive odor.
 - d. Oral loading dose is followed by maintenance doses. IV antidote is given continuously.
 - e. If using activated charcoal with lavage, do not also use *N*-acetylcysteine because activated charcoal inactivates the antidote.

C. Acetylsalicylic acid (aspirin)

1. Description
 - a. Overdose may be caused by acute ingestion or chronic ingestion.
 - b. Acute: Severe toxicity with 300 to 500 mg/kg
 - c. Chronic: Ingestion of more than 100 mg/kg per day for 2 days or more, which can be more serious than acute ingestion
2. Assessment
 - a. Gastrointestinal effects: Nausea, vomiting, and thirst from dehydration
 - b. Central nervous system effects: Hyperpnea, confusion, tinnitus, seizures, coma, respiratory failure, circulatory collapse
 - c. Renal effects: Oliguria
 - d. Hematopoietic effects: Bleeding tendencies
 - e. Metabolic effects: Diaphoresis, fever, hyponatremia, hypokalemia, dehydration, hypoglycemia, metabolic acidosis

3. Interventions

- a. Prepare to administer activated charcoal to decrease absorption of salicylate.
- b. Emesis or cathartic measures may be prescribed.
- c. Administer IV fluids; sodium bicarbonate may be prescribed to correct metabolic acidosis.
- d. Other interventions include external cooling, anticonvulsants, vitamin K (if bleeding), and oxygen.
- e. Prepare the child for dialysis as prescribed if the child is unresponsive to the therapy.

D. Corrosives

1. Description
 - a. Items that can cause poisoning include household cleaners, detergents, bleach, paint or paint thinners, and batteries.
 - b. Liquid corrosives can cause more damage to the victim than other types of corrosives, such as granular.
2. Assessment
 - a. Severe burning in the mouth, throat, or stomach
 - b. Edema of the mucous membranes, lips, tongue, and pharynx
 - c. Vomiting
 - d. Drooling and inability to clear secretions
3. Interventions
 - a. Dilute corrosive with water or milk as prescribed (usually no more than 4 oz [120 mL]).
 - b. An induction of vomiting is contraindicated because vomiting redamages the mucous membranes.
 - c. Neutralization of the ingested corrosive is not done because it can cause a reaction producing heat and burns.

 Educate parents to call the Poison Control Center immediately in the event of poisoning. Parents need to post the Poison Control Center telephone number near each phone in the house and have it in their mobile phones.

XIX. Intestinal Parasites

A. Description: Common infections in children are giardiasis and pinworm infestation.

1. Giardiasis is caused by protozoa and is prevalent among children in crowded environments, such as classrooms or day care centers.
2. Pinworms (enterobiasis) are universally present in temperate climate zones and are easily transmitted in crowded environments.

B. Assessment

1. Giardiasis
 - a. Diarrhea and vomiting
 - b. Anorexia

- c. Failure to thrive
 - d. Abdominal cramps with intermittent loose stools and constipation
 - e. Steatorrhea
 - f. Stool specimens from three or more collections are used for diagnosis.
2. Pinworms
 - a. Intense perianal itching
 - b. Irritability, restlessness
 - c. Poor sleeping
 - d. Bed-wetting
- C. Interventions
1. Giardiasis
 - a. Medications that kill the parasites may be prescribed; medications are not usually prescribed for children younger than 2 years.
 - b. Caregivers need to wash hands meticulously.
 - c. Provide education to family and caregivers regarding sanitary practices.
 2. Pinworms
 - a. Perform a visual inspection of the anus with a flashlight 2 to 3 hours after sleep.
 - b. The tape test is the most common diagnostic test.
 - c. Educate the family and caregivers regarding the tape test. A loop of transparent tape is placed firmly against the child's perianal area; it is removed in the morning and placed in a glass jar or plastic bag and transported to the laboratory for analysis.
 - d. Medications that kill the parasites may be prescribed; medications are not usually prescribed for children younger than 2 years.
 - e. The medication regimen may be repeated in 2 weeks to prevent reinfection.
 - f. All members of the family are treated for the infection.
 - g. Teach the family and caregivers about the importance of meticulous handwashing and about washing all clothes and bed linens in hot water.
2. An infant has just returned to the nursing unit after surgical repair of a cleft lip on the right side. The nurse would place the infant in which best position at this time?
 1. Prone position
 2. On the stomach
 3. Left lateral position
 4. Right lateral position
 3. The nurse reviews the record of a newborn infant and notes that a diagnosis of esophageal atresia with tracheoesophageal fistula is suspected. The nurse expects to note which most likely sign of this condition documented in the record?
 1. Incessant crying
 2. Coughing at nighttime
 3. Choking with feedings
 4. Severe projectile vomiting
 4. The nurse provides feeding instructions to the parent of an infant diagnosed with gastroesophageal reflux disease. Which instruction would the nurse give to the parent to assist in reducing the episodes of emesis?
 1. Provide less frequent, larger feedings.
 2. Burp the infant less frequently during feedings.
 3. Thin the feedings by adding water to the formula.
 4. Thicken the feedings by adding rice cereal to the formula.
 5. A child is hospitalized because of persistent vomiting. The nurse would monitor the child closely for which problem?
 1. Diarrhea
 2. Metabolic acidosis
 3. Metabolic alkalosis
 4. Hyperactive bowel sounds
 6. The nurse is caring for a newborn with a suspected diagnosis of imperforate anus. The nurse monitors the infant, knowing that which is a clinical manifestation associated with this disorder?
 1. Bile-stained fecal emesis
 2. The passage of currant jelly-like stools
 3. Failure to pass meconium stool in the first 24 hours after birth
 4. Sausage-shaped mass palpated in the upper right abdominal quadrant
 7. The nurse admits a child to the hospital with a diagnosis of pyloric stenosis. On assessment, which data would the nurse expect to obtain when asking the parent about the child's symptoms?
 1. Watery diarrhea
 2. Projectile vomiting
 3. Increased urine output
 4. Vomiting large amounts of bile

PRACTICE QUESTIONS

1. The clinic nurse reviews the record of an infant and notes that the primary health care provider (PHCP) has documented a diagnosis of suspected Hirschsprung's disease. The nurse reviews the assessment findings documented in the record, knowing that which sign most likely led the parent to seek health care for the infant?
 1. Diarrhea
 2. Projectile vomiting
 3. Regurgitation of feedings
 4. Foul-smelling ribbon-like stools

8. The nurse provides home care instructions to the parents of a child with celiac disease. The nurse would teach the parents to include which food item in the child's diet?
 1. Rice
 2. Oatmeal
 3. Rye toast
 4. Wheat bread

9. The nurse is preparing to care for a child with a diagnosis of intussusception. The nurse reviews the child's record and expects to note which sign of this disorder documented?
 1. Watery diarrhea
 2. Ribbon-like stools
 3. Profuse projectile vomiting
 4. Bright red blood and mucus in the stools

10. Which interventions would the nurse include when creating a care plan for a child with hepatitis? Select all that apply.
 - 1. Providing a low-fat, well-balanced diet
 - 2. Teaching the child effective handwashing techniques
 - 3. Scheduling playtime in the playroom with other children
 - 4. Notifying the primary health care provider (PHCP) if jaundice is present
 - 5. Instructing the parents to avoid administering medications unless prescribed
 - 6. Arranging for indefinite homeschooling because the child will not be able to return to school

ANSWERS

1. Answer: 4

Rationale: Hirschsprung's disease is a congenital anomaly also known as *congenital aganglionosis* or *aganglionic megacolon*. It occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine. Chronic constipation beginning in the first month of life and resulting in pellet-like or ribbon-like stools that are foul-smelling is a clinical manifestation of this disorder. Delayed passage or absence of meconium stool in the neonatal period is also a sign. Bowel obstruction, especially in the neonatal period; abdominal pain and distention; and failure to thrive are also clinical manifestations. Options 1, 2, and 3 are not associated specifically with this disorder.

Test-Taking Strategy: Note the **strategic words**, *most likely*. Use knowledge regarding the pathophysiology associated with Hirschsprung's disease to direct you to the correct option. Remember that chronic constipation beginning in the first month of life and resulting in pellet-like or ribbon-like, foul-smelling stools is a clinical manifestation of this disorder.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 844.

2. Answer: 3

Rationale: A cleft lip is a congenital anomaly that occurs as a result of failure of soft tissue or bony structure to fuse during embryonic development. After cleft lip repair, the nurse avoids positioning an infant on the side of the repair or in the prone position, because these positions can cause rubbing of the surgical site on the mattress. The nurse positions the infant on the side opposite the repair or on the back upright and positions the infant to prevent airway obstruction by secretions, blood, or the tongue. From the options provided, placing the

infant on the left side immediately after surgery is best to prevent the risk of aspiration if the infant vomits.

Test-Taking Strategy: Note the **strategic word**, *best*. Eliminate options 1 and 2 because they are **comparable or alike** positions. Consider the anatomical location of the surgical site and note the words *right side* in the question to direct you to the correct option from those remaining.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 248.

3. Answer: 3

Rationale: In esophageal atresia and tracheoesophageal fistula, the esophagus terminates before it reaches the stomach, ending in a blind pouch, and a fistula is present that forms an unnatural connection with the trachea. Any child who exhibits the "3 Cs"—coughing and choking with feedings and unexplained cyanosis—would be suspected to have tracheoesophageal fistula. Options 1, 2, and 4 are not specifically associated with tracheoesophageal fistula.

Test-Taking Strategy: Note the **strategic words**, *most likely*. Focus on the diagnosis, and think about the pathophysiology of the disorder. Recalling the "3 Cs" associated with this disorder will assist in directing you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 872.

4. Answer: 4

Rationale: Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter. Small, more frequent feedings with frequent burping often are prescribed in the treatment of gastroesophageal reflux. Feedings thickened with rice cereal may reduce episodes of emesis. If

thickened formula is used, cross-cutting of the nipple may be required.

Test-Taking Strategy: Note the **subject**, gastroesophageal reflux disease. Use basic principles related to feeding an infant to assist in eliminating options 1 and 2. Noting the words *reducing the episodes of emesis* in the question will assist in directing you to select the correct option over option 3.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 846.

5. Answer: 3

Rationale: Vomiting causes the loss of hydrochloric acid and subsequent metabolic alkalosis. Metabolic acidosis would occur in a child experiencing diarrhea because of the loss of bicarbonate. Diarrhea might or might not accompany vomiting. Hyperactive bowel sounds are not associated with vomiting.

Test-Taking Strategy: Focus on the **subject**, complications related to vomiting. Recalling that gastric fluids are acidic and that the loss of these fluids leads to alkalosis will assist you in answering the question. No data in the question support options 1 and 4.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. p. 989.

6. Answer: 3

Rationale: Imperforate anus is the incomplete development or absence of the anus in its normal position in the perineum. During the newborn assessment, this defect would be identified easily on sight. However, a rectal thermometer or tube may be necessary to determine patency if meconium is not passed in the first 24 hours after birth. Other assessment findings include absence or stenosis of the anal rectal canal, presence of an anal membrane, and an external fistula to the perineum. Options 1, 2, and 4 are findings noted in intussusception.

Test-Taking Strategy: Note the **subject**, manifestations of imperforate anus. Use the definition of the word *imperforate* to assist in answering this question. This would direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 880.

7. Answer: 2

Rationale: In pyloric stenosis, hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum. Clinical manifestations of pyloric stenosis include projectile vomiting, irritability, hunger and crying, constipation, and signs of dehydration, including a decrease in urine output.

Test-Taking Strategy: Focus on the **subject**, the manifestations of pyloric stenosis. Considering the anatomical location of this disorder and its potential effects will assist in eliminating options 1 and 3. Thinking about the pathophysiology of the disorder and recalling that a major clinical manifestation is projectile vomiting will assist in directing you to the correct option from those remaining.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 859.

8. Answer: 1

Rationale: Celiac disease also is known as *gluten enteropathy* or *celiac sprue* and refers to intolerance to gluten, the protein component of wheat, barley, rye, and oats. The important factor to remember is that all wheat, rye, barley, and oats need to be eliminated from the diet and replaced with corn, rice, or millet. Vitamin supplements—especially the fat-soluble vitamins, iron, and folic acid—may be needed to correct deficiencies. Dietary restrictions are likely to be lifelong.

Test-Taking Strategy: Focus on the **subject**, home care instructions for the child with celiac disease. Recalling that corn, rice, and millet are food substitutes in this disease will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 862-863.

9. Answer: 4

Rationale: Intussusception is a telescoping of one portion of the bowel into another. The condition results in an obstruction to the passage of intestinal contents. A child with intussusception typically has severe abdominal pain that is crampy and intermittent, causing the child to draw in the knees to the chest. Vomiting may be present, but is not projectile. Bright red blood and mucus are passed through the rectum and commonly are described as currant jelly-like stools. Watery diarrhea and ribbon-like stools are not manifestations of this disorder.

Test-Taking Strategy: Focus on the **subject**, the manifestations of intussusception. Think about the pathophysiology associated with this condition. Recalling that a classic manifestation is currant jelly-like stools will assist in directing you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. pp. 860-861.

10. Answer: 1, 2, 5

Rationale: Hepatitis is an acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process. Because hepatitis can be viral, standard precautions need to be instituted in the hospital. The child would be discouraged from sharing toys, so playtime in the playroom with other children is not part of the plan of care. The child will be allowed to return to school 1 week after the onset of jaundice, so indefinite homeschooling would not need to be arranged. Jaundice is an expected finding with hepatitis and would not warrant notification of the PHCP. Provision of a low-fat, well-balanced diet is recommended. Parents are cautioned about administering any medication to the child, because normal doses of many medications may become dangerous, owing to the liver's inability to detoxify and excrete them. Handwashing is the most effective measure for control of hepatitis in any setting, and effective handwashing can prevent the immunocompromised child from contracting an opportunistic type of infection.

Test-Taking Strategy: Focus on the **subject**, care for a child with hepatitis. Thinking about the pathophysiology associated with hepatitis and the method of transmission will assist you in answering the question. Because the infection can be transmitted to others, playing with other children in the playroom is an inappropriate intervention. Since jaun-

dice is an expected finding, notifying the PHCP is unnecessary. Planning for an indefinite period of homeschooling is not necessary.

CHAPTER 35

Eye, Ear, and Throat Problems

Contributor: Necole Leland, DNP, RN, PNP, CPN

PRIORITY CONCEPTS Safety; Sensory Perception

I. Strabismus

A. Description

1. Called “squint” or “cross-eye”
2. Condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles
3. It most often results from muscle imbalance or paralysis of extraocular muscles, but it also may result from a congenital defect or poor vision.
4. Amblyopia (reduced visual acuity) may occur if not treated early, because the brain receives two messages as a result of the nonparallel visual axes.
5. To assess condition: six cardinal positions of gaze, corneal light reflex, and the cover-uncover test
6. Permanent loss of vision can occur if not treated early.
7. This condition, considered a normal finding in a young infant, would not be present after about age 4 months.
8. Treatment of the condition depends on the cause.

B. Assessment

1. Crossed eyes
2. Squinting; tilts the head or closes one eye to see
3. Loss of binocular vision
4. Impairment of depth perception
5. Frequent headaches
6. Diplopia; photophobia

C. Interventions

1. Corrective lenses may be indicated.
2. Instruct the parents regarding patching (occlusion therapy) of the “good” eye to strengthen the weak eye.

3. Prepare for surgery to realign the weak muscles as prescribed if nonsurgical interventions are unsuccessful.
4. Instruct the parents about the need for follow-up visits.

II. Conjunctivitis

A. Description

1. Also known as “pink eye”; an inflammation of the conjunctiva
2. Conjunctivitis usually is caused by allergy, infection, or trauma.
3. Types include viral, bacterial, or allergic; bacterial or viral conjunctivitis is extremely contagious.

B. Assessment

1. Itching, burning, or scratchy eyelids
2. Redness
3. Edema
4. Discharge

! Chlamydial conjunctivitis is rare in older children; if diagnosed in a child who is not sexually active, the child needs to be assessed for possible sexual abuse.

C. Interventions

1. Viral conjunctivitis.
 - a. The infection will usually resolve in 7 to 14 days; in some cases it can take 2 to 3 weeks or more to resolve.
 - b. Antiviral medication may be prescribed to treat more serious forms of conjunctivitis, such as those caused by herpes simplex virus or varicella zoster virus; antibiotics are not effective against viruses.

2. Bacterial conjunctivitis
 - a. Mild cases may improve without antibiotic treatment.
 - b. An antibiotic, usually prescribed topically as eye drops or ointment, may be prescribed to shorten the length of infection, reduce complications, and reduce the spread to others.
3. Allergic conjunctivitis
 - a. Removing the allergen from the environment often improves the condition.
 - b. Allergy medications and eye drops such as topical antihistamine and vasoconstrictors may be prescribed.
4. General interventions
 - a. The primary health care provider (PHCP) needs to be consulted regarding going to school and contact with others.
 - b. Instruct the child and parents about the administration of the prescribed medications.
 - c. The tip of the eye drop or ointment delivery device cannot touch the eye, eyelid, or lashes.
 - d. Instruct in infection control measures, such as good handwashing and not sharing towels and washcloths.
 - e. Instruct the child to avoid rubbing the eye to prevent injury.
 - f. Instruct a child who is wearing contact lenses to discontinue wearing them and to obtain new lenses to eliminate the chance of reinfection that can occur from the use of the old lenses.
 - g. Instruct an adolescent that eye makeup needs to be discarded and replaced.
 - h. For additional information, refer to the Centers for Disease Control and Prevention at <https://www.cdc.gov/conjunctivitis/index.html>

III. Otitis Media

A. Description

1. An inflammatory disorder usually caused by an infection of the middle ear, occurring as a result of a blocked eustachian tube, which prevents normal drainage; can be acute or chronic
2. Otitis media is a common complication of an acute respiratory infection (most commonly from respiratory syncytial virus, influenza, or group A streptococcus).
3. Infants and children have eustachian tubes that are shorter, wider, and straighter, which makes them more prone to otitis media.

B. Prevention

1. Feed infants in an upright position to prevent reflux.
2. Maintain routine immunizations.
3. Encourage breast-feeding/chest-feeding for at least the first 6 months of life.
4. Avoid exposure to tobacco smoke and allergens.

C. Assessment

1. Fever
2. Acute onset of ear pain
3. Crying, irritability, lethargy
4. Loss of appetite
5. Rolling of head from side to side
6. Pulling on or rubbing the ear
7. Purulent ear drainage may be present
8. Red, opaque, bulging, immobile tympanic membrane on otoscopic examination
9. Signs of hearing loss (indicative of chronic otitis media)

D. Interventions

1. Encourage fluid intake (may be difficult if the child is in pain).
2. Instruct the child to avoid chewing as much as possible during the acute period, because chewing increases pain.
3. Provide local heat or cold as prescribed to relieve discomfort, and have the child lie with the affected ear down.
4. Instruct the parents in the appropriate procedure to clean drainage from the external ear canal with sterile swabs or gauze; frequent cleansing and the application of moisture barriers may be prescribed to prevent ear excoriation from the drainage.
5. Instruct the parents in the administration of analgesics or antipyretics such as acetaminophen or ibuprofen as prescribed to decrease fever and pain.
6. Instruct the parents in the administration of antibiotics if prescribed, emphasizing that the prescribed period of administration is necessary to eliminate infective organisms.
7. In healthy infants older than 6 months and in children, careful use of antibiotics is recommended because of concerns about medication-resistant *Streptococcus pneumoniae*; usually, waiting up to 72 hours for spontaneous resolution is a safe and appropriate management of acute otitis media.
8. Instruct the parents that screening for hearing loss may be necessary.
9. Instruct the parents about the procedure for administering ear medications such as topical pain-relief drops, if prescribed.

E. Otitis Externa

1. Description: Inflammation of the external auditory canal, which can occur with or without infection; also known as “swimmer’s ear”
2. Assessment
 - a. Rapid onset of symptoms within 48 hours; symptoms include otalgia, pruritus, fullness, drainage, and impaired hearing.
 - b. A low-grade fever may be present.

- c. Tenderness on manipulation of the pinna and tragus is noted on physical exam.
 - d. May have regional lymphadenopathy.
3. Interventions: Treatment is indicated with topical antibiotics and may include neomycin with or without polymyxin B or a fluoroquinolone preparation.

! To administer ear medications in a child younger than 3 years, pull the earlobe down and back. In a child older than 3 years, pull the pinna up and back.

F. Myringotomy

1. Description

- a. A surgical incision into the tympanic membrane to provide drainage of the purulent middle ear fluid; may be done by a laser-assisted procedure
- b. Tympanoplasty tubes, which are small cylinder-shaped tubes, may be inserted into the middle ear to allow continued drainage and to equalize pressure and allow ventilation of the middle ear.

2. Postoperative interventions

- a. Instruct the parents and child to keep the ears dry.
- b. The child needs to wear earplugs while bathing, shampooing, and swimming (diving and submerging under water are not allowed).
- c. Parents can administer an analgesic such as acetaminophen or ibuprofen to relieve discomfort after insertion of tympanoplasty tubes.
- d. Parents need to be taught that the child should not blow the nose for 7 to 10 days after surgery.
- e. Instruct the parents that the tubes usually fall out spontaneously in 6-12 months, it is not an emergency, but the PHCP needs to be notified; inform the parents of the appearance of the tubes (tiny, white, spool-shaped tubes).

IV. Tonsillitis and Adenoiditis

A. Description

1. *Tonsillitis* refers to inflammation and infection of the tonsils, which is lymphoid tissue located in the pharynx (Fig. 35.1).
2. *Adenoiditis* refers to inflammation and infection of the adenoids (pharyngeal tonsils), located on the posterior wall of the nasopharynx.
3. Enlarged tonsils and adenoids may lead to an obstructive sleep apnea in children, manifested by snoring and periods of sudden waking and fragmented sleep; a polysomnography and refer-

FIG. 35.1 Location of various tonsillar masses.

ral to an ear, nose, and throat specialist may be needed.

4. Can be the result of a viral, bacterial, or fungal infection. Group A streptococcus (“strep throat”) is a common bacterial infection of the oropharynx, particularly in children, which can result in streptococcal toxic shock syndrome. Mononucleosis is another possible cause of tonsillitis and adenoiditis.
5. Tonsillectomy (surgical removal of the tonsils) and adenoidectomy (surgical removal of the adenoids) may be necessary, depending on the number of infections per year as well as signs of obstructive respiratory disturbance.

B. Assessment

1. Persistent or recurrent sore throat
2. Enlarged, bright red tonsils that may be covered with white exudate
3. Difficulty in swallowing
4. Mouth breathing and an unpleasant mouth odor
5. Fever
6. Cough
7. Enlarged adenoids may cause nasal quality of speech, mouth breathing, hearing difficulty, snoring, or obstructive sleep apnea.

C. Preoperative interventions

1. Assess for signs of active infection.
2. Assess bleeding and clotting studies, because the throat is vascular.
3. Assess for any loose teeth to decrease the risk of aspiration during surgery.
4. Prepare the child for a sore throat postoperatively, and inform the child that they will need to drink liquids.

D. Interventions postoperatively

1. Position the child prone or side-lying to facilitate drainage.
2. Have suction equipment available, but do not suction unless there is an airway obstruction.

3. Monitor for signs of bleeding (frequent swallowing/clearing of throat may indicate bleeding); if bleeding occurs, turn the child to the side and notify the PHCP.
4. Discourage coughing, clearing the throat, or nose blowing to prevent bleeding.
5. Provide an ice collar or analgesics (rectally or intravenously) for discomfort.
6. Administer antiemetics to prevent vomiting if prescribed.
7. Provide clear, cool, noncitrus, and noncarbonated fluids (crushed ice, ice pops).
8. Avoid red, purple, or brown liquids, which simulate the appearance of blood if the child vomits.
9. Avoid milk products such as milk, ice cream, and pudding initially because they coat the throat, causing the child to cough to clear the throat.
10. Soft foods may be prescribed 1 to 2 days postoperatively.
11. Do not give the child any straws, forks, or sharp objects that can be put into the mouth.
12. Mouth odor, slight ear pain, and a low-grade fever may occur for a few days postoperatively, but the parents need to be instructed to notify the PHCP if bleeding, persistent earache, or fever occurs.
13. Instruct the parents to keep the child away from crowds until healing has occurred; usually the child is able to resume normal activities 1 to 2 weeks postoperatively.

V. Epistaxis (Nosebleed)

A. Description

1. The nose, especially the septum, is a highly vascular structure, and bleeding usually results from direct trauma, foreign bodies, and nose picking or from mucosal inflammation.
2. Recurrent epistaxis and severe bleeding may indicate an underlying disease.

B. Interventions (see **Clinical Judgment: Take Action Box**)

VI. Allergic Rhinitis

A. Description: a condition in which children are sensitized to environmental allergens

B. Assessment

1. Itchy and watery eyes, runny nose, itchy throat
2. May be a family history of atopic disease
3. Dark circles under the eyes, cobblestoning of the conjunctiva, pale nasal mucosa, clear nasal drainage, nasal polyps, fluid in the middle ear, cobblestoning of the posterior pharynx, wheezes, rhonchi, eczema, hives, angioedema

C. Interventions

1. Children with allergic rhinitis need to be tested for environmental allergies, food allergies, atopic dermatitis, and asthma.

2. Avoidance of triggers; administration of prescribed antihistamines, nasal corticosteroids, inhalers

⚡ CLINICAL JUDGMENT: TAKE ACTION

A nurse is attending a school-aged child's soccer game when a child is hit in the nose area with the soccer ball and is bleeding from the nose. The nurse takes the following actions to stop the bleeding:

- Approaches the child calmly
- Remains calm and keeps the child calm and quiet
- Assists the child to sit up and lean forward
- Applies continuous pressure to the nose with the thumb and forefinger for at least 10 minutes
- Inserts cotton or wadded tissue into each nostril, and applies ice or a cold cloth to the bridge of the nose if bleeding persists
- Arranges for transport of the child to the emergency department if the bleeding cannot be controlled; packing or cauterization of the bleeding vessel may be indicated

PRACTICE QUESTIONS

1. After a tonsillectomy, a child begins to vomit bright red blood. The nurse would take which initial action?
 1. Turn the child to the side.
 2. Administer the prescribed antiemetic.
 3. Maintain NPO (nothing by mouth) status.
 4. Notify the primary health care provider (PHCP).
2. The parent of a 6-year-old child arrives at a clinic because the child has been experiencing itchy, red, and swollen eyes. The nurse notes a discharge from the eyes and sends a culture to the laboratory for analysis. Chlamydial conjunctivitis is diagnosed. On the basis of this diagnosis, the nurse determines that which requires further investigation?
 1. Possible trauma
 2. Possible sexual abuse
 3. Presence of an allergy
 4. Presence of a respiratory infection
3. The nurse prepares a teaching plan for the parent of a child diagnosed with bacterial conjunctivitis. Which, if stated by the parent, indicates a need for further teaching?
 1. "I need to wash my hands frequently."
 2. "I need to clean the eye as prescribed."
 3. "It is okay to share towels and washcloths."
 4. "I need to give the eye drops as prescribed."

4. The nurse is reviewing the laboratory results for a child scheduled for a tonsillectomy. The nurse determines that which laboratory value is most significant to review?
 1. Creatinine level
 2. Prothrombin time
 3. Sedimentation rate
 4. Blood urea nitrogen level
5. The nurse is preparing to care for a child after a tonsillectomy. The nurse documents on the plan of care to place the child in which position?
 1. Supine
 2. Side-lying
 3. High-Fowler's
 4. Trendelenburg's
6. After a tonsillectomy, the nurse reviews the surgeon's postoperative prescriptions. Which prescription would the nurse question?
 1. Monitor for bleeding.
 2. Suction every 2 hours.
 3. Give no milk or milk products.
 4. Give clear, cool liquids when awake and alert.
7. The nurse is caring for a child after a tonsillectomy. The nurse monitors the child, knowing that which finding indicates the child is bleeding?
 1. Frequent swallowing
 2. A decreased pulse rate
 3. Complaints of discomfort
 4. An elevation in blood pressure
8. Antibiotics are prescribed for a child with otitis media who underwent a myringotomy with insertion of tympanostomy tubes. The nurse provides discharge instructions to the parents regarding the administration of the antibiotics. Which statement, if made by the parents, indicates understanding of the instructions provided?
 1. "Administer the antibiotics until they are gone."
 2. "Administer the antibiotics if the child has a fever."
 3. "Administer the antibiotics until the child feels better."
 4. "Begin to taper the antibiotics after 3 days of a full course."
9. The day care nurse is observing a 2-year-old child and suspects that the child may have strabismus. Which observation made by the nurse indicates the presence of this condition?
 1. The child has difficulty hearing.
 2. The child consistently tilts the head to see.
 3. The child does not respond when spoken to.
 4. The child consistently turns the head to hear.
10. A child has been diagnosed with acute otitis media of the right ear. Which interventions would the nurse include in the plan of care? Select all that apply.
 1. Provide a soft diet.
 2. Position the child on the left side.
 3. Administer an antihistamine twice daily.
 4. Irrigate the right ear with normal saline every 8 hours.
 5. Administer ibuprofen for fever every 4 hours as prescribed and as needed.
 6. Instruct the parents about the need to administer the prescribed antibiotics for the full course of therapy.

ANSWERS

1. Answer: 1

Rationale: After tonsillectomy, if bleeding occurs, the nurse immediately turns the child to the side to prevent aspiration and then notifies the PHCP. NPO status would be maintained, and an antiemetic may be prescribed; however, the initial nursing action would be to turn the child to the side. If continuous bleeding is suspected, the surgeon is notified immediately.

Test-Taking Strategy: Note the **strategic word**, *initial*. Although all of the options may be appropriate to maintain physiological integrity, the initial action is to turn the child to the side to prevent aspiration.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 896.

2. Answer: 2

Rationale: Conjunctivitis is an inflammation of the conjunctiva. A diagnosis of chlamydial conjunctivitis in a child who is not sexually active would signal the health care provider to assess the child for possible sexual abuse. Trauma, allergy, and infection can cause conjunctivitis, but the causative organism is not likely to be *Chlamydia*.

Test-Taking Strategy: Note the age of the child and the organism that is identified in the question. Also note that options 1, 3, and 4 are **comparable or alike** in that they can be recognized as the common causes of conjunctivitis and they relate to a physiological problem.

Reference: Potter, P., Perry, A. G., Stockert, P. A., & Hall, A. M. (2021). *Fundamentals of nursing*. (10th ed.). St. Louis: Elsevier. pp. 709, 712.

3. Answer: 3

Rationale: Conjunctivitis is an inflammation of the conjunctiva. Bacterial conjunctivitis is highly contagious, and the nurse would teach infection control measures. These include good handwashing and not sharing towels and washcloths. Options 1, 2, and 4 are correct treatment measures.

Test-Taking Strategy: Note the **strategic words**, *need for further teaching*. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 can be eliminated by recalling that bacterial conjunctivitis is highly contagious.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 189.

4. Answer: 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. Because the tonsillar area is so vascular, postoperative bleeding is a concern. Prothrombin time, partial thromboplastin time, platelet count, hemoglobin and hematocrit, white blood cell count, and urinalysis are performed preoperatively. The prothrombin time results would identify a potential for bleeding. Creatinine level, sedimentation rate, and blood urea nitrogen would not determine the potential for bleeding.

Test-Taking Strategy: Note the **strategic word**, *most*. Focus on the surgical procedure and the **subject** of the question. The **subject** of the question relates to a laboratory value that would be important to review after tonsillectomy. Remember that bleeding is a concern. Options 1 and 4 can be eliminated because they relate to kidney function. Option 3 can be eliminated because it is unrelated to the **subject** of the question.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 895.

5. Answer: 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. The child needs to be placed in a prone or side-lying position after the surgical procedure to facilitate drainage. Options 1, 3, and 4 would not achieve this goal.

Test-Taking Strategy: Focus on the **subject**, *positioning after tonsillectomy*. Focus on the surgical procedure, and visualize each of the positions described in the options. Keeping in mind that the goal is to facilitate drainage will direct you to the correct option.

Reference: Hockenberry, M., Wilson, D., & Rodgers, C. (2019). *Wong's nursing care of infants and children*. (11th ed.). St. Louis: Elsevier. p. 895.

6. Answer: 2
